Preface

This guide describes how to configure OcNOS.

IP Maestro Support

Monitor devices running OcNOS Release 6.3.4-70 and above using IP Maestro software.

Audience

This guide is intended for network administrators and other engineering professionals who configure OcNOS.

Conventions

Table 1 on page 33 shows the conventions used in this guide.

Table 1: Conventions

Convention	Description
Italics	Emphasized terms; titles of books
Note:	Special instructions, suggestions, or warnings
`monospaced type`	Code elements such as commands, parameters, files, and directories

Chapter Organization

The chapters in command references are organized as described in Command Description Format.

The chapters in configuration guides are organized into these major sections:

- An overview that explains a configuration in words
- Topology with a diagram that shows the devices and connections used in the configuration
- Configuration steps in a table for each device where the left-hand side shows the commands you enter and the right-hand side explains the actions that the commands perform
- Validation which shows commands and their output that verify the configuration

Related Documentation

For information about installing OcNOS, see the *Installation Guide* for your platform.

Feature Availability

The features described in this document that are available depend upon the OcNOS SKU that you purchased. See the *Feature Matrix* for a description of the OcNOS SKUs.

Migration Guide

Check the *Migration Guide* for configuration changes to make when migrating from one version of OcNOS to another.

Support

For support-related questions, contact support@ipinfusion.com.

Comments

If you have comments, or need to report a problem with the content, contact techpubs@ipinfusion.com.

Command Line Interface

This chapter introduces the OcNOS Command Line Interface (CLI) and how to use its features.

Overview

You use the CLI to configure, monitor, and maintain OcNOS devices. The CLI is text-based and each command is usually associated with a specific task.

You can give the commands described in this manual locally from the console of a device running OcNOS or remotely from a terminal emulator such as `putty` or `xterm`. You can also use the commands in scripts to automate configuration tasks.

Command Line Interface Help

You access the CLI help by entering a full or partial command string and a question mark "?". The CLI displays the command keywords or parameters along with a short description. For example, at the CLI command prompt, type:

```
> show ?
```

The CLI displays this keyword list with short descriptions for each keyword:

```
show ?
  application-priority             Application Priority
  arp                              Internet Protocol (IP)
  bfd                              Bidirectional Forwarding Detection (BFD)
  bgp                              Border Gateway Protocol (BGP)
  bi-lsp                           Bi-directional lsp status and configuration
  bridge                           Bridge group commands
  ce-vlan                          COS Preservation for Customer Edge VLAN
  class-map                        Class map entry
  cli                              Show CLI tree of current mode
  clns                             Connectionless-Mode Network Service (CLNS)
  control-adjacency                Control Adjacency status and configuration
  control-channel                  Control Channel status and configuration
  cspf                             CSPF Information
  customer                         Display Customer spanning-tree
  cvlan                            Display CVLAN information
  debugging                        Debugging functions
  etherchannel                     LACP etherchannel
  ethernet                         Layer-2
...
```

If you type the ? in the middle of a keyword, the CLI displays help for that keyword only.

```
> show de?
debugging  Debugging functions
```

If you type the ? in the middle of a keyword, but the incomplete keyword matches several other keywords, OcNOS displays help for all matching keywords.

```
> show i? (CLI does not display the question mark).
interface  Interface status and configuration
ip         IP information
isis       ISIS information
```

Command Completion

The CLI can complete the spelling of a command or a parameter. Begin typing the command or parameter and then press the tab key. For example, at the CLI command prompt type `sh`:

```
> sh
```

Press the tab key. The CLI displays:

```
> show
```

If the spelling of a command or parameter is ambiguous, the CLI displays the choices that match the abbreviation. Type `show i` and press the tab key. The CLI displays:

```
> show i
  interface  ip          ipv6       isis
> show i
```

The CLI displays the `interface` and `ip` keywords. Type `n` to select `interface` and press the tab key. The CLI displays:

```
> show in
> show interface
```

Type ? and the CLI displays the list of parameters for the `show interface` command.

```
> show interface
  IFNAME  Interface name
  |       Output modifiers
  >       Output redirection
  <cr>
```

The CLI displays the only parameter associated with this command, the `IFNAME` parameter.

Command Abbreviations

The CLI accepts abbreviations that uniquely identify a keyword in commands. For example:

```
> sh int xe0
```

is an abbreviation for:

```
> show interface xe0
```

Command Line Errors

Any unknown spelling causes the CLI to display the error `Unrecognized command` in response to the ?. The CLI displays the command again as last entered.

```
> show dd?
% Unrecognized command
> show dd
```

When you press the Enter key after typing an invalid command, the CLI displays:

```
(config)#router ospf here
                          ^
% Invalid input detected at '^' marker.
```

where the ^ points to the first character in error in the command.

If a command is incomplete, the CLI displays the following message:

```
> show
% Incomplete command.
```

Some commands are too long for the display line and can wrap mid-parameter or mid-keyword, as shown below. This does *not* cause an error and the command performs as expected:

```
area 10.10.0.18 virtual-link 10.10.0.19 authent
ication-key 57393
```

Command Negation

Many commands have a `no` form that resets a feature to its default value or disables the feature. For example:

- The `ip address` command assigns an IPv4 address to an interface
- The `no ip address` command removes an IPv4 address from an interface

Syntax Conventions

Table 2 on page 37 describes the conventions used to represent command syntax in this reference.

Table 2: Syntax conventions

Convention	Description	Example
`monospaced font`	Command strings entered on a command line	`show ip ospf`
`lowercase`	Keywords that you enter exactly as shown in the command syntax.	`show ip ospf`
`UPPERCASE`	See Variable Placeholders	`IFNAME`
`()`	Optional parameters, from which you must select one. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	`(A.B.C.D|<0-4294967295>)`
`()`	Optional parameters, from which you select one or none. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	`(A.B.C.D|<0-4294967295>|)`
`()`	Optional parameter which you can specify or omit. Do not enter the parentheses or vertical bar as part of the command.	`(IFNAME|)`
`{}`	Optional parameters, from which you must select one or more. Vertical bars delimit the selections. Do not enter the braces or vertical bars as part of the command.	`{intra-area <1-255>|inter-area <1-255>|external <1-255>}`

Table 2: Syntax conventions (Continued)

Convention	Description	Example
`[]`	Optional parameters, from which you select zero or more. Vertical bars delimit the selections. Do not enter the brackets or vertical bars as part of the command.	`[<1-65535>|AA:NN|internet|local-AS|no-advertise|no-export]`
`?`	Nonrepeatable parameter. The parameter that follows a question mark can only appear once in a command string. Do not enter the question mark as part of the command.	`?route-map WORD`
`.`	Repeatable parameter. The parameter that follows a period can be repeated more than once. Do not enter the period as part of the command.	`set as-path prepend .<1-65535>`

Variable Placeholders

Table 3 on page 38 shows the tokens used in command syntax use to represent variables for which you supply a value.

Table 3: Variable placeholders

Token	Description
`WORD`	A contiguous text string (excluding spaces)
`LINE`	A text string, including spaces; no other parameters can follow this parameter
`IFNAME`	Interface name whose format varies depending on the platform; examples are: `eth0`, `Ethernet0`, `ethernet0`, `xe0`
`A.B.C.D`	IPv4 address
`A.B.C.D/M`	IPv4 address and mask/prefix
`X:X::X:X`	IPv6 address
`X:X::X:X/M`	IPv6 address and mask/prefix
`HH:MM:SS`	Time format
`AA:NN`	BGP community value
`XX:XX:XX:XX:XX:XX`	MAC address

`<1-5>`
`<1-65535>`
`<0-2147483647>`
`<0-4294967295>`
	Numeric range

Command Description Format

Table 4 on page 39 explains the sections used to describe each command in this reference.

Table 4: Command descriptions

Section	Description
Command Name	The name of the command, followed by what the command does and when should it be used
Command Syntax	The syntax of the command
Parameters	Parameters and options for the command
Default	The state before the command is executed
Command Mode	The mode in which the command runs; see Command Modes
Example	An example of the command being executed

Keyboard Operations

Table 5 on page 39 lists the operations you can perform from the keyboard.

Table 5: Keyboard operations

Key combination	Operation
Left arrow or Ctrl+b	Moves one character to the left. When a command extends beyond a single line, you can press left arrow or Ctrl+b repeatedly to scroll toward the beginning of the line, or you can press Ctrl+a to go directly to the beginning of the line.
Right arrow or Ctrl-f	Moves one character to the right. When a command extends beyond a single line, you can press right arrow or Ctrl+f repeatedly to scroll toward the end of the line, or you can press Ctrl+e to go directly to the end of the line.
Esc, b	Moves back one word
Esc, f	Moves forward one word
Ctrl+e	Moves to end of the line
Ctrl+a	Moves to the beginning of the line
Ctrl+u	Deletes the line
Ctrl+w	Deletes from the cursor to the previous whitespace
Alt+d	Deletes the current word
Ctrl+k	Deletes from the cursor to the end of line
Ctrl+y	Pastes text previously deleted with Ctrl+k, Alt+d, Ctrl+w, or Ctrl+u at the cursor

© 2025 IP Infusion Inc. Proprietary

Table 5: Keyboard operations (Continued)

Key combination	Operation
Ctrl+t	Transposes the current character with the previous character
Ctrl+c	Ignores the current line and redisplays the command prompt
Ctrl+z	Ends configuration mode and returns to exec mode
Ctrl+l	Clears the screen
Up Arrow or Ctrl+p	Scroll backward through command history
Down Arrow or Ctrl+n	Scroll forward through command history

Show Command Modifiers

You can use two tokens to modify the output of a `show` command. Enter a question mark to display these tokens:

```
# show users ?
  | Output modifiers
  > Output redirection
```

You can type the | (vertical bar character) to use output modifiers. For example:

```
> show rsvp | ?
  begin     Begin with the line that matches
  exclude   Exclude lines that match
  include   Include lines that match
  last      Last few lines
  redirect  Redirect output
```

Begin Modifier

The `begin` modifier displays the output beginning with the first line that contains the input string (everything typed after the `begin` keyword). For example:

```
# show running-config | begin xe1
...skipping
interface xe1
 ipv6 address fe80::204:75ff:fee6:5393/64
!
interface xe2
 ipv6 address fe80::20d:56ff:fe96:725a/64
!
line con 0
 login
!
end
```

You can specify a regular expression after the `begin` keyword, This example begins the output at a line with either “xe2” or “xe4”:

```
# show running-config | begin xe[2-4]

...skipping
```

```
interface xe2
 shutdown
!
interface xe4
 shutdown
!
interface svlan0.1
 no shutdown
!
route-map myroute permit 2
!
route-map mymap1 permit 10
!
route-map rmap1 permit 2
!
line con 0
 login
line vty 0 4
 login
!
end
```

Include Modifier

The `include` modifier includes only those lines of output that contain the input string. In the output below, all lines containing the word "input" are included:

```
# show interface xe1 | include input
    input packets 80434552, bytes 2147483647, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1, missed 0
```

You can specify a regular expression after the `include` keyword. This examples includes all lines with "input" or "output":

```
#show interface xe0 | include (in|out)put
    input packets 597058, bytes 338081476, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
    output packets 613147, bytes 126055987, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
```

Exclude Modifier

The `exclude` modifier excludes all lines of output that contain the input string. In the following output example, all lines containing the word "input" are excluded:

```
# show interface xe1 | exclude input
Interface xe1
  Scope: both
  Hardware is Ethernet, address is 0004.75e6.5393
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
  inet6 fe80::204:75ff:fee6:5393/64
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0
```

You can specify a regular expression after the `exclude` keyword. This example excludes lines with “output” or “input”:

```
# show interface xe0 | exclude (in|out)put
Interface xe0
  Scope: both
  Hardware is Ethernet  Current HW addr: 001b.2139.6c4a
  Physical:001b.2139.6c4a  Logical:(not set)
  index 2 metric 1 mtu 1500 duplex-full arp ageing timeout 3000
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Bandwidth 100m
  DHCP client is disabled.
  inet 10.1.2.173/24 broadcast 10.1.2.255
  VRRP Master of :  VRRP is not configured on this interface.
  inet6 fe80::21b:21ff:fe39:6c4a/64
    collisions 0
```

Redirect Modifier

The `redirect` modifier writes the output into a file. The output is not displayed.

```
# show cli history | redirect /var/frame.txt
```

The output redirection token (>) does the same thing:

```
# show cli history >/var/frame.txt
```

Last Modifier

The `last` modifier displays the output of last few number of lines (As per the user input). The last number ranges from 1 to 9999.

For example:

```
#show running-config | last 10
```

© 2025 IP Infusion Inc. Proprietary

String Parameters

The restrictions in Table 6 on page 43 apply for all string parameters used in OcNOS commands, unless some other restrictions are noted for a particular command.

Table 6: String parameter restrictions

Restriction	Description
Input length	1965 characters or less
Restricted special characters	"?", ",", ">", "|", and "=" The "|" character is allowed only for the `description` command in interface mode.

Command Modes

Commands are grouped into modes arranged in a hierarchy. Each mode has its own set of commands. Table P-7 lists the command modes common to all protocols.

Table 7: Common command modes

Name	Description
Executive mode	Also called *view* mode, this is the first mode to appear after you start the CLI. It is a base mode from where you can perform basic commands such as `show`, `exit`, `quit`, `help`, and `enable`.
Privileged executive mode	Also called *enable* mode, in this mode you can run additional basic commands such as `debug`, `write`, and `show`.
Configure mode	Also called *configure terminal* mode, in this mode you can run configuration commands and go into other modes such as interface, router, route map, key chain, and address family. Configure mode is single user. Only one user at a time can be in configure mode.
Interface mode	In this mode you can configure protocol-specific settings for a particular interface. Any setting you configure in this mode overrides a setting configured in router mode.
Router mode	This mode is used to configure router-specific settings for a protocol such as BGP or OSPF.

© 2025 IP Infusion Inc. Proprietary

Command Mode Tree

The diagram below shows the common command mode hierarchy.

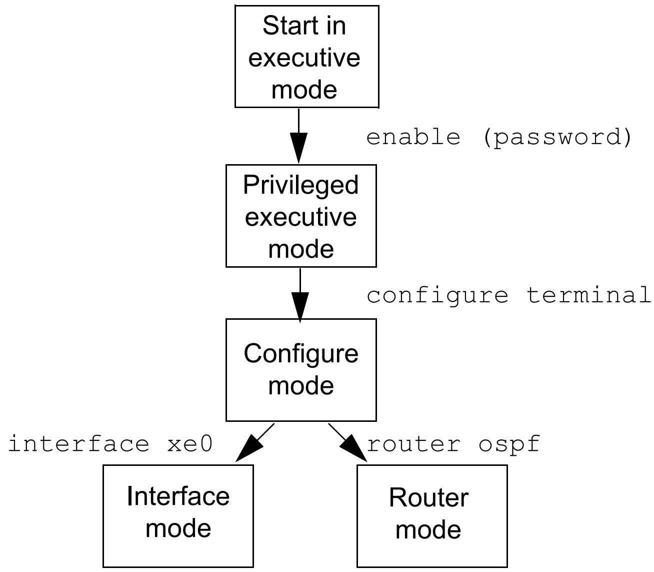

Figure P-1: Common command modes

To change modes:

1. Enter privileged executive mode by entering `enable` in Executive mode.

2. Enter configure mode by entering `configure terminal` in Privileged Executive mode.

The example below shows moving from executive mode to privileged executive mode to configure mode and finally to router mode:

```
> enable mypassword
# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)# router ospf
(config-router)#
```

Note: Each protocol can have modes in addition to the common command modes. See the command reference for the respective protocol for details.

Transaction-based Command-line Interface

The OcNOS command line interface is transaction based:

- Any changes done in configure mode are stored in a separate *candidate* configuration that you can view with the `show transaction current` command.
- When a configuration is complete, apply the candidate configuration to the running configuration with the `commit` command.
- If a `commit` fails, no configuration is applied as the entire transaction is considered failed. You can continue to change the candidate configuration and then retry the `commit`.
- Discard the candidate configuration with the `abort transaction` command.
- Check the last aborted transaction with the `show transaction last-aborted` command.
- Multiple configurations cannot be removed with a single `commit` . You must remove each configuration followed by a `commit`

Note: All commands MUST be executed only in the default CML shell (`cmlsh`). If you log in as root and start `imish`, then the system configurations will go out of sync. The `imish` shell is not supported and should not be started manually.

Ethernet Virtual Private Network Configuration

CHAPTER 1 EVPN MPLS Configuration

This chapter includes step-by-step configurations for EVPN MPLS for Single Homing and Multi Homing.

Overview

Ethernet VPN (EVPN) solution provides Ethernet multipoint services over MPLS networks. EVPN operates in contrast to the existing Virtual Private LAN Service (VPLS) by enabling control-plane based MAC learning. PEs participating in the EVPN instances learn customer MAC routes in control-plane using MP-BGP protocol. Control-plane MAC learning brings a number of benefits that allow EVPN to address the VPLS shortcomings, including support for multi-homing with per-flow load balancing.

In EVPN, PEs advertise the MAC addresses learned from the CEs that are connected to them, along with an MPLS label, to other PEs in the control plane using Multiprotocol BGP (MP-BGP). Control-plane learning enables load balancing of traffic to and from CEs that are multihomed to multiple PEs. This is in addition to load balancing across the MPLS core via multiple LSPs between the same pair of PEs. It also improves convergence times in the event of certain network failures.

Note: The EVPN will supported over static LSP, LDP,BGP-LU transports.

VPN Terminology

MAC-VRF: A virtual routing and forwarding table for storing MACs on a PE for specific bridge domain.

CE: Customer Edge device, e.g., a host, router, or switch.

PE: Provider edge device

EVI: An EVPN instance spanning the Provider Edge (PE) devices participating in that EVPN.

Note: Ethernet Segment (ES): Set of Ethernet links connected between CE and PE. Single CE can be connected to multiple PEs.

Ethernet Segment Identifier (ESI): A unique non-zero identifier that identifies an Ethernet segment is called an ESI

Ethernet Tag: An Ethernet tag identifies a particular broadcast domain, e.g., a VLAN. An EVPN instance consists of one or more broadcast domains.

Benefits

The EVPN control-plane MAC learning has the following benefits:

- Eliminate flood and learn mechanism as hosts are learned over control plane.
- OcNOS supports both dynamically learned hosts and statically configured hosts, which are advertised/learned over the EVPN control plane.
- Fast-reroute, resiliency, and faster convergence in case of multihoming
- Load balancing of traffic to and from CEs that are multihomed to multiple PE's.

The following EVPN types are supported:

- Single-homed CE: One CE is connected to One PE device.
- Multihomed CE: One CE is connected to Multiple PE devices. OcNOS supports dual-homed CEs with all- active multi homing mode.

Route Types

These EVPN route types are supported:

- Route Type 1: Ethernet Auto-Discovery (AD) Route

  The Ethernet (AD) routes are advertised on per EVI and per ESI basis. These routes are sent per ES. They carry the list of EVIs that belong to the ES.

  This route is advertised when multihomed CEs already exist.

- Route Type 2: MAC/IP Advertisement Route

  The host's IP and MAC addresses are advertised to the peers within NLRI. The control plane learning of MAC addresses reduces unknown unicast flooding.

- Route Type 3: Inclusive Multicast Ethernet Tag Route

  This route establishes the connection for broadcast, unknown unicast, and multicast (BUM) traffic from a source PE to a remote PE.

  This route is advertised on per VLAN and per ESI basis.

- Route Type 4: Ethernet Segment Route

  Ethernet segment routes enable to connect a CE device to two or PE devices.

  Ethernet segment routes enable the discovery of connected PE devices that are connected to the same Ethernet segment.

EVPN auto route target will be supported under MAC VRF.

In EVPN-VPWS the auto-discovery of peer PE nodes is done with the pair of Ethernet A-D routes. Inclusive Multicast route does not have participation on auto-discovery unlike ELAN-EVPN VPLS. Since there is no mac-advertisement, MAC-IP route is not applicable

Note: Only Sub-interface supported as Access-port for EVPN-MPLS.

EVPN MPLS Single Homing

Topology

Figure 1-1 depicts the Single Homed topology for the EVPN MPLS configuration examples for both ELINE and ELAN service with LDP as underlay MPLS path.

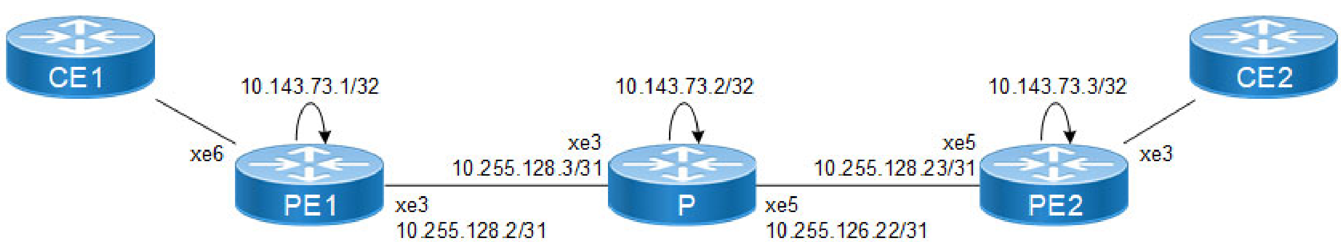

Figure 1-1: EVPN MPLS Single Homing configuration

PE1: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.1/32 secondary`	Configure IP address on loopback interface.
`(config-if)#commit`	Commit the transaction.
`(config-if)#exit`	Exit interface mode

PE1: Global EVPN MPLS Command

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS
`(config)#evpn mpls vtep-ip-global 10.143.73.1`	Configuring VTEP global IP to loopback IP
`(config)#commit`	Commit candidate configuration to be running configuration Note: Reload is required after Enabling/Disabling EVPN MPLS Feature.

PE1: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 10.143.73.1`	Set the router ID to IP address 10.143.73.1
`(config-router)#transport-address ipv4 10.143.73.1`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 10.143.73.3`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config)#commit`	Commit the transaction.

PE1: Interface Configuration Network Side

`(config)#interface xe3`	Enter the Interface mode for eth2.
`(config-if)#ip address 10.255.128.8/31`	Configure IP address on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the transaction.

Note: For RSVP Configuration refer RSVP-TE Configuration

PE1: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.1	Router-ID configurations
(config-router)#network 10.143.73.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.8/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the transaction.

PE1: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)#neighbor 10.143.73.3 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.3 update-source lo	Source of routing updates as loopback
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)#neighbor 10.143.73.3 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit the transaction.

PE1: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.1:2	Configuring Route-Distinguisher value 10.143.73.1:2
(config-vrf)#route-target both 2:2	Configuring import and export value as 2:2
(config-vrf)#exit	Exiting VRF Mode

PE1: MAC VRF Configuration with Auto route target

(config)#mac vrf vpls1001	Enter VRF mode
(config-vrf)#rd 10.143.73.1:1001	Configuring Route-Distinguisher value 10.143.73.1:1001
(config-vrf)#route-target both evpn-auto-rt	Configuring import and export value as evpn-auto-rt. Route target will be derived automatically. Support: route-target export route-target import
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit the transaction.

© 2025 IP Infusion Inc. Proprietary

PE1: EVPN and MAC VRF Mapping

(config)#evpn mpls id 2 xconnect target-mpls-id 252	Configure the EVPN-VPWS identifier with source identifier 2 and target identifier 252
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 1001	Configure the EVPN-VPLS identifier with identifier 1001
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE1: Access Port Configuration

(config)#interface xe6	Enter the Interface mode for xe6.
(config-if)#interface xe6.2 switchport	Creating L2 sub interface of physical interface xe6
(config-if)#encapsulation dot1q 2	Setting Encapsulation to dot1q with VLAN ID 2 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 2	Map vpn-id 2 to interface xe6.2 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#interface xe6.1001 switchport	Creating L2 sub interface of physical interface xe6
(config-if)#encapsulation dot1q 1001	Setting Encapsulation to dot1q with VLAN ID 1001 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 1001	Map vpn-id 1001 to interface xe6.1001 (VPLS)
OcNOS(config-access-if)#commit	Commit candidate configuration to be running configuration

P: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.6/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

P: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.255.128.25	Set the router ID to IP address 10.255.128.25
(config-router)#transport-address ipv4 10.255.128.25	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit the transaction.

P: Interface Configuration

(config)#interface xe3	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.9/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe5	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.25/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

P: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.6	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.6/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.8/31 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)#network 10.255.128.24/31 area 0.0.0.0	Advertise xe5 network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

PE2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.3/32 secondary	Configure IP address on loopback interface.

(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

PE2: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.3	Set the router ID to IP address 10.143.73.3
(config-router)#transport-address ipv4 10.143.73.3	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#targeted-peer ipv4 10.143.73.1	Configure targeted peer.
(config-router-targeted-peer)#exit	Exit router mode
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit the transaction.

PE2: Global EVPN MPLS Command

(config)#evpn mpls enable	Enable EVPN MPLS
(config)#commit	Commit candidate configuration to be running configuration Note: Reload is required after Enabling/Disabling EVPN MPLS Feature
(config)#evpn mpls vtep-ip-global 10.143.73.3	Configuring VTEP global IP to loopback IP
(config)#commit	Commit the transaction.

Interface Configuration Network Side:

(config)#interface xe3	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.24/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

PE2: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.3	Router-ID configurations
(config-router)#network 10.143.73.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.24/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the transaction.

© 2025 IP Infusion Inc. Proprietary

PE2: BGP Configuration

`(config)#router bgp 65010`	Enter the Router BGP mode, ASN: 65010
`(config-router)#neighbor 10.143.73.1 remote-as 65010`	Configuring PE1 as iBGP neighbor using it's loopback IP
`(config-router)#neighbor 10.143.73.1 update-source lo`	Source of routing updates as loopback
`(config-router)#address-family l2vpn evpn`	Entering into address family mode as EVPN
`(config-router-af)#neighbor 10.143.73.1 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)#exit`	Exiting of Address family mode
`(config)#commit`	Commit the transaction.

PE2: MAC VRF Configuration

`(config)#mac vrf vrf2`	Enter VRF mode
`(config-vrf)#rd 10.143.73.3:2`	Configuring Route-Distinguisher value 10.143.73.3:2
`(config-vrf)#route-target both 2:2`	Configuring import and export value as 2:2 Support: route-target export route-target import
`(config-vrf)#exit`	Exiting VRF Mode

PE2: MAC VRF Configuration with Auto route target

`(config)#mac vrf vpls1001`	Enter VRF mode
`(config-vrf)#rd 10.143.73.1:1001`	Configuring Route-Distinguisher value 10.143.73.1:1001
`(config-vrf)#route-target both evpn-auto-rt`	Configuring import and export value as evpn-auto-rt. Route target will be derived automatically.
`(config-vrf)#exit`	Exiting VRF Mode
`(config)#commit`	Commit the transaction.

PE2: EVPN and VRF Mapping

`(config)#evpn mpls id 252 xconnect target-mpls-id 2`	Configure the EVPN-ELINE identifier with source identifier 252 and target identifier 2
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Mapping vrf "vrf2" to EVPN-ELINE identifier
`(config-evpn-mpls)#commit`	Commit the transaction.
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.
`(config)#evpn mpls id 1001`	Configure the EVPN-ELAN identifier with identifier 1001
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001`	Mapping vrf "vpls1001" to EVPN-ELAN identifier
`(config-evpn-mpls)#commit`	Commit the transaction.
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.

© 2025 IP Infusion Inc. Proprietary

PE2: Access Port Configuration

`(config)#interface xe2`	Enter the Interface mode for xe2.
`(config-if)#description access-side-int`	Giving Interface Description
`(config-if)#interface xe2.2 switchport`	Creating L2 sub interface of physical interface xe2
`(config-if)#encapsulation dot1q 2`	Setting Encapsulation to dot1q with VLAN ID 2 Supported Encapsulation: dot1ad, dot1q, untagged, default
`(config-if)#access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-access-if)#map vpn-id 2`	Map vpn-id 252 to interface xe2.2 (VPWS)
`(config-access-if)#exit`	Exiting out of access interface mode
`(config-if)#interface xe2.1001 switchport`	Creating L2 sub interface of physical interface xe2
`(config-if)#encapsulation dot1q 1001`	Setting Encapsulation to dot1q with VLAN ID 1001 Supported Encapsulation: dot1ad, dot1q, untagged, default
`(config-if)#access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-access-if)#map vpn-id 1001`	Map vpn-id 1001 to interface xe2.1001 (VPLS)
`(config)#commit`	Commit candidate configuration to be running configuration

Validation

EVPN MPLS Single Homing Over BGP-LU

Topology

depicts the Single Homed topology for the EVPN MPLS configuration examples for both ELINE and ELAN service with BGP-LU as underlay MPLS path which in turn over another underlay of LDP/RSVP/SR MPLS paths.

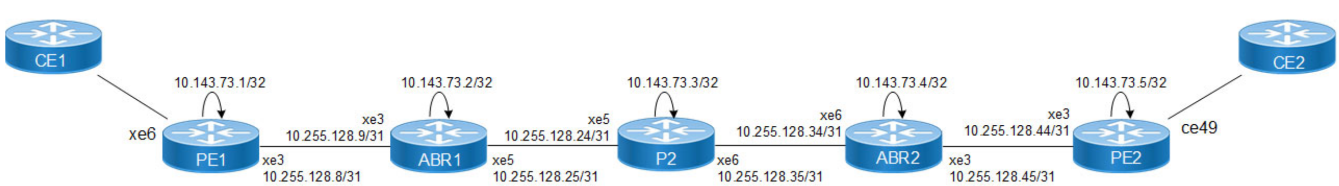

Figure 1-2: EVPN MPLS Single Homing over LU configuration

Configuration

PE1: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.1/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit candidate configuration to be running configuration

PE1: Global EVPN MPLS Command

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS
`(config)#evpn mpls vtep-ip-global 10.143.73.1`	Configuring VTEP global IP to loopback IP
`(config)#commit`	Commit candidate configuration to be running configuration

PE1: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 10.143.73.1`	Set the router ID to IP address 10.143.73.1
`(config-router)# transport-address ipv4 10.143.73.1`	Configure transport address at LDP mode
`(config-router)#targeted-peer ipv4 10.143.73.5`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config)#commit`	Commit candidate configuration to be running configuration

PE1: Interface Configuration Network Side

`(config)#interface xe3`	Enter the Interface mode for eth2.
`(config-if)#ip address 10.255.128.8/31`	Configure IP address on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config)#commit`	Commit candidate configuration to be running configuration

Note: For RSVP Configuration refer RSVP-TE Configuration.

© 2025 IP Infusion Inc. Proprietary

PE1: OSPF Configuration

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.1	Router-ID configurations
(config-router)#network 10.143.73.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.8/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#commit	Commit the transaction.

PE1: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config)#allocate-label all	Configure allocate all under router bgp
(config-router)#neighbor 10.143.73.5 remote-as 65010	Configuring PE2 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.2 remote-as 65010	Configuring ABR1 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.5 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.2 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Entering into address family ipv4 unicast
(config-router-af)# network 10.143.73.1/32	Advertise 10.143.73.1/31 network
(config-router-af)# exit-address-family	Exit from ipv4 address family
(config-router)# address-family ipv4 labeled-unicast	Entering into address family ipv4 labeled-unicast
(config-router-af)#neighbor 10.143.73.2 activate	Activate the ipv4 labeled-unicast neighbor
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)#neighbor 10.143.73.5 activate	Enabling EVPN Address family for neighbor
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit candidate configuration to be running configuration

PE1: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.1:2	Configuring Route-Distinguisher value 10.143.73.1:2
(config-vrf)#route-target both 2:2	Configuring import and export value as 2:2 Support: route-target export route-target import
(config-vrf)#exit	Exiting VRF Mode
(config)#mac vrf vpls1001	Enter VRF mode
(config-vrf)#rd 10.143.73.1:1001	Configuring Route-Distinguisher value 10.143.73.1:1001

(config-vrf)#route-target both 1001:1001	Configuring import and export value as 1001:1001 Support: route-target export Support: route-target export
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit candidate configuration to be running configuration

PE1: EVPN and MAC VRF Mapping

(config)#evpn mpls id 2 xconnect target-mpls-id 252	Configure the EVPN-VPWS identifier with source identifier 2 and target identifier 252
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 1001	Configure the EVPN-VPLS identifier with identifier 1001
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE1: Access Port Configuration

(config)#interface xe6	Enter the Interface mode for xe6.
(config-if)#description access-side-int	Giving Interface Description
(config-if)#interface xe6.2 switchport	Creating L2 sub interface of physical interface xe6
(config-if)#encapsulation dot1q 2	Setting Encapsulation to dot1q with VLAN ID 2 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 2	Map vpn-id 2 to interface xe6.2 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#interface xe6.1001 switchport	Creating L2 sub interface of physical interface xe6
(config-if)#encapsulation dot1q 1001	Setting Encapsulation to dot1q with VLAN ID 1001 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 1001	Map vpn-id 1001 to interface xe6.1001 (VPLS)
(config-access-if)#commit	Commit candidate configuration to be running configuration

ABR1: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.2/32 secondary	Configure IP address on loopback interface.

© 2025 IP Infusion Inc. Proprietary

(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit candidate configuration to be running configuration

ABR1: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#transport-address ipv4 10.143.73.2	Configure transport address under router ldp
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit candidate configuration to be running configuration

ABR1: Interface Configuration

(config)#interface xe3	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.9/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe5	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.25/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit candidate configuration to be running configuration

ABR1: OSPF Configuration

(config)#enable ext-ospf-multi-inst	Enable multiple-instance capabilit
(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.2	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.2/32 area 0.0.0.0 instance-id 100	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.25/31 area 0.0.0.0	Advertise network address in OSPF.
(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#network 10.143.73.2/32 area 0.0.0.0 instance-id 1	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.9/31 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

ABR1: BGP-LU Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config)#allocate-label all	Configure allocate all under router bgp
(config-router)#neighbor 10.143.73.1 remote-as 65010	Configuring PE1 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.4 remote-as 65010	Configuring ABR2 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.4 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Entering into address family ipv4 unicast
(config-router-af)# network 10.143.73.2/32	Advertise the network
(config-router-af)# exit-address-family	Exit from ipv4 address family
(config-router)# address-family ipv4 labeled-unicast	Entering into address family ipv4 labeled-unicast
(config-router-af)#neighbor 10.143.73.4 activate	Activate the ipv4 labeled-unicast neighbor
(config-router-af)#neighbor 10.143.73.4 next-hop-self	Configure next-hopself for the ipv4 labeled-unicast neighbor
config-router-af)#neighbor 10.143.73.4 route-reflector-client	Configure neighbor as route reflector client
(config-router-af)#neighbor 10.143.73.1 activate	Activate the ipv4 labeled-unicast neighbor
config-router-af)#neighbor 10.143.73.1 route-reflector-client	Configure neighbor as route reflector client
(config-router-af)#neighbor 10.143.73.1 next-hop-self	Configure next-hopself for the ipv4 labeled-unicast neighbor
(config)#commit	Commit candidate configuration to be running configuration

P2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.3/32 secondary	Configure IP address on loopback interface.
(config-f)#commit	Commit the transaction.

P2: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#commit	Commit the transaction.

P2: Interface Configuration

(config)#interface xe5	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.24/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe6	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.35/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#commit	Commit the transaction.

P2: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.3	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.24/31 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)#network 10.255.128.35/31 area 0.0.0.0	Advertise xe5 network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

ABR2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.4/32 secondary	Configure IP address on loopback interface.
(config-if)#commit	Commit the transaction.

ABR2: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#transport-address ipv4 10.143.73.4	Configure transport address under router ldp
(config)#commit	Commit the transaction.

ABR2: Interface Configuration

(config)#interface xe6	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.34/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe3	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.45/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#commit	Commit the transaction.

ABR2: OSPF Configuration

(config)#enable ext-ospf-multi-inst	Enable multiple-instance capabilit
(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.4	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.4/32 area 0.0.0.0 instance-id 200	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.34/31 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config)#router ospf 200	Enter the Router OSPF mode.
(config-router)#network 10.255.128.45/31 area 0.0.0.0 instance-id 100	Advertise xe5 network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

ABR2: BGP-LU Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config)#allocate-label all	Configure allocate all under router bgp
(config-router)#neighbor 10.143.73.2 remote-as 65010	Configuring ABR1 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.5 remote-as 65010	Configuring PE2 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.2 update-source lo	Source of routing updates as loopback

© 2025 IP Infusion Inc. Proprietary

(config-router)#neighbor 10.143.73.5 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Entering into address family ipv4 unicast
(config-router-af)# network 10.143.73.4/32	Advertise the network
(config-router-af)# exit-address-family	Exit from ipv4 address family
(config-router)# address-family ipv4 labeled-unicast	Entering into address family ipv4 labeled-unicast
(config-router-af)#neighbor 10.143.73.2 activate	Activate the ipv4 labeled-unicast neighbor
(config-router-af)#neighbor 10.143.73.2 next-hop-self	Configure next-hop-self for the ipv4 labeled-unicast neighbor
config-router-af)#neighbor 10.143.73.2 route-reflector-client	Configure neighbor as route reflector client
(config-router-af)#neighbor 10.143.73.5 activate	Activate the ipv4 labeled-unicast neighbor
config-router-af)#neighbor 10.143.73.5 route-reflector-client	Configure neighbor as route reflector client
(config-router-af)#neighbor 10.143.73.5 next-hop-self	Configure next-hop-self for the ipv4 labeled-unicast neighbor
(config-router-af)#commit	Commit the transaction.

PE2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.5/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

PE2: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.5	Set the router ID to IP address 10.143.73.5
(config-router)#transport-address ipv4 10.143.73.5	Configure transport address under router ldp
(config-router)#targeted-peer ipv4 10.143.73.3	Configure targeted peer.
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#commit	Commit the transaction.

PE2: Global EVPN MPLS Command

(config)#evpn mpls enable	Enable EVPN MPLS
(config)#commit	Commit candidate configuration to be running configuration Note: Reload is required after Enabling/Disabling EVPN MPLS Feature

(config)#evpn mpls vtep-ip-global 10.143.73.5	Configuring VTEP global IP to loopback IP
(config)#commit	Commit the transaction.

PE2: Interface Configuration Network Side

(config)#interface xe3	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.44/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-router)#commit	Commit the transaction.

PE2: OSPF Configuration

(config)#router ospf 200	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.5	Router-ID configurations
(config-router)#network 10.143.73.5/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.44/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#commit	Commit the transaction.

PE2: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config)#allocate-label all	Configure allocate all under router bgp
(config-router)#neighbor 10.143.73.1 remote-as 65010	Configuring PE1 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.4 remote-as 65010	Configuring ABR2 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.4 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Entering into address family ipv4 unicast
(config-router-af)# network 10.143.73.5/32	Advertise the network
(config-router-af)# exit-address-family	Exit from ipv4 address family
(config-router)# address-family ipv4 labeled-unicast	Entering into address family ipv4 labeled-unicast
(config-router-af)#neighbor 10.143.73.4 activate	Activate the ipv4 labeled-unicast neighbor
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)#neighbor 10.143.73.1 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit the transaction.

PE2: MAC VRF Configuration

`(config)#mac vrf vrf2`	Enter VRF mode
`(config-vrf)#rd 10.143.73.5:2`	Configuring Route-Distinguisher value 10.143.73.3:2
`(config-vrf)#route-target both 2:2`	Configuring import and export value as 2:2 Support: route-target export route-target import
`(config-vrf)#exit`	Exiting VRF Mode
`(config)#mac vrf vpls1001`	Enter VRF mode
`(config-vrf)#rd 10.143.73.5:1001`	Configuring Route-Distinguisher value 10.143.73.3:1001
`(config-vrf)#route-target both 1001:1001`	Configuring import and export value as 1001:1001
`(config-vrf)#commit`	Commit the transaction.

PE2: EVPN and VRF Mapping

`(config)#evpn mpls id 252 xconnect target-mpls-id 2`	Configure the EVPN-ELINE identifier with source identifier 252 and target identifier 2
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Mapping vrf "vrf2" to EVPN-ELINE identifier
`(config-evpn-mpls)#commit`	Commit the transaction.
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.
`(config)#evpn mpls id 1001`	Configure the EVPN-ELAN identifier with identifier 1001
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001`	Mapping vrf "vpls1001" to EVPN-ELAN identifier
`(config-evpn-mpls)#commit`	Commit the transaction.
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.

PE2: Access Port Configuration

`(config)#interface xe2`	Enter the Interface mode for xe2.
`(config-if)#description access-side-int`	Giving Interface Description
`(config-if)#interface xe2.2 switchport`	Creating L2 sub interface of physical interface xe2
`(config-if)#encapsulation dot1q 2`	Setting Encapsulation to dot1q with VLAN ID 2 Supported Encapsulation: dot1ad, dot1q, untagged, default
`(config-if)#access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-access-if)#map vpn-id 252`	Map vpn-id 252 to interface xe2.2 (VPWS)
`(config-access-if)#exit`	Exiting out of access interface mode
`(config-if)#interface xe2.1001 switchport`	Creating L2 sub interface of physical interface xe2
`(config-if)#encapsulation dot1q 1001`	Setting Encapsulation to dot1q with VLAN ID 1001 Supported Encapsulation: dot1ad, dot1q, untagged, default
`(config-if)#access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-access-if)#map vpn-id 1001`	Map vpn-id 1001 to interface xe2.1001 (VPLS)
`(config)#commit`	Commit candidate configuration to be running configuration

EVPN MPLS Multihoming

Topology

The diagram depicts the Multi Homed topology for the EVPN MPLS configuration examples that follow.

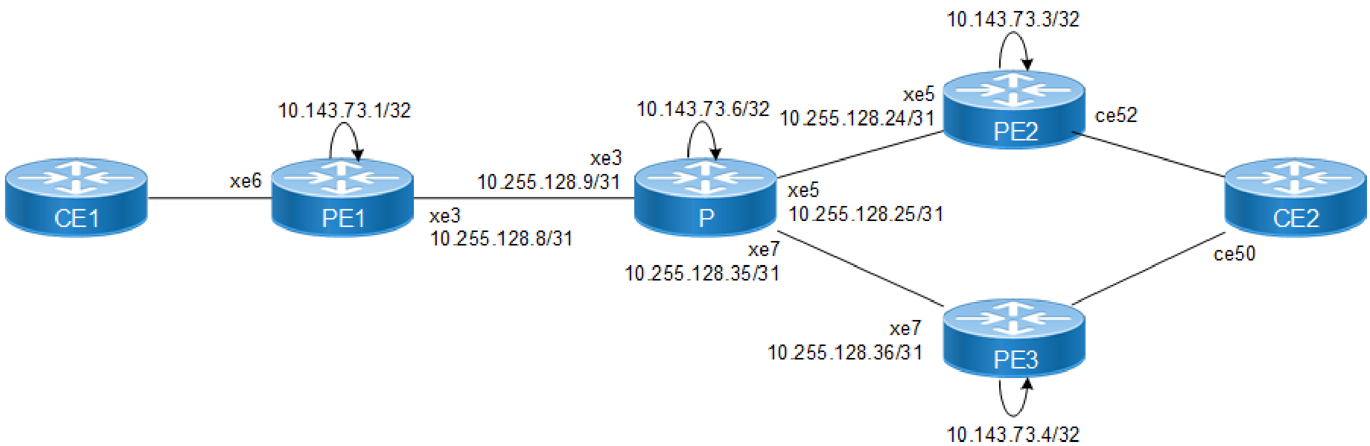

Figure 1-3: MPLS EVPN multi-homing configuration

PE1: Loopback Interface

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.1/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode
`(config-if)#commit`	Commit the transaction.

PE1: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 10.143.73.1`	Set the router ID to IP address 10.143.73.1
`(config-router)#transport-address ipv4 10.143.73.1`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 10.143.73.3`	Configure targeted peer.
`(config-router)#targeted-peer ipv4 10.143.73.4`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config-router)#commit`	Commit the transaction.

PE1: Global EVPN MPLS Command

(config)#evpn mpls enable	Enable EVPN MPLS
(config)#commit	Commit candidate configuration to be running configuration
(config)#evpn mpls vtep-ip-global 10.143.73.1	Configuring VTEP global IP to loopback IP
(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter EVPN-MPLS-MH
(config)#evpn mpls multihoming enable	Enable Multihoming
(config)#commit	Commit the transaction.

PE1: Interface Configuration Network Side

(config)#interface xe3	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.8/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config-if)#commit	Commit the transaction.

Note: For RSVP Configuration refer RSVP-TE Configuration

PE1: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.1	Router-ID configurations
(config-router)#network 10.143.73.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.8/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the transaction.

PE1: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)#neighbor 10.143.73.3 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.3 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.4 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.4 update-source lo	Source of routing updates as loopback
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN

(config-router-af)#neighbor 10.143.73.3 activate	Enabling EVPN Address family for neighbor
(config-router-af)#neighbor 10.143.73.4 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit the transaction.

PE1: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.1:1700	Configuring Route-Distinguisher value 10.143.73.1:1700
(config-vrf)#route-target both 1700:1700	Configuring import and export value as 1700:1700
(config-vrf)#exit	Exiting VRF Mode
(config)#mac vrf vpls1001	Enter VRF mode
(config-vrf)#rd 10.143.73.1:1001	Configuring Route-Distinguisher value 10.143.73.1:1001
(config-vrf)#route-target both 1001:1001	Configuring import and export value as 1001:1001
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit the transaction.

PE1: EVPN and VRF Mapping

(config)#evpn mpls id 1700 xconnect target-mpls-id 1800	Configure the EVPN-VPWS identifier with source identifier 1700 and target identifier 1800
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier with identifier 3000
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE1: Access Port Configuration

(config)#interface xe6	Enter the Interface mode for xe6.
(config-if)#interface xe6.1700 switchport	Creating L2 sub interface of physical interface xe6
(config-if)#description access-side-int	Giving Interface Description
(config-if)#encapsulation dot1q 1700	Setting Encapsulation to dot1q with VLAN ID 1700
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 1700	Map vpn-id 1700 to interface xe6.1700 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#interface xe6.300 switchport	Creating L2 sub interface of physical interface xe6
(config-if)#encapsulation dot1q 3000	Setting Encapsulation to dot1q with VLAN ID 3000

`(config-if)#access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-access-if)#map vpn-id 3000`	Map vpn-id 3000 to interface xe6.3000 (VPLS)
`(config-access-if)#commit`	Commit candidate configuration to be running configuration

P: Loopback Interface

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.6/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode
`(config-if)#commit`	Commit the transaction.

P: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 10.143.73.6`	Set the router ID to IP address 10.143.73.6
`(config-router)#transport-address ipv4 10.143.73.6`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config-router)#commit`	Commit the transaction.

P: Interface Configuration

`(config)#interface xe3`	Enter the Interface mode for xe3.
`(config-if)#ip address 10.255.128.9/31`	Configure IP address on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe5`	Enter the Interface mode for xe5
`(config-if)#ip address 10.255.128.25/31`	Configure IP address on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface po92`	Enter the Interface mode for po92
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#interface xe7`	Enter the Interface mode for xe7
`(config-if)#channel-group 92 mode active`	Moving interface to Dynamic LAG 92
`(config-if)#interface xe8`	Enter the Interface mode for xe8
`(config-if)#channel-group 92 mode active`	Moving interface to Dynamic LAG 92

(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

P: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.6	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.6/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.8/31 area 0.0.0.0	Advertise xe3 network address in OSPF that comes under same subnet
(config-router)#network 10.255.128.24/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#network 10.255.128.36/31 area 0.0.0.0	Advertise po92 network address in OSPF that comes under same subnet
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
OcNOS(config)#commit	Commit candidate configuration to be running configuration

PE2: Loopback Interface

#configure terminal	Enter configure mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.3/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

PE2: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.3	Set the router ID to IP address 10.143.73.3
(config-router)#transport-address ipv4 10.143.73.3	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note:It is preferable to use the loopback address as the transport address.
(config-router)#targeted-peer ipv4 10.143.73.1	Configure targeted peer.
(config-router-targeted-peer)# targeted-peer ipv4 10.143.73.4	Configure targeted peer
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit the transaction.

PE2: Global EVPN MPLS Command

(config)#evpn mpls enable	Enable EVPN MPLS Note: Reload is required after Enabling/Disabling EVPN MPLS Feature
(config)#commit	Commit candidate configuration to be running configuration
(config)#evpn mpls vtep-ip-global 10.143.73.3	Configuring VTEP global IP to loopback IP
(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter EVPN-MPLS-MH
(config)#evpn mpls multihoming enable	Enable Multihoming
(config)#evpn esi hold-time 60	Delay timer for ESI to come up before enabling evpn
(config)#commit	Commit the transaction.

PE2: Interface Configuration Network Side

(config)#interface xe3	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.24/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config-if)#commit	Commit the transaction.

Note: For RSVP Configuration refer RSVP-TE Configuration

PE2: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.3	Router-ID configurations
(config-router)#network 10.143.73.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.24/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
OcNOS(config)#commit	Commit candidate configuration to be running configuration

PE2: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)#neighbor 10.143.73.1 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.4 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.4 update-source lo	Source of routing updates as loopback

© 2025 IP Infusion Inc. Proprietary

(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)#neighbor 10.143.73.1 activate	Enabling EVPN Address family for neighbor
(config-router-af)#neighbor 10.143.73.4 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit the transaction.

PE2: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.3:1700	Configuring Route-Distinguisher value 10.143.73.3:1700
(config-vrf)#route-target both 1700:1700	Configuring import and export value as 1700:1700 Support: route-target export route-target import
(config-vrf)#exit	Exiting VRF Mode
(config)#mac vrf vpls1001	Enter VRF mode
(config-vrf)#rd 10.143.73.3:1001	Configuring Route-Distinguisher value 10.143.73.3:1001
(config-vrf)#route-target both 1001:1001	Configuring import and export value as 1001:1001
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit the transaction.

PE2: EVPN and MAC VRF Mapping

(config)#evpn mpls id 1800 xconnect target-mpls-id 1700	Configure the EVPN-VPWS identifier with source identifier 1800 and target identifier 1700
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "test" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier with identifier 3000
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE2: Access Port Configuration

(config)#interface po90	Enter the Interface mode for po90.
(config-if)#load-interval 30	Load interval setting
(config-if)#evpn multi-homed system-mac 0000.aaaa.bbbc	Configure ESI on a link on which Multi homed CE is connected
(config-if)#interface po90.1700 switchport	Creating L2 sub interface of Dynamic LAG po90
(config-if)#encapsulation dot1q 1700	Setting Encapsulation to dot1q with VLAN ID 1700 Supported Encapsulation: dot1ad, dot1q, untagged, default

© 2025 IP Infusion Inc. Proprietary

(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 1800	Map vpn-id 2 to interface xe2.2 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#interface po90.300 switchport	Creating L2 sub interface of Dynamic LAG po90
(config-if)#encapsulation dot1q 3000	Setting Encapsulation to dot1q with VLAN ID 3000 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 3000	Map vpn-id 3000 to interface po90.300 (VPLS)
(config-access-if)#exit	Exiting out of Access if mode
(config-if)#interface xe2	Enter the Interface mode for xe2
(config-if)#channel-group 90 mode active	Putting interface xe2 in Dynamic LAG po90
(config)#commit	Commit candidate configuration to be running configuration

PE3: Loopback Interface

#configure terminal	Enter configure mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.4/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

PE3: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.4	Set the router ID to IP address 10.143.73.4
(config-router)#transport-address ipv4 10.143.73.4	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#targeted-peer ipv4 10.143.73.1	Configure targeted peer.
(config-router-targeted-peer)# targeted-peer ipv4 10.143.73.3	Configure targeted peer.
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#exit	Exit from router LDP mode
(config-router)#commit	Commit the transaction.

PE3: Global EVPN MPLS Command

(config)#evpn mpls enable	Enable EVPN MPLS
(config)#commit	Commit candidate configuration to be running configuration
(config)#evpn mpls vtep-ip-global 10.143.73.4	Configuring VTEP global IP to loopback IP

(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter EVPN-MPLS-MH
(config)#evpn mpls multihoming enable	Enable Multihoming
(config)#evpn esi hold-time 60	Delay timer for ESI to come up before enabling evpn
(config)#commit	Commit the transaction.

PE3: Interface Configuration Network Side

(config)#interface xe3	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.36/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config-if)#interface xe7	Enter the Interface mode for xe7
(config-if)#channel-group 92 mode active	Moving interface to Dynamic LAG 92
(config-if)#interface xe8	Enter the Interface mode for xe8
(config-if)#channel-group 92 mode active	Moving interface to Dynamic LAG 92
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

Note: For RSVP Configuration refer RSVP-TE Configuration

PE3: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.4	Router-ID configurations
(config-router)#network 10.143.73.4/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.36/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the transaction.

PE3: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)#neighbor 10.143.73.1 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.3 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.3 update-source lo	Source of routing updates as loopback
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN

© 2025 IP Infusion Inc. Proprietary

(config-router-af)#neighbor 10.143.73.1 activate	Enabling EVPN Address family for neighbor
(config-router-af)#neighbor 10.143.73.3 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit the transaction.

PE3: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.4:1700	Configuring Route-Distinguisher value 10.143.73.4:1700
(config-vrf)#route-target both 1700:1700	Configuring import and export value as 1700:1700
(config-vrf)#exit	Exiting VRF Mode
(config)#mac vrf vpls1001	Enter VRF mode
(config-vrf)#rd 10.143.73.4:1001	Configuring Route-Distinguisher value 10.143.73.4:1001
(config-vrf)#route-target both 1001:1001	Configuring import and export value as 1001:1001
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit the transaction.

PE3: EVPN and MAC VRF Mapping

(config)#evpn mpls id 1800 xconnect target-mpls-id 1700	Configure the EVPN-VPWS identifier with source identifier 1800 and target identifier 1800
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "test" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier with identifier 3000
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE3: Access Port Configuration

(config)#interface po90	Enter the Interface mode for po90.
(config-if)#load-interval 30	Load interval setting
(config-if)#evpn multi-homed system-mac 0000.aaaa.bbbc	Configure ESI on a link on which Multi homed CE is connected
(config-if)#interface po90.1700 switchport	Creating L2 sub interface of Dynamic LAG po90
(config-if)#encapsulation dot1q 1700	Setting Encapsulation to dot1q with VLAN ID 1700 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration

(config-access-if)#map vpn-id 1800	Map vpn-id 1800 to Dynamic LAG sub interface po90.1700 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#interface po90.300 switchport	Creating L2 sub interface of Dynamic LAG po90
(config-if)#encapsulation dot1q 3000	Setting Encapsulation to dot1q with VLAN ID 3000 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 3000	Map vpn-id 3000 to interface po90.3000 (VPLS)
(config-access-if)#exit	Exiting out of Access if mode
(config-if)#interface xe2	Enter the Interface mode for xe2
(config-if)#channel-group 90 mode active	Putting interface xe2 in Dynamic LAG po90
(config-if)#commit	Commit candidate configuration to be running configuration

EVPN MPLS Multhoming over BGP-LU

Topology

The diagram depicts the Multi Homed topology for the EVPN MPLS configuration and examples for both ELINE and ELAN service with BGP-LU as underlay MPLS path.

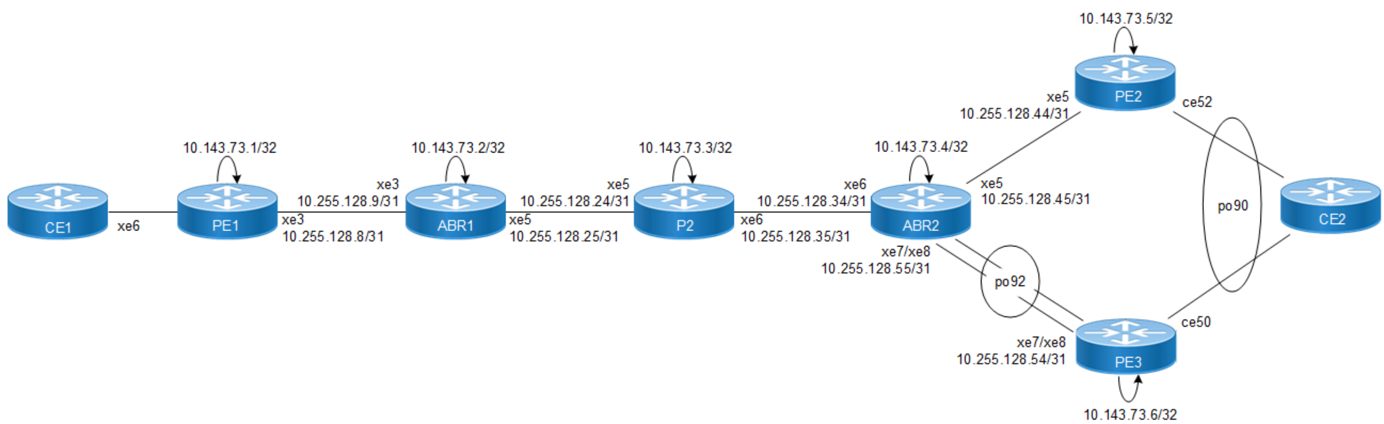

Figure 1-4: MPLS EVPN multi-homing over LU configuration

Configuration

PE1: Loopback Interface

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.1/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the transaction.

PE1: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 10.143.73.1`	Set the router ID to IP address 10.143.73.1
`(config-router)#transport-address ipv4 10.143.73.1`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router-targeted-peer)# targeted-peer ipv4 10.143.73.6`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config)#commit`	Commit the transaction.

PE1: Global EVPN MPLS Command

`(config)#evpn mpls enable`	Enable EVPN MPLS
`(config)#commit`	Commit candidate configuration to be running configuration
`(config)#evpn mpls vtep-ip-global 10.143.73.1`	Configuring VTEP global IP to loopback IP
`(config)#hardware-profile filter evpn-mpls-mh enable`	Enable hardware-profile filter EVPN-MPLS-MH
`(config)#evpn mpls multihoming enable`	Enable Multihoming
`(config)#commit`	Commit the transaction.

PE1: Interface Configuration Network Side

`(config)#interface xe3`	Enter the Interface mode for xe3.
`(config-if)#ip address 10.255.128.8/31`	Configure IP address on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#exit`	Exit interface mode

Note: For RSVP Configuration refer RSVP-TE Configuration.

PE1: OSPF Configuration

`(config)#router ospf 100`	Enter the Router OSPF mode.
`(config-router)#ospf router-id 10.143.73.1`	Router-ID configurations
`(config-router)#network 10.143.73.1/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`(config-router)#network 10.255.128.8/31 area 0.0.0.0`	Advertise network address in OSPF.
`(config-router)#exit`	Exit Router OSPF mode and return to Configure mode.
`(config)#commit`	Commit the transaction.

PE1: BGP Configuration

`(config)#router bgp 65010`	Enter the Router BGP mode, ASN: 65010
`(config-router)#neighbor 10.143.73.5 remote-as 65010`	Configuring Neighbor as iBGP neighbor
`(config-router)#neighbor 10.143.73.5 update-source lo`	Source of routing updates as loopback
`(config-router)#neighbor 10.143.73.6 remote-as 65010`	Configuring Neighbor as iBGP neighbor
`(config-router)#neighbor 10.143.73.6 update-source lo`	Source of routing updates as loopback
`(config-router)#address-family l2vpn evpn`	Entering into address family mode as EVPN
`(config-router-af)#neighbor 10.143.73.5 activate`	Enabling EVPN Address family for neighbor

(config-router-af)#neighbor 10.143.73.6 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit the transaction.

PE1: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.1:1700	Configuring Route-Distinguisher value 10.143.73.1:1700
(config-vrf)#route-target both 1700:1700	Configuring import and export value as 1700:1700
(config-vrf)#exit	Exiting VRF Mode
(config)#mac vrf vpls1001	Enter VRF mode
(config-vrf)#rd 10.143.73.1:1001	Configuring Route-Distinguisher value 10.143.73.1:1001
(config-vrf)#route-target both 1001:1001	Configuring import and export value as 1001:1001
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit the transaction.

PE1: EVPN and VRF Mapping

(config)#evpn mpls id 1700 xconnect target-mpls-id 1800	Configure the EVPN-VPWS identifier with source identifier 1700 and target identifier 1800
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier with identifier 3000
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit candidate configuration to be running configuration
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE1: Access Port Configuration

(config)#interface xe6	Enter the Interface mode for xe6.
(config-if)#interface xe6.1700 switchport	Creating L2 sub interface of physical interface xe6
(config-if)#description access-side-int	Giving Interface Description
(config-if)#encapsulation dot1q 1700	Setting Encapsulation to dot1q with VLAN ID 1700 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 1700	Map vpn-id 1700 to interface xe6.1700 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#interface xe6.300 switchport	Creating L2 sub interface of physical interface xe6
(config-if)#encapsulation dot1q 3000	Setting Encapsulation to dot1q with VLAN ID 3000 Supported Encapsulation: dot1ad, dot1q, untagged, default

(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 3000	Map vpn-id 3000 to interface xe6.3000 (VPLS)
(config-access-if)#commit	Commit candidate configuration to be running configuration

ABR1: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.2/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

ABR1: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.2	Set the router ID to IP address 10.143.73.2
(config-router)#transport-address ipv4 10.143.73.2	Configure transport address under router ldp
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit the transaction.

ABR1: Interface Configuration

(config)#interface xe3	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.9/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe5	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.25/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

ABR1: OSPF Configuration

(config)#enable ext-ospf-multi-inst	Enable multiple-instance capabilit
(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.2	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.2/32 area 0.0.0.0 instance-id 200	Advertise loopback address in OSPF.

© 2025 IP Infusion Inc. Proprietary

(config-router)#network 10.255.128.25/31 area 0.0.0.0	Advertise network address in OSPF.
(config)#router ospf 200	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.2	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.2/32 area 0.0.0.0 instance-id 100	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.9/31 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

ABR1: BGP-LU Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config)#allocate-label all	Configure allocate all under router bgp
(config-router)#neighbor 10.143.73.1 remote-as 65010	Configuring PE1 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.4 remote-as 65010	Configuring ABR2 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.4 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Entering into address family ipv4 unicast
(config-router-af)# network 10.143.73.2/32	Advertise the network
(config-router-af)# exit-address-family	Exit from ipv4 address family
(config-router)# address-family ipv4 labeled-unicast	Entering into address family ipv4 labeled-unicast
(config-router-af)#neighbor 10.143.73.4 activate	Activate the ipv4 labeled-unicast neighbor
(config-router-af)#neighbor 10.143.73.4 next-hop-self	Configure next-hopself for the ipv4 labeled-unicast neighbor
config-router-af)#neighbor 10.143.73.4 route-reflector-client	Configure neighbor as route reflector client
(config-router-af)#neighbor 10.143.73.1 activate	Activate the ipv4 labeled-unicast neighbor
config-router-af)#neighbor 10.143.73.1 route-reflector-client	Configure neighbor as route reflector client
(config-router-af)#neighbor 10.143.73.1 next-hop-self	Configure next-hopself for the ipv4 labeled-unicast neighbor
(config-router-af)#commit	Commit the transaction.

P2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.

(config-if)#ip address 10.143.73.3/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

P2: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.3	Set the router ID to IP address 10.143.73.3
(config-router)#transport-address ipv4 10.143.73.3	Configure transport address under router LDP
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit candidate configuration to be running configuration

P2: Interface Configuration

(config)#interface xe5	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.24/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe6	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.35/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit candidate configuration to be running configuration

P2: OSPF Configuration

(config)#router ospf 200	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.3	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.24/31 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)#network 10.255.128.35/31 area 0.0.0.0	Advertise xe5 network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

ABR2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.

(config-if)#ip address 10.143.73.4/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

ABR2: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.4	Set the router ID to IP address 10.143.73.4
(config-router)#transport-address ipv4 10.143.73.4	Configure transport address under router ldp
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit the transaction.

ABR2: Interface Configuration

(config)#interface xe6	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.34/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe5	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.45/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface po92	Enter the Interface mode for po92
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#ip address 10.255.128.55/31	Configure IP address on the interface.
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#interface xe7	Enter the Interface mode for xe7
(config-if)#channel-group 92 mode active	Moving interface to Dynamic LAG 92
(config-if)#interface xe8	Enter the Interface mode for xe8
(config-if)#channel-group 92 mode active	Moving interface to Dynamic LAG 92
(config-if)#commit	Commit the transaction.

ABR2: OSPF Configuration

(config)#enable ext-ospf-multi-inst	Enable multiple-instance capabilit
(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.4	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.4/32 area 0.0.0.0 instance-id 300	Advertise loopback address in OSPF.

© 2025 IP Infusion Inc. Proprietary

(config-router)#network 10.255.128.34/31 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config)#router ospf 300	Enter the Router OSPF mode.
(config-router)#network 10.143.73.4/32 area 0.0.0.0 instance-id 200	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.45/31 area 0.0.0.0	Advertise xe5 network address in OSPF.
(config-router)#network 10.255.128.55/31 area 0.0.0.0	Advertise po network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

ABR2: BGP-LU Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config)#allocate-label all	Configure allocate all under router bgp
(config-router)#neighbor 10.143.73.2 remote-as 65010	Configuring ABR1 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.5 remote-as 65010	Configuring PE2 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.6 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.2 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.5 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.6 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Entering into address family ipv4 unicast
(config-router-af)# network 10.143.73.4/32	Advertise the network
(config-router-af)# exit-address-family	Exit from ipv4 address family
(config-router)# address-family ipv4 labeled-unicast	Entering into address family ipv4 labeled-unicast
(config-router-af)#neighbor 10.143.73.2 activate	Activate the ipv4 labeled-unicast neighbor
(config-router-af)#neighbor 10.143.73.2 next-hop-self	Configure next-hop-self for the ipv4 labeled-unicast neighbor
config-router-af)#neighbor 10.143.73.2 route-reflector-client	Configure neighbor as route reflector client
(config-router-af)#neighbor 10.143.73.5 activate	Activate the ipv4 labeled-unicast neighbor
config-router-af)#neighbor 10.143.73.5 route-reflector-client	Configure neighbor as route reflector client
(config-router-af)#neighbor 10.143.73.5 next-hop-self	Configure next-hop-self for the ipv4 labeled-unicast neighbor
(config-router-af)#neighbor 10.143.73.6 activate	Activate the ipv4 labeled-unicast neighbor

`config-router-af)#neighbor 10.143.73.6 route-reflector-client`	Configure neighbor as route reflector client
`(config-router-af)#neighbor 10.143.73.6 next-hop-self`	Configure next-hop-self for the ipv4 labeled-unicast neighbor
`(config-router-af)#commit`	Commit candidate configuration to be running configuration

PE2: Loopback Interface

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.5/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit candidate configuration to be running configuration

PE2: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 10.143.73.5`	Set the router ID to IP address 10.143.73.5
`(config-router)#transport-address ipv4 10.143.73.5`	Configure transport address under router ldp
`(config-router)#targeted-peer ipv4 10.143.73.1`	Configure targeted peer.
`(config-router-targeted-peer)# targeted-peer ipv4 10.143.73.6`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config)#commit`	Commit candidate configuration to be running configuration

PE2: Global EVPN MPLS Command

`(config)#evpn mpls enable`	Enable EVPN MPLS Note: Reload is required after Enabling/Disabling EVPN MPLS Feature
`(config)#commit`	Commit candidate configuration to be running configuration
`(config)#evpn mpls vtep-ip-global 10.143.73.5`	Configuring VTEP global IP to loopback IP
`(config)#hardware-profile filter evpn-mpls-mh enable`	Enable hardware-profile filter EVPN-MPLS-MH
`(config)#evpn mpls multihoming enable`	Enable Multihoming
`(config)#evpn esi hold-time 60`	Delay timer for ESI to come up before enabling evpn
`(config)#commit`	Commit candidate configuration to be running configuration

PE2: Interface Configuration Network Side

(config)#interface xe5	Enter the Interface mode for xe5.
(config-if)#ip address 10.255.128.44/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit candidate configuration to be running configuration

Note: For RSVP Configuration refer RSVP-TE Configuration.

PE2: OSPF Configuration

(config)#router ospf 300	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.5	Router-ID configurations
(config-router)#network 10.143.73.5/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.44/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

PE2: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)#neighbor 10.143.73.1 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.4 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.4 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.6 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.6 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 labeled-unicast	Entering into address family ipv4 labeled-unicast
(config-router-af)#neighbor 10.143.73.4 activate	Activate the ipv4 labeled-unicast neighbor
(config-router-af)#neighbor 10.143.73.4 next-hop-self	Configure next-hop-self for the ipv4 labeled-unicast neighbor
(config-router-af)#exit-address-family	Exit the address family
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)#neighbor 10.143.73.1 activate	Enabling EVPN Address family for neighbor

(config-router-af)#neighbor 10.143.73.6 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit candidate configuration to be running configuration

PE2: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.5:1700	Configuring Route-Distinguisher value 10.143.75.3:1700
(config-vrf)#route-target both 1700:1700	Configuring import and export value as 1700:1700
(config-vrf)#exit	Exiting VRF Mode
(config)#mac vrf vpls1001	Enter VRF mode
(config-vrf)#rd 10.143.73.5:1001	Configuring Route-Distinguisher value 10.143.73.5:1001
(config-vrf)#route-target both 1001:1001	Configuring import and export value as 1001:1001
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit candidate configuration to be running configuration

PE2: EVPN and MAC VRF Mapping

(config)#evpn mpls id 1800 xconnect target-mpls-id 1700	Configure the EVPN-VPWS identifier with source identifier 1800 and target identifier 1700
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "test" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier with identifier 3000
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit candidate configuration to be running configuration
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE2: Access Port Configuration

(config)#interface po90	Enter the Interface mode for po90.
(config-if)#load-interval 30	Load interval setting
(config-if)#evpn multi-homed system-mac 0000.aaaa.bbbc	Configure ESI on a link on which Multi homed CE is connected
(config-if)#interface po90.1700 switchport	Creating L2 sub interface of Dynamic LAG po90
(config-if)#encapsulation dot1q 1700	Setting Encapsulation to dot1q with VLAN ID 1700
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 1800	Map vpn-id 2 to interface ce49.2 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#interface po90.300 switchport	Creating L2 sub interface of Dynamic LAG po90

(config-if)#encapsulation dot1q 3000	Setting Encapsulation to dot1q with VLAN ID 3000 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 3000	Map vpn-id 3000 to interface po90.300 (VPLS)
(config-access-if)#exit	Exiting out of Access if mode
(config-if)#interface ce52	Enter the Interface mode for ce52
(config-if)#channel-group 90 mode active	Putting interface ce50 in Dynamic LAG po90
(config)#commit	Commit candidate configuration to be running configuration

PE3: Loopback Interface

#configure terminal	Enter configure mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.6/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit candidate configuration to be running configuration

PE3: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.6	Set the router ID to IP address 10.143.73.5
(config-router)#transport-address ipv4 10.143.73.6	Configure transport address under router ldp
(config-router)#targeted-peer ipv4 10.143.73.1	Configure targeted peer.
(config-router-targeted-peer)# targeted-peer ipv4 10.143.73.5	Configure targeted peer.
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#exit	Exit from router LDP mode
(config)#commit	Commit candidate configuration to be running configuration

PE3: Global EVPN MPLS Command

(config)#evpn mpls enable	Enable EVPN MPLS
(config)#commit	Commit candidate configuration to be running configuration
(config)#evpn mpls vtep-ip-global 10.143.73.6	Configuring VTEP global IP to loopback IP
(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter EVPN-MPLS-MH
(config)#evpn mpls multihoming enable	Enable Multihoming
(config)#evpn esi hold-time 60	Delay timer for ESI to come up before enabling evpn
(config)#commit	Commit candidate configuration to be running configuration

PE3: Interface Configuration Network Side

(config)#interface po92	Enter the Interface mode for xe3.
(config-if)#ip address 10.255.128.54/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config-if)#interface xe7	Enter the Interface mode for xe7
(config-if)#channel-group 92 mode active	Moving interface to Dynamic LAG 92
(config-if)#interface xe8	Enter the Interface mode for xe8
(config-if)#channel-group 92 mode active	Moving interface to Dynamic LAG 92
(config-if)#exit	Exit interface mode
(config)#commit	Commit candidate configuration to be running configuration

PE3: OSPF Configuration

(config)#router ospf 300	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.6	Router-ID configurations
(config-router)#network 10.143.73.6/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.54/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

PE3: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)#neighbor 10.143.73.1 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.4 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.4 update-source lo	Source of routing updates as loopback
(config-router)#neighbor 10.143.73.5 remote-as 65010	Configuring Neighbor as iBGP neighbor
(config-router)#neighbor 10.143.73.5 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 labeled-unicast	Entering into address family ipv4 labeled-unicast
(config-router-af)#neighbor 10.143.73.4 activate	Activate the ipv4 labeled-unicast neighbor
(config-router-af)#neighbor 10.143.73.4 next-hop-self	Configure next-hop-self for the ipv4 labeled-unicast neighbor

(config-router-af)#exit-address-family	Exit the address family
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)#neighbor 10.143.73.1 activate	Enabling EVPN Address family for neighbor
(config-router-af)#neighbor 10.143.73.5 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit candidate configuration to be running configuration

PE3: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.6:1700	Configuring Route-Distinguisher value 10.143.73.6:1700
(config-vrf)#route-target both 1700:1700	Configuring import and export value as 1700:1700
(config-vrf)#exit	Exiting VRF Mode
(config)#mac vrf vpls1001	Enter VRF mode
(config-vrf)#rd 10.143.73.6:1001	Configuring Route-Distinguisher value 10.143.73.6:1001
(config-vrf)#route-target both 1001:1001	Configuring import and export value as 1001:1001
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit candidate configuration to be running configuration

PE3: EVPN and MAC VRF Mapping

(config)#evpn mpls id 1800 xconnect target-mpls-id 1700	Configure the EVPN-VPWS identifier with source identifier 1800 and target identifier 1800
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "test" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier with identifier 3000
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit candidate configuration to be running configuration
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE3: Access Port Configuration

(config)#interface po90	Enter the Interface mode for po90.
(config-if)#load-interval 30	Load interval setting
(config-if)#evpn multi-homed system-mac 0000.aaaa.bbbc	Configure ESI on a link on which Multi homed CE is connected
(config-if)#interface po90.1700 switchport	Creating L2 sub interface of Dynamic LAG po90
(config-if)#encapsulation dot1q 1700	Setting Encapsulation to dot1q with VLAN ID 1700 Supported Encapsulation: dot1ad, dot1q, untagged, default

(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 1800	Map vpn-id 1800 to Dynamic LAG sub interface po90.1700 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#interface po90.300 switchport	Creating L2 sub interface of Dynamic LAG po90
(config-if)#encapsulation dot1q 3000	Setting Encapsulation to dot1q with VLAN ID 3000 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 3000	Map vpn-id 3000 to interface po90.3000 (VPLS)
(config-access-if)#exit	Exiting out of Access if mode
(config-if)#interface ce50	Enter the Interface mode for ce50
(config-if)#channel-group 90 mode active	Putting interface ce50 in Dynamic LAG po90
(config)#commit	Commit candidate configuration to be running configuration

Validation

EVPN-MPLS L2CP Tunneling

EVPN-MPLS services shall support transparent L2 control plane protocol tunneling via network tunnels between CE's, via Sub-ifp framework support. The protocols which are tunneled are controlled by configuration at parent Interface (of A/C ports).The below list of L2 control plane BPDU shall be transparently tunneled across EVPN-MPLS networks based on egress tunnels when Tunnel action is configured.

- dot1x
- efm
- elmi
- lldp
- xSTP
- lacp

In case of action "DISCARD" and "PEER" appropriate behavior should see.

- PEER - the corresponding L2 control packet shall be uplifted to the CPU/control plane for processing.
- DISCARD - the corresponding L2 control packets are dropped at node.

Default behavior is PEER.

Topology

See Figure 1-1 and Figure 1-3.

Note: L2CP should be enabled in all PEs access interface to have end to end traffic.

L2CP Configurations

(config)#in xe1	Entering into interface level of access side interface
(config-if)#l2protocol <protocol> tunnel	Enabling tunnel for the L2CP protocol
(config-if)#l2protocol <protocol> peer	Enabling peer for the L2CP protocol
(config-if)#l2protocol <protocol> discard	Enabling discard for the L2CP protocol

Validation

```

```

Note: CPU drop counters will increment for both peer and discard as per design.

EVPN-MPLS MAC Statistics

MAC Statistics feature provides statistics based on number of MAC's routes learned during ELAN and ETREE EVPN-MPLS service. Generic show command supported for both MH and SH services.

"show evpn mpls route-count" is used by admin to fetch all the three route type count (MAC-Only, MAC-IPV4, MAC-IPV6) for per VPN-ID of an EVPN MPLS service and/or route-type.

The details of routes can be fetched via "show evpn mpls nd-cache", "show evpn mpls arp-cache" and "show evpn mpls mac table".

MAC Statistics functionality is "Not Applicable" for EVPN E-LINE service as its point-2-point and does not have MAC advertisements functionality.

Topology

See Figure 1-1 and Figure 1-3.

Configurations

Refer to above configurations to bring up the EVPN service for both SH andMH. No specific configuration needed to get the show command output. Based on the installed service and traffic below route count will be fetched.

Validation

```
PE1#show evpn mpls route-count
EVPN-MPLS Active route count information
====================================
Max route count    : 32768
Active route count: 51
---------------------------------------------
 VNID     Total     MACONLY  MACIPv4  MACIPv6
---------------------------------------------

 601      17        7        5        5
 801      17        7        5        5
 802      0         0        0        0
Total number of entries are 4
```

EVPN-MPLS Control-Word Support

A control-word is 4-byte optional field inserted between MPLS label stack & MPLS payload in data traffic as demarcation between MPLS labels & payload to distinguish a PW payload from an IP payload carried over the MPLS LSP, so that LSR or transit node which does deep packet inspection should not treat PW payload as IP payload and result in incorrect ECMP/load-sharing.

Some of salient points for support provided in OcNOS:

- control-word is applicable for both L2-EVPN (E-LAN, E-LINE etc) service data traffics and not applicable for L3-EVPN (IRB) traffic.
- control-word is based on static-CLI configurable along with any EVPN instance creation.

  `hardware-profile filter evpn-mpls-cw enable` CLI must be configured for Control-word Support.

  System requires reboot once after hardware profile filter control-word enabled.

Topology

See Figure 1-1 and Figure 1-3.

Note: Control-word should be symmetrically enabled/disabled across all PE nodes to have end to end non-malformed traffic handling.

EVPN-MPLS Control-Word Configurations

Refer to EVPN MPLS Single Homing configurations to bring up the EVPN service for SH.

PE1: EVPN and MAC VRF Mapping

`(config)#hardware-profile filter evpn-mpls-cw enable`	Enable hardware profile filter evpn-mpls-cw for Control-word support
`(config)#evpn mpls id 2 xconnect target-mpls-id 252 control-word`	Configure the EVPN-VPWS identifier with source identifier 2 and target identifier 252 along with control-word
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Mapping vrf "vrf2" to EVPN-VPWS identifier

(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 1001 control-word	Configure the EVPN-VPLS identifier with identifier 1001 along with control-word
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE2: EVPN and VRF Mapping

(config)#hardware-profile filter evpn-mpls-cw enable	Enable hardware profile filter evpn-mpls-cw for Control-word support
(config)#evpn mpls id 252 xconnect target-mpls-id 2 control-word	Configure the EVPN-ELINE identifier with source identifier 252 and target identifier 2 along with control-word
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-ELINE identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 1001 control-word	Configure the EVPN-ELAN identifier with identifier 1001 along with control-word
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-ELAN identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

Refer to EVPN MPLS Multihoming configurations to bring up the EVPN service for MH.

PE1: EVPN and VRF Mapping

(config)#hardware-profile filter evpn-mpls-cw enable	Enable hardware profile filter evpn-mpls-cw for Control-word support
(config)#evpn mpls id 1700 xconnect target-mpls-id 1800 control-word	Configure the EVPN-VPWS identifier with source identifier 1700 and target identifier 1800 along with control-word
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#evpn mpls id 3000 control-word	Configure the EVPN-VPLS identifier with identifier 3000 along with control-word
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Mapping vrf "vpls1001" to EVPN-VPLS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE2: EVPN and MAC VRF Mapping

`(config)#hardware-profile filter evpn-mpls-cw enable`	Enable hardware profile filter evpn-mpls-cw for Control-word support
`(config)#evpn mpls id 1800 xconnect target-mpls-id 1700 control-word`	Configure the EVPN-VPWS identifier with source identifier 1800 and target identifier 1700 along with control-word
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Mapping vrf "test" to EVPN-VPWS identifier
`(config-evpn-mpls)#commit`	Commit the transaction.
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.
`(config)#evpn mpls id 3000 control-word`	Configure the EVPN-VPLS identifier with identifier 3000 along with control-word
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001`	Mapping vrf "vpls1001" to EVPN-VPLS identifier
`(config-evpn-mpls)#commit`	Commit the transaction.
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.

PE3: EVPN and MAC VRF Mapping

`(config)#hardware-profile filter evpn-mpls-cw enable`	Enable hardware profile filter evpn-mpls-cw for Control-word support
`(config)#evpn mpls id 1800 xconnect target-mpls-id 1700 control-word`	Configure the EVPN-VPWS identifier with source identifier 1800 and target identifier 1800 along with control-word
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Mapping vrf "test" to EVPN-VPWS identifier
`(config-evpn-mpls)#commit`	Commit the transaction.
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.
`(config)#evpn mpls id 3000 control-word`	Configure the EVPN-VPLS identifier with identifier 3000 along with control-word
`(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001`	Mapping vrf "vpls1001" to EVPN-VPLS identifier
`(config-evpn-mpls)#commit`	Commit the transaction.
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.

Validation

`show running-config evpn mpls` should display control-word configuration along EVI instance. Traffic validations are performed using packet capture to observe 4-byte control word present in data traffic.

EVPN-MPLS RSVP Multipath

EVPN-MPLS services with RSVP multipath as a transport provides, Multiple RSVP tunnels which are grouped in ECMP/Multipath group to do load sharing for better optimized and efficient usages of multiple RSVP trunks towards the same Destination.

At ingress node the traffic is load-balanced based on the configured hash (L3 src/dest IP/port, L2 src/dst mac, or in-label if intermediate Autonomous segments). Each LSP path within multipath group can provide individual protection for each path (facility, 1-to-1, secondary).

Each tunnel path in multipath group cost may vary (can have different hop, with consideration for load-balancing the traffic).

Unicast traffic is load shared across all the available multipath member (but not mandatory always) where as in case of BUM only the Active member carries traffic. Addition/deletion should not have impact in traffic in case of unicast, and switchover time is not guaranteed <50ms in case of BUM traffic.

This feature supports across all EVPN service as both SH and MH modes and only BUM Traffic not supported for ELINE service alone as per RFC standard.

Topology

See Figure 1-1, Figure 1-3, Figure 1-5.

Multi Path Configurations

See the previous configurations to bring up the EVPN service for both SH and MH. Transport alone we need to change it from LDP/RSVP to RSVP Multipath as per below configurations.

`(config)#router rsvp`	Creation of RSVP
`(config-router)#int xe1`	Entering into interface level
`(config-if)#enable-rsvp`	Associate the configured RSVP to the exit interface.
`(config-router)#int xe2`	Creation into interface level
`(config-if)#enable-rsvp`	Associate the configured RSVP to the exit interface.
`(Config)#rsvp-multipath MP1`	Create an RSVP multipath group 1
`(config-multipath)#description To-PE3-SH-ELINE-ELAN-ETREE`	RSVP multipath specific description
`(config-multipath)#to 7.7.7.7`	RSVP multipath destination prefix
`(config)# rsvp-path P1_PE3`	Path for Resource Reservation Protocol (RSVP) with Name
`(config-path)# 10.1.24.2 loose`	Configure this explicit route path as a loose or strict hop
`(config-path)#exit`	Exit Path mode.
`(config)# rsvp-path P2_PE3`	Path for Resource Reservation Protocol (RSVP) with Name
`(config-path)# 10.1.34.2 loose`	Configure this explicit route path as a loose or strict hop
`(config-path)#exit`	Exit Path mode.
`(config)#rsvp-trunk T1_PE3`	Create an RSVP trunk T1 and enter the Trunk mode.
`(config-trunk)#primary path P1_PE3`	Specify an RSVP path to be used
`(config-trunk)#to 7.7.7.7`	Specify the IPv4 egress (destination point) for the LSP
`(config-trunk)#multipath-group MP1`	Associating the MP member to the RSVP trunk
`(config)#rsvp-trunk T2_PE3`	Create an RSVP trunk T1 and enter the Trunk mode.
`(config-trunk)#primary path P2_PE3`	Specify an RSVP path to be used
`(config-trunk)#to 7.7.7.7`	Specify the IPv4 egress (destination point) for the LSP
`(config-trunk)#multipath-group MP1`	Associating the MP member to the RSVP trunk
`(config-trunk)#exit`	Exit trunk mode.
`(config)#commit`	Commit candidate configuration to be running configuration

Validation

Below command shows RSVP multipath group info per VPN-ID/destination.

```
PE3#show evpn mpls tunnel label
EVPN-MPLS Network tunnel labels

EVPN-ELINE CFM Single Homing

CFM (as per IEEE 802.1ag 2007) provides capabilities useful for detecting, verifying and isolating connectivity failures in Virtual Bridged Local Area Networks through Continuity Check, Loop Back and Link Trace protocols. These capabilities can be used in networks operated by multiple independent organizations, each with restricted access to each other's equipment.

The network administrator is generally informed about the failure in the connection based on the reception of Continuity Check Messages or by the user. The administrator can then initiate Loop Back or Link Trace accordingly to quickly determine and then isolate the fault condition.

The CFM information is conveyed in Protocol frames called CFM Protocol Data Units (CFM PDUs). The CFM PDUs contain the appropriate control and status information used to detect, verify and isolate faults. It also contains information for path discovery in CFM-enabled links.

Currently, supported only for EVPN-ELINE Single home and up MEP service on both Q1 and Q2 platforms.

Topology

The diagram depicts the Single Homed topology for the EVPN MPLS configuration examples that follow.

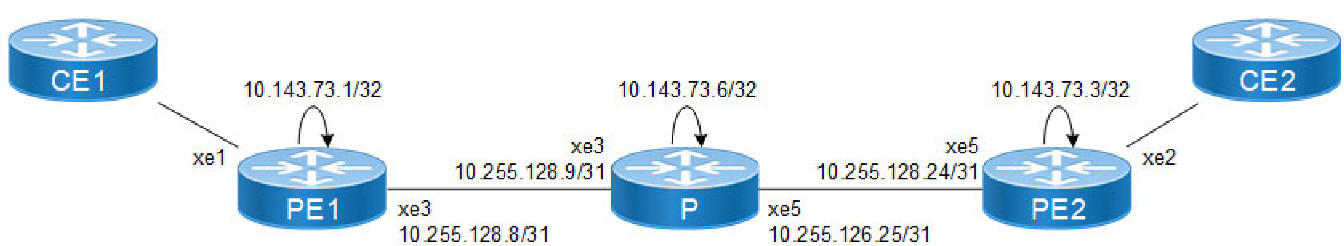

Figure 1-5: EVPN MPLS Single Homing configuration

Prerequisite

Configure below hardware-profile commands related to CFM in configuration mode and reboot the nodes.

```
hardware-profile filter cfm-domain-name-str enable
```

```
hardware-profile statistics cfm-ccm enable
```

PE1: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.1/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit candidate configuration to be running configuration

PE1: Global EVPN MPLS Command

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS
`(config)#commit`	Commit candidate configuration to be running configuration Note: Reload is required after Enabling/Disabling EVPN MPLS Feature
`(config)#evpn mpls vtep-ip-global 10.143.73.1`	Configuring VTEP global IP to loopback IP

PE1: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`PE1(config-router)#router-id 10.143.73.1`	Set the router ID to IP address 10.143.73.1
`PE1(config-router)#transport-address ipv4 10.143.73.1 0`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address
`PE1(config-router)#targeted-peer ipv4 10.143.73.3`	Configure targeted peer.
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config)#commit`	Commit candidate configuration to be running configuration

PE1: Interface Configuration Network Side

`(config)#interface xe3`	Enter the Interface mode for xe3
`(config-if)#ip address 10.255.128.2/31`	Configure IP address on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit candidate configuration to be running configuration

Note: For RSVP Configuration refer RSVP-TE Configuration.

PE1: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.1	Router-ID configurations
(config-router)#network 10.143.73.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.2/31 area 0.0.0.0	Advertise xe3 network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

PE1: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)#neighbor 10.143.73.3 remote-as 65010	Configuring PE2 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.3 update-source lo	Source of routing updates as loopback
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)#neighbor 10.143.73.3 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit candidate configuration to be running configuration

PE1: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.1:2	Configuring Route-Distinguisher value 10.143.73.1:2
(config-vrf)#route-target both 2:2	Configuring import and export value as 2:2
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit candidate configuration to be running configuration

PE1: EVPN and VRF Mapping

(config)#evpn mpls id 2 xconnect target-mpls-id 252	Configure the EVPN-VPWS identifier with source identifier 2 and target identifier 252
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE1: Access Port Configuration

(config)#interface xe6	Enter the Interface mode for xe6.
(config-if)#description access-side-int	Giving Interface Description
(config-if)#interface xe6.2 switchport	Creating L2 sub interface of physical interface xe6

`(config-if)#encapsulation dot1q 2`	Setting Encapsulation to dot1q with VLAN ID 2 Supported Encapsulation: dot1ad, dot1q, untagged, default
`(config-if)#access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-access-if)#map vpn-id 2`	Map vpn-id 252 to interface xe2.2 (VPWS)
`(config-access-if)#exit`	Exiting out of access interface mode
`(config-if)#commit`	Commit candidate configuration to be running configuration

PE1: CFM Configuration

`(config)#hardware-profile filter cfm-domain-name-str enable`	Configure cfm-domain-name-str profile to enable cfm
`(config)#ethernet cfm domain-type character-string domain-name MD-01 level 2 mip-creation none`	Create CFM domain for Evpn ELine with type as character string and set mip creation to none
`(config-ether-cfm-mpls-md)#service ma-type string ma-name S1`	Create ma type with string and set mip creation to none
`(config-ether-cfm-mpls-ma)# evpn 2`	Configure evpn <Evpn-id>
`(config-ether-cfm-mpls-ma)#ethernet cfm mep up mpid 8191 active true evpn 2`	Create up-mep for local evpn id 2
`(config-ether-cfm-mpls-ma-mep)#cc multicast state enable`	Enable cc multicast
`(config-ether-cfm-mpls-ma-mep)#exit-ether-ma-mep-mode`	Exit Ethernet ma-mep-mode
`(config-ether-cfm-mpls-ma)#mep crosscheck mpid 8000`	Configure cross check to remote mep for vlan 2
`(config-ether-cfm-mpls-ma)#cc interval 2`	Enable cc interval with value 2 i.e 10 milliseconds
`(config-ether-cfm-mpls-ma)#exit-ether-ma-mode`	Exit ethernnet ma mode
`(config-ether-cfm-mpls-md)#exit`	Exit Ethernet cfm mode
`(config)#exit`	Exit from config mode
`(config)#commit`	Commit candidate configuration to be running configuration

P: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.2/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit candidate configuration to be running configuration

P: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`PE1(config-router)#router-id 10.143.73.2`	Set the router ID to IP address 10.143.73.2

PE1(config-router)#transport-address ipv4 10.143.73.2 0	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit candidate configuration to be running configuration

P: Interface Configuration

(config)#interface xe3	Enter the Interface mode for xe3
(config-if)#ip address 10.255.128.3/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe5	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.22/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit candidate configuration to be running configuration

P: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.2	Setting the Router ID as Loopback IP
(config-router)#network 10.143.73.2/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.22/31 area 0.0.0.0	Advertise xe5 network address in OSPF
(config-router)#network 10.255.128.3/31 area 0.0.0.0	Advertise xe3 network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

PE2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.3/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit candidate configuration to be running configuration

PE2: Global LDP

(config)#router ldp	Enter the Router LDP mode.
PE1(config-router)#router-id 10.143.73.3	Set the router ID to IP address 10.143.73.3
PE1(config-router)#transport-address ipv4 10.143.73.3 0	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
PE1(config-router)#targeted-peer ipv4 10.143.73.1	Configure targeted peer.
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit candidate configuration to be running configuration

PE2: Global EVPN MPLS Command

(config)#evpn mpls enable	Enable EVPN MPLS
(config)#commit	Commit candidate configuration to be running configuration Note: Reload is required after Enabling/Disabling EVPN MPLS Feature.
(config)#evpn mpls vtep-ip-global 10.143.73.3	Configuring VTEP global IP to loopback IP
(config)#commit	Commit candidate configuration to be running configuration

PE2: Interface Configuration Network Side

(config)#interface xe5	Enter the Interface mode for xe5
(config-if)#ip address 10.255.128.23/31	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit candidate configuration to be running configuration

PE2: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.3	Router-ID configurations
(config-router)#network 10.143.73.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.255.128.23/31 area 0.0.0.0	Advertise xe5 network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

© 2025 IP Infusion Inc. Proprietary

PE2: BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)#neighbor 10.143.73.1 remote-as 65010	Configuring PE1 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)#address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)#neighbor 10.143.73.1 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit candidate configuration to be running configuration

PE2: MAC VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.3:2	Configuring Route-Distinguisher value 10.143.73.3:2
(config-vrf)#route-target both 2:2	Configuring import and export value as 2:2
(config-vrf)#exit	Exiting VRF Mode
(config)#commit	Commit candidate configuration to be running configuration

PE2: EVPN and VRF Mapping

(config)#evpn mpls id 252 xconnect target-mpls-id 2	Configure the EVPN-ELINE identifier with source identifier 252 and target identifier 2
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-ELINE identifier
(config-evpn-mpls)#commit	Commit candidate configuration to be running configuration
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE2: Access Port Configuration:

(config)#interface xe2	Enter the Interface mode for xe2.
(config-if)#description access-side-int	Giving Interface Description
(config-if)#interface xe2.2 switchport	Creating L2 sub interface of physical interface xe2
(config-if)#encapsulation dot1q 2	Setting Encapsulation to dot1q with VLAN ID 2 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-access-if)#map vpn-id 252	Map vpn-id 252 to interface xe2.2 (VPWS)
(config-access-if)#exit	Exiting out of access interface mode
(config-if)#commit	Commit candidate configuration to be running configuration

© 2025 IP Infusion Inc. Proprietary

PE2: CFM Configuration

(config)#hardware-profile filter cfm-domain-name-str enable	Configure cfm-domain-name-str profile to enable cfm
(config)#ethernet cfm domain-type character-string domain-name MD-01 level 2 mip-creation none	Create CFM domain for Evpn ELine with type as character string and set mip creation to none
(config-ether-cfm-mpls-md)#service ma-type string ma-name S1	Create ma type with string and set mip creation to none
(config-ether-cfm-mpls-ma)# evpn 252	Configure evpn <Evpn-id>
(config-ether-cfm-mpls-ma)#ethernet cfm mep up mpid 8000 active true evpn 252	Create up-mep for local evpn id 252
(config-ether-cfm-mpls-ma-mep)#cc multicast state enable	Enable cc multicast
(config-ether-cfm-mpls-ma-mep)#exit-ether-ma-mep-mode	Exit Ethernet ma-mep-mode
(config-ether-cfm-mpls-ma)#mep crosscheck mpid 8191	Configure cross check to remote mep for vlan 2
(config-ether-cfm-mpls-ma)#cc interval 2	Enable cc interval with value 2 i.e 10 milliseconds
(config-ether-cfm-mpls-ma)#exit-ether-ma-mode	Exit ethernnet ma mode
(config-ether-cfm-mpls)#exit	Exit Ethernet cfm mode
(config)#exit	Exit from config mode
(config)#commit	Commit candidate configuration to be running configuration

CHAPTER 2 EVPN MPLS IRB Configuration

This chapter includes step-by-step configurations for EVPN MPLS IRB.

Overview

EVPN provides an extensible and flexible multihoming VPN solution over an MPLS/IP network for intra-subnet connectivity among Tenant Systems (TSs) and end devices that can be physical or virtual, where an IP subnet is represented by an EVPN instance (EVI) for a VLAN-based service or by an (EVI, VLAN) association for a VLAN-aware bundle service. However, there are scenarios for which there is a need for a dynamic and efficient inter-subnet connectivity among these Tenant Systems and end devices while maintaining the multihoming capabilities of EVPN. This document describes an Integrated Routing and Bridging (IRB) solution based on EVPN to address such requirements

Integrated Routing and Bridging combines switching of tenant data with routing into different VNID of the same tenant. This is accomplished by having a unique per-tenant layer 3 IP-VRF across all PEs hosting tenant systems for that tenant and the layer-2 MAC VRFs (mapping to one or more bridged domains (VNIDS)) belonging to that tenant on different PEs being mapped to the common IP-VRF through logical interfaces called IRB interfaces. The MAC-VRF tables are used for switching intra-subnet communication whereas the IP-VRF tables are used for routing inter-subnet traffic.

IRB has two modes of working.

- Asymmetric IRB (Anycast and Centralized)
- Symmetric IRB (Distributed)

Asymmetric IRB

In asymmetric IRB, the lookup operation is asymmetric and the ingress PE performs three lookups, whereas the egress PE performs a single lookup -- i.e., the ingress PE performs a MAC lookup, followed by an IP lookup, followed by a MAC lookup again. The egress PE performs just a single MAC lookup as depicted in following figure:

```
     Ingress PE                          Egress PE
  +-------------------+          +-------------------+
  |                   |          |                   |
  |    +-> IP-VRF ->  |          |       IP-VRF      |
  |    |          |   |          |                   |
  |   BT1        BT2  |          |  BT3        BT2   |
  |    |          |   |          |              | |  |
  |    |          +--|--->----|--------------+ |  |
  |    |              |          |                v  |
  +-------------------+          +----------------|--+
       ^                                          |
       |                                          |
 TS1->-+                                          +->-TS2
```

Figure 2-1: Asymmetric IRB

In other words, each PE participating in asymmetric IRB MUST maintain ARP entries for remote hosts (hosts connected

to other PEs) as well as maintain MAC-VRFs/BTs and IRB interfaces for ALL subnets in an IP-VRF, including subnets that may not be locally attached.

Symmetric IRB

In symmetric IRB, as its name implies, the lookup operation is symmetric at both the ingress and egress PEs -- i.e., both ingress and egress PEs perform lookups on both MAC and IP addresses. The ingress PE performs a MAC lookup followed by an IP lookup, and the egress PE performs an IP lookup followed by a MAC lookup, as depicted in the following figure:

```
          Ingress PE                   Egress PE
    +-------------------+        +------------------+
    |                   |        |                  |
    |    +-> IP-VRF ----|---->---|-----> IP-VRF -+  |
    |    |              |        |               |  |
    |   BT1        BT2  |        |  BT3         BT2 |
    |    |              |        |               |  |
    |    ^              |        |               v  |
    |    |              |        |               |  |
    +-------------------+        +------------------+
         ^                                       |
         |                                       |
   TS1->-+                                       +->-TS2
```

Figure 2-2: Symmetric IRB

Therefore, in symmetric IRB, there is no need for the ingress PE to maintain ARP entries for the association of the destination TS2's IP and MAC addresses in its ARP table. Each PE participating in symmetric IRB only maintains ARP entries for locally connected hosts and MAC-VRFs/BTs for only locally configured subnets.

Route Types

These EVPN route types are supported:

- Route Type 1: Ethernet Auto-Discovery (AD) Route

  The Ethernet (AD) routes are advertised on per EVI and per ESI basis. These routes are sent per ES. They carry the list of EVIs that belong to the ES.

  This route is advertised when multihomed CEs already exist.

- Route Type 2: MAC/IP Advertisement Route

  The host's IP and MAC addresses are advertised to the peers within NLRI. The control plane learning of MAC addresses reduces unknown unicast flooding.

- Route Type 3: Inclusive Multicast Ethernet Tag Route

  This route establishes the connection for broadcast, unknown unicast, and multicast (BUM) traffic from a source PE to a remote PE.

  This route is advertised on per VLAN and per ESI basis.

- Route Type 4: Ethernet Segment Route

  Ethernet segment routes enable to connect a CE device to two or PE devices.

  Ethernet segment routes enable the discovery of connected PE devices that are connected to the same Ethernet segment.

- Route Type 5: IP prefix Route

An IP prefix route provides encoding for inter-subnet forwarding. In the control plane, EVPN Type 5 routes are used to advertise IP prefixes for inter-subnet connectivity across data centers.

In EVPN-VPWS the auto-discovery of peer PE nodes is done with the pair of Ethernet A-D routes. Inclusive Multicast route does not have participation on auto-discovery unlike ELAN-EVPN VPLS. Since there is no MAC-advertisement, MAC-IP route is not applicable.

Note:

1. RD value should be unique for multihoming nodes.
2. ANYCAST gateway MAC is mandatory on multihoming nodes.
3. "rewrite pop" is mandatory on access interface.
4. arp-nd refresh timer needs to be configured to avoid ARP table getting clear after ARP timeout.

EVPN MPLS IRB Symmetric Distributed mode

Topology

Figure 2-3 depicts the EVPN MPLS IRB with LDP as underlay MPLS path.

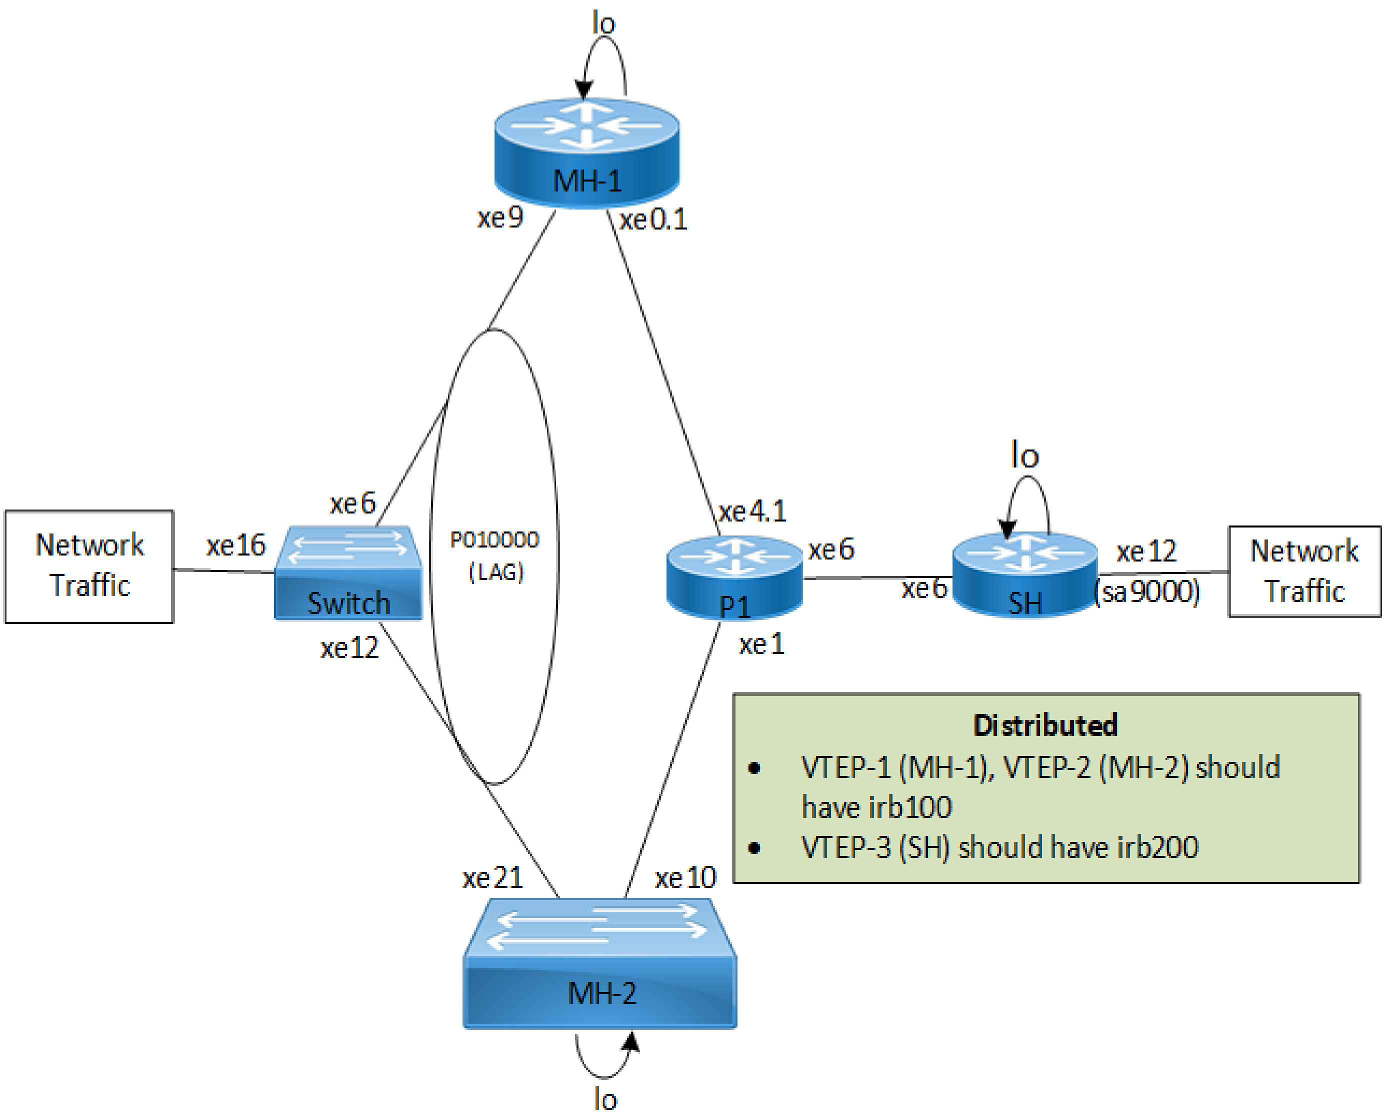

Figure 2-3: EVPN MPLS IRB Distributed configuration

Configurations

SH1

Enable EVPN MPLS and IRB

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS globally
`(config)#evpn mpls irb`	Enable EVPN MPLS IRB globally

Loopback Interface

`(config-if)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)# ip address 5.5.5.5/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

Configure MAC VRF

`(config)#mac vrf green`	Create MAC VRF green.
`(config-vrf)# rd 5.5.5.5:200`	Configure route distinguisher
`(config-vrf)# route-target both evpn-auto-rt`	Configure route target as evpn auto route target (we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode

Configure IP VRF

`(config)#ip vrf evpn`	Configure IP VRF evpn.
`(config-vrf)# rd 30:200`	Configure route distinguisher
`(config-vrf)# route-target both 100:200`	Configure route target
`(config-vrf)# l3vni 20000`	Configure L3 VNID for routing
`(config-vrf)#exit`	Exit VRF mode

Configuring IRB interface

`(config)#interface irb200`	Create IRB interface irb100
`(config-irb-if)# ip vrf forwarding evpn`	Map L3 VRF to the IRB interface
`(config-irb-if)# ip address 70.70.1.1/24`	Assign IP address
`(config-irb-if)#exit`	Exit interface mode

Creating EVPN MPLS ID

`(config)#evpn mpls vtep-ip-global 5.5.5.5`	Configure VTEP global IP
`(config)#evpn mpls id 200`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachability-protocol evpn-bgp green`	Map the MAC VRF green
`(config-evpn-mpls)# evpn irb irb200`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode

Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 5.5.5.5`	Enter LDP router-id
`(config-router)# transport-address ipv4 5.5.5.5`	Configure LDP transport address

(config-router)# targeted-peer ipv4 2.2.2.2	Configure LDP target peer address (MH-1)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)# targeted-peer ipv4 3.3.3.3	Configure LDP target peer address (MH-2)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side

(config-if)#interface xe6	Enter interface mode
(config-if)# description connected to P1	Configure interface description
(config-if)# ip address 30.30.30.1/24	Assign IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSPF Configuration

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)#ospf router-id 5.5.5.5	Configure OSPF router id
(config-router)# network 5.5.5.5/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 30.30.30.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit OSPF mode

BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)# neighbor 2.2.2.2 remote-as 65010	Configuring MH-1 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 2.2.2.2 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 3.3.3.3 remote-as 65010	Configuring MH-2 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 3.3.3.3 update-source lo	Source of routing updates as loopback
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 2.2.2.2 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 3.3.3.3 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode

© 2025 IP Infusion Inc. Proprietary

(config-router)# address-family ipv4 vrf evpn	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration

(config-if)#interface sa9000	Creating Static LAG interface
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)#exit	Exiting out of interface mode
(config-if)#interface sa9000.200 switchport	Creating Static LAG L2 sub interface of physical interface xe12
(config-if)# encapsulation dot1q 200	Setting Encapsulation to dot1q with VLAN ID 200
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)#map vpn-id 200	Map VPN-ID 200
(config-acc-if-evpn)#exit	Exiting out of access interface mode
(config-if)#interface xe12	Enter the Interface mode
(config-if)# static-channel-group 9000	Map the physical interface xe12 as static LAG member
(config-if)#exit	Exit interface mode

P1

Loopback Interface:

#configure terminal	Enter configuration mode.
(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 4.4.4.4/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)# router-id 4.4.4.4	Configure router id
(config-router)# transport-address ipv4 4.4.4.4	Configure transport address
(config-router)#exit	Exit from LDP mode
(config-router)#exit	Exit from LDP mode

Interface Configuration

(config-if)#interface xe4	Enter the Interface mode for xe4.
(config-if)# mtu 9216	Configure MTU.
(config-if)#exit	Enable LDP on the physical interface

© 2025 IP Infusion Inc. Proprietary

(config)#interface xe4.1	Create sub-interface xe4.1.
(config-if)# description connected-to-MH-1	Configure Interface description
(config-if)# ip address 10.10.10.2/24	Assign IP address
(config-if)# mtu 9216	Configure MTU to the sub-if
(config-if)# encapsulation dot1q 20	Configure encapsulation as dotq
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter into Interface mode
(config-if)# description connected to MH-2	Configure Interface description
(config-if)# ip address 20.20.20.2/24	Cofigure IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe6	Enter into Interface mode
(config-if)# description connected to SH	Configure Interface description
(config-if)# ip address 30.30.30.2/24	Assign IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSPF Configuration

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# ospf router-id 4.4.4.4	Setting the Router ID as Loopback IP
(config-router)# network 4.4.4.4/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 10.10.10.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)# network 20.20.20.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)# network 30.30.30.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

© 2025 IP Infusion Inc. Proprietary

MH-1

Enable EVPN MPLS and IRB

`#configure terminal`	Enter configuration mode.
`(config)#hardware-profile filter evpn-mpls-mh enable`	Configure hardware profile to enable EVPN MPLS multi homing in hardware
`(config)#evpn mpls enable`	Enable EVPN MPLS globally
`(config)#evpn mpls irb`	Enable EVPN MPLS IRB globally
`(config)#evpn mpls multihoming enable`	Enable EVPN MPLS multihoming globally

Loopback Interface

`(config-if)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 2.2.2.2/32 secondarysss`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

Configure MAC VRF

`(config-vrf)#mac vrf green`	Create MAC VRF green.
`(config-vrf)# rd 2.2.2.2:200`	Configure route distinguisher
`(config-vrf)# route-target both evpn-auto-rt`	Configure route target as evpn auto-rt(we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode

Configure IP VRF

`(config)#ip vrf evpn`	Configure IP VRF evpn.
`(config-vrf)# rd 10:200`	Configure route distinguisher
`(config-vrf)# route-target both 100:200`	Configure route target
`(config-vrf)# l3vni 20000`	Configure L3 VNID for routing
`(config-vrf)#exit`	Exit VRF mode

Configure Anycast Gateway MAC

:

`(config)#evpn irb-forwarding anycast-gateway- mac 0011.2233.4455`	Configure anycast gateway MAC globally
`(config)#interface irb100`	Create IRB interface irb100
`(config-irb-if)# ip vrf forwarding evpn`	Map L3 VRF to the IRB interface
`(config-irb-if)# ip address 80.80.1.1/24 anycast`	Assign IP address
`(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac`	Map anycast gateway MAC
`(config-irb-if)#exit`	Exit interface mode

Creating EVPN MPLS ID

(config)#evpn mpls vtep-ip-global 2.2.2.2	Configure VTEP global IP
(config)#evpn mpls id 100	Create EVPN MPLS ID
(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp green	Map the MAC VRF green
(config-evpn-mpls)# evpn irb irb100	Map the IRB interface
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode

Global LDP

(config)#router ldp	Enter the Router LDP mode
(config-router)#router-id 2.2.2.2	Enter LDP router-id
(config-router)# transport-address ipv4 2.2.2.2	Configure LDP transport address
(config-router)# targeted-peer ipv4 5.5.5.5	Configure LDP target peer address (SH)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side

(config-if)#interface xe0	Enter the Interface mode for xe0.
(config-if)# mtu 9216	Configure MTU.
(config-if)#exit	Exit from interface xe0
(config)#interface xe0.1	Create subinterface in xe10
(config-if)# encapsulation dot1q 20	Configure encapsulation as dotq
(config-if)# ip address 10.10.10.1/24	Assign IP address
(config-if)# mtu 9216	Configure MTU to the sub-if
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4

OSPF Configuration

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# ospf router-id 2.2.2.2	Router-ID configurations
(config-router)# network 2.2.2.2/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 10.10.10.0/24 area 0.0.0.0	Advertise network address in OSPF.

© 2025 IP Infusion Inc. Proprietary

BGP Configuration

`(config-router)#router bgp 65010`	Enter the Router BGP mode, ASN: 100
`(config-router)# neighbor 3.3.3.3 remote-as 65010`	Configuring PE2 as iBGP neighbor using it's loopback IP
`(config-router)# neighbor 3.3.3.3 update-source lo`	Source of routing updates as loopback
`(config-router)# neighbor 5.5.5.5 remote-as 65010`	Configuring PE2 as iBGP neighbor using it's loopback IP
`(config-router)# neighbor 5.5.5.5 update-source lo`	Source of routing updates as loopback
`(config-router)# address-family l2vpn evpn`	Entering into address family mode as EVPN
`(config-router-af)# neighbor 3.3.3.3 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# neighbor 5.5.5.5 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# exit-address-family`	Exiting of Address family mode
`(config-router)# address-family ipv4 vrf evpn`	Entering into VRF address family mode
`(config-router-af)# redistribute connected`	Redistribute connected routes to the network
`(config-router-af)# exit-address-family`	Exiting of Address family mode

Access Port Configuration

`(config)#interface xe9`	Enter configuration mode
`(config-if)# mtu 9216`	Configure MTU
`(config-if)# channel-group 10000 mode active`	Configure physical interface xe9 as LAG member po10000
`(config-if)#exit`	Exit from interface xe9
`(config)#interface po10000`	Create LAG interface po10000
`(config-if)# mtu 9216`	Configure MTU
`(config-if)# description connected to Switch`	Configure Interface description
`(config-if)# evpn multi-homed system-mac 0000.1111.aaaa`	Configure system MAC for multi homing
`(config)#interface po10000.100 switchport`	Creating L2 sub interface of physical interface xe9
`(config-if)# encapsulation dot1q 100`	Setting Encapsulation to dot1q with VLAN ID 100
`(config-if)#rewrite pop`	Configure rewrite with action pop
`(config-if)#mtu 9216`	Configure MTU as 9216
`(config-if)# access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-acc-if-evpn)# map vpn-id 100`	Map VPN-ID 202
`(config-acc-if-evpn)#exit`	Exiting out of access interface mode

MH-2

Enable EVPN MPLS and IRB

#configure terminal	Enter configuration mode.
(config)#hardware-profile filter evpn-mplsmh enable	Configure hardware profile to enable EVPN MPLS multi homing in hardware
(config)#evpn mpls enable	Enable EVPN MPLS globally
(config)#evpn mpls irb	Enable EVPN MPLS IRB globally
(config)#evpn mpls multihoming enable	Enable EVPN MPLS multihoming globally

Loopback Interface

(config-if)#interface lo	Enter the Interface mode for the loopback interface
(config-if)# ip address 3.3.3.3/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Configure MAC VRF

(config-vrf)#mac vrf green	Create MAC VRF green.
(config-vrf)# rd 3.3.3.3:200	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto-rt (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode

Configure IP VRF

(config)#ip vrf evpn	Configure IP VRF evpn.
(config-vrf)# rd 20:200	Configure route distinguisher
(config-vrf)# route-target both 100:200	Configure route target
(config-vrf)# l3vni 20000	Configure L3 VNID for routing
(config-vrf)#exit	Exit VRF mode

Configure Anycast Gateway MAC

(config)#evpn irb-forwarding anycastgateway-mac 0011.2233.4455	Configure anycast gateway MAC globally

Configuring IRB interface

(config)#interface irb100	Create IRB interface irb100
(config-irb-if)# ip vrf forwarding evpn	Map L3 VRF to the IRB interface
(config-irb-if)# ip address 80.80.1.1/24 anycast	Assign IP address

© 2025 IP Infusion Inc. Proprietary

(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac	Map anycast gateway MAC
(config-irb-if)#exit	Exit interface mode

Creating EVPN MPLS ID

(config)#evpn mpls vtep-ip-global 3.3.3.3	Configure VTEP global IP
(config)#evpn mpls id 100	Create EVPN MPLS ID
(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp green	Map the MAC VRF green
(config-evpn-mpls)# evpn irb irb100	Map the IRB interface
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode

Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)# transport-address ipv4 3.3.3.3	Configure LDP transport address
(config-router)# targeted-peer ipv4 5.5.5.5	Configure LDP target peer address (SH)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side

(config-if)#interface xe10	Enter the configuration mode.
(config-if)# description connected to P1	Configure Interface description
(config-if)# ip address 20.20.20.1/24	Assign IP address
(config-if)# mtu 9216	Configure MTU to the sub-if
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSPF Configuration

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# ospf router-id 3.3.3.3	Router-ID configurations
(config-router)# network 3.3.3.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 20.20.20.0/24 area 0.0.0.0	Advertise network address in OSPF.

© 2025 IP Infusion Inc. Proprietary

BGP Configuration

(config-router)#router bgp 65010	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 2.2.2.2 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 2.2.2.2 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 5.5.5.5 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 5.5.5.5 update-source lo	Source of routing updates as loopback
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 2.2.2.2 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 5.5.5.5 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family ipv4 vrf evpn	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration

(config)#interface xe21	Enter configuration mode
(config-if)# mtu 9216	Configure MTU
(config-if)# channel-group 10000 mode active	Configure physical interface xe21 as LAG member po10000
(config-if)#exit	Exit from interface xe21
(config)#interface po10000	Create LAG interface po10000
(config-if)# mtu 9216	Configure MTU
(config-if)# description connected to Switch	Configure Interface description
(config-if)# evpn multi-homed system-mac 0000.1111.aaaa	Configure system MAC for multi homing
(config)#interface po10000.100 switchport	Creating L2 sub interface of physical interface xe21
(config-if)# encapsulation dot1q 100	Setting Encapsulation to dot1q with VLAN ID 100
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 100	Map VPN-ID 202
(config-acc-if-evpn)#exit	Exiting out of access interface mode

Validation

Note: Remote entries cannot be fetched from through MAC table/ARP cache/ND cache. However they can be fetched from the BGP table.

MH-1

```
MH-1#sh evpn mpls

EVPN MPLS IRB Asymmetric Anycast mode

Topology:

Refer Figure 2-4 depicts the EVPN MPLS IRB with LDP as underlay MPLS path.

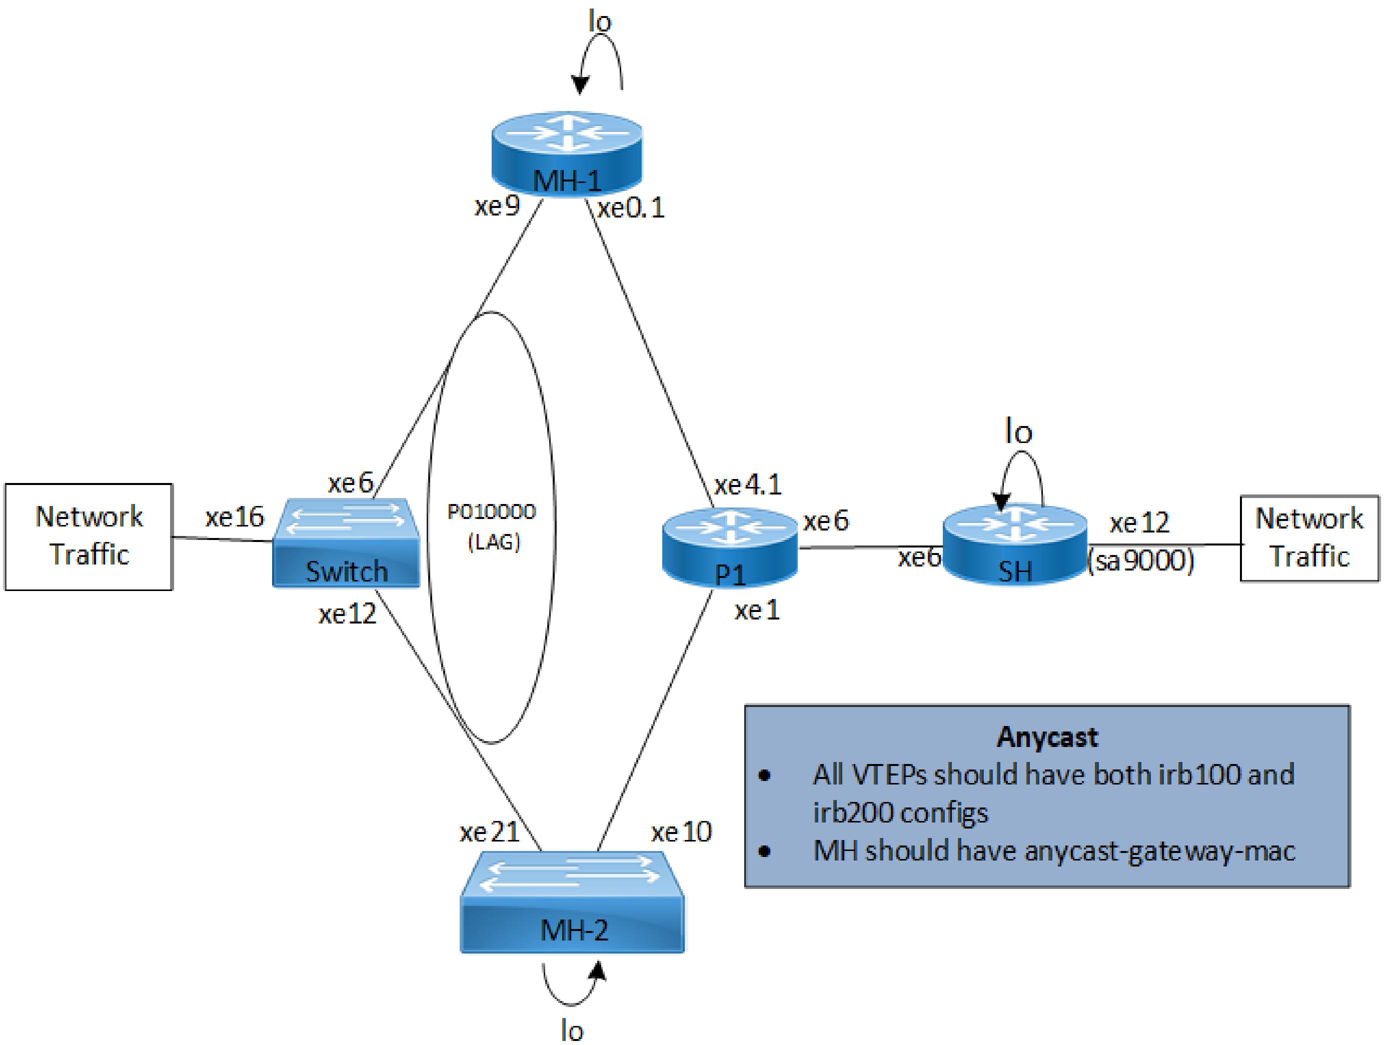

Figure 2-4: EVPN MPLS IRB Asymmetric Anycast mode

Configuration

SH

Enable EVPN MPLS and IRB:

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS globally
`(config)#evpn mpls irb`	Enable EVPN MPLS IRB globally

Loopback Interface:

`(config-if)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)# ip address 5.5.5.5/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

Configure MAC VRF:

`(config)#mac vrf red`	Create MAC VRF red.
`(config-vrf)# rd 5.5.5.5:100`	Configure route distinguisher
`(config-vrf)# route-target both evpn-auto-rt`	Configure route target as evpn auto route target (we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode
`(config)#mac vrf blue`	Create MAC VRF blue.
`(config-vrf)# rd 5.5.5.5:200`	Configure route distinguisher
`(config-vrf)# route-target both evpn-auto-rt`	Configure route target as evpn auto route target (we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode

Configure IP VRF:

`(config)#ip vrf evpn_anycast`	Configure IP VRF evpn.
`(config-vrf)# rd 30:200`	Configure route distinguisher
`(config-vrf)# route-target both 100:200`	Configure route target
`(config-vrf)# l3vni 10000`	Configure L3 VNID for routing
`(config-vrf)#exit`	Exit VRF mode

Configuring IRB interface:

`(config)#interface irb100`	Create IRB interface irb100
`(config-irb-if)# ip vrf forwarding evpn_anycast`	Map L3 VRF to the IRB interface
`(config-irb-if)# ip address 80.80.1.3/24 anycast`	Assign IP address
`(config-irb-if)#exit`	Exit interface mode
`(config)#interface irb200`	Create IRB interface irb100
`(config-irb-if)# ip vrf forwarding evpn_anycast`	Map L3 VRF to the IRB interface

© 2025 IP Infusion Inc. Proprietary

(config-irb-if)# ip address 90.90.1.3/24 anycast	Assign IP address
(config-irb-if)#exit	Exit interface mode

Creating EVPN MPLS ID:

(config)#evpn mpls vtep-ip-global 5.5.5.5	Configure VTEP global IP
(config)#evpn mpls id 100	Create EVPN MPLS ID
(config-evpn-mpls)# host-reachability-protocol evpn-bgp red	Map the MAC VRF red
(config-evpn-mpls)# evpn irb irb100	Map the IRB interface
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode
(config)#evpn mpls id 200	Create EVPN MPLS ID
(config-evpn-mpls)# host-reachability-protocol evpn-bgp blue	Map the MAC VRF blue
(config-evpn-mpls)# evpn irb irb200	Map the IRB interface
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode

Global LDP:

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 5.5.5.5	Enter LDP router-id
(config-router)# transport-address ipv4 5.5.5.5	Configure LDP transport address
(config-router)# targeted-peer ipv4 2.2.2.2	Configure LDP target peer address (MH-1)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)# targeted-peer ipv4 3.3.3.3	Configure LDP target peer address (MH-2)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side:

(config-if)#interface xe6	Enter interface mode
(config-if)# description connected to P1	Configure interface description
(config-if)# ip address 30.30.30.1/24	Assign IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSPF Configuration:

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)#ospf router-id 5.5.5.5	Configure OSPF router id
(config-router)# network 5.5.5.5/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 30.30.30.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit OSPF mode

BGP Configuration:

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)# neighbor 2.2.2.2 remote-as 65010	Configuring MH-1 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 2.2.2.2 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 3.3.3.3 remote-as 65010	Configuring MH-2 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 3.3.3.3 update-source lo	Source of routing updates as loopback
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 2.2.2.2 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 3.3.3.3 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family ipv4 vrf evpn_anycast	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration:

(config-if)#interface sa9000	Creating Static LAG interface
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)#exit	Exiting out of interface mode
(config-if)#interface sa9000.100 switchport	Creating Static LAG L2 sub interface of physical interface xe12
(config-if)# encapsulation dot1q 100	Setting Encapsulation to dot1q with VLAN ID 100
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)#map vpn-id 100	Map VPN-ID 100
(config-acc-if-evpn)#exit	Exiting out of access interface mode
(config-if)#interface sa9000.200 switchport	Creating Static LAG L2 sub interface of physical interface xe12
(config-if)# encapsulation dot1q 200	Setting Encapsulation to dot1q with VLAN ID 200
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)#map vpn-id 200	Map VPN-ID 200
(config-acc-if-evpn)#exit	Exiting out of access interface mode
(config-if)#interface xe12	Enter the Interface mode
(config-if)# static-channel-group 9000	Map the physical interface xe12 as static LAG member
(config-if)#exit	Exit interface mode

P1:

Loopback Interface:

#configure terminal	Enter configuration mode.
(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 4.4.4.4/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Global LDP:

(config)#router ldp	Enter the Router LDP mode.
(config-router)# router-id 4.4.4.4	Configure router id
(config-router)# transport-address ipv4 4.4.4.4	Configure transport address
(config-router)#exit	Exit from LDP mode

© 2025 IP Infusion Inc. Proprietary

Interface Configuration:

(config-if)#interface xe4	Enter the Interface mode for xe4.
(config-if)# mtu 9216	Configure MTU.
(config-if)#exit	Enable LDP on the physical interface
(config)#interface xe4.1	Create sub-interface xe4.1.
(config-if)# description connected-to-MH-1	Configure Interface description
(config-if)# ip address 10.10.10.2/24	Assign IP address
(config-if)# mtu 9216	Configure MTU to the sub-if
(config-if)# encapsulation dot1q 20	Configure encapsulation as dotq
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter into Interface mode
(config-if)# description connected to MH-2	Configure Interface description
(config-if)# ip address 20.20.20.2/24	Cofigure IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe6	Enter into Interface mode
(config-if)# description connected to SH	Configure Interface description
(config-if)# ip address 30.30.30.2/24	Assign IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSPF Configuration:

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# ospf router-id 4.4.4.4	Setting the Router ID as Loopback IP
(config-router)# network 4.4.4.4/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 10.10.10.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)# network 20.20.20.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.

(config-router)# network 30.30.30.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

MH-1:

Enable EVPN MPLS and IRB:

#configure terminal	Enter configuration mode.
(config)#hardware-profile filter evpn-mpls-mh enable	Configure hardware profile to enable EVPN MPLS multi homing in hardware
(config)#evpn mpls enable	Enable EVPN MPLS globally
(config)#evpn mpls irb	Enable EVPN MPLS IRB globally
(config)#evpn mpls multihoming enable	Enable EVPN MPLS multihoming globally

Loopback Interface:

(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 2.2.2.2/32 secondarysss	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Configure MAC VRF:

(config)#mac vrf red	Create MAC VRF red.
(config-vrf)# rd 2.2.2.2:100	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode
(config)#mac vrf blue	Create MAC VRF blue.
(config-vrf)# rd 2.2.2.2:200	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode

Configure IP VRF:

`(config)#ip vrf evpn_anycast`	Configure IP VRF evpn.
`(config-vrf)# rd 10:200`	Configure route distinguisher
`(config-vrf)# route-target both 100:200`	Configure route target
`(config-vrf)# l3vni 10000`	Configure L3 VNID for routing
`(config-vrf)#exit`	Exit VRF mode

Configure Anycast Gateway MAC:

`(config)#evpn irb-forwarding anycast-gateway- mac 0011.2233.4455`	Configure anycast gateway MAC globally
`(config)#interface irb100`	Create IRB interface irb100
`(config-irb-if)# ip vrf forwarding evpn`	Map L3 VRF to the IRB interface
`(config-irb-if)# ip address 80.80.1.1/24 anycast`	Assign IP address
`(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac`	Map anycast gateway MAC
`(config-irb-if)#exit`	Exit interface mode
`(config)#interface irb200`	Create IRB interface irb200
`(config-irb-if)# ip vrf forwarding evpn`	Map L3 VRF to the IRB interface
`(config-irb-if)# ip address 90.90.1.1/24 anycast`	Assign IP address
`(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac`	Map anycast gateway MAC
`(config-irb-if)#exit`	Exit interface mode

Creating EVPN MPLS ID:

`(config)#evpn mpls vtep-ip-global 2.2.2.2`	Configure VTEP global IP
`(config)#evpn mpls id 100`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp red`	Map the MAC VRF red
`(config-evpn-mpls)# evpn irb irb100`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode
`(config)#evpn mpls id 200`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp blue`	Map the MAC VRF blue
`(config-evpn-mpls)# evpn irb irb200`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode

Global LDP:

`(config)#router ldp`	Enter the Router LDP mode
`(config-router)#router-id 2.2.2.2`	Enter LDP router-id
`(config-router)# transport-address ipv4 2.2.2.2`	Configure LDP transport address
`(config-router)# targeted-peer ipv4 5.5.5.5`	Configure LDP target peer address (SH)
`(config-router-targeted-peer)#exit`	Exit from LDP target peer mode
`(config-router)#exit`	Exit from LDP mode

Interface Configuration Network Side:

`(config-if)#interface xe0`	Enter the Interface mode for xe0.
`(config-if)# mtu 9216`	Configure MTU.
`(config-if)#exit`	Exit from interface xe0
`(config)#interface xe0.1`	Create subinterface in xe10
`(config-if)# encapsulation dot1q 20`	Configure encapsulation as dotq
`(config-if)# ip address 10.10.10.1/24`	Assign IP address
`(config-if)# mtu 9216`	Configure MTU to the sub-if
`(config-if)# label-switching`	Enable label switching
`(config-if)# mpls ldp-igp sync ospf`	Enable LDP IGP sync
`(config-if)# enable-ldp ipv4`	Enable LDP IPv4

OSPF Configuration:

`(config)#router ospf 1`	Enter the Router OSPF mode.
`(config-router)# ospf router-id 2.2.2.2`	Router-ID configurations
`(config-router)# network 2.2.2.2/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`(config-router)# network 10.10.10.0/24 area 0.0.0.0`	Advertise network address in OSPF.

BGP Configuration:

(config-router)#router bgp 65010	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 3.3.3.3 remote-as 65010	Configuring PE2 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 3.3.3.3 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 5.5.5.5 remote-as 65010	Configuring PE2 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 5.5.5.5 update-source lo	Source of routing updates as loopback
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 3.3.3.3 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 5.5.5.5 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family ipv4 vrf evpn	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration:

(config)#interface xe9	Enter configuration mode
(config-if)# mtu 9216	Configure MTU
(config-if)# channel-group 10000 mode active	Configure physical interface xe9 as LAG member po10000
(config-if)#exit	Exit from interface xe9
(config)#interface po10000	Create LAG interface po10000
(config-if)# mtu 9216	Configure MTU
(config-if)# description connected to Switch	Configure Interface description
(config-if)# evpn multi-homed system-mac 0000.1111.aaaa	Configure system MAC for multi homing
(config)#interface po10000.100 switchport	Creating L2 sub interface of physical interface xe9
(config-if)# encapsulation dot1q 100	Setting Encapsulation to dot1q with VLAN ID 100
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 100	Map VPN-ID 202
(config-acc-if-evpn)#exit	Exiting out of access interface mode
(config)#interface po10000.200 switchport	Creating L2 sub interface of physical interface xe9

© 2025 IP Infusion Inc. Proprietary

(config-if)# encapsulation dot1q 200	Setting Encapsulation to dot1q with VLAN ID 200
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 200	Map VPN-ID 202
(config-acc-if-evpn)#exit	Exiting out of access interface mode

MH-2:

Enable EVPN MPLS and IRB:

#configure terminal	Enter configuration mode.
(config)#hardware-profile filter evpn-mpls-mh enable	Configure hardware profile to enable EVPN MPLS multi homing in hardware
(config)#evpn mpls enable	Enable EVPN MPLS globally
(config)#evpn mpls irb	Enable EVPN MPLS IRB globally
(config)#evpn mpls multihoming enable	Enable EVPN MPLS multihoming globally

Loopback Interface:

(config-if)#interface lo	Enter the Interface mode for the loopback interface
(config-if)# ip address 3.3.3.3/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Configure MAC VRF:

(config)#mac vrf red	Create MAC VRF red.
(config-vrf)# rd 3.3.3.3:100	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode
(config)#mac vrf blue	Create MAC VRF blue.
(config-vrf)# rd 3.3.3.3:200	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode

Configure IP VRF:

(config)#ip vrf evpn_anycast	Configure IP VRF evpn.
(config-vrf)# rd 20:200	Configure route distinguisher
(config-vrf)# route-target both 100:200	Configure route target
(config-vrf)# l3vni 10000	Configure L3 VNID for routing
(config-vrf)#exit	Exit VRF mode

Configure Anycast Gateway MAC:

(config)#evpn irb-forwarding anycastgateway-mac 0011.2233.4455	Configure anycast gateway MAC globally

Configuring IRB interface:

(config)#interface irb100	Create IRB interface irb100
(config-irb-if)# ip vrf forwarding evpn	Map L3 VRF to the IRB interface
(config-irb-if)# ip address 80.80.1.1/24 anycast	Assign IP address
(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac	Map anycast gateway MAC
(config-irb-if)#exit	Exit interface mode
(config)#interface irb200	Create IRB interface irb200
(config-irb-if)# ip vrf forwarding evpn	Map L3 VRF to the IRB interface
(config-irb-if)# ip address 90.90.1.1/24 anycast	Assign IP address
(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac	Map anycast gateway MAC
(config-irb-if)#exit	Exit interface mode

Creating EVPN MPLS ID:

`(config)#evpn mpls vtep-ip-global 3.3.3.3`	Configure VTEP global IP
`(config)#evpn mpls id 100`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp red`	Map the MAC VRF red
`(config-evpn-mpls)# evpn irb irb100`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode
`(config)#evpn mpls id 200`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp blue`	Map the MAC VRF blue
`(config-evpn-mpls)# evpn irb irb200`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode

Global LDP:

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)# transport-address ipv4 3.3.3.3`	Configure LDP transport address
`(config-router)# targeted-peer ipv4 5.5.5.5`	Configure LDP target peer address (SH)
`(config-router-targeted-peer)#exit`	Exit from LDP target peer mode
`(config-router)#exit`	Exit from LDP mode

Interface Configuration Network Side:

`(config-if)#interface xe10`	Enter the configuration mode.
`(config-if)# description connected to P1`	Configure Interface description
`(config-if)# ip address 20.20.20.1/24`	Assign IP address
`(config-if)# mtu 9216`	Configure MTU to the sub-if
`(config-if)# label-switching`	Enable label switching
`(config-if)# mpls ldp-igp sync ospf`	Enable LDP IGP sync
`(config-if)# enable-ldp ipv4`	Enable LDP IPv4
`(config-if)#exit`	Exit interface mode

OSPF Configuration:

`(config)#router ospf 1`	Enter the Router OSPF mode.
`(config-router)# ospf router-id 3.3.3.3`	Router-ID configurations
`(config-router)# network 3.3.3.3/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`(config-router)# network 20.20.20.0/24 area 0.0.0.0`	Advertise network address in OSPF.

BGP Configuration:

(config-router)#router bgp 65010	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 2.2.2.2 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 2.2.2.2 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 5.5.5.5 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 5.5.5.5 update-source lo	Source of routing updates as loopback
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 2.2.2.2 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 5.5.5.5 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family ipv4 vrf evpn_anycast	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration:

(config)#interface xe21	Enter configuration mode
(config-if)# mtu 9216	Configure MTU
(config-if)# channel-group 10000 mode active	Configure physical interface xe21 as LAG member po10000
(config-if)#exit	Exit from interface xe21
(config)#interface po10000	Create LAG interface po10000
(config-if)# mtu 9216	Configure MTU
(config-if)# description connected to Switch	Configure Interface description
(config-if)# evpn multi-homed system-mac 0000.1111.aaaa	Configure system MAC for multi homing
(config)#interface po10000.100 switchport	Creating L2 sub interface of physical interface xe21
(config-if)# encapsulation dot1q 100	Setting Encapsulation to dot1q with VLAN ID 100
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 100	Map VPN-ID 202
(config-acc-if-evpn)#exit	Exiting out of access interface mode
(config)#interface po10000.200 switchport	Creating L2 sub interface of physical interface xe21
(config-if)# encapsulation dot1q 200	Setting Encapsulation to dot1q with VLAN ID 200
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 200	Map VPN-ID 202
(config-acc-if-evpn)#exit	Exiting out of access interface mode

Validation

Note: Remote entries cannot be fetched from through MAC table/ARP cache/ND cache. However they can be fetched from the BGP table.

EVPN MPLS IRB Asymmetric Centralized mode

Topology

Figure 2-5 depicts the EVPN MPLS IRB Asymmetric centralized mode.

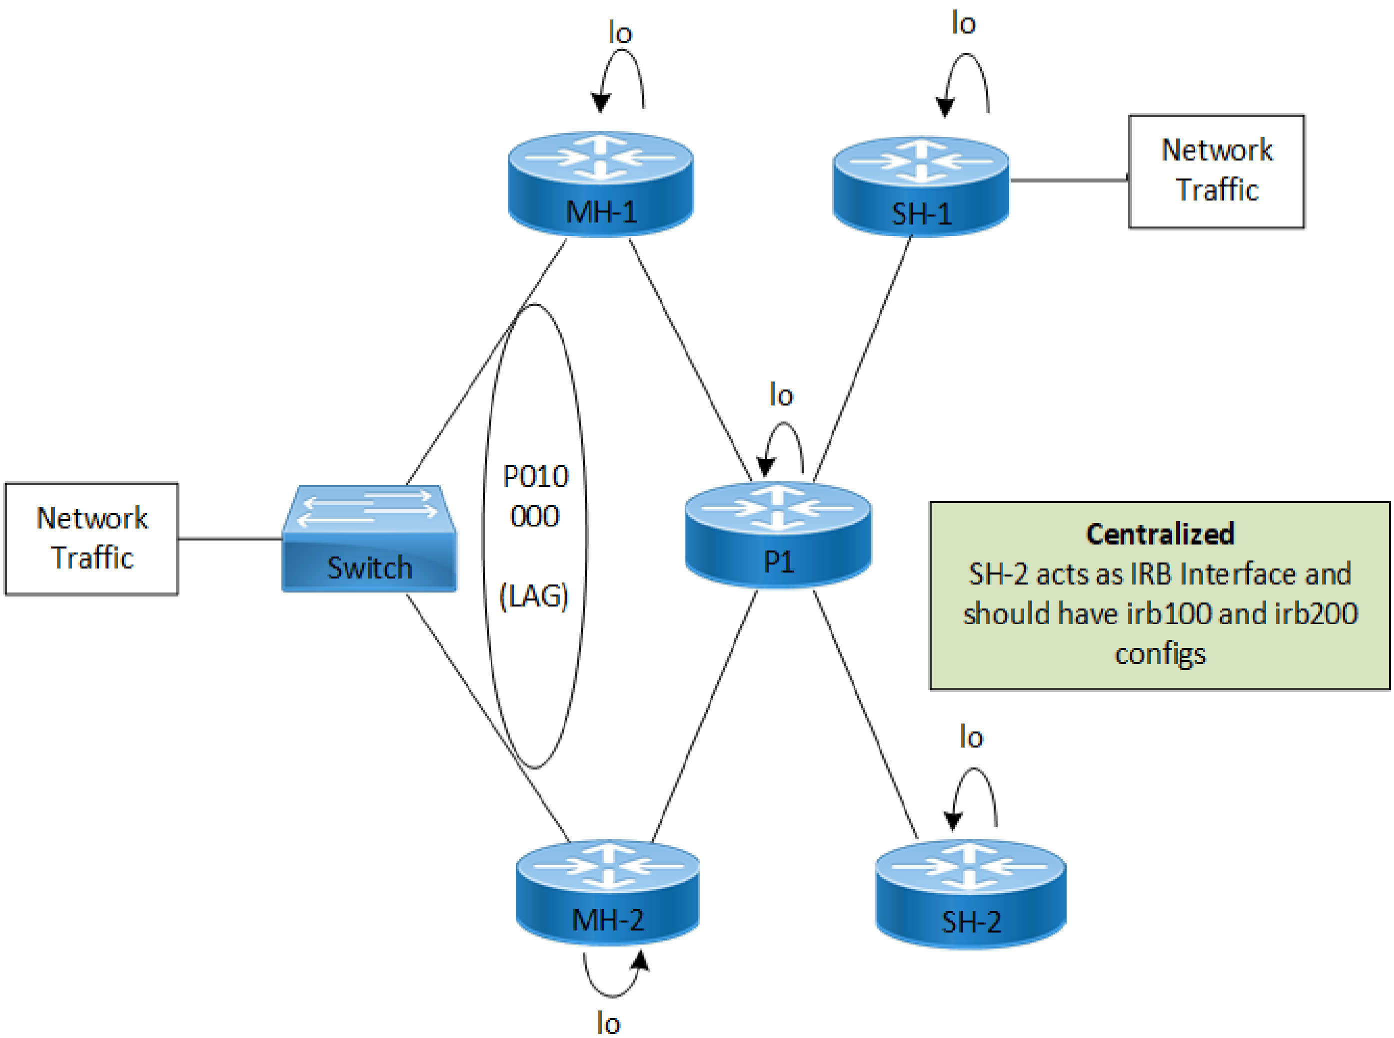

Figure 2-5: EVPN MPLS IRB Centralized Mode

Configurations:

SH-2:

Enable EVPN MPLS and IRB:

#configure terminal	Enter configuration mode.
(config)#evpn mpls enable	Enable EVPN MPLS globally
(config)#evpn mpls irb	Enable EVPN MPLS IRB globally

Loopback Interface:

(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 6.6.6.6/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Configure MAC VRF:

(config)#mac vrf red	Create MAC VRF red.
(config-vrf)# rd 6.6.6.6:100	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode
(config)#mac vrf blue	Create MAC VRF blue.
(config-vrf)# rd 6.6.6.6:200	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode

Configure IP VRF:

(config)#ip vrf evpn_anycast	Configure IP VRF evpn.
(config-vrf)# rd 30:200	Configure route distinguisher
(config-vrf)# route-target both 100:200	Configure route target
(config-vrf)# l3vni 10000	Configure L3 VNID for routing
(config-vrf)#exit	Exit VRF mode

Configuring IRB interface:

(config)#evpn irb-forwarding anycast-gateway- mac 0077.8899.5566	Configure anycast gateway MAC globally
(config)#interface irb100	Create IRB interface irb100
(config-irb-if)# ip vrf forwarding evpn_anycast	Map L3 VRF to the IRB interface
(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac	Map anycast gateway MAC
(config-irb-if)# ip address 80.80.1.3/24 anycast	Assign IP address
(config-irb-if)#exit	Exit interface mode

`(config)#interface irb200`	Create IRB interface irb100
`(config-irb-if)# ip vrf forwarding evpn_anycast`	Map L3 VRF to the IRB interface
`(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac`	Map anycast gateway MAC
`(config-irb-if)# ip address 90.90.1.3/24 anycast`	Assign IP address
`(config-irb-if)#exit`	Exit interface mode

Creating EVPN MPLS ID:

`(config)#evpn mpls vtep-ip-global 6.6.6.6`	Configure VTEP global IP
`(config)#evpn mpls id 100`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachability-protocol evpn-bgp red`	Map the MAC VRF red
`(config-evpn-mpls)# evpn irb irb100`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode
`(config)#evpn mpls id 200`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachability-protocol evpn-bgp blue`	Map the MAC VRF blue
`(config-evpn-mpls)# evpn irb irb200`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode

Global LDP:

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 6.6.6.6	Enter LDP router-id
(config-router)# transport-address ipv4 6.6.6.6	Configure LDP transport address
(config-router)# targeted-peer ipv4 2.2.2.2	Configure LDP target peer address (MH-1)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)# targeted-peer ipv4 3.3.3.3	Configure LDP target peer address (MH-2)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)# targeted-peer ipv4 5.5.5.5	Configure LDP target peer address (SH-1)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side:

(config-if)#interface xe14	Enter interface mode
(config-if)# description connected to P1	Configure interface description
(config-if)# ip address 40.40.40.1/24	Assign IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSPF Configuration:

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)#ospf router-id 6.6.6.6	Configure OSPF router id
(config-router)# network 6.6.6.6/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 40.40.40.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit OSPF mode

BGP Configuration:

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)# neighbor 2.2.2.2 remote-as 65010	Configuring MH-1 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 2.2.2.2 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 3.3.3.3 remote-as 65010	Configuring MH-2 as I-BGP neighbor using it's loopback IP

`(config-router)# neighbor 3.3.3.3 update-source lo`	Source of routing updates as loopback
`(config-router)# neighbor 5.5.5.5 remote-as 65010`	Configuring MH-1 as I-BGP neighbor using it's loopback IP
`(config-router)# neighbor 5.5.5.5 update-source lo`	Source of routing updates as loopback
`(config-router-af)# exit-address-family`	Exiting of Address family mode
`(config-router)# address-family l2vpn evpn`	Entering into address family mode as EVPN
`(config-router-af)# neighbor 2.2.2.2 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# neighbor 3.3.3.3 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# neighbor 5.5.5.5 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# exit-address-family`	Exiting of Address family mode
`(config-router)# address-family ipv4 vrf evpn_anycast`	Entering into VRF address family mode
`(config-router-af)# redistribute connected`	Redistribute connected routes to the network
`(config-router-af)# exit-address-family`	Exiting of Address family mode

SH-1:

Enable EVPN MPLS and IRB:

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS globally
`(config)#evpn mpls irb`	Enable EVPN MPLS IRB globally

Loopback Interface:

`(config-if)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)# ip address 5.5.5.5/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

Configure MAC VRF:

`(config)#mac vrf red`	Create MAC VRF red.
`(config-vrf)# rd 5.5.5.5:100`	Configure route distinguisher
`(config-vrf)# route-target both evpn-auto-rt`	Configure route target as evpn auto route target (we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode
`(config)#mac vrf blue`	Create MAC VRF blue.
`(config-vrf)# rd 5.5.5.5:200`	Configure route distinguisher
`(config-vrf)# route-target both evpn-auto-rt`	Configure route target as evpn auto route target (we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode

Creating EVPN MPLS ID:

`(config)#evpn mpls vtep-ip-global 5.5.5.5`	Configure VTEP global IP
`(config)#evpn mpls id 100`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachability-protocol evpn-bgp red`	Map the MAC VRF red
`(config-evpn-mpls)# evpn irb irb100`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode
`(config)#evpn mpls id 200`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachability-protocol evpn-bgp blue`	Map the MAC VRF blue
`(config-evpn-mpls)# evpn irb irb200`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode

Global LDP:

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 5.5.5.5	Enter LDP router-id
(config-router)# transport-address ipv4 5.5.5.5	Configure LDP transport address
(config-router)# targeted-peer ipv4 2.2.2.2	Configure LDP target peer address (MH-1)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)# targeted-peer ipv4 3.3.3.3	Configure LDP target peer address (MH-2)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)# targeted-peer ipv4 6.6.6.6	Configure LDP target peer address (SH-2)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side:

(config-if)#interface xe6	Enter interface mode
(config-if)# description connected to P1	Configure interface description
(config-if)# ip address 30.30.30.1/24	Assign IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSPF Configuration:

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)#ospf router-id 5.5.5.5	Configure OSPF router id
(config-router)# network 5.5.5.5/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 30.30.30.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit OSPF mode

© 2025 IP Infusion Inc. Proprietary

BGP Configuration:

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)# neighbor 2.2.2.2 remote-as 65010	Configuring MH-1 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 2.2.2.2 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 3.3.3.3 remote-as 65010	Configuring MH-2 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 3.3.3.3 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 6.6.6.6 remote-as 65010	Configuring MH-2 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 6.6.6.6 update-source lo	Source of routing updates as loopback
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 2.2.2.2 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 3.3.3.3 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 6.6.6.6 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration:

(config-if)#interface sa9000	Creating Static LAG interface
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)#exit	Exiting out of interface mode
(config-if)#interface sa9000.100 switchport	Creating Static LAG L2 sub interface of physical interface xe12
(config-if)# encapsulation dot1q 100	Setting Encapsulation to dot1q with VLAN ID 100
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)#map vpn-id 100	Map VPN-ID 100
(config-acc-if-evpn)#exit	Exiting out of access interface mode
(config-if)#interface sa9000.200 switchport	Creating Static LAG L2 sub interface of physical interface xe12
(config-if)# encapsulation dot1q 200	Setting Encapsulation to dot1q with VLAN ID 200
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)#map vpn-id 200	Map VPN-ID 200
(config-acc-if-evpn)#exit	Exiting out of access interface mode
(config-if)#interface xe12	Enter the Interface mode

© 2025 IP Infusion Inc. Proprietary

`(config-if)# static-channel-group 9000`	Map the physical interface xe12 as static LAG member
`(config-if)#exit`	Exit interface mode

P1:

Loopback Interface:

#configure terminal	Enter configuration mode.
(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 4.4.4.4/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Global LDP:

(config)#router ldp	Enter the Router LDP mode.
(config-router)# router-id 4.4.4.4	Configure router id
(config-router)# transport-address ipv4 4.4.4.4	Configure transport address
(config-router)#exit	Exit from LDP mode

Interface Configuration:

(config-if)#interface xe4	Enter the Interface mode for xe4.
(config-if)# mtu 9216	Configure MTU.
(config-if)#exit	Enable LDP on the physical interface
(config)#interface xe4.1	Create sub-interface xe4.1.
(config-if)# description connected-to-MH-1	Configure Interface description
(config-if)# ip address 10.10.10.2/24	Assign IP address
(config-if)# mtu 9216	Configure MTU to the sub-if
(config-if)# encapsulation dot1q 20	Configure encapsulation as dotq
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter into Interface mode
(config-if)# description connected to MH-2	Configure Interface description
(config-if)# ip address 20.20.20.2/24	Cofigure IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe6	Enter into Interface mode
(config-if)# description connected to SH-1	Configure Interface description
(config-if)# ip address 30.30.30.2/24	Assign IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync

(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe10	Enter into Interface mode
(config-if)# description connected to SH-2	Configure Interface description
(config-if)# ip address 40.40.40.2/24	Assign IP address
(config-if)# mtu 9216	Configure MTU
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSFP Configuration

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# ospf router-id 4.4.4.4	Setting the Router ID as Loopback IP
(config-router)# network 4.4.4.4/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 10.10.10.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)# network 20.20.20.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)# network 30.30.30.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)# network 40.40.40.0/24 area 0.0.0.0	Advertise network address in OSPF that comes under same subnet.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

MH-1:

Enable EVPN MPLS and IRB:

#configure terminal	Enter configuration mode.
(config)#hardware-profile filter evpn-mpls-mh enable	Configure hardware profile to enable EVPN MPLS multi homing in hardware
(config)#evpn mpls enable	Enable EVPN MPLS globally
(config)#evpn mpls irb	Enable EVPN MPLS IRB globally
(config)#evpn mpls multihoming enable	Enable EVPN MPLS multihoming globally

Loopback Interface:

(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 2.2.2.2/32 secondarysss	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Configure MAC VRF:

(config)#mac vrf red	Create MAC VRF red.
(config-vrf)# rd 2.2.2.2:100	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode
(config)#mac vrf blue	Create MAC VRF blue.
(config-vrf)# rd 2.2.2.2:200	Configure route distinguisher
(config-vrf)# route-target both evpn-auto-rt	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode

Configure Anycast Gateway MAC:

(config)#evpn irb-forwarding anycast-gateway- mac 0011.2233.4455	Configure anycast gateway MAC globally

Creating EVPN MPLS ID:

(config)#evpn mpls vtep-ip-global 2.2.2.2	Configure VTEP global IP
(config)#evpn mpls id 100	Create EVPN MPLS ID
(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp red	Map the MAC VRF red
(config-evpn-mpls)# evpn irb irb100	Map the IRB interface
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode
(config)#evpn mpls id 200	Create EVPN MPLS ID
(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp blue	Map the MAC VRF blue
(config-evpn-mpls)# evpn irb irb200	Map the IRB interface
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode

Global LDP:

(config)#router ldp	Enter the Router LDP mode
(config-router)#router-id 2.2.2.2	Enter LDP router-id
(config-router)# transport-address ipv4 2.2.2.2	Configure LDP transport address
(config-router)# targeted-peer ipv4 5.5.5.5	Configure LDP target peer address (SH)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)# targeted-peer ipv4 6.6.6.6	Configure LDP target peer address (SH)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side:

(config-if)#interface xe0	Enter the Interface mode for xe0.
(config-if)# mtu 9216	Configure MTU.
(config-if)#exit	Exit from interface xe0
(config)#interface xe0.1	Create subinterface in xe10
(config-if)# encapsulation dot1q 20	Configure encapsulation as dotq
(config-if)# ip address 10.10.10.1/24	Assign IP address
(config-if)# mtu 9216	Configure MTU to the sub-if
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4

© 2025 IP Infusion Inc. Proprietary

OSPF Configuration:

`(config)#router ospf 1`	Enter the Router OSPF mode.
`(config-router)# ospf router-id 2.2.2.2`	Router-ID configurations
`(config-router)# network 2.2.2.2/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`(config-router)# network 10.10.10.0/24 area 0.0.0.0`	Advertise network address in OSPF.

BGP Configuration:

`(config-router)#router bgp 65010`	Enter the Router BGP mode, ASN: 100
`(config-router)# neighbor 3.3.3.3 remote-as 65010`	Configuring MH-2 as iBGP neighbor using it's loopback IP
`(config-router)# neighbor 3.3.3.3 update-source lo`	Source of routing updates as loopback
`(config-router)# neighbor 5.5.5.5 remote-as 65010`	Configuring SH-1 as iBGP neighbor using it's loopback IP
`(config-router)# neighbor 5.5.5.5 update-source lo`	Source of routing updates as loopback
`(config-router)# neighbor 6.6.6.6 remote-as 65010`	Configuring SH-2 as iBGP neighbor using it's loopback IP
`(config-router)# neighbor 6.6.6.6 update-source lo`	Source of routing updates as loopback
`(config-router)# address-family l2vpn evpn`	Entering into address family mode as EVPN
`(config-router-af)# neighbor 3.3.3.3 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# neighbor 5.5.5.5 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# neighbor 6.6.6.6 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# exit-address-family`	Exiting of Address family mode
`(config-router)# address-family ipv4 vrf evpn`	Entering into VRF address family mode
`(config-router-af)# redistribute connected`	Redistribute connected routes to the network
`(config-router-af)# exit-address-family`	Exiting of Address family mode

Access Port Configuration:

`(config)#interface xe9`	Enter configuration mode
`(config-if)# mtu 9216`	Configure MTU
`(config-if)# channel-group 10000 mode active`	Configure physical interface xe9 as LAG member po10000
`(config-if)#exit`	Exit from interface xe9
`(config)#interface po10000`	Create LAG interface po10000
`(config-if)# mtu 9216`	Configure MTU
`(config-if)# description connected to Switch`	Configure Interface description
`(config-if)# evpn multi-homed system-mac 0000.1111.aaaa`	Configure system MAC for multi homing
`(config)#interface po10000.100 switchport`	Creating L2 sub interface of physical interface xe9
`(config-if)# encapsulation dot1q 100`	Setting Encapsulation to dot1q with VLAN ID 100
`(config-if)#rewrite pop`	Configure rewrite with action pop
`(config-if)#mtu 9216`	Configure MTU as 9216
`(config-if)# access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-acc-if-evpn)# map vpn-id 100`	Map VPN-ID 202
`(config-acc-if-evpn)#exit`	Exiting out of access interface mode
`(config)#interface po10000.200 switchport`	Creating L2 sub interface of physical interface xe9
`(config-if)# encapsulation dot1q 200`	Setting Encapsulation to dot1q with VLAN ID 200
`(config-if)#rewrite pop`	Configure rewrite with action pop
`(config-if)#mtu 9216`	Configure MTU as 9216
`(config-if)# access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-acc-if-evpn)# map vpn-id 200`	Map VPN-ID 202
`(config-acc-if-evpn)#exit`	Exiting out of access interface mode

MH-2:

Enable EVPN MPLS and IRB:

`#configure terminal`	Enter configuration mode.
`(config)#hardware-profile filter evpn-mpls-mh enable`	Configure hardware profile to enable EVPN MPLS multi homing in hardware
`(config)#evpn mpls enable`	Enable EVPN MPLS globally
`(config)#evpn mpls irb`	Enable EVPN MPLS IRB globally
`(config)#evpn mpls multihoming enable`	Enable EVPN MPLS multihoming globally

Loopback Interface:

`(config-if)#interface lo`	Enter the Interface mode for the loopback interface
`(config-if)# ip address 3.3.3.3/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

© 2025 IP Infusion Inc. Proprietary

Configure MAC VRF:

`(config)#mac vrf red`	Create MAC VRF red.
`(config-vrf)# rd 3.3.3.3:100`	Configure route distinguisher
`(config-vrf)# route-target both evpn-auto-rt`	Configure route target as evpn auto route target (we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode
`(config)#mac vrf blue`	Create MAC VRF blue.
`(config-vrf)# rd 3.3.3.3:200`	Configure route distinguisher
`(config-vrf)# route-target both evpn-auto-rt`	Configure route target as evpn auto route target (we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode

Configure Anycast Gateway MAC:

`(config)#evpn irb-forwarding anycastgateway-mac 0011.2233.4455`	Configure anycast gateway MAC globally

Creating EVPN MPLS ID:

`(config)#evpn mpls vtep-ip-global 3.3.3.3`	Configure VTEP global IP
`(config)#evpn mpls id 100`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp red`	Map the MAC VRF red
`(config-evpn-mpls)# evpn irb irb100`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode
`(config)#evpn mpls id 200`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachabilityprotocol evpn-bgp blue`	Map the MAC VRF blue
`(config-evpn-mpls)# evpn irb irb200`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode

© 2025 IP Infusion Inc. Proprietary

Global LDP:

(config)#router ldp	Enter the Router LDP mode.
(config-router)# transport-address ipv4 3.3.3.3	Configure LDP transport address
(config-router)# targeted-peer ipv4 5.5.5.5	Configure LDP target peer address (SH)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)# targeted-peer ipv4 6.6.6.6	Configure LDP target peer address (SH)
(config-router-targeted-peer)#exit	Exit from LDP target peer mode
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side:

(config-if)#interface xe10	Enter the configuration mode.
(config-if)# description connected to P1	Configure Interface description
(config-if)# ip address 20.20.20.1/24	Assign IP address
(config-if)# mtu 9216	Configure MTU to the sub-if
(config-if)# label-switching	Enable label switching
(config-if)# mpls ldp-igp sync ospf	Enable LDP IGP sync
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode

OSPF Configuration:

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# ospf router-id 3.3.3.3	Router-ID configurations
(config-router)# network 3.3.3.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 20.20.20.0/24 area 0.0.0.0	Advertise network address in OSPF.

BGP Configuration:

(config-router)#router bgp 65010	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 2.2.2.2 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 2.2.2.2 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 5.5.5.5 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 5.5.5.5 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 6.6.6.6 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 6.6.6.6 update-source lo	Source of routing updates as loopback
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 2.2.2.2 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 5.5.5.5 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 6.6.6.6 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family ipv4 vrf evpn_anycast	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration:

(config)#interface xe21	Enter configuration mode
(config-if)# mtu 9216	Configure MTU
(config-if)# channel-group 10000 mode active	Configure physical interface xe21 as LAG member po10000
(config-if)#exit	Exit from interface xe21
(config)#interface po10000	Create LAG interface po10000
(config-if)# mtu 9216	Configure MTU
(config-if)# description connected to Switch	Configure Interface description
(config-if)# evpn multi-homed system-mac 0000.1111.aaaa	Configure system MAC for multi homing
(config)#interface po10000.100 switchport	Creating L2 sub interface of physical interface xe21
(config-if)# encapsulation dot1q 100	Setting Encapsulation to dot1q with VLAN ID 100

(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 100	Map VPN-ID 202
(config-acc-if-evpn)#exit	Exiting out of access interface mode
(config)#interface po10000.200 switchport	Creating L2 sub interface of physical interface xe21
(config-if)# encapsulation dot1q 200	Setting Encapsulation to dot1q with VLAN ID 200
(config-if)#rewrite pop	Configure rewrite with action pop
(config-if)#mtu 9216	Configure MTU as 9216
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 200	Map VPN-ID 202
(config-acc-if-evpn)#exit	Exiting out of access interface mode

Validation

Note: Remote entries cannot be fetched from through MAC table/ARP cache/ND cache. However they can be fetched from the BGP table.

EVPN MPLS IRB Symmetric with Host Routes

Overview

EVPN-IRB facilitates communication between two L2VNI’s with the help of Routing using IP-VRF. This features provides the Host (/32 or /128) based Symmetric IRB support which forwards the inter-subnet traffic directly towards the host (CEs) attached to VTEP (PEs).

Host based Symmetric IRB support is two modes: interface-full and interface-less.

- Interface-full mode refers to configuring of IRB interface
- Interface-less mode refers to configuring the access interface as L3 interface and using the IRB configuration. IRB interface is not used in this case.
- Interface-full mode supports “evpn irb-advertise-host-route” CLI under evpn mpls id <id>.
- Interface-less mode supports both “evpn irb-advertise-host-route” CLI under evpn mpls id <id> and “redistribute-connected-host-routes” under bgp vrf address family.
- Host based Symmetric IRB support is achieved through one of the modes:
    - “evpn irb-advertise-host-route” in interface-full mode (with IRB interface“)
    - evpn irb-advertise-host-route” in interface-less mode (without IRB interface)
    - “redistribute-connected-host-routes” in interface-less mode (without IRB interface)

Topology

Figure 2-6 depicts the EVPN MPLS IRB with LDP as underlay MPLS path.

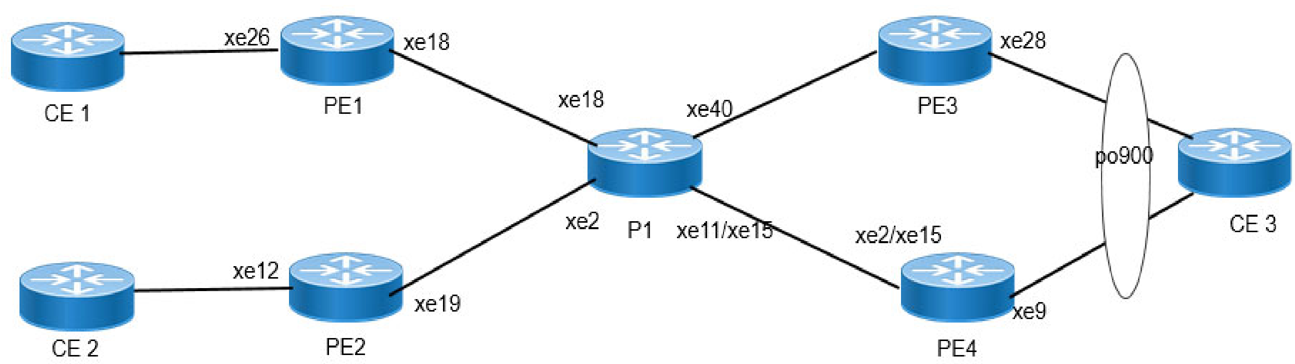

Figure 2-6: Host based symmetric IRB support

PE1

Enable EVPN MPLS and IRB

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS globally.
`(config)#evpn mpls irb`	Enable EVPN MPLS IRB globally.

Loopback Interface

`(config-if)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)# ip address 20.20.20.20/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode.

Configure MAC VRF:

`(config)#mac vrf green`	Create MAC VRF mvrf4.
`(config-vrf)# rd 20.20.20.20:400`	Configure route distinguisher.
`(config-vrf)# route-target both 65010:400`	Configure route target as evpn auto route target (it can be configured as manual RT).
`(config-vrf)#exit`	Exit VRF mode.

Configure IP VRF:

(config)#ip vrf vrf400	Configure IP VRF vrf100.
(config-vrf)# rd 30:400	Configure route distinguisher
(config-vrf)# route-target both 100:400	Configure route target
(config-vrf)# l3vni 40000	Configure L3 VNID for routing
(config-vrf)#exit	Exit VRF mode

Configure anycast gateway MAC:

(config)#evpn irb-forwarding anycast-gateway-mac 0011.2233.5577	Configure anycast gateway MAC globally.

Configuring IRB interface:

(config)#interface irb400	Create IRB interface irb100.
(config-irb-if)# ip vrf forwarding vrf400	Map L3 VRF to the IRB interface.
(config-irb-if)# ip address 40.40.1.1/24 anycast	Assign IP address.
(config-irb-if)# ipv6 address 5001::1/48	Assign IPv6 address.
(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac	Map anycast gateway MAC.
(config-irb-if)#exit	Exit interface mode.

Creating EVPN MPLS ID:

(config)#evpn mpls vtep-ip-global 20.20.20.20	Configure VTEP global IP.
(config)#evpn mpls id 400	Create EVPN MPLS ID.
(config-evpn-mpls)# host-reachability-protocol evpn-bgp green	Map the MAC VRF mvrf4.
(config-evpn-mpls)# evpn irb irb400	Map the IRB interface.
(config-evpn-mpls)# evpn irb-advertise-host-route	Set host to route advertise.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode.

Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)# router-id 20.20.20.20	Set router ID of LDP.
(config-router)# targeted-peer ipv4 17.17.17.17	Configure targeted peer.
(config-router-targeted-peer)# exit	Exit from targeted-peer mode.

(config-router)# transport-address ipv4 20.20.20.20	Configure LDP transport address.
(config-router)#exit	Exit from LDP mode.

Interface Configuration Network Side

(config)#interface xe18	Configure physical interface.
(config-if)# mtu 9216	Configure MTU on the interface.
(config-if)# load-interval 30	Set load interval.
(config-if)# ip address 55.55.55.1/24	Assign IP address.
(config-if)# label-switching	Enable label switching.
(config-if)# isis network point-to-point	Configure isis as point-to-point network.
(config-if)# enable-ldp ipv4	Enable LDP IPv4.
(config-if)# ip router isis ISIS-IGP	Enable a routing process.
(config-if)#exit	Exit interface mode.
(config-if)# router isis ISIS-IGP	Enter the Router ISIS mode.
(config-router)# is-type level-1	IS Level for this routing process.
(config-router)# mpls traffic-eng router-id 20.20.20.20	Routing protocol commands for MPLS Traffic Engineering.
(config-router)# net 49.0001.0000.0000.0001.00	Configure net.
(config-router)#exit	Exit OSPF mode.

BGP Configuration

(config)#router bgp	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 11.11.11.11 remote-as 65010	Configuring PE3 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 11.11.11.11 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 22.22.22.22 remote-as 65010	Configuring PE2 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 22.22.22.22 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 17.17.17.17 remote-as 65010	Configuring PE3 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 22.22.22.22 update-source lo	Source of routing updates as loopback
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 11.11.11.11 activate	Enabling EVPN Address family for neighbor

`(config-router-af)# neighbor 22.22.22.22 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# neighbor 17.17.17.17 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)# exit-address-family`	Exiting of Address family mode
`(config-router)# address-family ipv4 vrf vrf400`	Entering into VRF address family mode
`(config-router-af)# redistribute connected`	Redistribute connected routes to the network
`(config-router-af)# exit-address-family`	Exiting of Address family mode

Access Port Configuration:

`(config)# interface xe26`	Configure physical interface
`(config-if)# static-channel-group 10000`	Create static channel group
`(config-if)# exit`	Exit interface mode
`(config)# interface sa10000`	Configure Static channel sa10000
`(config-if)# switchport`	Make it L2 interface
`(config-if)# load-interval 30`	Set load interval
`(config-if)# mtu 9216`	Configure MTU on the interface.
`(config)# exit`	Exit interface mode
`(config)# interface sa10000.400 switchport`	Configure static sub-interface
`(config-if)# encapsulation dot1q 701`	Configure encapsulation
`(config-ig)# rewrite pop`	Pop the outer VID
`(config-if)# access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`(config-acc-if-evpn)#  map vpn-id 400`	Map VPN-ID 400
`(config-acc-if-evpn)# mac 0000.0000.aaaa ip 40.40.1.10`	Configure static mac with IP
`(config-acc-if-evpn)# mac 0000.0000.bbbb ipv6 5001:aaaa::1`	Configure static mac with IPv6
`(config-acc-if-evpn)#exit`	Exiting out of access interface mode

PE2

Enable EVPN MPLS and IRB:

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS globally
`(config)#evpn mpls irb`	Enable EVPN MPLS IRB globally

Loopback Interface

(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 22.22.22.22/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Configure MAC VRF

(config)#mac vrf green	Create MAC VRF mvrf4.
(config-vrf)# rd 22.22.22.22:400	Configure route distinguisher
(config-vrf)# route-target both 65010:400	Configure route target as evpn auto route target (we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode

Configure IP VRF

(config)#ip vrf vrf400	Configure IP VRF vrf100.
(config-vrf)# rd 40:400	Configure route distinguisher
(config-vrf)# route-target both 100:400	Configure route target
(config-vrf)# l3vni 40000	Configure L3 VNID for routing
(config-vrf)#exit	Exit VRF mode

Configure anycast gateway MAC

(config)#evpn irb-forwarding anycast-gateway-mac 0011.2233.5577	Configure anycast gateway MAC globally

Configuring IRB interface

(config)#interface irb400	Create IRB interface irb100
(config-irb-if)# ip vrf forwarding vrf400	Map L3 VRF to the IRB interface
(config-irb-if)# ip address 40.40.1.1/24 anycast	Assign IP address
(config-irb-if)# ipv6 address 5001::1/48	Assign IPv6 address
(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac	Map anycast gateway MAC
(config-irb-if)#exit	Exit interface mode

Creating EVPN MPLS ID:

`(config)#evpn mpls vtep-ip-global 22.22.22.22`	Configure VTEP global IP
`(config)#evpn mpls id 400`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachability-protocol evpn-bgp green`	Map the MAC VRF mvrf4
`(config-evpn-mpls)# evpn irb irb400`	Map the IRB interface
`(config-evpn-mpls)# evpn irb-advertise-host-route`	Set host to route advertise
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode

Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)# router-id 22.22.22.22`	Set router ID of LDP
`(config-router)# targeted-peer ipv4 17.17.17.17`	Configure targeted peer
`(config-router)# targeted-peer ipv4 11.11.11.11`	Configure targeted peer
`(config-router-targeted-peer)# exit`	Exit from targeted-peer mode
`(config-router)# transport-address ipv4 22.22.22.22`	Configure LDP transport address
`(config-router)#exit`	Exit from LDP mode

Interface Configuration Network Side

`(config)#interface xe19`	Configure physical interface
`(config-if)# mtu 9216`	Configure MTU on the interface.
`(config-if)# load-interval 30`	Set load interval
`(config-if)# ip address 30.30.30.1/24`	Assign IP address
`(config-if)# label-switching`	Enable label switching
`(config-if)# isis network point-to-point`	Configure isis as point-to-point network
`(config-if)# enable-ldp ipv4`	Enable LDP IPv4
`(config-if)# ip router isis ISIS-IGP`	Enable a routing process
`(config-if)#exit`	Exit interface mode
`(config-if)# router isis ISIS-IGP`	Enter the Router ISIS mode.
`(config-router)# is-type level-1`	IS Level for this routing process
`(config-router)# mpls traffic-eng router-id 22.22.22.22`	routing protocol commands for MPLS Traffic Engineering

(config-router)# net 49.0001.0000.0000.0006.00	Configure net
(config-router)#exit	Exit OSPF mode

BGP Configuration

(config)#router bgp	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 11.11.11.11 remote-as 65010	Configuring PE3 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 11.11.11.11 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 20.20.20.20 remote-as 65010	Configuring PE2 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 20.20.20.20 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 17.17.17.17 remote-as 65010	Configuring PE3 as I-BGP neighbor using it's loopback IP
(config-router)# neighbor 17.17.17.17 update-source lo	Source of routing updates as loopback
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 11.11.11.11 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 22.22.22.22 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 17.17.17.17 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family ipv4 vrf vrf400	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration

(config)# interface xe12.400 switchport	Configure static sub-interface
(config-if)# encapsulation dot1q 400	Configure encapsulation
(config-ig)# rewrite pop	Pop the outer VID
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 400	Map VPN-ID 400
(config-acc-if-evpn)# mac 0000.0000.aabb ip 40.40.1.20	Configure static mac with IP

(config-acc-if-evpn)# mac 0000.0000.bbaa ipv6 5001::20	Configure static mac with IPv6
(config-acc-if-evpn)#exit	Exiting out of access interface mode

P1

Loopback Interface:

#configure terminal	Enter configuration mode.
(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 24.24.24.24/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)# router-id 24.24.24.24	Configure router id
(config-router)# transport-address ipv4 24.24.24.24	Configure transport address

Interface Configuration

(config)#interface xe2	Configure physical interface
(config-if)# mtu 9216	Configure MTU on the interface.
(config-if)# load-interval 30	Set load interval
(config-if)# ip address 30.30.30.2/24	Assign IP address
(config-if)# label-switching	Enable label switching
(config-if)# isis network point-to-point	Configure isis as point-to-point network
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe18	Configure physical interface
(config-if)# mtu 9216	Configure MTU on the interface.
(config-if)# load-interval 30	Set load interval
(config-if)# ip address 55.55.55.2/24	Assign IP address
(config-if)# label-switching	Enable label switching
(config-if)# isis network point-to-point	Configure isis as point-to-point network
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)#exit	Exit interface mode
(config)#interface xe40	Configure physical interface
(config-if)# mtu 9216	Configure MTU on the interface.

(config-if)# load-interval 30	Set load interval
(config-if)# ip address 76.76.76.2/24	Enter interface mode xe40
(config-if)# label-switching	Set label switching
(config-if)# isis network point-to-point	Set routing protocol isis
(config-if)# enable-ldp ipv4	Enable ldp
(config-if)#exit	Exit interface mode
(config-if)# mtu 1522	Configure MTU on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe11	Create po subinterface
(config-if)# ip address 60.60.60.2/24	Assign IP address
(config-if)# mtu 9216	Configure MTU to the sub-if
(config-if)# label-switching	Enable label switching
(config-if)# enable-ldp ipv4	Enable LDP IPv4
(config-if)# isis network point-to-point	Set routing protocol isis
(config-if)#exit	Exit interface mode

ISIS Configuration

(config)#router isis ISIS-IGP	Enter the Router IsIs mode.
(config-router)# is-type level-1	IS Level for this routing process
(config-router)# mpls traffic-eng router-id 24.24.24.24	routing protocol commands for MPLS Traffic Engineering
(config-router)# net 49.0001.0000.0000.0003.00	Configure net
(config-router)#exit	Exit Router isis mode and return to Configure mode.
(config)#commit	Commit candidate configuration to be running configuration

PE3

Enable EVPN MPLS and IRB

#configure terminal	Enter configuration mode.
(config)#hardware-profile filter evpn-mpls-mh enable	Configure hardware profile to enable EVPN MPLS multi homing in hardware
(config)#evpn mpls enable	Enable EVPN MPLS globally
(config)#evpn mpls irb	Enable EVPN MPLS IRB globally
(config)#evpn mpls multihoming enable	Enable EVPN MPLS multihoming globally

Loopback Interface

(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 11.11.11.11/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

Configure MAC VRF

(config-vrf)#mac vrf green	Create MAC VRF mvrf4.
(config-vrf)# rd 11.11.11.11:400	Configure route distinguisher
(config-vrf)# route-target both 65010:400	Configure route target as evpn auto-rt(we can configure as manual RT also)
(config-vrf)#exit	Exit VRF mode

Configure IP VRF

(config)#ip vrf vrf400	Configure IP VRF vrf100.
(config-vrf)# rd 20:400	Configure route distinguisher
(config-vrf)# route-target both 100:400	Configure route target
(config-vrf)# l3vni 40000	Configure L3 VNID for routing
(config-vrf)#exit	Exit VRF mode

Configure Anycast Gateway MAC

(config)#evpn irb-forwarding anycastgateway- mac 0011.2233.4455	Configure anycast gateway MAC globally
(config)#interface irb500	Create IRB interface irb100
(config-irb-if)# ip vrf forwarding vrf400	Map L3 VRF to the IRB interface
(config-irb-if)# ip address 80.80.1.1/24 anycast	Assign IP address
(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac	Map anycast gateway MAC
(config-irb-if)#exit	Exit interface mode

Creating EVPN MPLS ID

(config)#evpn mpls vtep-ip-global 11.11.11.11	Configure VTEP global IP
(config)#evpn mpls id 500	Create EVPN MPLS ID
(config-evpn-mpls)# host-reachability-protocol evpn-bgp green	Map the MAC VRF mvrf4

(config-evpn-mpls)# evpn irb irb500	Map the IRB interface
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode

Global LDP

(config)#router ldp	Enter the Router LDP mode
(config-router)# transport-address ipv4 11.11.11.11	Configure LDP transport address
(config-router)#exit	Exit from LDP mode

Interface Configuration Network Side

(config-if)#interface xe27	Enter the Interface mode for eth10.
(config-if)# mtu 9216	Configure MTU.
(config-if)# enable-ldp ipv4	Enable LDP on the physical interface
(config-if)# ip address ip address 76.76.76.1/24	Assign IP address
(config-if)# mtu 1522	Configure MTU to the sub-if
(config-if)# label-switching	Enable label switching
(config-if)# isis network point-to-point	Configure isis as point-to-point network
(config-if)# router isis ISIS-IGP	Configure isis with ISIS-IGP area tag
(config-if)# exit	Exit interface mode

ISIS Configuration

(config)# router isis ISIS-IGP	Enter the Router ISIS mode.
(config-router)# is-type level-1	IS Level for this routing process
(config-router)# mpls traffic-eng router-id 11.11.11.11	Routing protocol commands for MPLS Traffic Engineering
(config-router)# net 49.0001.0000.0000.0005.00	Configure net

BGP Configuration

(config-router)# router bgp 65010	Enter the Router BGP mode, ASN: 65010
(config-router)# neighbor 20.20.20.20 remote-as 65010	Configuring PE1 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 20.20.20.20 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 22.22.22.22 remote-as 65010	Configuring PE2 as iBGP neighbor using it's loopback IP

(config-router)# neighbor 22.22.22.22 update-source lo lo	Source of routing updates as loopback
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 20.20.20.20 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 22.22.22.22 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family ipv4 vrf Vrf400	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration

(config)#interface po900	Create LAG interface po900
(config-if)# switchport	Configure as switchport
(config-if)# evpn multi-homed system-mac 0000.1111.aaaa	Configure system MAC for multi homing
(config)#interface po900.500 switchport	Creating L2 sub interface of physical interface xe28
(config-if)# encapsulation dot1q 500	Setting Encapsulation to dot1q with VLAN ID 500
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 500	Map VPN-ID 500
(config-acc-if-evpn)#exit	Exiting out of access interface mode

PE4

Enable EVPN MPLS and IRB

#configure terminal	Enter configuration mode.
(config)#hardware-profile filter evpn-mpls-mh enable	Configure hardware profile to enable EVPN MPLS multi homing in hardware
(config)#evpn mpls enable	Enable EVPN MPLS globally
(config)#evpn mpls irb	Enable EVPN MPLS IRB globally
(config)#evpn mpls multihoming enable	Enable EVPN MPLS multihoming globally

Loopback Interface

(config-if)#interface lo	Enter the Interface mode for the loopback interface

`(config-if)# ip address 17.17.17/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

Configure MAC VRF

`(config-vrf)#mac vrf green`	Create MAC VRF mvrf4.
`(config-vrf)# rd 17.17.17.17:400`	Configure route distinguisher
`(config-vrf)# route-target both 65010:400`	Configure route target as evpn auto-rt (we can configure as manual RT also)
`(config-vrf)#exit`	Exit VRF mode

Configure IP VRF

`(config)#ip vrf vrf400`	Configure IP VRF vrf100.
`(config-vrf)# rd 10:400`	Configure route distinguisher
`(config-vrf)# route-target both 100:400`	Configure route target
`(config-vrf)# l3vni 40000`	Configure L3 VNID for routing
`(config-vrf)#exit`	Exit VRF mode

Configure Anycast Gateway MAC

`(config)#evpn irb-forwarding anycast-gateway-mac 0011.2233.5577`	Configure anycast gateway MAC globally

Configuring IRB interface

`(config)#interface irb500`	Create IRB interface irb100
`(config-irb-if)# ip vrf forwarding vrf400`	Map L3 VRF to the IRB interface
`(config-irb-if)# ip address 80.80.1.1/24 anycast`	Assign IP address
`(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac`	Map anycast gateway MAC
`(config-irb-if)#exit`	Exit interface mode

Creating EVPN MPLS ID

`(config)#evpn mpls vtep-ip-global 17.17.17.17`	Configure VTEP global IP
`(config)#evpn mpls id 500`	Create EVPN MPLS ID
`(config-evpn-mpls)# host-reachability-protocol evpn-bgp green`	Map the MAC VRF green

`(config-evpn-mpls)# evpn irb irb500`	Map the IRB interface
`(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode

Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 17.17.17.17`	Configure lo under ldp
`(config-router)#targeted-peer ipv4 20.20.20.20`	Configure targeted peer
`(config-router-targeted-peer)# exit-targeted-peer-mode`	Exit target peer mode
`(config-router)# targeted-peer ipv4 22.22.22.22`	Configure targeted peer
`(config-router-targeted-peer)# exit-targeted-peer-mode`	Exit target peer mode
`(config-router)# transport-address ipv4 17.17.17.17`	Configure LDP transport address
`(config-router)#exit`	Exit from LDP mode

Interface Configuration Network Side

`(config-if)#interface xe2`	Configure physical interface
`(config-if)# ip address 60.60.60.1/24`	Assign IP address
`(config-if)# mtu 9216`	Configure MTU to the sub-if
`(config-if)# label-switching`	Enable label switching
`(config-if)# isis network point-to-point`	Configure ISIS as point-to-point network
`(config-if)# ip router isis ISIS-IGP`	Configure ISIS with area tag ISIS-IGP
`(config-if)# enable-ldp ipv4`	Enable LDP IPv4
`(config-if)#exit`	Exit interface mode

ISIS Configuration

`(config)# router isis ISIS-IGP`	Enter the Router OSPF mode.
`(config-router)# is-type level-1`	Configure routing ISIS level
`(config-router)# mpls traffic-eng router-id 17.17.17.17`	Routing protocol commands for MPLS Traffic Engineering.
`(config-router)# net 49.0001.0000.0000.0004.00`	Configure net

© 2025 IP Infusion Inc. Proprietary

BGP Configuration

(config)#router bgp 65010	Enter the Router BGP mode, ASN: 100
(config-router)# bgp router-id 17.17.17.17	
(config-router)# neighbor 20.20.20.20 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 20.20.20.20 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 22.22.22.22 remote-as 65010	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 22.22.22.21 update-source lo	Source of routing updates as loopback
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 20.20.20.20 activate	Enabling EVPN Address family for neighbor
(config-router-af)# neighbor 22.22.22.22 activate	Enabling EVPN Address family for neighbor
(config-router-af)# exit-address-family	Exiting of Address family mode
(config-router)# address-family ipv4 vrf Vrf500	Entering into VRF address family mode
(config-router-af)# redistribute connected	Redistribute connected routes to the network
(config-router-af)# exit-address-family	Exiting of Address family mode

Access Port Configuration

(config)#interface po900	Create LAG interface po1
(config-if)# switchport	Configure as switchport
(config-if)# evpn multi-homed system-mac 0000.0000.1111	Configure system MAC for multi homing
(config)#interface po900.500 switchport	Creating L2 sub interface of physical interface xe9
(config-if)# encapsulation dot1q 500	Setting Encapsulation to dot1q with VLAN ID 500
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 500	Map VPN-ID 500
(config-acc-if-evpn)#exit	Exiting out of access interface mode

CHAPTER 3 EVPN Active-Standby

Overview

EVPN Multihoming is a mechanism that allows a host or customer edge (CE) device to be connected to multiple Provider Edge (PE) devices called Multihoming (MH) peers for redundancy and load balancing purposes. This provides high availability and resiliency to the network, ensuring continuous connectivity even in case of a PE device failure.

Note: OcNOS support extends to a maximum of two MH peers.

Multihoming supports two kinds of redundancy, namely 1. All Active 2. Active-Standby.

Till now, OcNOS support All-Active (A-A) only. In OcNOS version 6.4.1, Port-Active mode is supported and in OcNOS version 6.4.2, Single-Active mode is supported in the context of Active-Standby redundancy.

Single-Active

- In this mode, traffic for a specific host or MAC address is handled by only one of the PE devices (MH peers) at a time.
- The other PE devices remain in standby mode, ready to take over if the active PE fails.
- The physical link state (either Physical port or LACP port) on the standby PE remains up, enabling a faster transition to the active role in the event of a failover. The CE devices use different interfaces, including LACP or physical connections, to connect to the Peer MH devices.

Port-Active

- In this mode, traffic for a specific host or MAC address is handled by only one of the PE devices (MH peers) at a time.
- Each MH peer connects through LACP with the same key as the CE devices (similar to A-A redundancy).
- The physical link state (LACP port) on the standby PE is made down, effectively blocking traffic on those ports.
- If a failover occurs, the standby PE must bring up its LACP ports to start forwarding traffic.

IRB Active-Standby: Active-standby mode is also applicable to Integrated Routing and Bridging (IRB) for both L3VPN symmetric and asymmetric modes.

Feature Characteristics

Single-Active standby redundancy mechanisms support both ELAN and ELINE services.

Single-Active ELINE

ELINE refers to Ethernet Line services, where two PEs are cross-connected to each other over an Ethernet link.

In Single-Active ELINE, the primary objective is to achieve redundancy for hosts while also using the same link for data exchange until it fails, at which point it should switch to the secondary or standby link. Here's how it works:

- **MH Host Traffic**
  - One of the PE devices (MH peers) acts as the “Active” for the Attachment Circuit (AC) associated with the host. This PE sends and receives traffic to and from the host.
  - The other PE acts as the “Standby” for the same AC and does not allow traffic to or from the host.

  - The standby PE, despite receiving BUM traffic from the Host device (which is unaware of the cross-connect), blocks this traffic at the standby PE itself, as it operates in a standby role for the AC. Conversely, the active PE allows the flow of traffic.
- **Remote Host Traffic:** Traffic originating from remote hosts destined for the multihomed host is only sent to the active MH peer for the corresponding AC. This ensures that the cross connect is established only with the Active MH peer.

Single-Active ELAN

ELAN stands for Ethernet LAN services, where a group of PEs are interconnected in a multipoint Ethernet network.

In Single-Active ELAN, similar to Single-Active ELINE, redundancy for hosts and data exchange over the primary link are priorities, but there are some specific differences for Ethernet LAN (ELAN) scenarios:

- **MH Host Traffic**
  - One of the PE devices (MH peers) is designated as the “Active” for the AC associated with the host. This PE handles sending and receiving traffic to and from remote locations.
  - The other PE acts as the “Standby” role for the same AC. It receives BUM traffic from the host but blocks the traffic. Additionally, it refrains from learning MAC addresses and does not uplift Address Resolution Protocol/ Neighbor Discovery (ARP/ND) packets.
  - Unicast traffic from the host will be directed to the active PE, which will then allow the traffic to be sent across the network.
- **Remote Host Unicast Traffic:** Unicast traffic from remote hosts destined for the multihomed host is sent only to the active MH peer for the corresponding AC. This is because the MAC addresses of the host are learned only from the Active MH peer.
- **Remote Host BUM Traffic:** BUM traffic, such as broadcast and multicast packets from the remote PE device, is replicated to both MH PEs. However, only the active PE, which is also designated as a forwarder, allows this traffic to reach the host. The standby PE, classified as a Non-Designated Forwarder, drops the egress traffic.

Port-Active Ethernet LAN (ELAN) and Ethernet LINE (ELINE) are examples of port-active standby redundancy mechanisms.

Port-Active ELINE

Port-Active ELINE enables redundancy and optimized data exchange by designating an active port for traffic handling in multihomed network setups. Here's how it works:

- **Active AC Link:** Among the Multihomed (MH) peers, a designated PE is assigned as “Active” for the AC associated with the host. This PE manages bidirectional traffic to and from the host. In a port-active configuration, all hosts associated with the ESI link remain in the same state, as the Active and Standby status is determined per ESI link.
- **Standby AC Link:** The AC link attached to the host, designated as “Standby,” remains operationally down. It serves as a backup link for failover scenarios.
- **MH Host traffic:** BUM and unicast traffic from the host are always directed towards the Active PE because the link towards the Active PE is operational UP. Conversely, the link towards the Standby PE from the host devices is operational DOWN.
- **Remote Host Traffic:** Traffic originating from remote hosts and destined for the multihomed host is directed exclusively to the Active MH node that serves the corresponding AC. This ensures efficient traffic routing and intelligent cross-connection establishment.

Port-Active ELAN

Port-Active ELAN enhances redundancy and efficient data exchange by designating an active port for traffic management in multihomed Ethernet LAN environments. Here's how it works:

- **Active AC Link:** Within the MH peers, one PE is identified as the "Active" entity for the AC. It manages traffic to and from remote locations efficiently.
- **Standby AC Link:** Similar to Port-Active ELINE, the standby AC link attached to the host remains operationally down to ensure effective standby redundancy.
- **MH Host Traffic:** In a port-active scenario, the standby link does not receive any traffic from the host. Only the active link manages incoming traffic from the host. The Active PE also learns and advertises host information to remote locations, including MAC addresses and ARP/ND details.
- **Remote Host Unicast Traffic:** Unicast traffic from remote sources is directed exclusively to the Active MH PE that has advertised the host address, optimizing traffic flow.
- **Remote Host BUM Traffic:** BUM traffic is replicated across all MH nodes. However, egress traffic for BUM packets occurs only from the Active PE. The standby PE drops the traffic since the AC links are operational DOWN.

Benefits

The benefits of Single-Active and Port-Active include enhanced redundancy and fault tolerance for hosts and customer edge devices, efficient data exchange, minimized downtime, and improved network resiliency in multihomed Ethernet Line and Ethernet LAN environments. These mechanisms ensure uninterrupted connectivity and optimized traffic management, contributing to higher availability and improved user experience.

Prerequisites

Here are the prerequisites for configuring EVPN Multihoming:

Ensure EVPN Configuration: Make sure that the EVPN is configured already in the network as it is a requirement for EVPN Multihoming.

Configure Attachment Circuits (AC): Ensure that each CE device is appropriately linked to the PE devices through Attachment Circuits. These circuits must be configured correctly.

Set Up LACP Configuration: To use Link Aggregation Control Protocol (LACP) for multihoming, configure LACP appropriately on the relevant interfaces.

EVPN MPLS Global Configuration: To enable EVPN MPLS features, need to configure global settings, such as enabling EVPN MPLS, defining global VTEP IP addresses, enabling hardware profile filtering for multihoming, and activating EVPN MPLS multihoming functionality. These settings are essential for EVPN and MPLS operation.

Access Port Configuration: Depending on the network's redundancy plan (single-active or port-active), configure access ports, including parameters for load balancing, service carving preferences, and EVPN settings. These configurations are crucial for network access and connectivity in an EVPN environment.

These prerequisites ensure that the network is ready for the implementation of EVPN Multihoming, providing redundancy and load balancing for CE devices.

Configuration

Here are sample configurations for EVPN MPLS Active-Standby MultiHoming Configuration and EVPN SR Active-Standby Multi-Homing Configuration, including topology, configuration procedures, and corresponding validations.

For more information on the EVPN MPLS configurations, see the EVPN MPLS Configuration and EVPN MPLS IRB Configuration chapters in the *Multi-Protocol Label Switching Guide*.

EVPN MPLS Active-Standby MultiHoming Configuration

This section illustrates the Multi-Homed setup for the EVPN MPLS Active-Standby configuration, showcasing examples for both ELINE and ELAN services with LDP as the underlay MPLS path.

EVPN MPLS Active-Standby MH Topology

Figure 3-7 consists of customer edge routers CE1 and CE2, along with IPv4 Provider Edge routers PE1, PE2, PE3, and PE4, all interconnected through the core routers P1 and P2 in the IPv4 MPLS provider network.

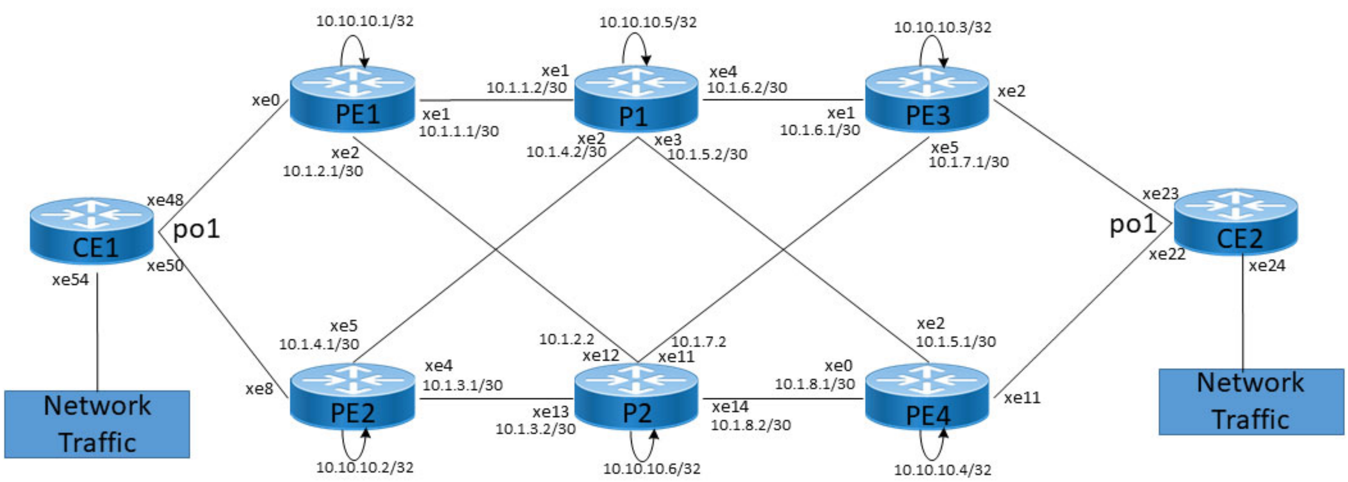

Figure 3-7: EVPN MPLS AS MH Configuration

CE1

The following configuration steps under CE1 are set up to enable VLANs and configure interfaces for carrying VLAN traffic.

`CE1#configure terminal`	Enter configure mode.
`CE1(config)#bridge 1 protocol ieee vlan-bridge`	Set up `bridge 1` to use the IEEE VLAN bridge protocol.
`CE1(config)#vlan 2-100 bridge 1 state enable`	Configure VLANs from `2-100` and associate them with bridge 1.
`CE1(config)#interface xe54`	Enter interface mode `xe54`.
`CE1(config-if)#switchport`	Configure the interface `xe54` as a Layer 2 switch port.
`CE1(config-if)#bridge-group 1`	Associate `xe54` to bridge 1.
`CE1(config-if)#switchport mode trunk`	Configure `xe54` as a trunk port.
`CE1(config-if)#switchport trunk allowed vlan all`	Allow all configured VLANs on the trunk interface `xe54`.
`CE1(config-if)#exit`	Exit interface mode `xe54`.
`CE1(config)#interface po1`	Enter interface mode and configure LAG interface port-channel 1 (`po1`).
`CE1(config-if)#switchport`	Configures port-channel 1 as a Layer 2 switch port.

CE1(config-if)#bridge-group 1	Associate po1 to bridge 1.
CE1(config-if)#switchport mode trunk	Configure po1 as a trunk port.
CE1(config-if)#switchport trunk allowed vlan all	Allow all configured VLANs on the trunk port-channel po1.
CE1(config-if)#exit	Exit interface mode po1.
CE1(config)#interface xe48	Enter interface mode xe48.
CE1(config-if)#lacp timeout short	Configure LACP timeout as short.
CE1(config-if)#channel-group 1 mode active	Add member to the LAG interface.
CE1(config-if)#exit	Exit interface mode xe48.
CE1(config-if)#interface xe50	Enter interface mode xe50.
CE1(config-if)#lacp timeout short	Configure LACP timeout as short.
CE1(config-if)#channel-group 1 mode active	Add member to the LAG interface.
CE1(config-if)#commit	Commit the transaction.
CE1(config-if)#end	Exit interface mode xe50 and configure mode.

PE1: Loopback Interface

The configuration on PE1 for a loopback interface with IP address 10.10.10.1/32 secondary is set up to provide IP connectivity for the router.

PE1#configure terminal	Enter configure mode.
PE1(config)#interface lo	Enter the interface mode for the loopback interface lo.
PE1(config-if)#ip address 10.10.10.1/32 secondary	Configure a secondary IP address, 10.10.10.1/32, on the loopback interface.
PE1(config-if)#exit	Exit interface mode lo.
PE1(config)#commit	Commit the transaction.

PE1: Global LDP

The configuration on PE1 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

PE1(config)#router ldp	Enter the Router LDP mode.
PE1(config-router)#router-id 10.10.10.1	Set the router ID for LDP to 10.10.10.1.
PE1(config-router)#transport-address ipv4 10.10.10.1	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
PE1(config-router)#targeted-peer ipv4 10.10.10.2	Configure targeted peer for LDP using IPv4 addresses.
PE1(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE1(config-router)#targeted-peer ipv4 10.10.10.3	Configure targeted peer for LDP using IPv4 addresses.
PE1(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.

PE1(config-router)#targeted-peer ipv4 10.10.10.4	Configure targeted peer for LDP using IPv4 addresses.
PE1(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE1(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE1(config)#commit	Commit the transaction.

PE1: Global EVPN MPLS Command

The configuration on PE1 for the Global EVPN MPLS, includes activating EVPN MPLS, defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multi-homing, and activating EVPN MPLS multi-homing functionality, all of which are crucial for enabling EVPN MPLS features.

PE1(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE1, enabling it to participate in EVPN MPLS services.
PE1(config)#commit	Commit candidate configuration to be running configuration.
PE1(config)#evpn mpls vtep-ip-global 10.10.10.1	Configure the global VTEP IP address 10.10.10.1, associating it with the loopback IP.
PE1(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multi-homing.
PE1(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multi-homing functionality, allowing PE1 to support multi-homed EVPN MPLS services.
PE1(config)#commit	Commit the transaction.

PE1: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE1 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE1(config)#interface xe1	Enter interface mode xe1.
PE1(config-if)#ip address 10.1.1.1/30	Configure an IP address, 10.1.1.1/30, on the interface xe1.
PE1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE1(config-if)#exit	Exit interface mode xe1.
PE1(config)#commit	Commit the transaction.
PE1(config)#interface xe2	Enter interface mode xe2.
PE1(config-if)#ip address 10.1.2.1/30	Configure an IP address, 10.1.2.1/30, on the interface xe2.
PE1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.

`PE1(config-if)#exit`	Exit interface mode `xe2`.
`PE1(config)#commit`	Commit the transaction.

PE1: OSPF Configuration

The below configuration is performed to set up OSPF on PE1, specifying the router ID, defining network interfaces, and configuring BFD parameters for efficient routing.

`PE1(config)#router ospf 100`	Enter the router OSPF mode. Configure PE1 to run OSPF with process ID 100.
`PE1(config-router)#ospf router-id 10.10.10.1`	Set the OSPF router ID to `10.10.10.1`, identifying PE1 within the OSPF network.
`PE1(config-router)#network 10.10.10.1/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`PE1(config-router)#network 10.1.1.1/30 area 0.0.0.0`	Advertise network address in OSPF.
`PE1(config-router)#network 10.1.2.1/30 area 0.0.0.0`	Advertise network address in OSPF.
`PE1(config-router)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval with an interval of `3`, a minimum receive interval of `3`, and a multiplier of `3`.
`PE1(config-router)#exit`	Exit router OSPF mode and return to configure mode.
`PE1(config)#commit`	Commit the transaction.

PE1: BGP Configuration

The below BGP configuration on PE1 is established to enable BGP routing with ASN 65010, set the BGP router ID, define iBGP neighbors, configure BFD, and enable the EVPN address family for efficient routing in an EVPN environment.

`PE1(config)#router bgp 65010`	Enter the Router BGP mode, ASN: 65010
`PE1(config-router)#bgp router-id 10.10.10.1`	Configure BGP router ID `10.10.10.1`, identifying PE1 within the BGP network.
`PE1(config-router)#neighbor 10.10.10.2 remote-as 65010`	Configure neighbor `10.10.10.2` as an iBGP neighbor with their remote AS number `65010`.
`PE1(config-router)#neighbor 10.10.10.2 update-source lo`	Configure neighbor `10.10.10.2` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE1(config-router)#neighbor 10.10.10.3 remote-as 65010`	Configure neighbor `10.10.10.3` as an iBGP neighbor with their remote AS number `65010`.
`PE1(config-router)#neighbor 10.10.10.3 update-source lo`	Configure neighbor `10.10.10.3` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE1(config-router)#neighbor 10.10.10.4 remote-as 65010`	Configure neighbor `10.10.10.4` as an iBGP neighbor with their remote AS number `65010`.
`PE1(config-router)#neighbor 10.10.10.4 update-source lo`	Configure neighbor `10.10.10.4` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE1(config-router)#neighbor 10.10.10.2 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.

`PE1(config-router)#neighbor 10.10.10.3 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE1(config-router)#neighbor 10.10.10.4 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE1(config-router)#neighbor 10.10.10.2 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE1(config-router)#neighbor 10.10.10.3 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE1(config-router)#neighbor 10.10.10.4 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE1(config-router)#address-family l2vpn evpn`	Enter into address family mode for L2VPN EVPN.
`PE1(config-router-af)#neighbor 10.10.10.2 activate`	Activate EVPN for iBGP neighbor `10.10.10.2` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE1(config-router-af)#neighbor 10.10.10.3 activate`	Activate EVPN for iBGP neighbor `10.10.10.3` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE1(config-router-af)#neighbor 10.10.10.4 activate`	Activate EVPN for iBGP neighbor `10.10.10.4` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE1(config-router-af)#exit`	Exit address family mode and return to the router BGP mode.
`PE1(config-router)#commit`	Commit the transaction.
`PE1(config-router)#exit`	Exit router BGP mode and return to the configure mode.

PE1: MAC VRF Configuration

The below MAC VRF configuration on PE1 is carried out to define and set up VRFs named `vrf2` and `vpls1001` with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

`PE1(config)#mac vrf vrf2`	Enter VRF mode named `vrf2`.
`PE1(config-vrf)#rd 10.10.10.1:1700`	Configure Route-Distinguisher value of `10.10.10.1:1700`.
`PE1(config-vrf)#route-target both 1700:1700`	Configure import and export values for the `vrf2` as `1700:1700`.
`PE1(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE1(config)#mac vrf vpls1001`	Enter VRF mode named `vpls1001`.
`PE1(config-vrf)#rd 10.10.10.1:1001`	Configure Route-Distinguisher value of `10.10.10.1:1001`.
`PE1(config-vrf)#route-target both 1001:1001`	Configure import and export values for the `vpls1001` as `1001:1001`.
`PE1(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE1(config)#commit`	Commit the transaction.

PE1: EVPN and VRF Mapping

The below EVPN and VRF mapping configuration on PE1 is performed to establish mappings between EVPN identifiers and VRFs, facilitating efficient routing and connectivity in an EVPN network environment.

PE1(config)#evpn mpls id 1800 xconnect target-mpls-id 1700	Configure the EVPN-VPWS identifier with a source identifier of 1800 and a target identifier of 1700.
PE1(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Map VRF vrf2 to the EVPN-VPWS identifier
PE1(config-evpn-mpls)#commit	Commit the transaction.
PE1(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
PE1(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier an identifier of 3000.
PE1(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Map VRF vpls1001 to the EVPN-VPWS identifier
PE1(config-evpn-mpls)#commit	Commit the transaction.
PE1(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE1: Access Port Configuration for Port-active

The below access port configuration for port-active mode on PE1 is carried out to configure various parameters including system-mac, load balancing, service carving preferences, and EVPN settings for efficient network access and connectivity.

PE1(config)#interface po1	Enter the port channel interface mode for po1
PE1(config-if)#load-interval 30	Set the load interval to 30.
PE1(config-if)#evpn multi-homed system-mac 0000.1111.7777 load-balancing port-active	Configure the system-mac address 0000.1111.7777 for port-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
PE1(config-if-es)#service-carving auto	Configure service carving as auto.
PE1(config-if-es)#exit	Exit the EVPN ES mode and return to the configure mode.
PE1(config-if)#exit	Exit interface mode po1 and return to the configure mode.
PE1(config)#commit	Commit the transaction.
PE1(config)#interface po1.1 switchport	Create a Layer 2 sub-interface po1.1 within the port channel.
PE1(config-if)#encapsulation dot1q 100	Set encapsulation to dot1q with VLAN ID 100.
PE1(config-if)#load-interval 30	Set the load interval to 30.
PE1(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE1(config-acc-if-evpn)#map vpn-id 1800	Map VPN-ID 1800.
PE1(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE1(config-if)#exit	Exit interface mode po1.1 and return to the configure mode.
PE1(config)#interface xe0	Enter the interface mode for xe0.
PE1(config-if)#speed 10g	Set the speed to 10g.
PE1(config-if)#channel-group 1 mode active	Attach LAG interface po1.
PE1(config-if)#exit	Exit interface mode xe0 and return to the configure mode.
PE1(config)#commit	Commit the transaction.

PE1: Access Port Configuration for Single-active

The below access port configuration for single-active mode on PE1 is implemented to set up various parameters, including Ethernet Segment Identifier (ESI) settings, service carving preferences, and EVPN configurations, ensuring efficient network access and connectivity.

`PE1(config)#interface sa1`	Enter the single active interface mode for `sa1`
`PE1(config-if)#load-interval 30`	Set the load interval to `30`.
`PE1(config-if)#evpn multi-homed esi 00:00:11:11:77:77 load-balancing single-active`	Configure the ESI with the value with the value `00:00:11:11:77:77` for single-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE1(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE1(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE1(config-if)#exit`	Exit interface mode `sa1` and return to the configure mode.
`PE1(config)#commit`	Commit the transaction.
`PE1(config)#interface sa1.1 switchport`	Create a Layer 2 sub-interface `sa1.1` within the port channel.
`PE1(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.
`PE1(config-if)#load-interval 30`	Set the load interval to `30`.
`PE1(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE1(config-acc-if-evpn)#map vpn-id 1800`	Map VPN-ID `1800`.
`PE1(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE1(config-if)#exit`	Exit interface mode `sa1.1` and return to the configure mode.
`PE1(config)#interface xe0`	Enter the interface mode for `xe0`.
`PE1(config-if)#speed 10g`	Set the speed to `10g`.
`PE1(config-if)#static-channel-group 1`	Attach the static-channel-group 1, the LAG interface `sa1` to `xe0`.
`PE1(config-if)#exit`	Exit interface mode `xe0` and return to the configure mode.
`PE1(config)#commit`	Commit the transaction.

PE2: Loopback Interface

The configuration on PE2 for a loopback interface with IP address `10.10.10.2/32` secondary is set up to provide IP connectivity for the router.

`PE2#configure terminal`	Enter configure mode.
`PE2(config)#interface lo`	Enter the interface mode for the loopback interface `lo`.
`PE2(config-if)#ip address 10.10.10.2/32 secondary`	Configure a secondary IP address, `10.10.10.2/32`, on the loopback interface.
`PE2(config-if)#exit`	Exit interface mode `lo`.
`PE2(config)#commit`	Commit the transaction.

PE2: Global LDP

The configuration on PE2 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

`PE2(config)#router ldp`	Enter the Router LDP mode.
`PE2(config-router)#router-id 10.10.10.2`	Set the router ID for LDP to `10.10.10.2`.
`PE2(config-router)#transport-address ipv4 10.10.10.2`	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
`PE2(config-router)#targeted-peer ipv4 10.10.10.1`	Configure targeted peer for LDP using IPv4 addresses.
`PE2(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit router targeted-peer-mode.
`PE2(config-router)#targeted-peer ipv4 10.10.10.3`	Configure targeted peer for LDP using IPv4 addresses.
`PE2(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit router targeted-peer-mode.
`PE2(config-router)#targeted-peer ipv4 10.10.10.4`	Configure targeted peer for LDP using IPv4 addresses.
`PE2(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit router targeted-peer-mode.
`PE2(config-router)#exit`	Exit router LDP mode and return to the configure mode.
`PE2(config)#commit`	Commit the transaction.

PE2: Global EVPN MPLS Command

The configuration on PE2 for the Global EVPN MPLS, includes activating EVPN MPLS, defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multi-homing, and activating EVPN MPLS multi-homing functionality, all of which are crucial for enabling EVPN MPLS features.

`PE2(config)#evpn mpls enable`	Activate the EVPN MPLS functionality on `PE2`, enabling it to participate in EVPN MPLS services.
`PE2(config)#commit`	Commit candidate configuration to be running configuration.
`PE2(config)#evpn mpls vtep-ip-global 10.10.10.2`	Configure the global VTEP IP address `10.10.10.2`, associating it with the loopback IP.
`PE2(config)#hardware-profile filter evpn-mpls-mh enable`	Enable hardware-profile filter for EVPN MPLS multi-homing.
`PE2(config)#evpn mpls multihoming enable`	Activate the EVPN MPLS multi-homing functionality, allowing `PE2` to support multi-homed EVPN MPLS services.
`PE2(config)#commit`	Commit the transaction.

PE2: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE2 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

`PE2(config)#interface xe4`	Enter interface mode `xe4`.
`PE2(config-if)#ip address 10.1.3.1/30`	Configure an IP address, `10.1.3.1/30`, on the interface `xe4`.
`PE2(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`PE2(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`PE2(config-if)#exit`	Exit interface mode `xe4`.
`PE2(config)#commit`	Commit the transaction.
`PE2(config)#interface xe5`	Enter interface mode `xe5`.
`PE2(config-if)#ip address 10.1.4.1/30`	Configure an IP address, `10.1.4.1/30`, on the interface `xe5`.
`PE2(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`PE2(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`PE2(config-if)#exit`	Exit interface mode `xe5`.
`PE2(config)#commit`	Commit the transaction.

PE2: OSPF Configuration

The below configuration is performed to set up OSPF on PE2, specifying the router ID, defining network interfaces, and configuring BFD parameters for efficient routing.

`PE2(config)#router ospf 100`	Enter the router OSPF mode. Configure PE2 to run OSPF with process ID 100.
`PE2(config-router)#ospf router-id 10.10.10.2`	Set the OSPF router ID to `10.10.10.2`, identifying PE2 within the OSPF network.
`PE2(config-router)#network 10.1.3.1/30 area 0.0.0.0`	Advertise loopback address in OSPF.
`PE2(config-router)#network 10.1.4.1/30 area 0.0.0.0`	Advertise network address in OSPF.
`PE2(config-router)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval with an interval of `3`, a minimum receive interval of `3`, and a multiplier of `3`.
`PE2(config-router)#exit`	Exit router OSPF mode and return to the configure mode.
`PE2(config)#commit`	Commit the transaction.

PE2: BGP Configuration

The below BGP configuration on PE2 is established to enable BGP routing with ASN 65010, set the BGP router ID, define iBGP neighbors, configure BFD, and enable the EVPN address family for efficient routing in an EVPN environment.

`PE2(config)#router bgp 65010`	Enter the Router BGP mode, ASN: 65010
`PE2(config-router)#bgp router-id 10.10.10.2`	Configure BGP router ID `10.10.10.2`, identifying PE2 within the BGP network.

`PE2(config-router)#neighbor 10.10.10.1 remote-as 65010`	Configure neighbor `10.10.10.1` as an iBGP neighbor with their remote AS number `65010`.
`PE2(config-router)#neighbor 10.10.10.1 update-source lo`	Configure neighbor `10.10.10.1` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE2(config-router)#neighbor 10.10.10.3 remote-as 65010`	Configure neighbor `10.10.10.3` as an iBGP neighbor with their remote AS number `65010`.
`PE2(config-router)#neighbor 10.10.10.3 update-source lo`	Configure neighbor `10.10.10.3` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE2(config-router)#neighbor 10.10.10.4 remote-as 65010`	Configure neighbor `10.10.10.4` as an iBGP neighbor with their remote AS number `65010`.
`PE2(config-router)#neighbor 10.10.10.4 update-source lo`	Configure neighbor `10.10.10.4` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE2(config-router)#neighbor 10.10.10.1 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE2(config-router)#neighbor 10.10.10.3 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE2(config-router)#neighbor 10.10.10.4 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE2(config-router)#neighbor 10.10.10.1 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE2(config-router)#neighbor 10.10.10.3 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE2(config-router)#neighbor 10.10.10.4 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE2(config-router)#address-family l2vpn evpn`	Enter into address family mode for L2VPN EVPN.
`PE2(config-router-af)#neighbor 10.10.10.1 activate`	Activate EVPN for iBGP neighbor `10.10.10.1` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE2(config-router-af)#neighbor 10.10.10.3 activate`	Activate EVPN for iBGP neighbor `10.10.10.3` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE2(config-router-af)#neighbor 10.10.10.4 activate`	Activate EVPN for iBGP neighbor `10.10.10.4` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE2(config-router-af)#exit`	Exit address family mode and return to the router BGP mode.
`PE2(config-router)#commit`	Commit the transaction.
`PE2(config-router)#exit`	Exit router BGP mode and return to the configure mode.

PE2: MAC VRF Configuration

The below MAC VRF configuration on PE2 is carried out to define and set up VRFs named `vrf2` and `vpls1001` with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

`PE2(config)#mac vrf vrf2`	Enter VRF mode named `vrf2`.
`PE2(config-vrf)#rd 10.10.10.2:1700`	Configure Route-Distinguisher value of `10.10.10.2:1700`.
`PE2(config-vrf)#route-target both 1700:1700`	Configure import and export values for the `vrf2` as `1700:1700`.
`PE2(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE2(config)#mac vrf vpls1001`	Enter VRF mode named `vpls1001`.
`PE2(config-vrf)#rd 10.10.10.2:1001`	Configure Route-Distinguisher value of `10.10.10.2:1001`.
`PE2(config-vrf)#route-target both 1001:1001`	Configure import and export values for the `vpls1001` as `1001:1001`.
`PE2(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE2(config)#commit`	Commit the transaction.

PE2: EVPN and VRF Mapping

The below EVPN and VRF mapping configuration on PE2 is performed to establish mappings between EVPN identifiers and VRFs, facilitating efficient routing and connectivity in an EVPN network environment.

`PE2(config)#evpn mpls id 1800 xconnect target-mpls-id 1700`	Configure the EVPN-VPWS identifier with a source identifier of `1800` and a target identifier of `1700`.
`PE2(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Map VRF `vrf2` to the EVPN-VPWS identifier
`PE2(config-evpn-mpls)#commit`	Commit the transaction.
`PE2(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.
`PE2(config)#evpn mpls id 3000`	Configure the EVPN-VPLS identifier an identifier of `3000`.
`PE2(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001`	Map VRF `vpls1001` to the EVPN-VPWS identifier
`PE2(config-evpn-mpls)#commit`	Commit the transaction.
`PE2(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.

PE2: Access Port Configuration for Port-active

The below access port configuration for port-active mode on PE2 is carried out to configure various parameters including system-mac, load balancing, service carving preferences, and EVPN settings for efficient network access and connectivity.

`PE2(config)#interface po1`	Enter the port channel interface mode for `po1`
`PE2(config-if)#load-interval 30`	Set the load interval to `30`.
`PE2(config-if)#evpn multi-homed system-mac 0000.1111.7777 load-balancing port-active`	Configure the system-mac address `0000.1111.7777` for port-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE2(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE2(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE2(config-if)#exit`	Exit interface mode `po1` and return to the configure mode.

PE2(config)#commit	Commit the transaction.
PE2(config)#interface po1.1 switchport	Create a Layer 2 sub-interface po1.1 within the port channel.
PE2(config-if)#encapsulation dot1q 100	Set encapsulation to dot1q with VLAN ID 100.
PE2(config-if)#load-interval 30	Set the load interval to 30.
PE2(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE2(config-acc-if-evpn)#map vpn-id 1800	Map VPN-ID 1800.
PE2(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE2(config-if)#exit	Exit interface mode po1.1 and return to the configure mode.
PE2(config)#interface xe08	Enter the interface mode for xe8.
PE2(config-if)#speed 10g	Set the speed to 10g.
PE2(config-if)#channel-group 1 mode active	Attach LAG interface po1.
PE2(config-if)#exit	Exit interface mode xe8 and return to the configure mode.
PE2(config)#commit	Commit the transaction.

PE2: Access Port Configuration for Single-active

The below access port configuration for single-active mode on PE2 is implemented to set up various parameters, including Ethernet Segment Identifier (ESI) settings, service carving preferences, and EVPN configurations, ensuring efficient network access and connectivity.

PE2(config)#interface sa2	Enter the single active interface mode for sa2.
PE2(config-if)#load-interval 30	Set the load interval to 30.
PE2(config-if)#evpn multi-homed esi 00:00:11:11:77:77 load-balancing single-active	Configure the ESI with the value 00:00:11:11:77:77 for single-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
PE2(config-if-es)#service-carving auto	Configure service carving as auto, allowing automatic determination of service distribution preferences.
PE2(config-if-es)#exit	Exit the EVPN ES mode and return to the configure mode.
PE2(config-if)#exit	Exit interface mode sa2 and return to the configure mode.
PE2(config)#commit	Commit the transaction.
PE2(config)#interface sa2.1 switchport	Create a Layer 2 sub-interface sa2.1 within the port channel.
PE2(config-if)#encapsulation dot1q 100	Set encapsulation to dot1q with VLAN ID 100.
PE2(config-if)#load-interval 30	Set the load interval to 30.
PE2(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE2(config-acc-if-evpn)#map vpn-id 1800	Map VPN-ID 1800.
PE2(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE2(config-if)#exit	Exit interface mode sa2.1 and return to the configure mode.
PE2(config)#interface xe8	Enter the interface mode for xe8.
PE2(config-if)#speed 10g	Set the speed to 10g.
PE2(config-if)#static-channel-group 2	Attach the static-channel-group 2, the LAG interface sa2 to xe8.

PE2(config-if)#exit	Exit interface mode xe8 and return to the configure mode.
PE2(config)#commit	Commit the transaction.

P1: Loopback Interface

The configuration on P1 for a loopback interface with IP address 10.10.10.5/32 secondary is set up to provide IP connectivity for the router.

P1#configure terminal	Enter configure mode.
P1(config)#interface lo	Enter the interface mode for the loopback interface lo.
P1(config-if)#ip address 10.10.10.5/32 secondary	Configure a secondary IP address, 10.10.10.5/32, on the loopback interface.
P1(config-if)#exit	Exit interface mode lo.
P1(config)#commit	Commit the transaction.

P1: Global LDP

The configuration on P1 for the Global LDP router, specifying router ID and targeted peer, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

P1(config)#router ldp	Enter the Router LDP mode.
P1(config-router)#router-id 10.10.10.5	Set the router ID for LDP to 10.10.10.5.
P1(config-router)#transport-address ipv4 10.10.10.5	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
P1(config-router)#exit	Exit router LDP mode and return to the configure mode.
P1(config)#commit	Commit the transaction.

P1: Interface Configuration

The below configuration is performed to set up interfaces on P1 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

P1(config)#interface xe1	Enter interface mode xe1.
P1(config-if)#ip address 10.1.1.2/30	Configure an IP address, 10.1.1.2/30, on the interface xe1.
P1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
P1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
P1(config-if)#exit	Exit interface mode xe1.
P1(config)#commit	Commit the transaction.
P1(config)#interface xe2	Enter interface mode xe2.
P1(config-if)#ip address 10.1.4.2/30	Configure an IP address, 10.1.4.2/30, on the interface xe2.

P1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
P1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
P1(config-if)#exit	Exit interface mode xe2.
P1(config)#commit	Commit the transaction.
P1(config)#interface xe3	Enter interface mode xe3.
P1(config-if)#ip address 10.1.5.2/30	Configure an IP address, 10.1.5.2/30, on the interface xe3.
P1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
P1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
P1(config-if)#exit	Exit interface mode xe3.
P1(config)#commit	Commit the transaction.
P1(config)#interface xe4	Enter interface mode xe4.
P1(config-if)#ip address 10.1.6.2/30	Configure an IP address, 10.1.6.2/30, on the interface xe4.
P1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
P1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
P1(config-if)#exit	Exit interface mode xe4.
P1(config)#commit	Commit the transaction.

P1: OSPF Configuration

The below configuration is performed to set up OSPF on P1, specifying the router ID, and defining network interfaces for efficient routing.

P1(config)#router ospf 100	Enter the router OSPF mode. Configure P1 to run OSPF with process ID 100.
P1(config-router)#ospf router-id 10.10.10.5	Set the OSPF router ID to 10.10.10.5, identifying P1 within the OSPF network.
P1(config-router)#network 10.10.10.5/32 area 0.0.0.0	Advertise loopback address in OSPF.
P1(config-router)#network 10.1.1.2/30 area 0.0.0.0	Advertise network address in OSPF.
P1(config-router)#network 10.1.4.2/30 area 0.0.0.0	Advertise network address in OSPF.
P1(config-router)#network 10.1.5.2/30 area 0.0.0.0	Advertise network address in OSPF.
P1(config-router)#network 10.1.6.2/30 area 0.0.0.0	Advertise network address in OSPF.

© 2025 IP Infusion Inc. Proprietary

P1(config-router)#exit	Exit router OSPF mode and return to the configure mode.
P1(config)#commit	Commit the transaction.

P2: Loopback Interface

The configuration on P2 for a loopback interface with IP address `10.10.10.6/32` secondary is set up to provide IP connectivity for the router.

P2#configure terminal	Enter configure mode.
P2(config)#interface lo	Enter the interface mode for the loopback interface `lo`.
P2(config-if)#ip address 10.10.10.6/32 secondary	Configure a secondary IP address, `10.10.10.6/32`, on the loopback interface.
P2(config-if)#exit	Exit interface mode `lo`.
P2(config)#commit	Commit the transaction.

P2: Global LDP

The configuration on P2 for the Global LDP router, specifying router ID and targeted peer, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

P2(config)#router ldp	Enter the Router LDP mode.
P2(config-router)#router-id 10.10.10.6	Set the router ID for LDP to `10.10.10.6`.
P2(config-router)#transport-address ipv4 10.10.10.6	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
P2(config-router)#exit	Exit router LDP mode and return to the configure mode.
P2(config)#commit	Commit the transaction.

P2: Interface Configuration

The below configuration is performed to set up interfaces on P2 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

P2(config)#interface xe12	Enter interface mode `xe12`.
P2(config-if)#ip address 10.1.2.2/30	Configure an IP address, `10.1.2.2/30`, on the interface `xe12`.
P2(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
P2(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
P2(config-if)#exit	Exit interface mode `xe12`.
P2(config)#commit	Commit the transaction.
P2(config)#interface xe13	Enter interface mode `xe13`.
P2(config-if)#ip address 10.1.3.2/30	Configure an IP address, `10.1.3.2/30`, on the interface `xe13`.

P2(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
P2(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
P2(config-if)#exit	Exit interface mode xe13.
P2(config)#commit	Commit the transaction.
P2(config)#interface xe11	Enter interface mode xe11.
P2(config-if)#ip address 10.1.7.2/30	Configure an IP address, 10.1.7.2/30, on the interface xe11.
P2(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
P2(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
P2(config-if)#exit	Exit interface mode xe11.
P2(config)#commit	Commit the transaction.
P2(config)#interface xe14	Enter interface mode xe14.
P2(config-if)#ip address 10.1.8.2/30	Configure an IP address, 10.1.8.2/30, on the interface xe14.
P2(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
P2(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
P2(config-if)#exit	Exit interface mode xe14.
P2(config)#commit	Commit the transaction.

P2: OSPF Configuration

The below configuration is performed to set up OSPF on P2, specifying the router ID, and defining network interfaces for efficient routing.

P2(config)#router ospf 100	Enter the router OSPF mode. Configure P2 to run OSPF with process ID 100.
P2(config-router)#ospf router-id 10.10.10.6	Set the OSPF router ID to 10.10.10.6, identifying P2 within the OSPF network.
P2(config-router)#network 10.10.10.6/32 area 0.0.0.0	Advertise loopback address in OSPF.
P2(config-router)#network 10.1.2.2/30 area 0.0.0.0	Advertise network address in OSPF.
P2(config-router)#network 10.1.3.2/30 area 0.0.0.0	Advertise network address in OSPF.
P2(config-router)#network 10.1.7.2/30 area 0.0.0.0	Advertise network address in OSPF.
P2(config-router)#network 10.1.8.2/30 area 0.0.0.0	Advertise network address in OSPF.

P2(config-router)#exit	Exit router OSPF mode and return to the configure mode.
P2(config)#commit	Commit the transaction.

PE3: Loopback Interface

The configuration on PE3 for a loopback interface with IP address `10.10.10.3/32` secondary is set up to provide IP connectivity for the router.

PE3#configure terminal	Enter configure mode.
PE3(config)#interface lo	Enter the interface mode for the loopback interface `lo`.
PE3(config-if)#ip address 10.10.10.3/32 secondary	Configure a secondary IP address, `10.10.10.3/32`, on the loopback interface.
PE3(config-if)#exit	Exit interface mode `lo`.
PE3(config)#commit	Commit the transaction.

PE3: Global LDP

The configuration on PE3 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

PE3(config)#router ldp	Enter the Router LDP mode.
PE3(config-router)#router-id 10.10.10.3	Set the router ID for LDP to `10.10.10.3`.
PE2(config-router)#transport-address ipv4 10.10.10.3	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
PE3(config-router)#targeted-peer ipv4 10.10.10.1	Configure targeted peer for LDP using IPv4 addresses.
PE3(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE3(config-router)#targeted-peer ipv4 10.10.10.2	Configure targeted peer for LDP using IPv4 addresses.
PE3(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE3(config-router)#targeted-peer ipv4 10.10.10.4	Configure targeted peer for LDP using IPv4 addresses.
PE3(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE3(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: Global EVPN MPLS Command

The configuration on PE3 for the Global EVPN MPLS, includes activating EVPN MPLS, defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multi-homing, and activating EVPN MPLS multi-homing functionality, all of which are crucial for enabling EVPN MPLS features.

PE3(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE3, enabling it to participate in EVPN MPLS services.
PE3(config)#commit	Commit candidate configuration to be running configuration.
PE3(config)#evpn mpls vtep-ip-global 10.10.10.3	Configure the global VTEP IP address 10.10.10.3, associating it with the loopback IP.
PE3(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multi-homing.
PE3(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multi-homing functionality, allowing PE3 to support multi-homed EVPN MPLS services.
PE3(config)#commit	Commit the transaction.

PE3: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE3 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE3(config)#interface xe1	Enter interface mode xe1.
PE3(config-if)#ip address 10.1.6.1/30	Configure an IP address, 10.1.6.1/30, on the interface xe1.
PE3(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE3(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE3(config-if)#exit	Exit interface mode xe1.
PE3(config)#commit	Commit the transaction.
PE3(config)#interface xe5	Enter interface mode xe5.
PE3(config-if)#ip address 10.1.7.1/30	Configure an IP address, 10.1.7.1/30, on the interface xe5.
PE3(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE3(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE3(config-if)#exit	Exit interface mode xe5.
PE3(config)#commit	Commit the transaction.

PE3: OSPF Configuration

The below configuration is performed to set up OSPF on PE3, specifying the router ID, defining network interfaces, and configuring BFD parameters for efficient routing.

PE3(config)#router ospf 100	Enter the router OSPF mode. Configure PE3 to run OSPF with process ID 100.
PE3(config-router)#ospf router-id 10.10.10.3	Set the OSPF router ID to 10.10.10.3, identifying PE3 within the OSPF network.
PE3(config-router)#network 10.10.10.3/32 area 0.0.0.0	Advertise loopback address in OSPF.

PE3(config-router)#network 10.1.6.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
PE3(config-router)#network 10.1.7.1/30 area 0.0.0.0	Advertise network address in OSPF.
PE3(config-router)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval with an interval of 3, a minimum receive interval of 3, and a multiplier of 3.
PE3(config-router)#exit	Exit router OSPF mode and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: BGP Configuration

The below BGP configuration on PE3 is established to enable BGP routing with ASN 65010, set the BGP router ID, define iBGP neighbors, configure BFD, and enable the EVPN address family for efficient routing in an EVPN environment.

PE3(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
PE3(config-router)#bgp router-id 10.10.10.3	Configure BGP router ID 10.10.10.2, identifying PE3 within the BGP network.
PE3(config-router)#neighbor 10.10.10.1 remote-as 65010	Configure neighbor 10.10.10.1 as an iBGP neighbor with their remote AS number 65010.
PE3(config-router)#neighbor 10.10.10.1 update-source lo	Configure neighbor 10.10.10.1 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE3(config-router)#neighbor 10.10.10.2 remote-as 65010	Configure neighbor 10.10.10.2 as an iBGP neighbor with their remote AS number 65010.
PE3(config-router)#neighbor 10.10.10.2 update-source lo	Configure neighbor 10.10.10.2 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE3(config-router)#neighbor 10.10.10.4 remote-as 65010	Configure neighbor 10.10.10.4 as an iBGP neighbor with their remote AS number 65010.
PE3(config-router)#neighbor 10.10.10.4 update-source lo	Configure neighbor 10.10.10.4 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE3(config-router)#neighbor 10.10.10.1 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE3(config-router)#neighbor 10.10.10.2 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE3(config-router)#neighbor 10.10.10.4 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE3(config-router)#neighbor 10.10.10.1 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE3(config-router)#neighbor 10.10.10.2 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE3(config-router)#neighbor 10.10.10.4 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE3(config-router)#address-family l2vpn evpn	Enter into address family mode for L2VPN EVPN.
PE3(config-router-af)#neighbor 10.10.10.1 activate	Activate EVPN for iBGP neighbor 10.10.10.1 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.

PE3(config-router-af)#neighbor 10.10.10.2 activate	Activate EVPN for iBGP neighbor 10.10.10.2 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE3(config-router-af)#neighbor 10.10.10.4 activate	Activate EVPN for iBGP neighbor 10.10.10.4 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE3(config-router-af)#exit	Exit address family mode and return to the router BGP mode.
PE3(config-router)#commit	Commit the transaction.
PE3(config-router)#exit	Exit router BGP mode and return to the configure mode.

PE3: MAC VRF Configuration

The below MAC VRF configuration on PE3 is carried out to define and set up VRFs named vrf2 and vpls1001 with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

PE3(config)#mac vrf vrf2	Enter VRF mode named vrf2.
PE3(config-vrf)#rd 10.10.10.3:1700	Configure Route-Distinguisher value of 10.10.10.3:1700.
PE3(config-vrf)#route-target both 1700:1700	Configure import and export values for the vrf2 as 1700:1700.
PE3(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE3(config)#mac vrf vpls1001	Enter VRF mode named vpls1001.
PE3(config-vrf)#rd 10.10.10.3:1001	Configure Route-Distinguisher value of 10.10.10.3:1001.
PE3(config-vrf)#route-target both 1001:1001	Configure import and export values for the vpls1001 as 1001:1001.
PE3(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: EVPN and VRF Mapping

The below EVPN and VRF mapping configuration on PE3 is performed to establish mappings between EVPN identifiers and VRFs, facilitating efficient routing and connectivity in an EVPN network environment.

PE3(config)#evpn mpls id 1700 xconnect target-mpls-id 1800	Configure the EVPN-VPWS identifier with a source identifier of 1700 and a target identifier of 1800.
PE3(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Map VRF vrf2 to the EVPN-VPWS identifier
PE3(config-evpn-mpls)#commit	Commit the transaction.
PE3(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
PE3(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier an identifier of 3000.
PE3(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Map VRF vpls1001 to the EVPN-VPWS identifier
PE3(config-evpn-mpls)#commit	Commit the transaction.
PE3(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE3: Access Port Configuration for Port-active

The below access port configuration for port-active mode on PE3 is carried out to configure various parameters including system-MAC, load balancing, service carving preferences, and EVPN settings for efficient network access and connectivity.

`PE3(config)#interface po1`	Enter the port channel interface mode for `po1`
`PE3(config-if)#load-interval 30`	Set the load interval to `30`.
`PE3(config-if)#evpn multi-homed system-mac 0000.2222.7777 load-balancing port-active`	Configure the system-mac address `0000.2222.7777` for port-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE3(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE3(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE3(config-if)#exit`	Exit interface mode `po1` and return to the configure mode.
`PE3(config)#commit`	Commit the transaction.
`PE3(config)#interface po1.1 switchport`	Create a Layer 2 sub-interface `po1.1` within the port channel.
`PE3(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.
`PE3(config-if)#load-interval 30`	Set the load interval to `30`.
`PE3(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE3(config-acc-if-evpn)#map vpn-id 1800`	Map VPN-ID `1800`.
`PE3(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE3(config-if)#exit`	Exit interface mode `po1.1` and return to the configure mode.
`PE3(config)#interface xe2`	Enter the interface mode for `xe2`.
`PE3(config-if)#speed 10g`	Set the speed to `10g`.
`PE3(config-if)#channel-group 1 mode active`	Attach LAG interface `po1`.
`PE3(config-if)#exit`	Exit interface mode `xe2` and return to the configure mode.
`PE3(config)#commit`	Commit the transaction.

PE3: Access Port Configuration for Single-active

The below access port configuration for single-active mode on PE3 is implemented to set up various parameters, including Ethernet Segment Identifier (ESI) settings, service carving preferences, and EVPN configurations, ensuring efficient network access and connectivity.

`PE3(config)#interface sa1`	Enter the single active interface mode for `sa1`.
`PE3(config-if)#load-interval 30`	Set the load interval to `30`.
`PE3(config-if)#evpn multi-homed esi 00:00:22:22:77:77 load-balancing single-active`	Configure the ESI with the value with the value `00:00:22:22:77:77` for single-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE3(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE3(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE3(config-if)#exit`	Exit interface mode `sa1` and return to the configure mode.

PE3(config)#commit	Commit the transaction.
PE3(config)#interface sa1.1 switchport	Create a Layer 2 sub-interface sa1.1 within the port channel.
PE3(config-if)#encapsulation dot1q 100	Set encapsulation to dot1q with VLAN ID 100.
PE3(config-if)#load-interval 30	Set the load interval to 30.
PE3(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE3(config-acc-if-evpn)#map vpn-id 1800	Map VPN-ID 1800.
PE3(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE3(config-if)#exit	Exit interface mode sa1.1 and return to the configure mode.
PE3(config)#interface xe2	Enter the interface mode for xe2.
PE3(config-if)#speed 10g	Set the speed to 10g.
PE3(config-if)#static-channel-group 1	Attach the static-channel-group 1, the LAG interface sa1 to xe2.
PE3(config-if)#exit	Exit interface mode xe2 and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE4: Loopback Interface

The configuration on PE4 for a loopback interface with IP address 10.10.10.4/32 secondary is set up to provide IP connectivity for the router.

PE4#configure terminal	Enter configure mode.
PE4(config)#interface lo	Enter the interface mode for the loopback interface lo.
PE4(config-if)#ip address 10.10.10.4/32 secondary	Configure a secondary IP address, 10.10.10.4/32, on the loopback interface.
PE4(config-if)#exit	Exit interface mode lo.
PE4(config)#commit	Commit the transaction.

PE4: Global LDP

The configuration on PE4 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

PE4(config)#router ldp	Enter the Router LDP mode.
PE4(config-router)#router-id 10.10.10.4	Set the router ID for LDP to 10.10.10.4.
PE4(config-router)#transport-address ipv4 10.10.10.4	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
PE4(config-router)#targeted-peer ipv4 10.10.10.1	Configure targeted peer for LDP using IPv4 addresses.
PE4(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE4(config-router)#targeted-peer ipv4 10.10.10.2	Configure targeted peer for LDP using IPv4 addresses.

PE4(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE4(config-router)#targeted-peer ipv4 10.10.10.3	Configure targeted peer for LDP using IPv4 addresses.
PE4(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE4(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE4(config)#commit	Commit the transaction.

PE4: Global EVPN MPLS Command

The configuration on PE4 for the Global EVPN MPLS, includes activating EVPN MPLS, defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multi-homing, and activating EVPN MPLS multi-homing functionality, all of which are crucial for enabling EVPN MPLS features.

PE4(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE4, enabling it to participate in EVPN MPLS services.
PE4(config)#commit	Commit candidate configuration to be running configuration.
PE4(config)#evpn mpls vtep-ip-global 10.10.10.4	Configure the global VTEP IP address 10.10.10.4, associating it with the loopback IP.
PE4(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multi-homing.
PE4(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multi-homing functionality, allowing PE4 to support multi-homed EVPN MPLS services.
PE4(config)#commit	Commit the transaction.

PE4: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE4 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE4(config)#interface xe2	Enter interface mode xe2.
PE4(config-if)#ip address 10.1.5.1/30	Configure an IP address, 10.1.5.1/30, on the interface xe2.
PE4(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE4(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE4(config-if)#exit	Exit interface mode xe2.
PE4(config)#commit	Commit the transaction.
PE4(config)#interface xe0	Enter interface mode xe0.
PE4(config-if)#ip address 10.1.8.1/30	Configure an IP address, 10.1.8.1/30, on the interface xe0.
PE4(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE4(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.

PE4(config-if)#exit	Exit interface mode xe0.
PE4(config)#commit	Commit the transaction.

PE4: OSPF Configuration

The below configuration is performed to set up OSPF on PE4, specifying the router ID, defining network interfaces, and configuring BFD parameters for efficient routing.

PE4(config)#router ospf 100	Enter the router OSPF mode. Configure PE4 to run OSPF with process ID 100.
PE4(config-router)#ospf router-id 10.10.10.4	Set the OSPF router ID to 10.10.10.4, identifying PE3 within the OSPF network.
PE4(config-router)#network 10.10.10.4/32 area 0.0.0.0	Advertise loopback address in OSPF.
PE4(config-router)#network 10.1.5.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
PE4(config-router)#network 10.1.8.1/30 area 0.0.0.0	Advertise network address in OSPF.
PE4(config-router)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval with an interval of 3, a minimum receive interval of 3, and a multiplier of 3.
PE4(config-router)#exit	Exit router OSPF mode and return to the configure mode.
PE4(config)#commit	Commit the transaction.

PE4: BGP Configuration

The below BGP configuration on PE4 is established to enable BGP routing with ASN 65010, set the BGP router ID, define iBGP neighbors, configure BFD, and enable the EVPN address family for efficient routing in an EVPN environment.

PE4(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
PE4(config-router)#bgp router-id 10.10.10.4	Configure BGP router ID 10.10.10.4, identifying PE4 within the BGP network.
PE4(config-router)#neighbor 10.10.10.1 remote-as 65010	Configure neighbor 10.10.10.1 as an iBGP neighbor with their remote AS number 65010.
PE4(config-router)#neighbor 10.10.10.1 update-source lo	Configure neighbor 10.10.10.1 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE4(config-router)#neighbor 10.10.10.2 remote-as 65010	Configure neighbor 10.10.10.2 as an iBGP neighbor with their remote AS number 65010.
PE4(config-router)#neighbor 10.10.10.2 update-source lo	Configure neighbor 10.10.10.2 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE4(config-router)#neighbor 10.10.10.3 remote-as 65010	Configure neighbor 10.10.10.3 as an iBGP neighbor with their remote AS number 65010.
PE4(config-router)#neighbor 10.10.10.3 update-source lo	Configure neighbor 10.10.10.3 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE4(config-router)#neighbor 10.10.10.1 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.

`PE4(config-router)#neighbor 10.10.10.2 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE4(config-router)#neighbor 10.10.10.3 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE4(config-router)#neighbor 10.10.10.1 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE4(config-router)#neighbor 10.10.10.2 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE4(config-router)#neighbor 10.10.10.3 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE4(config-router)#address-family l2vpn evpn`	Enter into address family mode for L2VPN EVPN.
`PE4(config-router-af)#neighbor 10.10.10.1 activate`	Activate EVPN for iBGP neighbor `10.10.10.1` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE4(config-router-af)#neighbor 10.10.10.2 activate`	Activate EVPN for iBGP neighbor `10.10.10.2` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE4(config-router-af)#neighbor 10.10.10.3 activate`	Activate EVPN for iBGP neighbor `10.10.10.3` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE4(config-router-af)#exit`	Exit address family mode and return to the router BGP mode.
`PE4(config-router)#commit`	Commit the transaction.
`PE4(config-router)#exit`	Exit router BGP mode and return to the configure mode.

PE4: MAC VRF Configuration

The below MAC VRF configuration on PE4 is carried out to define and set up VRFs named `vrf2` and `vpls1001` with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

`PE4(config)#mac vrf vrf2`	Enter VRF mode named `vrf2`.
`PE4(config-vrf)#rd 10.10.10.4:1700`	Configure Route-Distinguisher value of `10.10.10.4:1700.`
`PE4(config-vrf)#route-target both 1700:1700`	Configure import and export values for the `vrf2` as `1700:1700.`
`PE4(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE4(config)#mac vrf vpls1001`	Enter VRF mode named `vpls1001`.
`PE4(config-vrf)#rd 10.10.10.4:1001`	Configure Route-Distinguisher value of `10.10.10.4:1001.`
`PE4(config-vrf)#route-target both 1001:1001`	Configure import and export values for the `vpls1001` as `1001:1001.`
`PE4(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE4(config)#commit`	Commit the transaction.

PE4: EVPN and VRF Mapping

The below EVPN and VRF mapping configuration on PE4 is performed to establish mappings between EVPN identifiers and VRFs, facilitating efficient routing and connectivity in an EVPN network environment.

`PE4(config)#evpn mpls id 1700 xconnect target-mpls-id 1800`	Configure the EVPN-VPWS identifier with a source identifier of `1700` and a target identifier of `1800`.
`PE4(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Map VRF `vrf2` to the EVPN-VPWS identifier
`PE4(config-evpn-mpls)#commit`	Commit the transaction.
`PE4(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.
`PE4(config)#evpn mpls id 3000`	Configure the EVPN-VPLS identifier an identifier of `3000`.
`PE4(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001`	Map VRF `vpls1001` to the EVPN-VPWS identifier
`PE4(config-evpn-mpls)#commit`	Commit the transaction.
`PE4(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.

PE4: Access Port Configuration for Port-active

The below access port configuration for port-active mode on PE4 is carried out to configure various parameters including system-MAC, load balancing, service carving preferences, and EVPN settings for efficient network access and connectivity.

`PE4(config)#interface po1`	Enter the port channel interface mode for `po1`
`PE4(config-if)#load-interval 30`	Set the load interval to `30`.
`PE4(config-if)#evpn multi-homed system-mac 0000.2222.7777 load-balancing port-active`	Configure the system-mac address `0000.2222.7777` for port-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE4(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE4(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE4(config-if)#exit`	Exit interface mode `po1` and return to the configure mode.
`PE4(config)#commit`	Commit the transaction.
`PE4(config)#interface po1.1 switchport`	Create a Layer 2 sub-interface `po1.1` within the port channel.
`PE4(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.
`PE4(config-if)#load-interval 30`	Set the load interval to `30`.
`PE4(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE4(config-acc-if-evpn)#map vpn-id 1800`	Map VPN-ID `1800`.
`PE4(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE4(config-if)#exit`	Exit interface mode `po1.1` and return to the configure mode.
`PE4(config)#interface xe11`	Enter the interface mode for `xe11.`
`PE4(config-if)#speed 10g`	Set the speed to `10g`.
`PE4(config-if)#channel-group 1 mode active`	Attach LAG interface `po1.`
`PE4(config-if)#exit`	Exit interface mode `xe11` and return to the configure mode.
`PE4(config)#commit`	Commit the transaction.

PE4: Access Port Configuration for Single-active

The below access port configuration for single-active mode on PE4 is implemented to set up various parameters, including Ethernet Segment Identifier (ESI) settings, service carving preferences, and EVPN configurations, ensuring efficient network access and connectivity.

`PE4(config)#interface sa2`	Enter the single active interface mode for `sa2`.
`PE4(config-if)#load-interval 30`	Set the load interval to `30`.
`PE4(config-if)#evpn multi-homed esi 00:00:22:22:77:77 load-balancing single-active`	Configure the ESI with the value with the value `00:00:22:22:77:77` for single-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE4(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE4(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE4(config-if)#exit`	Exit interface mode `sa2` and return to the configure mode.
`PE4(config)#commit`	Commit the transaction.
`PE4(config)#interface sa2.1 switchport`	Create a Layer 2 sub-interface `sa2.1` within the port channel.
`PE4(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.
`PE4(config-if)#load-interval 30`	Set the load interval to `30`.
`PE4(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE4(config-acc-if-evpn)#map vpn-id 1800`	Map VPN-ID `1800`.
`PE4(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE4(config-if)#exit`	Exit interface mode `sa2.1` and return to the configure mode.
`PE4(config)#interface xe11`	Enter the interface mode for `xe11`.
`PE4(config-if)#speed 10g`	Set the speed to `10g`.
`PE4(config-if)#static-channel-group 2`	Attach the static-channel-group 2, the LAG interface `sa2` to `xe11`.
`PE4(config-if)#exit`	Exit interface mode `xe11` and return to the configure mode.
`PE4(config)#commit`	Commit the transaction.

CE2

The following configuration steps under CE2 are set up to enable VLANs and configure interfaces for carrying VLAN traffic.

`CE2#configure terminal`	Enter configure mode.
`CE2(config)#bridge 1 protocol ieee vlan-bridge`	Set up `bridge 1` to use the IEEE VLAN bridge protocol.
`CE2(config)#vlan 2-100 bridge 1 state enable`	Configure VLANs from `2-100` and associate them with bridge 1.
`CE2(config)#interface xe24`	Enter interface mode `xe24`.
`CE2(config-if)#switchport`	Configure the interface `xe24` as a Layer 2 switch port.
`CE2(config-if)#bridge-group 1`	Associate `xe24` to bridge 1.
`CE2(config-if)#switchport mode trunk`	Configure `xe24` as a trunk port.

CE2(config-if)#switchport trunk allowed vlan all	Allow all configured VLANs on the trunk interface xe24.
CE2(config-if)#exit	Exit interface mode xe24.
CE2(config)#interface po1	Enter interface mode and configure LAG interface port-channel 1 (po1).
CE2(config-if)#switchport	Configures port-channel 1 as a Layer 2 switch port.
CE2(config-if)#bridge-group 1	Associate po1 to bridge 1.
CE2(config-if)#switchport mode trunk	Configure po1 as a trunk port.
CE2(config-if)#switchport trunk allowed vlan all	Allow all configured VLANs on the trunk port-channel po1.
CE2(config-if)#exit	Exit interface mode po1.
CE2(config)#interface xe22	Enter interface mode xe22.
CE2(config-if)#lacp timeout short	Configure LACP timeout as short.
CE2(config-if)#channel-group 1 mode active	Add member to the LAG interface.
CE2(config-if)#exit	Exit interface mode xe22.
CE2(config-if)#interface xe23	Enter interface mode xe23.
CE2(config-if)#lacp timeout short	Configure LACP timeout as short.
CE2(config-if)#channel-group 1 mode active	Add member to the LAG interface.
CE2(config-if)#commit	Commit the transaction.
CE2(config-if)#end	Exit interface mode xe23 and configure mode.

EVPN MPLS Active-Standby MH Validation

The following show outputs provide validation results for both single-active and port-active modes, covering ELINE and ELAN services configurations with LDP as the underlay MPLS path.

Single-Active

The following show output displays the types of load-balancing port selection criteria (PSC) used on configured static aggregators for CE1, PE1, PE2, PE3, PE4, and CE2 devices in the network Figure 3-7 using the **show static-channel-group** command.

```
CE1#show static-channel-group
 Static Aggregator: sa1
 Member Status
  xe48   up
-------------------------------------------
 Static Aggregator: sa2
 Member Status
  xe50   up

PE1#show static-channel-group
 Static Aggregator: sa1
 Member Status  weight
  xe0    up

PE2#show static-channel-group
 Static Aggregator: sa2
 Member Status  weight
  xe8    up

PE3#show static-channel-group
 Static Aggregator: sa1
 Member Status  weight
  xe2    up
```

```
PE4#show static-channel-group
 Static Aggregator: sa2
 Member Status  weight
  xe11   up

CE2#show static-channel-group
 Static Aggregator: sa1
 Member Status  weight
  xe23   up
------------------------------------------
 Static Aggregator: sa2
 Member Status  weight
  ge11   up
```

Single-Active ELINE

The following show output displays the active EVPN MPLS Tunnels and load balance for ELINE on PE1, PE2, PE3, and PE4 devices in the network Figure 3-7 using the **show evpn load-balance all** and **show evpn mpls xconnect tunnel** commands.

```
PE1#show evpn load-balance all
ESI                          AC-IF/PE     PE-IP-ADDRESS    Redundancy         Service-carving    weight   Revertive  AC-DF

EVPN SR Active-Standby Multi-Homing Configuration

This section illustrates the Multi-Homed setup for the EVPN Segment Routing (SR) Active-Standby configuration, showcasing examples for both ELINE and ELAN services with SR as the underlay MPLS path.

EVPN SR Active-Standby MH Topology

Figure 3-8 consists of customer edge routers CE1 and CE2, along with IPv4 Provider Edge routers PE1, PE2, PE3, and PE4, all interconnected through the core routers P1 and P2 in the IPv4 MPLS provider network.

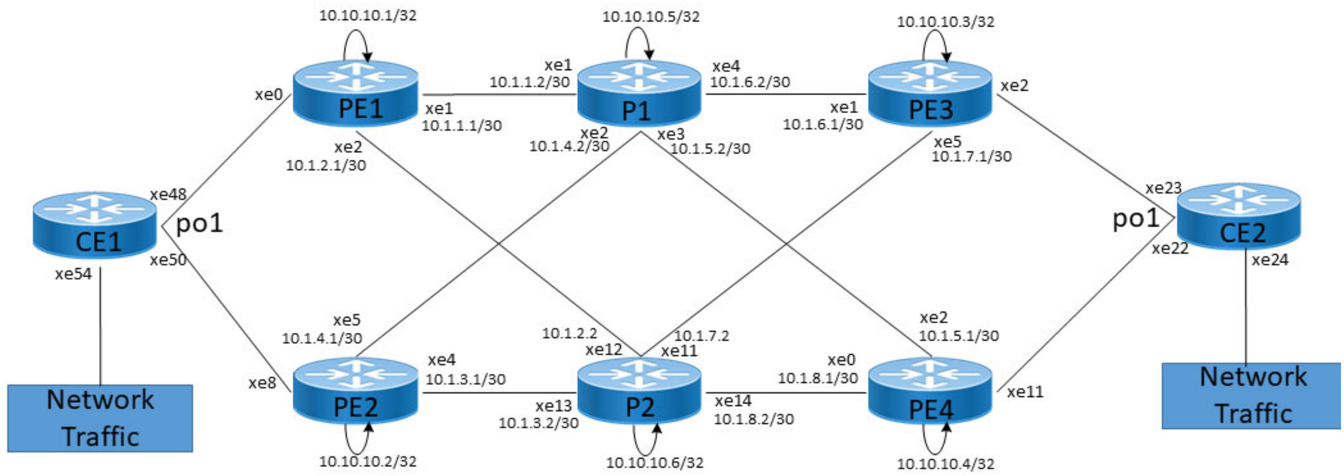

Figure 3-8: EVPN MPLS AS MH Configuration

CE1

The following configuration steps under CE1 are set up to enable VLANs and configure interfaces for carrying VLAN traffic.

`CE1#configure terminal`	Enter configure mode.
`CE1(config)#bridge 1 protocol ieee vlan-bridge`	Set up `bridge 1` to use the IEEE VLAN bridge protocol.
`CE1(config)#vlan 2-100 bridge 1 state enable`	Configure VLANs from `2-100` and associate them with bridge 1.
`CE1(config)#interface xe54`	Enter interface mode `xe54`.
`CE1(config-if)#switchport`	Configure the interface `xe54` as a Layer 2 switch port.
`CE1(config-if)#bridge-group 1`	Associate `xe54` to bridge 1.
`CE1(config-if)#switchport mode trunk`	Configure `xe54` as a trunk port.
`CE1(config-if)#switchport trunk allowed vlan all`	Allow all configured VLANs on the trunk interface `xe54`.
`CE1(config-if)#exit`	Exit interface mode `xe54`.
`CE1(config)#interface po1`	Enter interface mode and configure LAG interface port-channel 1 (`po1`).
`CE1(config-if)#switchport`	Configures port-channel 1 as a Layer 2 switch port.
`CE1(config-if)#bridge-group 1`	Associate `po1` to bridge 1.
`CE1(config-if)#switchport mode trunk`	Configure `po1` as a trunk port.
`CE1(config-if)#switchport trunk allowed vlan all`	Allow all configured VLANs on the trunk port-channel `po1`.
`CE1(config-if)#exit`	Exit interface mode `po1`.
`CE1(config)#interface xe48`	Enter interface mode `xe48`.
`CE1(config-if)#lacp timeout short`	Configure LACP timeout as `short`.
`CE1(config-if)#channel-group 1 mode active`	Add member to the LAG interface.
`CE1(config-if)#exit`	Exit interface mode `xe48`.
`CE1(config-if)#interface xe50`	Enter interface mode `xe50`.

CE1(config-if)#lacp timeout short	Configure LACP timeout as short.
CE1(config-if)#channel-group 1 mode active	Add member to the LAG interface.
CE1(config-if)#commit	Commit the transaction.
CE1(config-if)#end	Exit interface mode xe50 and configure mode.

PE1: Loopback Interface

The configuration on PE1 for a loopback interface with IP address 10.10.10.1/32 secondary is set up to provide IP connectivity for the ISIS router.

PE1#configure terminal	Enter configure mode.
PE1(config)#interface lo	Enter the interface mode for the loopback interface lo.
PE1(config-if)#ip address 10.10.10.1/32 secondary	Configure a secondary IP address, 10.10.10.1/32, on the loopback interface.
PE1(config-if)#ip router isis 1	Enable ISIS routing on a loopback interface lo for area 1.
PE1(config-if)#prefix-sid index 800	Configure a prefix segment identifier (prefix-SID) index value as 800.
PE1(config-if)#exit	Exit interface mode lo.
PE1(config)#commit	Commit the transaction.

PE1: Configure SR

The following configurations aim to activate Segment Routing (SR) on PE1 and make MPLS the preferred method for segment routing, optimizing routing efficiency.

PE1(config)#segment-routing	Configure segment routing on PE1 device.
PE1(config-sr)#mpls sr-prefer	Set MPLS as the preferred segment routing protocol over others.
PE1(config-sr)#exit	Exit the router SR mode.
PE1(config)#commit	Commit the transaction.

PE1: Global LDP

The configuration on PE1 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

PE1(config)#router ldp	Enter the Router LDP mode.
PE1(config-router)#router-id 10.10.10.1	Set the router ID for LDP to 10.10.10.1.
PE1(config-router)#transport-address ipv4 10.10.10.1	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
PE1(config-router)#targeted-peer ipv4 10.10.10.2	Configure targeted peer for LDP using IPv4 addresses.
PE1(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.

PE1(config-router)#targeted-peer ipv4 10.10.10.3	Configure targeted peer for LDP using IPv4 addresses.
PE1(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE1(config-router)#targeted-peer ipv4 10.10.10.4	Configure targeted peer for LDP using IPv4 addresses.
PE1(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE1(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE1(config)#commit	Commit the transaction.

PE1: Global EVPN MPLS Command

The configuration on PE1 for the Global EVPN MPLS, includes activating EVPN MPLS, defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multi-homing, and activating EVPN MPLS multi-homing functionality, all of which are crucial for enabling EVPN MPLS features.

PE1(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE1, enabling it to participate in EVPN MPLS services.
PE1(config)#commit	Commit candidate configuration to be running configuration.
PE1(config)#evpn mpls vtep-ip-global 10.10.10.1	Configure the global VTEP IP address 10.10.10.1, associating it with the loopback IP.
PE1(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multi-homing.
PE1(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multi-homing functionality, allowing PE1 to support multi-homed EVPN MPLS services.
PE1(config)#commit	Commit the transaction.

PE1: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE1 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE1(config)#interface xe1	Enter interface mode xe1.
PE1(config-if)#ip address 10.1.1.1/30	Configure an IP address, 10.1.1.1/30, on the interface xe1.
PE1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE1(config-if)#ip router isis 1	Enable ISIS IPv4 routing on an interface xe1.
PE1(config-if)#exit	Exit interface mode xe1.
PE1(config)#commit	Commit the transaction.
PE1(config)#interface xe2	Enter interface mode xe2.
PE1(config-if)#ip address 10.1.2.1/30	Configure an IP address, 10.1.2.1/30, on the interface xe2.

PE1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE1(config-if)#ip router isis 1	Enable ISIS IPv4 routing on an interface xe2.
PE1(config-if)#exit	Exit interface mode xe2.
PE1(config)#commit	Commit the transaction.

PE1: ISIS Configuration

The below configuration is performed to set up ISIS on PE1, to enable MPLS Traffic Engineering, Segment Routing, and other related features for efficient routing and network management.

PE1(config)#router isis 1	Enter router ISIS mode.
PE1(config-router)#is-type level-1-2	Configure IS-Type as Level-1-2 specifies that the router will participate in both Level-1 and Level-2 areas within the ISIS network.
PE1(config-router)#metric-style wide	Configure the new style of metric type as wide.
PE1(config-router)#mpls traffic-eng router-id 10.10.10.1	Configure the router's MPLS Traffic Engineering (TE) router ID TLV to 10.10.10.1, which is used for MPLS-TE path calculations.
PE1(config-router)#mpls traffic-eng level-1	Enable MPLS-TE for IS-Type Level-1 routing.
PE1(config-router)#mpls traffic-eng level-2	Enable MPLS-TE for IS-Type Level-2 routing.
PE1(config-router)#capability cspf	Enable Constraint Shortest Path First (CSPF) computation for traffic engineering.
PE1(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
PE1(config-router)#fast-reroute ti-lfa level-1 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
PE1(config-router)#fast-reroute ti-lfa level-2 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
PE1(config-router)#bfd all-interfaces	Configure BFD on all interfaces for fast link failure detection.
PE1(config-router)#net 49.0000.0000.0001.00	Set a Network Entity Title (NET) for this ISIS instance, specifying the area address and the system ID.
PE1(config-router)#isis segment-routing global block 17000 23500	Enable ISIS SR globally and allocates label blocks for Segment Routing.
PE1(config-router)#segment-routing mpls	Enable SR ISIS.
PE1(config-router)#exit	Exit router ISIS mode and return to configure mode.
PE1(config)#commit	Commit the transaction.

PE1: BGP Configuration

The below BGP configuration on PE1 is established to enable BGP routing with ASN 65010, set the BGP router ID, define iBGP neighbors, configure BFD, and enable the EVPN address family for efficient routing in an EVPN environment.

`PE1(config)#router bgp 65010`	Enter the Router BGP mode, ASN: 65010
`PE1(config-router)#bgp router-id 10.10.10.1`	Configure BGP router ID `10.10.10.1`, identifying PE1 within the BGP network.
`PE1(config-router)#neighbor 10.10.10.2 remote-as 65010`	Configure neighbor `10.10.10.2` as an iBGP neighbor with their remote AS number `65010`.
`PE1(config-router)#neighbor 10.10.10.2 update-source lo`	Configure neighbor `10.10.10.2` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE1(config-router)#neighbor 10.10.10.3 remote-as 65010`	Configure neighbor `10.10.10.3` as an iBGP neighbor with their remote AS number `65010`.
`PE1(config-router)#neighbor 10.10.10.3 update-source lo`	Configure neighbor `10.10.10.3` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE1(config-router)#neighbor 10.10.10.4 remote-as 65010`	Configure neighbor `10.10.10.4` as an iBGP neighbor with their remote AS number `65010`.
`PE1(config-router)#neighbor 10.10.10.4 update-source lo`	Configure neighbor `10.10.10.4` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE1(config-router)#neighbor 10.10.10.2 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE1(config-router)#neighbor 10.10.10.3 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE1(config-router)#neighbor 10.10.10.4 fall-over bfd multihop`	Configure BFD for the BGP neighbor to provide rapid failure detection.
`PE1(config-router)#neighbor 10.10.10.2 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE1(config-router)#neighbor 10.10.10.3 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE1(config-router)#neighbor 10.10.10.4 advertisement-interval 0`	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
`PE1(config-router)#address-family l2vpn evpn`	Enter into address family mode for L2VPN EVPN.
`PE1(config-router-af)#neighbor 10.10.10.2 activate`	Activate EVPN for iBGP neighbor `10.10.10.2` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE1(config-router-af)#neighbor 10.10.10.3 activate`	Activate EVPN for iBGP neighbor `10.10.10.3` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE1(config-router-af)#neighbor 10.10.10.4 activate`	Activate EVPN for iBGP neighbor `10.10.10.4` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE1(config-router-af)#exit`	Exit address family mode and return to the router BGP mode.
`PE1(config-router)#commit`	Commit the transaction.
`PE1(config-router)#exit`	Exit router BGP mode and return to the configure mode.

PE1: MAC VRF Configuration

The below MAC VRF configuration on PE1 is carried out to define and set up VRFs named `vrf2` and `vpls1001` with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

PE1(config)#mac vrf vrf2	Enter VRF mode named vrf2.
PE1(config-vrf)#rd 10.10.10.1:1700	Configure Route-Distinguisher value of 10.10.10.1:1700.
PE1(config-vrf)#route-target both 1700:1700	Configure import and export values for the vrf2 as 1700:1700.
PE1(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE1(config)#mac vrf vpls1001	Enter VRF mode named vpls1001.
PE1(config-vrf)#rd 10.10.10.1:1001	Configure Route-Distinguisher value of 10.10.10.1:1001.
PE1(config-vrf)#route-target both 1001:1001	Configure import and export values for the vpls1001 as 1001:1001.
PE1(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE1(config)#commit	Commit the transaction.

PE1: EVPN and VRF Mapping

The below EVPN and VRF mapping configuration on PE1 is performed to establish mappings between EVPN identifiers and VRFs, facilitating efficient routing and connectivity in an EVPN network environment.

PE1(config)#evpn mpls id 1800 xconnect target-mpls-id 1700	Configure the EVPN-VPWS identifier with a source identifier of 1800 and a target identifier of 1700.
PE1(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Map VRF vrf2 to the EVPN-VPWS identifier
PE1(config-evpn-mpls)#commit	Commit the transaction.
PE1(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
PE1(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier an identifier of 3000.
PE1(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Map VRF vpls1001 to the EVPN-VPWS identifier
PE1(config-evpn-mpls)#commit	Commit the transaction.
PE1(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE1: Access Port Configuration for Port-active

The below access port configuration for port-active mode on PE1 is carried out to configure various parameters including system-mac, load balancing, service carving preferences, and EVPN settings for efficient network access and connectivity.

PE1(config)#interface po1	Enter the port channel interface mode for po1
PE1(config-if)#load-interval 30	Set the load interval to 30.
PE1(config-if)#evpn multi-homed system-mac 0000.1111.7777 load-balancing port-active	Configure the system-mac address 0000.1111.7777 for port-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
PE1(config-if-es)#service-carving auto	Configure service carving as auto.
PE1(config-if-es)#exit	Exit the EVPN ES mode and return to the configure mode.
PE1(config-if)#exit	Exit interface mode po1 and return to the configure mode.
PE1(config)#commit	Commit the transaction.

`PE1(config)#interface po1.1 switchport`	Create a Layer 2 sub-interface `po1.1` within the port channel.
`PE1(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.
`PE1(config-if)#load-interval 30`	Set the load interval to `30`.
`PE1(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE1(config-acc-if-evpn)#map vpn-id 1800`	Map VPN-ID `1800`.
`PE1(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE1(config-if)#exit`	Exit interface mode `po1.1` and return to the configure mode.
`PE1(config)#interface xe0`	Enter the interface mode for `xe0.`
`PE1(config-if)#speed 10g`	Set the speed to `10g`.
`PE1(config-if)#channel-group 1 mode active`	Attach LAG interface `po1.`
`PE1(config-if)#exit`	Exit interface mode `xe0` and return to the configure mode.
`PE1(config)#commit`	Commit the transaction.

PE1: Access Port Configuration for Single-active

The below access port configuration for single-active mode on PE1 is implemented to set up various parameters, including Ethernet Segment Identifier (ESI) settings, service carving preferences, and EVPN configurations, ensuring efficient network access and connectivity.

`PE1(config)#interface sa1`	Enter the single active interface mode for `sa1`
`PE1(config-if)#load-interval 30`	Set the load interval to `30`.
`PE1(config-if)#evpn multi-homed esi 00:00:11:11:77:77 load-balancing single-active`	Configure the ESI with the value with the value `00:00:11:11:77:77` for single-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE1(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE1(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE1(config-if)#exit`	Exit interface mode `sa1` and return to the configure mode.
`PE1(config)#commit`	Commit the transaction.
`PE1(config)#interface sa1.1 switchport`	Create a Layer 2 sub-interface `sa1.1` within the port channel.
`PE1(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.
`PE1(config-if)#load-interval 30`	Set the load interval to `30`.
`PE1(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE1(config-acc-if-evpn)#map vpn-id 1800`	Map VPN-ID `1800`.
`PE1(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE1(config-if)#exit`	Exit interface mode `sa1.1` and return to the configure mode.
`PE1(config)#interface xe0`	Enter the interface mode for `xe0.`
`PE1(config-if)#speed 10g`	Set the speed to `10g`.
`PE1(config-if)#static-channel-group 1`	Attach the static-channel-group 1, the LAG interface `sa1` to `xe0`.

PE1(config-if)#exit	Exit interface mode xe0 and return to the configure mode.
PE1(config)#commit	Commit the transaction.

PE2: Loopback Interface

The configuration on PE2 for a loopback interface with IP address 10.10.10.2/32 secondary is set up to provide IP connectivity for the ISIS router.

PE2#configure terminal	Enter configure mode.
PE2(config)#interface lo	Enter the interface mode for the loopback interface lo.
PE2(config-if)#ip address 10.10.10.2/32 secondary	Configure a secondary IP address, 10.10.10.2/32, on the loopback interface.
PE2(config-if)#ip router isis 1	Enable ISIS routing on a loopback interface lo for area 1.
PE2(config-if)#prefix-sid index 800	Configure a prefix segment identifier (prefix-SID) index value as 800.
PE2(config-if)#exit	Exit interface mode lo.
PE2(config)#commit	Commit the transaction.

PE2: Configure SR

The following configurations aim to activate Segment Routing (SR) on PE2 and make MPLS the preferred method for segment routing, optimizing routing efficiency.

PE2(config)#segment-routing	Configure segment routing on PE2 device.
PE2(config-sr)#mpls sr-prefer	Set MPLS as the preferred segment routing protocol over others.
PE2(config-sr)#exit	Exit the router SR mode.
PE2(config)#commit	Commit the transaction.

PE2: Global LDP

The configuration on PE2 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

PE2(config)#router ldp	Enter the Router LDP mode.
PE2(config-router)#router-id 10.10.10.2	Set the router ID for LDP to 10.10.10.2.
PE2(config-router)#transport-address ipv4 10.10.10.2	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
PE2(config-router)#targeted-peer ipv4 10.10.10.1	Configure targeted peer for LDP using IPv4 addresses.
PE2(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE2(config-router)#targeted-peer ipv4 10.10.10.3	Configure targeted peer for LDP using IPv4 addresses.
PE2(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.

PE2(config-router)#targeted-peer ipv4 10.10.10.4	Configure targeted peer for LDP using IPv4 addresses.
PE2(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE2(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE2(config)#commit	Commit the transaction.

PE2: Global EVPN MPLS Command

The configuration on PE2 for the Global EVPN MPLS, includes activating EVPN MPLS, defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multi-homing, and activating EVPN MPLS multi-homing functionality, all of which are crucial for enabling EVPN MPLS features.

PE2(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE2, enabling it to participate in EVPN MPLS services.
PE2(config)#commit	Commit candidate configuration to be running configuration.
PE2(config)#evpn mpls vtep-ip-global 10.10.10.2	Configure the global VTEP IP address 10.10.10.2, associating it with the loopback IP.
PE2(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multi-homing.
PE2(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multi-homing functionality, allowing PE2 to support multi-homed EVPN MPLS services.
PE2(config)#commit	Commit the transaction.

PE2: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE2 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE2(config)#interface xe4	Enter interface mode xe4.
PE2(config-if)#ip address 10.1.3.1/30	Configure an IP address, 10.1.3.1/30, on the interface xe4.
PE2(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE2(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE2(config-if)#ip router isis 1	Enable ISIS routing on an interface xe4 for area 1.
PE2(config-if)#exit	Exit interface mode xe4.
PE2(config)#commit	Commit the transaction.
PE2(config)#interface xe5	Enter interface mode xe5.
PE2(config-if)#ip address 10.1.4.1/30	Configure an IP address, 10.1.4.1/30, on the interface xe5.
PE2(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE2(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.

PE2(config-if)#ip router isis 1	Enable ISIS routing on an interface xe5 for area 1.
PE2(config-if)#exit	Exit interface mode xe5.
PE2(config)#commit	Commit the transaction.

PE2: ISIS Configuration

The below configuration is performed to set up ISIS on PE2, to enable MPLS Traffic Engineering, Segment Routing, and other related features for efficient routing and network management.

PE2(config)#router isis 1	Enter router ISIS mode.
PE2(config-router)#is-type level-1-2	Configure IS-Type as Level-1-2 specifies that the router will participate in both Level-1 and Level-2 areas within the ISIS network.
PE2(config-router)#metric-style wide	Configure the new style of metric type as wide.
PE2(config-router)#mpls traffic-eng router-id 10.10.10.2	Configure the router's MPLS Traffic Engineering (TE) router ID TLV to 10.10.10.2, which is used for MPLS-TE path calculations.
PE2(config-router)#mpls traffic-eng level-1	Enable MPLS-TE for IS-Type Level-1 routing.
PE2(config-router)#mpls traffic-eng level-2	Enable MPLS-TE for IS-Type Level-2 routing.
PE2(config-router)#capability cspf	Enable Constraint Shortest Path First (CSPF) computation for traffic engineering.
PE2(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
PE2(config-router)#fast-reroute ti-lfa level-1 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
PE2(config-router)#fast-reroute ti-lfa level-2 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
PE2(config-router)#bfd all-interfaces	Configure BFD on all interfaces for fast link failure detection.
PE2(config-router)#net 49.0000.0000.0002.00	Set a Network Entity Title (NET) for this ISIS instance, specifying the area address and the system ID.
PE2(config-router)#isis segment-routing global block 17000 23500	Enable ISIS SR globally and allocates label blocks for Segment Routing.
PE2(config-router)#segment-routing mpls	Enable SR ISIS.
PE2(config-router)#exit	Exit router ISIS mode and return to configure mode.
PE2(config)#commit	Commit the transaction.

PE2: BGP Configuration

The below BGP configuration on PE2 is established to enable BGP routing with ASN 65010, set the BGP router ID, define iBGP neighbors, configure BFD, and enable the EVPN address family for efficient routing in an EVPN environment.

PE2(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
PE2(config-router)#bgp router-id 10.10.10.2	Configure BGP router ID 10.10.10.2, identifying PE2 within the BGP network.
PE2(config-router)#neighbor 10.10.10.1 remote-as 65010	Configure neighbor 10.10.10.1 as an iBGP neighbor with their remote AS number 65010.

PE2(config-router)#neighbor 10.10.10.1 update-source lo	Configure neighbor 10.10.10.1 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE2(config-router)#neighbor 10.10.10.3 remote-as 65010	Configure neighbor 10.10.10.3 as an iBGP neighbor with their remote AS number 65010.
PE2(config-router)#neighbor 10.10.10.3 update-source lo	Configure neighbor 10.10.10.3 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE2(config-router)#neighbor 10.10.10.4 remote-as 65010	Configure neighbor 10.10.10.4 as an iBGP neighbor with their remote AS number 65010.
PE2(config-router)#neighbor 10.10.10.4 update-source lo	Configure neighbor 10.10.10.4 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE2(config-router)#neighbor 10.10.10.1 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE2(config-router)#neighbor 10.10.10.3 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE2(config-router)#neighbor 10.10.10.4 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE2(config-router)#neighbor 10.10.10.1 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE2(config-router)#neighbor 10.10.10.3 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE2(config-router)#neighbor 10.10.10.4 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE2(config-router)#address-family l2vpn evpn	Enter into address family mode for L2VPN EVPN.
PE2(config-router-af)#neighbor 10.10.10.1 activate	Activate EVPN for iBGP neighbor 10.10.10.1 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE2(config-router-af)#neighbor 10.10.10.3 activate	Activate EVPN for iBGP neighbor 10.10.10.3 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE2(config-router-af)#neighbor 10.10.10.4 activate	Activate EVPN for iBGP neighbor 10.10.10.4 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE2(config-router-af)#exit	Exit address family mode and return to the router BGP mode.
PE2(config-router)#commit	Commit the transaction.
PE2(config-router)#exit	Exit router BGP mode and return to the configure mode.

PE2: MAC VRF Configuration

The below MAC VRF configuration on PE2 is carried out to define and set up VRFs named vrf2 and vpls1001 with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

PE2(config)#mac vrf vrf2	Enter VRF mode named vrf2.
PE2(config-vrf)#rd 10.10.10.2:1700	Configure Route-Distinguisher value of 10.10.10.2:1700.

PE2(config-vrf)#route-target both 1700:1700	Configure import and export values for the vrf2 as 1700:1700.
PE2(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE2(config)#mac vrf vpls1001	Enter VRF mode named vpls1001.
PE2(config-vrf)#rd 10.10.10.2:1001	Configure Route-Distinguisher value of 10.10.10.2:1001.
PE2(config-vrf)#route-target both 1001:1001	Configure import and export values for the vpls1001 as 1001:1001.
PE2(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE2(config)#commit	Commit the transaction.

PE2: EVPN and VRF Mapping

The below EVPN and VRF mapping configuration on PE2 is performed to establish mappings between EVPN identifiers and VRFs, facilitating efficient routing and connectivity in an EVPN network environment.

PE2(config)#evpn mpls id 1800 xconnect target-mpls-id 1700	Configure the EVPN-VPWS identifier with a source identifier of 1800 and a target identifier of 1700.
PE2(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Map VRF vrf2 to the EVPN-VPWS identifier
PE2(config-evpn-mpls)#commit	Commit the transaction.
PE2(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
PE2(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier an identifier of 3000.
PE2(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Map VRF vpls1001 to the EVPN-VPWS identifier
PE2(config-evpn-mpls)#commit	Commit the transaction.
PE2(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE2: Access Port Configuration for Port-active

The below access port configuration for port-active mode on PE2 is carried out to configure various parameters including system-mac, load balancing, service carving preferences, and EVPN settings for efficient network access and connectivity.

PE2(config)#interface po1	Enter the port channel interface mode for po1
PE2(config-if)#load-interval 30	Set the load interval to 30.
PE2(config-if)#evpn multi-homed system-mac 0000.1111.7777 load-balancing port-active	Configure the system-mac address 0000.1111.7777 for port-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
PE2(config-if-es)#service-carving auto	Configure service carving as auto, allowing automatic determination of service distribution preferences.
PE2(config-if-es)#exit	Exit the EVPN ES mode and return to the configure mode.
PE2(config-if)#exit	Exit interface mode po1 and return to the configure mode.
PE2(config)#commit	Commit the transaction.
PE2(config)#interface po1.1 switchport	Create a Layer 2 sub-interface po1.1 within the port channel.
PE2(config-if)#encapsulation dot1q 100	Set encapsulation to dot1q with VLAN ID 100.

© 2025 IP Infusion Inc. Proprietary

PE2(config-if)#load-interval 30	Set the load interval to 30.
PE2(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE2(config-acc-if-evpn)#map vpn-id 1800	Map VPN-ID 1800.
PE2(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE2(config-if)#exit	Exit interface mode po1.1 and return to the configure mode.
PE2(config)#interface xe8	Enter the interface mode for xe8.
PE2(config-if)#speed 10g	Set the speed to 10g.
PE2(config-if)#channel-group 1 mode active	Attach LAG interface po1.
PE2(config-if)#exit	Exit interface mode xe8 and return to the configure mode.
PE2(config)#commit	Commit the transaction.

PE2: Access Port Configuration for Single-active

The below access port configuration for single-active mode on PE2 is implemented to set up various parameters, including Ethernet Segment Identifier (ESI) settings, service carving preferences, and EVPN configurations, ensuring efficient network access and connectivity.

PE2(config)#interface sa2	Enter the single active interface mode for sa2.
PE2(config-if)#load-interval 30	Set the load interval to 30.
PE2(config-if)#evpn multi-homed esi 00:00:11:11:77:77 load-balancing single-active	Configure the ESI with the value with the value 00:00:11:11:77:77 for single-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
PE2(config-if-es)#service-carving auto	Configure service carving as auto, allowing automatic determination of service distribution preferences.
PE2(config-if-es)#exit	Exit the EVPN ES mode and return to the configure mode.
PE2(config-if)#exit	Exit interface mode sa2 and return to the configure mode.
PE2(config)#commit	Commit the transaction.
PE2(config)#interface sa2.1 switchport	Create a Layer 2 sub-interface sa2.1 within the port channel.
PE2(config-if)#encapsulation dot1q 100	Set encapsulation to dot1q with VLAN ID 100.
PE2(config-if)#load-interval 30	Set the load interval to 30.
PE2(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE2(config-acc-if-evpn)#map vpn-id 1800	Map VPN-ID 1800.
PE2(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE2(config-if)#exit	Exit interface mode sa2.1 and return to the configure mode.
PE2(config)#interface xe8	Enter the interface mode for xe8.
PE2(config-if)#speed 10g	Set the speed to 10g.
PE2(config-if)#static-channel-group 2	Attach the static-channel-group 2, the LAG interface sa2 to xe8.
PE2(config-if)#exit	Exit interface mode xe8 and return to the configure mode.
PE2(config)#commit	Commit the transaction.

P1: Loopback Interface

The configuration on P1 for a loopback interface with IP address 10.10.10.5/32 secondary is set up to provide IP connectivity for the router.

P1#configure terminal	Enter configure mode.
P1(config)#interface lo	Enter the interface mode for the loopback interface lo.
P1(config-if)#ip address 10.10.10.5/32 secondary	Configure a secondary IP address, 10.10.10.5/32, on the loopback interface.
P1(config-if)#ip router isis 1	Enable ISIS routing on a loopback interface lo for area 1.
P1(config-if)#prefix-sid index 800	Configure a prefix segment identifier (prefix-SID) index value as 800.
P1(config-if)#exit	Exit interface mode lo.
P1(config)#commit	Commit the transaction.

P1: Configure SR

The following configurations aim to activate Segment Routing (SR) on P1 and make MPLS the preferred method for segment routing, optimizing routing efficiency.

P1(config)#segment-routing	Configure segment routing on P1 device.
P1(config-sr)#mpls sr-prefer	Set MPLS as the preferred segment routing protocol over others.
P1(config-sr)#exit	Exit the router SR mode.
P1(config)#commit	Commit the transaction.

P1: Global LDP

The configuration on P1 for the Global LDP router, specifying router ID and targeted peer, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

P1(config)#router ldp	Enter the Router LDP mode.
P1(config-router)#router-id 10.10.10.5	Set the router ID for LDP to 10.10.10.5.
P1(config-router)#transport-address ipv4 10.10.10.5	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
P1(config-router)#exit	Exit router LDP mode and return to the configure mode.
P1(config)#commit	Commit the transaction.

P1: Interface Configuration

The below configuration is performed to set up interfaces on P1 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

P1(config)#interface xe1	Enter interface mode xe1.
P1(config-if)#ip address 10.1.1.2/30	Configure an IP address, 10.1.1.2/30, on the interface xe1.

`P1(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P1(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P1(config-if)#ip router isis 1`	Enable ISIS routing on an interface `xe1` for area 1.
`P1(config-if)#exit`	Exit interface mode `xe1`.
`P1(config)#commit`	Commit the transaction.
`P1(config)#interface xe2`	Enter interface mode `xe2`.
`P1(config-if)#ip address 10.1.4.2/30`	Configure an IP address, `10.1.4.2/30`, on the interface `xe2`.
`P1(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P1(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P1(config-if)#ip router isis 1`	Enable ISIS routing on an interface `xe2` for area 1.
`P1(config-if)#exit`	Exit interface mode `xe2`.
`P1(config)#commit`	Commit the transaction.
`P1(config)#interface xe3`	Enter interface mode `xe3`.
`P1(config-if)#ip address 10.1.5.2/30`	Configure an IP address, `10.1.5.2/30`, on the interface `xe3`.
`P1(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P1(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P1(config-if)#ip router isis 1`	Enable ISIS routing on an interface `xe3` for area 1.
`P1(config-if)#exit`	Exit interface mode `xe3`.
`P1(config)#commit`	Commit the transaction.
`P1(config)#interface xe4`	Enter interface mode `xe4`.
`P1(config-if)#ip address 10.1.6.2/30`	Configure an IP address, `10.1.6.2/30`, on the interface `xe4`.
`P1(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P1(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P1(config-if)#ip router isis 1`	Enable ISIS routing on an interface `xe4` for area 1.
`P1(config-if)#exit`	Exit interface mode `xe4`.
`P1(config)#commit`	Commit the transaction.

P1: ISIS Configuration

The below configuration is performed to set up ISIS on P1, to enable MPLS Traffic Engineering, Segment Routing, and other related features for efficient routing and network management.

P1(config)#router isis 1	Enter router ISIS mode.
P1(config-router)#is-type level-1-2	Configure IS-Type as Level-1-2 specifies that the router will participate in both Level-1 and Level-2 areas within the ISIS network.
P1(config-router)#metric-style wide	Configure the new style of metric type as wide.
P1(config-router)#mpls traffic-eng router-id 10.10.10.5	Configure the router's MPLS Traffic Engineering (TE) router ID TLV to 10.10.10.5, which is used for MPLS-TE path calculations.
P1(config-router)#mpls traffic-eng level-1	Enable MPLS-TE for IS-Type Level-1 routing.
P1(config-router)#mpls traffic-eng level-2	Enable MPLS-TE for IS-Type Level-2 routing.
P1(config-router)#capability cspf	Enable Constraint Shortest Path First (CSPF) computation for traffic engineering.
P1(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
P1(config-router)#fast-reroute ti-lfa level-1 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
P1(config-router)#fast-reroute ti-lfa level-2 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
P1(config-router)#bfd all-interfaces	Configure BFD on all interfaces for fast link failure detection.
P1(config-router)#net 49.0000.0000.0005.00	Set a Network Entity Title (NET) for this ISIS instance, specifying the area address and the system ID.
P1(config-router)#isis segment-routing global block 17000 23500	Enable ISIS SR globally and allocates label blocks for Segment Routing.
P1(config-router)#segment-routing mpls	Enable SR ISIS.
P1(config-router)#exit	Exit router ISIS mode and return to the configure mode.
P1(config)#commit	Commit the transaction.

P2: Loopback Interface

The configuration on P2 for a loopback interface with IP address 10.10.10.6/32 secondary is set up to provide IP connectivity for the router.

P2#configure terminal	Enter configure mode.
P2(config)#interface lo	Enter the interface mode for the loopback interface lo.
P2(config-if)#ip address 10.10.10.6/32 secondary	Configure a secondary IP address, 10.10.10.6/32, on the loopback interface.
P2(config-if)#ip router isis 1	Enable ISIS routing on a loopback interface lo for area 1.
P2(config-if)#prefix-sid index 800	Configure a prefix segment identifier (prefix-SID) index value as 800.
P2(config-if)#exit	Exit interface mode lo.
P2(config)#commit	Commit the transaction.

P2: Configure SR

The following configurations aim to activate Segment Routing (SR) on P2 and make MPLS the preferred method for segment routing, optimizing routing efficiency.

© 2025 IP Infusion Inc. Proprietary

`P2(config)#segment-routing`	Configure segment routing on P2 device.
`P2(config-sr)#mpls sr-prefer`	Set MPLS as the preferred segment routing protocol over others.
`P2(config-sr)#exit`	Exit the router SR mode.
`P2(config)#commit`	Commit the transaction.

P2: Global LDP

The configuration on P2 for the Global LDP router, specifying router ID and targeted peer, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

`P2(config)#router ldp`	Enter the Router LDP mode.
`P2(config-router)#router-id 10.10.10.6`	Set the router ID for LDP to `10.10.10.6`.
`P2(config-router)#transport-address ipv4 10.10.10.6`	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
`P2(config-router)#exit`	Exit router LDP mode and return to the configure mode.
`P2(config)#commit`	Commit the transaction.

P2: Interface Configuration

The below configuration is performed to set up interfaces on P2 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

`P2(config)#interface xe12`	Enter interface mode `xe12`.
`P2(config-if)#ip address 10.1.2.2/30`	Configure an IP address, `10.1.2.2/30`, on the interface `xe12`.
`P2(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P2(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P2(config-if)#ip router isis 1`	Enable ISIS routing on an interface `xe12` for area 1.
`P2(config-if)#exit`	Exit interface mode `xe12`.
`P2(config)#commit`	Commit the transaction.
`P2(config)#interface xe13`	Enter interface mode `xe13`.
`P2(config-if)#ip address 10.1.3.2/30`	Configure an IP address, `10.1.3.2/30`, on the interface `xe13`.
`P2(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P2(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P2(config-if)#ip router isis 1`	Enable ISIS routing on an interface `xe13` for area 1.
`P2(config-if)#exit`	Exit interface mode `xe13`.

`P2(config)#commit`	Commit the transaction.
`P2(config)#interface xe11`	Enter interface mode `xe11`.
`P2(config-if)#ip address 10.1.7.2/30`	Configure an IP address, `10.1.7.2/30`, on the interface `xe11`.
`P2(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P2(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P2(config-if)#ip router isis 1`	Enable ISIS routing on an interface `xe11` for area 1.
`P2(config-if)#exit`	Exit interface mode `xe11`.
`P2(config)#commit`	Commit the transaction.
`P2(config)#interface xe14`	Enter interface mode `xe14`.
`P2(config-if)#ip address 10.1.8.2/30`	Configure an IP address, `10.1.8.2/30`, on the interface `xe14`.
`P2(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P2(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P2(config-if)#ip router isis 1`	Enable ISIS routing on an interface `xe14` for area 1.
`P2(config-if)#exit`	Exit interface mode `xe14`.
`P2(config)#commit`	Commit the transaction.

P2: ISIS Configuration

The below configuration is performed to set up ISIS on P2, to enable MPLS Traffic Engineering, Segment Routing, and other related features for efficient routing and network management.

`P2(config)#router isis 1`	Enter router ISIS mode.
`P2(config-router)#is-type level-1-2`	Configure IS-Type as `Level-1-2` specifies that the router will participate in both Level-1 and Level-2 areas within the ISIS network.
`P2(config-router)#metric-style wide`	Configure the new style of metric type as `wide`.
`P2(config-router)#mpls traffic-eng router-id 10.10.10.6`	Configure the router's MPLS Traffic Engineering (TE) router ID TLV to `10.10.10.6`, which is used for MPLS-TE path calculations.
`P2(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE for IS-Type `Level-1` routing.
`P2(config-router)#mpls traffic-eng level-2`	Enable MPLS-TE for IS-Type `Level-2` routing.
`P2(config-router)#capability cspf`	Enable Constraint Shortest Path First (CSPF) computation for traffic engineering.
`P2(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`P2(config-router)#fast-reroute ti-lfa level-1 proto ipv4`	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
`P2(config-router)#fast-reroute ti-lfa level-2 proto ipv4`	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities

`P2(config-router)#bfd all-interfaces`	Configure BFD on all interfaces for fast link failure detection.
`P2(config-router)#net 49.0000.0000.0006.00`	Set a Network Entity Title (NET) for this ISIS instance, specifying the area address and the system ID.
`P2(config-router)#isis segment-routing global block 17000 23500`	Enable ISIS SR globally and allocates label blocks for Segment Routing.
`P2(config-router)#segment-routing mpls`	Enable SR ISIS.
`P2(config-router)#exit`	Exit router ISIS mode and return to the configure mode.
`P2(config)#commit`	Commit the transaction.

PE3: Loopback Interface

The configuration on PE3 for a loopback interface with IP address `10.10.10.3/32` secondary is set up to provide IP connectivity for the router.

`PE3#configure terminal`	Enter configure mode.
`PE3(config)#interface lo`	Enter the interface mode for the loopback interface `lo`.
`PE3(config-if)#ip address 10.10.10.3/32 secondary`	Configure a secondary IP address, `10.10.10.3/32`, on the loopback interface.
`PE3(config-if)#ip router isis 1`	Enable ISIS routing on a loopback interface `lo` for area 1.
`PE3(config-if)#prefix-sid index 800`	Configure a prefix segment identifier (prefix-SID) index value as `800`.
`PE3(config-if)#exit`	Exit interface mode `lo`.
`PE3(config)#commit`	Commit the transaction.

PE3: Configure SR

The following configurations aim to activate Segment Routing (SR) on PE3 and make MPLS the preferred method for segment routing, optimizing routing efficiency.

`PE3(config)#segment-routing`	Configure segment routing on PE3 device.
`PE3(config-sr)#mpls sr-prefer`	Set MPLS as the preferred segment routing protocol over others.
`PE3(config-sr)#exit`	Exit the router SR mode.
`PE3(config)#commit`	Commit the transaction.

PE3: Global LDP

The configuration on PE3 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

`PE3(config)#router ldp`	Enter the Router LDP mode.
`PE3(config-router)#router-id 10.10.10.3`	Set the router ID for LDP to `10.10.10.3`.
`PE2(config-router)#transport-address ipv4 10.10.10.3`	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.

PE3(config-router)#targeted-peer ipv4 10.10.10.1	Configure targeted peer for LDP using IPv4 addresses.
PE3(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE3(config-router)#targeted-peer ipv4 10.10.10.2	Configure targeted peer for LDP using IPv4 addresses.
PE3(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE3(config-router)#targeted-peer ipv4 10.10.10.4	Configure targeted peer for LDP using IPv4 addresses.
PE3(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE3(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: Global EVPN MPLS Command

The configuration on PE3 for the Global EVPN MPLS, includes activating EVPN MPLS, defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multi-homing, and activating EVPN MPLS multi-homing functionality, all of which are crucial for enabling EVPN MPLS features.

PE3(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE3, enabling it to participate in EVPN MPLS services.
PE3(config)#commit	Commit candidate configuration to be running configuration.
PE3(config)#evpn mpls vtep-ip-global 10.10.10.3	Configure the global VTEP IP address 10.10.10.3, associating it with the loopback IP.
PE3(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multi-homing.
PE3(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multi-homing functionality, allowing PE3 to support multi-homed EVPN MPLS services.
PE3(config)#commit	Commit the transaction.

PE3: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE3 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE3(config)#interface xe1	Enter interface mode xe1.
PE3(config-if)#ip address 10.1.6.1/30	Configure an IP address, 10.1.6.1/30, on the interface xe1.
PE3(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE3(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE3(config-if)#ip router isis 1	Enable ISIS routing on an interface xe1 for area 1.
PE3(config-if)#exit	Exit interface mode xe1.
PE3(config)#commit	Commit the transaction.
PE3(config)#interface xe5	Enter interface mode xe5.

PE3(config-if)#ip address 10.1.7.1/30	Configure an IP address, 10.1.7.1/30, on the interface xe5.
PE3(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE3(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE3(config-if)#ip router isis 1	Enable ISIS routing on an interface xe5 for area 1.
PE3(config-if)#exit	Exit interface mode xe5.
PE3(config)#commit	Commit the transaction.

PE3: ISIS Configuration

The below configuration is performed to set up ISIS on PE3, to enable MPLS Traffic Engineering, Segment Routing, and other related features for efficient routing and network management.

PE3(config)#router isis 1	Enter router ISIS mode.
PE3(config-router)#is-type level-1-2	Configure IS-Type as Level-1-2 specifies that the router will participate in both Level-1 and Level-2 areas within the ISIS network.
PE3(config-router)#metric-style wide	Configure the new style of metric type as wide.
PE3(config-router)#mpls traffic-eng router-id 10.10.10.3	Configure the router's MPLS Traffic Engineering (TE) router ID TLV to 10.10.10.3, which is used for MPLS-TE path calculations.
PE3(config-router)#mpls traffic-eng level-1	Enable MPLS-TE for IS-Type Level-1 routing.
PE3(config-router)#mpls traffic-eng level-2	Enable MPLS-TE for IS-Type Level-2 routing.
PE3(config-router)#capability cspf	Enable Constraint Shortest Path First (CSPF) computation for traffic engineering.
PE3(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
PE3(config-router)#fast-reroute ti-lfa level-1 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
PE3(config-router)#fast-reroute ti-lfa level-2 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
PE3(config-router)#bfd all-interfaces	Configure BFD on all interfaces for fast link failure detection.
PE3(config-router)#net 49.0000.0000.0003.00	Set a Network Entity Title (NET) for this ISIS instance, specifying the area address and the system ID.
PE3(config-router)#isis segment-routing global block 17000 23500	Enable ISIS SR globally and allocates label blocks for Segment Routing.
PE3(config-router)#segment-routing mpls	Enable SR ISIS.
PE3(config-router)#exit	Exit router ISIS mode and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: BGP Configuration

The below BGP configuration on PE3 is established to enable BGP routing with ASN 65010, set the BGP router ID, define iBGP neighbors, configure BFD, and enable the EVPN address family for efficient routing in an EVPN environment.

PE3(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
PE3(config-router)#bgp router-id 10.10.10.3	Configure BGP router ID 10.10.10.3, identifying PE3 within the BGP network.
PE3(config-router)#neighbor 10.10.10.1 remote-as 65010	Configure neighbor 10.10.10.1 as an iBGP neighbor with their remote AS number 65010.
PE3(config-router)#neighbor 10.10.10.1 update-source lo	Configure neighbor 10.10.10.1 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE3(config-router)#neighbor 10.10.10.2 remote-as 65010	Configure neighbor 10.10.10.2 as an iBGP neighbor with their remote AS number 65010.
PE3(config-router)#neighbor 10.10.10.2 update-source lo	Configure neighbor 10.10.10.2 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE3(config-router)#neighbor 10.10.10.4 remote-as 65010	Configure neighbor 10.10.10.4 as an iBGP neighbor with their remote AS number 65010.
PE3(config-router)#neighbor 10.10.10.4 update-source lo	Configure neighbor 10.10.10.4 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE3(config-router)#neighbor 10.10.10.1 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE3(config-router)#neighbor 10.10.10.2 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE3(config-router)#neighbor 10.10.10.4 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE3(config-router)#neighbor 10.10.10.1 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE3(config-router)#neighbor 10.10.10.2 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE3(config-router)#neighbor 10.10.10.4 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE3(config-router)#address-family l2vpn evpn	Enter into address family mode for L2VPN EVPN.
PE3(config-router-af)#neighbor 10.10.10.1 activate	Activate EVPN for iBGP neighbor 10.10.10.1 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE3(config-router-af)#neighbor 10.10.10.2 activate	Activate EVPN for iBGP neighbor 10.10.10.2 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE3(config-router-af)#neighbor 10.10.10.4 activate	Activate EVPN for iBGP neighbor 10.10.10.4 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE3(config-router-af)#exit	Exit address family mode and return to the router BGP mode.
PE3(config-router)#commit	Commit the transaction.
PE3(config-router)#exit	Exit router BGP mode and return to the configure mode.

PE3: MAC VRF Configuration

The below MAC VRF configuration on PE3 is carried out to define and set up VRFs named vrf2 and vpls1001 with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

PE3(config)#mac vrf vrf2	Enter VRF mode named vrf2.
PE3(config-vrf)#rd 10.10.10.3:1700	Configure Route-Distinguisher value of 10.10.10.3:1700.
PE3(config-vrf)#route-target both 1700:1700	Configure import and export values for the vrf2 as 1700:1700.
PE3(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE3(config)#mac vrf vpls1001	Enter VRF mode named vpls1001.
PE3(config-vrf)#rd 10.10.10.3:1001	Configure Route-Distinguisher value of 10.10.10.3:1001.
PE3(config-vrf)#route-target both 1001:1001	Configure import and export values for the vpls1001 as 1001:1001.
PE3(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: EVPN and VRF Mapping

The below EVPN and VRF mapping configuration on PE3 is performed to establish mappings between EVPN identifiers and VRFs, facilitating efficient routing and connectivity in an EVPN network environment.

PE3(config)#evpn mpls id 1700 xconnect target-mpls-id 1800	Configure the EVPN-VPWS identifier with a source identifier of 1700 and a target identifier of 1800.
PE3(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Map VRF vrf2 to the EVPN-VPWS identifier
PE3(config-evpn-mpls)#commit	Commit the transaction.
PE3(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
PE3(config)#evpn mpls id 3000	Configure the EVPN-VPLS identifier an identifier of 3000.
PE3(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001	Map VRF vpls1001 to the EVPN-VPWS identifier
PE3(config-evpn-mpls)#commit	Commit the transaction.
PE3(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE3: Access Port Configuration for Port-active

The below access port configuration for port-active mode on PE3 is carried out to configure various parameters including system-MAC, load balancing, service carving preferences, and EVPN settings for efficient network access and connectivity.

PE3(config)#interface po1	Enter the port channel interface mode for po1
PE3(config-if)#load-interval 30	Set the load interval to 30.
PE3(config-if)#evpn multi-homed system-mac 0000.2222.7777 load-balancing port-active	Configure the system-mac address 0000.2222.7777 for port-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
PE3(config-if-es)#service-carving auto	Configure service carving as auto, allowing automatic determination of service distribution preferences.
PE3(config-if-es)#exit	Exit the EVPN ES mode and return to the configure mode.
PE3(config-if)#exit	Exit interface mode po1 and return to the configure mode.

`PE3(config)#commit`	Commit the transaction.
`PE3(config)#interface po1.1 switchport`	Create a Layer 2 sub-interface `po1.1` within the port channel.
`PE3(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.
`PE3(config-if)#load-interval 30`	Set the load interval to `30`.
`PE3(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE3(config-acc-if-evpn)#map vpn-id 1800`	Map VPN-ID `1800`.
`PE3(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE3(config-if)#exit`	Exit interface mode `po1.1` and return to the configure mode.
`PE3(config)#interface xe2`	Enter the interface mode for `xe2`.
`PE3(config-if)#speed 10g`	Set the speed to `10g`.
`PE3(config-if)#channel-group 1 mode active`	Attach LAG interface `po1`.
`PE3(config-if)#exit`	Exit interface mode `xe2` and return to the configure mode.
`PE3(config)#commit`	Commit the transaction.

PE3: Access Port Configuration for Single-active

The below access port configuration for single-active mode on PE3 is implemented to set up various parameters, including Ethernet Segment Identifier (ESI) settings, service carving preferences, and EVPN configurations, ensuring efficient network access and connectivity.

`PE3(config)#interface sa1`	Enter the single active interface mode for `sa1`.
`PE3(config-if)#load-interval 30`	Set the load interval to `30`.
`PE3(config-if)#evpn multi-homed esi 00:00:22:22:77:77 load-balancing single-active`	Configure the ESI with the value with the value `00:00:22:22:77:77` for single-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE3(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE3(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE3(config-if)#exit`	Exit interface mode `sa1` and return to the configure mode.
`PE3(config)#commit`	Commit the transaction.
`PE3(config)#interface sa1.1 switchport`	Create a Layer 2 sub-interface `sa1.1` within the port channel.
`PE3(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.
`PE3(config-if)#load-interval 30`	Set the load interval to `30`.
`PE3(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE3(config-acc-if-evpn)#map vpn-id 1800`	Map VPN-ID `1800`.
`PE3(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE3(config-if)#exit`	Exit interface mode `sa1.1` and return to the configure mode.
`PE3(config)#interface xe2`	Enter the interface mode for `xe2`.
`PE3(config-if)#speed 10g`	Set the speed to `10g`.
`PE3(config-if)#static-channel-group 1`	Attach the static-channel-group 1, the LAG interface `sa1` to `xe2`.

PE3(config-if)#exit	Exit interface mode xe2 and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE4: Loopback Interface

The configuration on PE4 for a loopback interface with IP address 10.10.10.4/32 secondary is set up to provide IP connectivity for the router.

PE4#configure terminal	Enter configure mode.
PE4(config)#interface lo	Enter the interface mode for the loopback interface lo.
PE4(config-if)#ip address 10.10.10.4/32 secondary	Configure a secondary IP address, 10.10.10.4/32, on the loopback interface.
PE4(config-if)#ip router isis 1	Enable ISIS routing on a loopback interface lo for area 1.
PE4(config-if)#prefix-sid index 800	Configure a prefix segment identifier (prefix-SID) index value as 800.
PE4(config-if)#exit	Exit interface mode lo.
PE4(config)#commit	Commit the transaction.

PE4: Configure SR

The following configurations aim to activate Segment Routing (SR) on PE4 and make MPLS the preferred method for segment routing, optimizing routing efficiency.

PE4(config)#segment-routing	Configure segment routing on PE4 device.
PE4(config-sr)#mpls sr-prefer	Set MPLS as the preferred segment routing protocol over others.
PE4(config-sr)#exit	Exit the router SR mode.
PE4(config)#commit	Commit the transaction.

PE4: Global LDP

The configuration on PE4 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

PE4(config)#router ldp	Enter the Router LDP mode.
PE4(config-router)#router-id 10.10.10.4	Set the router ID for LDP to 10.10.10.4.
PE4(config-router)#transport-address ipv4 10.10.10.4	Configure the transport address for IPv4 (for IPv6 use ipv6 parameter) to be used for a TCP session where LDP operates. Note: It is preferable to use the loopback address as the transport address.
PE4(config-router)#targeted-peer ipv4 10.10.10.1	Configure targeted peer for LDP using IPv4 addresses.
PE4(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE4(config-router)#targeted-peer ipv4 10.10.10.2	Configure targeted peer for LDP using IPv4 addresses.
PE4(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.

PE4(config-router)#targeted-peer ipv4 10.10.10.3	Configure targeted peer for LDP using IPv4 addresses.
PE4(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE4(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE4(config)#commit	Commit the transaction.

PE4: Global EVPN MPLS Command

The configuration on PE4 for the Global EVPN MPLS, includes activating EVPN MPLS, defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multi-homing, and activating EVPN MPLS multi-homing functionality, all of which are crucial for enabling EVPN MPLS features.

PE4(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE4, enabling it to participate in EVPN MPLS services.
PE4(config)#commit	Commit candidate configuration to be running configuration.
PE4(config)#evpn mpls vtep-ip-global 10.10.10.4	Configure the global VTEP IP address 10.10.10.4, associating it with the loopback IP.
PE4(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multi-homing.
PE4(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multi-homing functionality, allowing PE4 to support multi-homed EVPN MPLS services.
PE4(config)#commit	Commit the transaction.

PE4: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE4 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE4(config)#interface xe2	Enter interface mode xe2.
PE4(config-if)#ip address 10.1.5.1/30	Configure an IP address, 10.1.5.1/30, on the interface xe2.
PE4(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE4(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE4(config-if)#ip router isis 1	Enable ISIS routing on an interface xe2 for area 1.
PE4(config-if)#exit	Exit interface mode xe2.
PE4(config)#commit	Commit the transaction.
PE4(config)#interface xe0	Enter interface mode xe0.
PE4(config-if)#ip address 10.1.8.1/30	Configure an IP address, 10.1.8.1/30, on the interface xe0.
PE4(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE4(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.

PE4(config-if)#ip router isis 1	Enable ISIS routing on an interface xe2 for area 1.
PE4(config-if)#exit	Exit interface mode xe0.
PE4(config)#commit	Commit the transaction.

PE4: ISIS Configuration

The below configuration is performed to set up ISIS on PE4, to enable MPLS Traffic Engineering, Segment Routing, and other related features for efficient routing and network management.

PE4(config)#router isis 1	Enter router ISIS mode.
PE4(config-router)#is-type level-1-2	Configure IS-Type as Level-1-2 specifies that the router will participate in both Level-1 and Level-2 areas within the ISIS network.
PE4(config-router)#metric-style wide	Configure the new style of metric type as wide.
PE4(config-router)#mpls traffic-eng router-id 10.10.10.4	Configure the router's MPLS Traffic Engineering (TE) router ID TLV to 10.10.10.4, which is used for MPLS-TE path calculations.
PE4(config-router)#mpls traffic-eng level-1	Enable MPLS-TE for IS-Type Level-1 routing.
PE4(config-router)#mpls traffic-eng level-2	Enable MPLS-TE for IS-Type Level-2 routing.
PE4(config-router)#capability cspf	Enable Constraint Shortest Path First (CSPF) computation for traffic engineering.
PE4(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
PE4(config-router)#fast-reroute ti-lfa level-1 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
PE4(config-router)#fast-reroute ti-lfa level-2 proto ipv4	Configure Remote Loop-Free Alternate (LFA) to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
PE4(config-router)#bfd all-interfaces	Configure BFD on all interfaces for fast link failure detection.
PE4(config-router)#net 49.0000.0000.0004.00	Set a Network Entity Title (NET) for this ISIS instance, specifying the area address and the system ID.
PE4(config-router)#isis segment-routing global block 17000 23500	Enable ISIS SR globally and allocates label blocks for Segment Routing.
PE4(config-router)#segment-routing mpls	Enable SR ISIS.
PE4(config-router)#exit	Exit router ISIS mode and return to configure mode.
PE4(config)#commit	Commit the transaction.

PE4: BGP Configuration

The below BGP configuration on PE4 is established to enable BGP routing with ASN 65010, set the BGP router ID, define iBGP neighbors, configure BFD, and enable the EVPN address family for efficient routing in an EVPN environment.

PE4(config)#router bgp 65010	Enter the Router BGP mode, ASN: 65010
PE4(config-router)#bgp router-id 10.10.10.4	Configure BGP router ID 10.10.10.4, identifying PE4 within the BGP network.
PE4(config-router)#neighbor 10.10.10.1 remote-as 65010	Configure neighbor 10.10.10.1 as an iBGP neighbor with their remote AS number 65010.

PE4(config-router)#neighbor 10.10.10.1 update-source lo	Configure neighbor 10.10.10.1 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE4(config-router)#neighbor 10.10.10.2 remote-as 65010	Configure neighbor 10.10.10.2 as an iBGP neighbor with their remote AS number 65010.
PE4(config-router)#neighbor 10.10.10.2 update-source lo	Configure neighbor 10.10.10.2 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE4(config-router)#neighbor 10.10.10.3 remote-as 65010	Configure neighbor 10.10.10.3 as an iBGP neighbor with their remote AS number 65010.
PE4(config-router)#neighbor 10.10.10.3 update-source lo	Configure neighbor 10.10.10.3 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE4(config-router)#neighbor 10.10.10.1 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE4(config-router)#neighbor 10.10.10.2 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE4(config-router)#neighbor 10.10.10.3 fall-over bfd multihop	Configure BFD for the BGP neighbor to provide rapid failure detection.
PE4(config-router)#neighbor 10.10.10.1 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE4(config-router)#neighbor 10.10.10.2 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE4(config-router)#neighbor 10.10.10.3 advertisement-interval 0	Configure advertisement interval for the neighbor, allowing more frequent BGP updates.
PE4(config-router)#address-family l2vpn evpn	Enter into address family mode for L2VPN EVPN.
PE4(config-router-af)#neighbor 10.10.10.1 activate	Activate EVPN for iBGP neighbor 10.10.10.1 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE4(config-router-af)#neighbor 10.10.10.2 activate	Activate EVPN for iBGP neighbor 10.10.10.2 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE4(config-router-af)#neighbor 10.10.10.3 activate	Activate EVPN for iBGP neighbor 10.10.10.3 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE4(config-router-af)#exit	Exit address family mode and return to the router BGP mode.
PE4(config-router)#commit	Commit the transaction.
PE4(config-router)#exit	Exit router BGP mode and return to the configure mode.

PE4: MAC VRF Configuration

The below MAC VRF configuration on PE4 is carried out to define and set up VRFs named vrf2 and vpls1001 with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

PE4(config)#mac vrf vrf2	Enter VRF mode named vrf2.
PE4(config-vrf)#rd 10.10.10.4:1700	Configure Route-Distinguisher value of 10.10.10.4:1700.

`PE4(config-vrf)#route-target both 1700:1700`	Configure import and export values for the `vrf2` as `1700:1700`.
`PE4(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE4(config)#mac vrf vpls1001`	Enter VRF mode named `vpls1001`.
`PE4(config-vrf)#rd 10.10.10.4:1001`	Configure Route-Distinguisher value of `10.10.10.4:1001`.
`PE4(config-vrf)#route-target both 1001:1001`	Configure import and export values for the `vpls1001` as `1001:1001`.
`PE4(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE4(config)#commit`	Commit the transaction.

PE4: EVPN and VRF Mapping

The below EVPN and VRF mapping configuration on PE4 is performed to establish mappings between EVPN identifiers and VRFs, facilitating efficient routing and connectivity in an EVPN network environment.

`PE4(config)#evpn mpls id 1700 xconnect target-mpls-id 1800`	Configure the EVPN-VPWS identifier with a source identifier of `1700` and a target identifier of `1800`.
`PE4(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Map VRF `vrf2` to the EVPN-VPWS identifier
`PE4(config-evpn-mpls)#commit`	Commit the transaction.
`PE4(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.
`PE4(config)#evpn mpls id 3000`	Configure the EVPN-VPLS identifier an identifier of `3000`.
`PE4(config-evpn-mpls)#host-reachability-protocol evpn-bgp vpls1001`	Map VRF `vpls1001` to the EVPN-VPWS identifier
`PE4(config-evpn-mpls)#commit`	Commit the transaction.
`PE4(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.

PE4: Access Port Configuration for Port-active

The below access port configuration for port-active mode on PE4 is carried out to configure various parameters including system-MAC, load balancing, service carving preferences, and EVPN settings for efficient network access and connectivity.

`PE4(config)#interface po1`	Enter the port channel interface mode for `po1`
`PE4(config-if)#load-interval 30`	Set the load interval to `30`.
`PE4(config-if)#evpn multi-homed system-mac 0000.2222.7777 load-balancing port-active`	Configure the system-mac address `0000.2222.7777` for port-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
`PE4(config-if-es)#service-carving auto`	Configure service carving as `auto`, allowing automatic determination of service distribution preferences.
`PE4(config-if-es)#exit`	Exit the EVPN ES mode and return to the configure mode.
`PE4(config-if)#exit`	Exit interface mode `po1` and return to the configure mode.
`PE4(config)#commit`	Commit the transaction.
`PE4(config)#interface po1.1 switchport`	Create a Layer 2 sub-interface `po1.1` within the port channel.
`PE4(config-if)#encapsulation dot1q 100`	Set encapsulation to dot1q with VLAN ID `100`.

PE4(config-if)#load-interval 30	Set the load interval to 30.
PE4(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE4(config-acc-if-evpn)#map vpn-id 1800	Map VPN-ID 1800.
PE4(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE4(config-if)#exit	Exit interface mode po1.1 and return to the configure mode.
PE4(config)#interface xe11	Enter the interface mode for xe11.
PE4(config-if)#speed 10g	Set the speed to 10g.
PE4(config-if)#channel-group 1 mode active	Attach LAG interface po1.
PE4(config-if)#exit	Exit interface mode xe11 and return to the configure mode.
PE4(config)#commit	Commit the transaction.

PE4: Access Port Configuration for Single-active

The below access port configuration for single-active mode on PE4 is implemented to set up various parameters, including Ethernet Segment Identifier (ESI) settings, service carving preferences, and EVPN configurations, ensuring efficient network access and connectivity.

PE4(config)#interface sa2	Enter the single active interface mode for sa2.
PE4(config-if)#load-interval 30	Set the load interval to 30.
PE4(config-if)#evpn multi-homed esi 00:00:22:22:77:77 load-balancing single-active	Configure the ESI with the value with the value 00:00:22:22:77:77 for single-active mode, which plays a role in load balancing and enter to the EVPN Ethernet Segment (ES) mode.
PE4(config-if-es)#service-carving auto	Configure service carving as auto, allowing automatic determination of service distribution preferences.
PE4(config-if-es)#exit	Exit the EVPN ES mode and return to the configure mode.
PE4(config-if)#exit	Exit interface mode sa2 and return to the configure mode.
PE4(config)#commit	Commit the transaction.
PE4(config)#interface sa2.1 switchport	Create a Layer 2 sub-interface sa2.1 within the port channel.
PE4(config-if)#encapsulation dot1q 100	Set encapsulation to dot1q with VLAN ID 100.
PE4(config-if)#load-interval 30	Set the load interval to 30.
PE4(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE4(config-acc-if-evpn)#map vpn-id 1800	Map VPN-ID 1800.
PE4(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE4(config-if)#exit	Exit interface mode sa2.1 and return to the configure mode.
PE4(config)#interface xe11	Enter the interface mode for xe11.
PE4(config-if)#speed 10g	Set the speed to 10g.
PE4(config-if)#static-channel-group 2	Attach the static-channel-group 2, the LAG interface sa2 to xe11.
PE4(config-if)#exit	Exit interface mode xe11 and return to the configure mode.
PE4(config)#commit	Commit the transaction.

CE2

The following configuration steps under CE2 are set up to enable VLANs and configure interfaces for carrying VLAN traffic.

`CE2#configure terminal`	Enter configure mode.
`CE2(config)#bridge 1 protocol ieee vlan-bridge`	Set up `bridge 1` to use the IEEE VLAN bridge protocol.
`CE2(config)#vlan 2-100 bridge 1 state enable`	Configure VLANs from `2-100` and associate them with bridge 1.
`CE2(config)#interface xe24`	Enter interface mode `xe24`.
`CE2(config-if)#switchport`	Configure the interface `xe24` as a Layer 2 switch port.
`CE2(config-if)#bridge-group 1`	Associate `xe24` to bridge 1.
`CE2(config-if)#switchport mode trunk`	Configure `xe24` as a trunk port.
`CE2(config-if)#switchport trunk allowed vlan all`	Allow all configured VLANs on the trunk interface `xe24`.
`CE2(config-if)#exit`	Exit interface mode `xe24`.
`CE2(config)#interface po1`	Enter interface mode and configure LAG interface port-channel 1 (`po1`).
`CE2(config-if)#switchport`	Configures port-channel 1 as a Layer 2 switch port.
`CE2(config-if)#bridge-group 1`	Associate `po1` to bridge 1.
`CE2(config-if)#switchport mode trunk`	Configure `po1` as a trunk port.
`CE2(config-if)#switchport trunk allowed vlan all`	Allow all configured VLANs on the trunk port-channel `po1`.
`CE2(config-if)#exit`	Exit interface mode `po1`.
`CE2(config)#interface xe22`	Enter interface mode `xe22`.
`CE2(config-if)#lacp timeout short`	Configure LACP timeout as `short`.
`CE2(config-if)#channel-group 1 mode active`	Add member to the LAG interface.
`CE2(config-if)#exit`	Exit interface mode `xe22`.
`CE2(config-if)#interface xe23`	Enter interface mode `xe23`.
`CE2(config-if)#lacp timeout short`	Configure LACP timeout as `short`.
`CE2(config-if)#channel-group 1 mode active`	Add member to the LAG interface.
`CE2(config-if)#commit`	Commit the transaction.
`CE2(config-if)#end`	Exit interface mode `xe23` and configure mode.

EVPN SR Active-Standby MH Validation

This section provides show outputs validation for port-active mode, covering ELINE and ELAN services with SR as the underlay MPLS path.

The following show output displays the forwarding table entries on PE1, PE2, PE3, and PE4 devices in the network Figure 3-8 using the **show mpls forwarding-table** command.

```
PE1#show mpls forwarding-table
Codes: > - installed FTN, * - selected FTN, p - stale FTN, ! - using backup
       B - BGP FTN, K - CLI FTN, (t) - tunnel, P - SR Policy FTN, (b) - bypass,
       L - LDP FTN, R - RSVP-TE FTN, S - SNMP FTN, I - IGP-Shortcut,
       U - unknown FTN, O - SR-OSPF FTN, i - SR-ISIS FTN, k - SR-CLI FTN
       (m) - FTN mapped over multipath transport, (e) - FTN is ECMP
```

```
FTN-ECMP LDP: Disabled

Implementation Examples

Scenario: Customer wants to achieve redundancy for its hosts in a network using Single-Active or Port-Active redundancy.

- Customer configures the `evpn multi-homed` command with the `load-balancing single-active or load-balancing port-active` option on the relevant PE interfaces.
- Single-Active or Port-Active redundancy is now in effect, ensuring redundancy for hosts.
- The feature works in conjunction with other EVPN-related configurations, such as VRF, VLAN mapping, and other EVPN settings.

New CLI Commands

The EVPN Active-Standby feature introduces the following configuration commands. For more information of the EVPN MPLS commands, see the EVPN MPLS Commands chapter in the *Multi-Protocol Label Switching Guide*.

service-carving ac-driven

Use this command to enable the AC-influenced method for any selected Designated Forwarder (DF) algorithm.

Enabling the `ac-driven` method allows the Designated Forwarder (DF) algorithm to be influenced by the Attachment Circuits (AC's) associated with a specific Ethernet Segment (ES). This means that the DF selection is based on the AC's characteristics and conditions, such as whether an AC is operational UP, mapped, or unmapped on the ESI.

Use `no` form of this command to disable the AC-influenced method for any selected Designated Forwarder (DF) algorithm.

Command Syntax

```
service-carving ac-driven
no service-carving ac-driven
```

Parameters

None

Default

`ac-driven` is disabled.

Command Mode

EVPN Ethernet Segment (ES) Mode

Applicability

This command was introduced in the OcNOS version 6.4.2.

Example

The provided examples showcase the configuration of the `service-carving ac-driven` command in EVPN Ethernet Segment (ES) mode. The first two examples demonstrate enabling this feature with different DF election methods, and the final example illustrates the command to disable `service-carving ac-driven`.

```
OcNOS#configure terminal
OcNOS(config)#interface sa1
OcNOS(config-if)#evpn multi-homed esi 11:22:33:44:55:66:77:88:99 load-
balancing single-active
OcNOS(config-if-es)#service-carving preference-based
OcNOS(config-if-es)#service-carving ac-driven
OcNOS(config-if-es)#end

OcNOS#configure terminal
OcNOS(config)#interface sa1
OcNOS(config-if)#evpn multi-homed esi 11:22:33:44:55:66:77:88:99 load-
balancing single-active
OcNOS(config-if-es)#service-carving auto
OcNOS(config-if-es)#service-carving ac-driven

OcNOS(config-if-es)#no service-carving ac-driven
OcNOS(config-if-es)#end
```

service-carving

Use this command to provide the flexibility to select the Designated Forwarder (DF) election algorithm based on preference based or modulo-based DF election.

Use no form of this command to disable service-carving.

Command Syntax

```
service-carving (preference-based|auto)
no service-carving
```

Parameters

`preference-based`	Select the DF election algorithm based on preference based.
`auto`	Select the DF election algorithm based on modulo based.

Default

None

Command Mode

EVPN ES Mode

Applicability

This command was introduced in the OcNOS version 6.4.1.

Example

The following examples demonstrate the configuration of the `service-carving` command in both `single-active` or `port-active` mode for the EVPN multi-homed system, with one utilizing `auto` service carving and the other using `preference-based` service carving.

```
OcNOS#configure terminal
OcNOS(config)#interface sa1
OcNOS(config-if)#evpn multi-homed esi 11:22:33:44:55:66:77:88:99 load-
balancing single-active
OcNOS(config-if-es)#service-carving auto
OcNOS(config-if-es)#end

OcNOS#configure terminal
OcNOS(config)#interface po1
OcNOS(config-if)#evpn multi-homed system-mac 0000.0000.0011 load-balancing
port-active
OcNOS(config-if-es)#service-carving auto
OcNOS(config-if-es)#end

OcNOS#configure terminal
OcNOS(config)#interface po1
OcNOS(config-if)#evpn multi-homed system-mac 0000.0000.0011 load-balancing
port-active
OcNOS(config-if-es)#service-carving preference-based
OcNOS(config-if-es)#end
```

The following example is used to disable the `service-carving` for the EVPN multi-homed system.

```
OcNOS(config-if-es)#no service-carving
OcNOS(config-if-es)#end
```

service-carving weight

Use this command to specify a preference value when the preference-based Designated Forwarder (DF) election algorithm is selected. This preference value determines the priority of the local PE device to become the DF for a particular Ethernet segment.

Use no form of this command to replace the preference weight value and choose the default preference value.

Command Syntax

```
service-carving weight <1-65535>

no service-carving weight
```

Parameters

`weight <1-65535>` Specifies the preference weight value. A lower weight value indicates a higher priority for becoming the DF.

Default

The service-carving weight command is set to 32767 by default.

Command Mode

EVPN Ethernet Segment (ES) Mode

Applicability

This command was introduced in the OcNOS version 6.4.1.

Example

The `service-carving weight` command is used to configure the preference weight value for service-carving in both port-active and single-active modes.

```
OcNOS#configure terminal
OcNOS(config)#interface po1
OcNOS(config-if)#evpn multi-homed system-mac 0000.0000.0011 load-balancing
port-active
OcNOS(config-if-es)#service-carving preference-based
OcNOS(config-if-es)#service-carving weight 100
OcNOS(config-if-es)#end

OcNOS#configure terminal
OcNOS(config)#interface sa1
OcNOS(config-if)#evpn multi-homed esi 11:22:33:44:55:66:77:88:99 load-
balancing single-active
OcNOS(config-if-es)#service-carving preference-based
OcNOS(config-if-es)#service-carving weight 100
```

To disable the configured weight, use the `no service-carving weight` command.

```
OcNOS(config-if-es)#no service-carving weight
OcNOS(config-if-es)#end
```

Revised CLI Commands

Below is the revised command for configuring EVPN Active-Standby.

evpn multi-homed

- The command `evpn multi-homed` allows users to configure single-active and port-active load-balancing Ethernet Segment Identifier (ESI) on a link with a multihomed Customer Edge (CE) in the context of EVPN multi-homed configurations. For more details, refer to the evpn multi-homed command in the EVPN MPLS Commands chapter in the Multi-Protocol Label Switching Guide.
- The existing syntax now includes the newly added parameter for load-balancing, namely `single-active and port-active`.

Troubleshooting

To ensure the reliable operation of the single-active or port-active setup and maintain data accuracy and consistency, follow these troubleshooting steps:

1. Verify the Configuration:
   - Use the `show running-config` command to confirm that the ESI configuration includes `load-balancing single-active or port-active`, such as:

     ```
     evpn multi-homed esi 11:22:33:44:55:66:77:88:99 load-balancing single-active
     or
     evpn multi-homed system-mac 0000.4321.1234 load-balancing port-active
     ```
   - Ensure that the `service-carving` algorithm type is configured.

2. Verify the `show` command:
   - Use the `show bgp l2vpn evpn multihoming es-route` command to confirm that it matches the `service-carving` algorithm type.
   - Use the `show evpn load-balance single-active or port-active` command to verify the status of the Multihomed (MH) nodes as `ACTIVE` and `STANDBY`.

3. **Ensure Proper Connectivity:** Validate the connectivity between the router and the EVPN tunnel to ensure it is up. This involves verifying network settings, ports, and firewalls.

4. **For the server:** Enable debugging on OcNOS and enable debug mode. Verify the logs in `/var/log/messages` for further insights.

Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

Acronym	Description
EVPN	Ethernet Virtual Private Network
ELINE	Ethernet Line services
ELAN	Ethernet LAN services
LAN	Local Area Network
CE	Customer Edge
PE	Provider Edge
MH	Multihoming
AC	Attachment Circuit
LACP	Link Aggregation Control Protocol
BUM	Broadcast, Unknown Unicast, Multicast
MAC	Media Access Control
ARP/ND	Address Resolution Protocol/Neighbor Discovery
DF	Designated Forwarder

© 2025 IP Infusion Inc. Proprietary

Glossary

The following provides definitions for key terms used throughout this document.

Ethernet Virtual Private Network (EVPN)	A network technology that extends Layer 2 Ethernet services over a Layer 3 IP/MPLS network.
Ethernet Line services (ELINE)	Two PEs are directly connected over an Ethernet link, enabling redundancy and efficient data exchange.
Ethernet LAN services (ELAN)	A group of PEs are interconnected in a multipoint Ethernet network, providing redundancy and optimized data transfer.
Port-Active	A redundancy mechanism in which multiple Provider Edge (PE) devices can be active simultaneously for the same host or MAC address, with specific active ports associated with each active PE.
Single-Active	A redundancy mechanism in which only one of the Provider Edge (PE) devices is active at a time for handling traffic for a specific host or MAC address.
Customer Edge (CE)	A device at the customer's network edge that connects to the service provider's network.
Provider Edge (PE)	A device at the service provider's network edge that connects to customer edge devices.
Multihoming (MH)	Connecting a host or CE device to multiple PE devices for redundancy and load balancing.
Attachment Circuit (AC)	The connection between a CE device and a PE device in an EVPN network.
Link Aggregation Control Protocol (LACP)	A protocol used to manage and bundle multiple physical links into a single logical link for higher bandwidth and redundancy.
Broadcast, Unknown Unicast, Multicast (BUM)	Categories of network traffic that includes broadcast, unknown unicast, and multicast packets.
Media Access Control (MAC)	A unique identifier assigned to network interfaces, typically associated with a hardware address.
Address Resolution Protocol/Neighbor Discovery (ARP/ND)	Protocols used to map IP addresses to MAC addresses in a local network.
Designated Forwarder (DF)	A PE device selected to forward broadcast, unknown unicast, and multicast traffic within an Ethernet segment.
Redundancy	The provision of duplicate equipment or links to ensure network availability in case of failures.
Failover	The process of switching to a backup device or link in case of a primary device or link failure.
Resiliency	The ability of a network to maintain its functionality even in the face of failures or disruptions.
Unicast	Communication between a single sender and a single receiver in a network.
Multicast	Communication from a single sender to multiple receivers in a network.

Egress	The process of traffic leaving a device or network segment.
Standby	In redundancy, a secondary device or link that is ready to take over in case the primary device or link fails.
Active	In redundancy, the primary device or link that is currently handling traffic.
Forwarding	The process of transmitting network packets from one device to another.
Link State	The operational status of a network link, indicating whether it is up or down.
Virtual Routing and Forwarding (VRF)	A technology that enables multiple instances of a routing table to coexist within a router.
Virtual Local Area Network (VLAN)	A logical network segment within a physical network.
Data Exchange	The process of sending and receiving data between network devices.
Downtime	The period during which a network or service is not available due to maintenance or failures.

CHAPTER 4 EVPN MPLS E-Tree

Overview

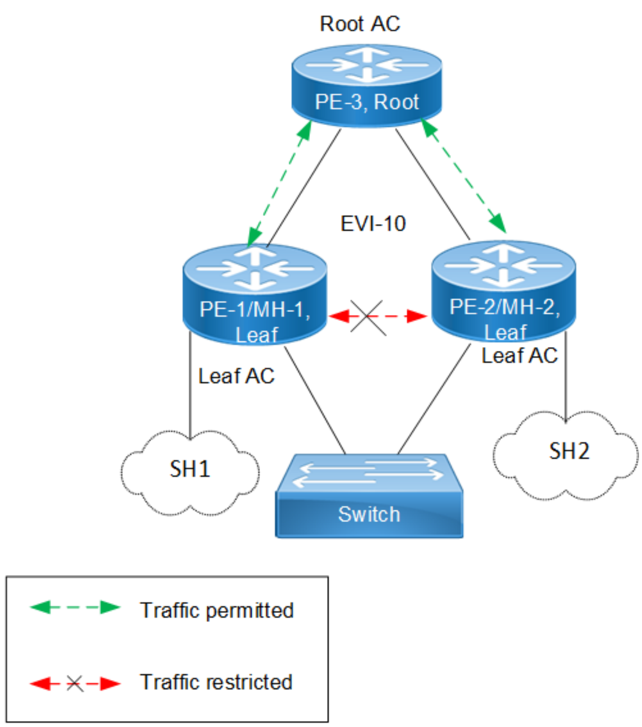
Ethernet VPN Ethernet-Tree (EVPN E-Tree), is a networking solution designed to manage communication within broadcast domains, incorporating redundancy through multi-homing in a network. It optimizes traffic routing and control, especially in scenarios where specific services or devices need controlled communication. It categorizes network nodes based on predefined definitions of EVPN Instances as Leaf or Root, allowing or restricting communication between them.

Feature Characteristics

Implemented Scenario 1 of the EVPN E-Tree solution, as defined by RFC-8317, designates each Provider Edge (PE) node as either a Leaf or a Root site per Virtual Private Network (VPN) for VXLAN and MPLS EVPN in OcNOS.

Scenario 1: Leaf or Root Site(s) per PE

Scenario 1 involves a topology with three PE nodes: PE-1, PE-2, and PE-3. PE-1 and PE-2 are Multi-Homed nodes (MH-1 and MH-2), with PE-3 acting as the Root node. PE-1 and PE-2 function as Leaf nodes and are part of a single home access interface (SH1 and SH2).



EVPN E-Tree

The classification ensures that communication follows specific rules:

- Communication between Leaf hosts is restricted, as indicated by red dotted lines with a cross mark (X) in the topology diagram. However, communication between Leaf and Root nodes, as well as between Root nodes, is permitted, marked by green dotted lines.

© 2025 IP Infusion Inc. Proprietary

- Leaf nodes within PE-1 and PE-2 are isolated from each other, preventing intra-PE communication.

The scenario 1 is achieved through two main concepts:

1. **Inter-PE Communication**
   - The inter-PE Route Target (RT) Constraint Method is applicable only to Single-Homing (SH) devices. Two RTs per broadcast domain are utilized, with Leaf PEs exporting Leaf RTs and Root nodes exporting Root RTs. Leaf nodes import only Root RTs, allowing communication with Root PEs while preventing communication with other Leaf nodes. RT constraints limit the import of specific EVPN routes (MAC-IP and IMET routes) to designated paths for inter-PE communication.
   - IPI employs a proprietary method to support inter-PE connectivity for both SH and MH devices, using BGP extended community to advertise Leaf Indication in BGP routes and influence traffic flow for both Unicast and BUM traffic. This method enables implementation of ARP or ND cache suppression and MAC mobility sub-features specified in RFC-7432.
2. **Intra-PE communication:** Local Split Horizon controls intra-PE communication between Attachment Circuits (ACs) within Leaf PE nodes, ensuring that traffic between ACs does not egress to other Leaf ACs.

   Note: This functionality depends on hardware capabilities.

Benefits

EVPN E-Tree offers benefits in networking environments by providing efficient traffic control, enhanced security, scalability, and improved performance.

Efficient Traffic Control: EVPN E-Tree allows for efficient control over traffic within network broadcast domains. By segregating nodes into Leaf and Root categories, it enables precise management of communication flows, ensuring the traffic is directed only where needed.

Enhanced Security: The isolation of Leaf hosts from each other adds a layer of security to the network. This prevents unauthorized communication between devices within the same broadcast domain, reducing the risk of data breaches and unauthorized access.

Scalability: EVPN E-Tree is scalable, making it suitable for networks of various sizes and complexities. Whether deploying in small-scale environments or large enterprise networks, EVPN E-Tree offers flexibility and scalability to meet evolving business needs.

Improved Performance: By controlling communication paths and optimizing traffic flows, EVPN E-Tree can improve network performance. This ensures that critical data packets are delivered efficiently, reducing latency and enhancing overall network performance.

Prerequisites

In setting up a MPLS EVPN network, certain prerequisites are essential to ensure proper functionality and connectivity.

Ensure MPLS EVPN Configuration: Confirm that MPLS EVPN and MPLS MH filtering are already enabled in all leaf and root nodes of the network as they are required for MPLS EVPN Multihoming.

```
!
hardware-profile filter evpn-mpls-mh enable
!
evpn mpls enable
!
evpn mpls multihoming enable
!
qos enable
```

```
!
```

Define Interfaces and Loopback Addresses: Configure Layer 2 interfaces, like port channel interfaces (e.g., po1), and assign specific system MAC addresses for proper identification and routing. Additionally, assign loopback IP addresses to establish essential points of connectivity. These configurations establish the efficient network routing and communication.

```
!
interface po1
 switchport
 load-interval 30
 evpn multi-homed system-mac 0000.4321.1234
!
interface lo
 ip address 8.8.8.8/32 secondary
 ip router isis ISIS-IGP
 enable-ldp ipv4
!
interface xe8
 switchport
!
interface xe26
 channel-group 1 mode active
!
```

Configure ISIS and BGP for Dynamic Routing: Enable ISIS to facilitate dynamic routing on all Leaf and Root nodes within the network. Define ISIS router instances to match loopback IP addresses and add network segments to ISIS areas for proper route distribution. Additionally, establish BGP sessions to advertise routes between different nodes. Set up neighbor relationships using loopback IP addresses, ensuring efficient route advertisement and convergence for optimal network performance.

```
!
router isis ISIS-IGP
 is-type level-1
 ignore-lsp-errors
 lsp-gen-interval 5

 !
 exit
!
```

Configure LDP and RSVP for Efficient Network Operation: Enable Label Distribution Protocol (LDP) and Resource Reservation Protocol (RSVP) on all Leaf and Root nodes to optimize traffic routing and quality of service. LDP assigns labels for packet forwarding, while RSVP reserves network resources along specified paths to enhance network performance and reliability.

```
!
router ldp

 primary path LEAF1-ROOT1
 to 9.9.9.9
!
rsvp-trunk LEAF1-ROOT2 ipv4
 primary fast-reroute protection facility
 primary path LEAF1-ROOT2
 to 24.24.24.24
!
```

Create VRF for Isolated Routing Instances: Configure VRF on all Leaf and Root nodes to create isolated routing instances within the network. This enables separate routing tables and forwarding behaviors for different groups of network resources.

```
!
mac vrf vrf103
 rd 8.8.8.8:103
 route-target both 65535:103
```

```
!
```

Connect Network Interfaces: Configure network interfaces on all Leaf and Root nodes with connection details, IP addresses, and protocol settings. Enable label-switching and configure participation in the ISIS routing protocol, including support for protocols like LDP and RSVP for IPv4. These configurations optimize routing and resource management across the network.

```
!
interface xe11
 description connected to ROOT2 int xe9
 ip address 24.1.4.25/24
 label-switching
 ip router isis ISIS-IGP
 enable-ldp ipv4
 enable-rsvp
!
interface xe20
 description connected to ROOT1 int xe20
 ip address 26.1.2.27/24
 label-switching
 ip router isis ISIS-IGP
 enable-ldp ipv4
 enable-rsvp
!
```

Configure Switch: Set up a VLAN bridge by enabling the VLAN and associating specific VLANs with the bridge. Configure network interfaces as trunk ports to allow traffic for all permitted VLANs across the network. Designate interfaces connected to Leaf and Root nodes as member ports of the VLAN bridge. This setup optimizes network segmentation and traffic management

```
!
bridge 1 protocol rstp vlan-bridge
!
vlan database
 vlan-reservation 4030-4094
 vlan 2-3010 bridge 1 state enable
!
interface po100

!
 exit
```

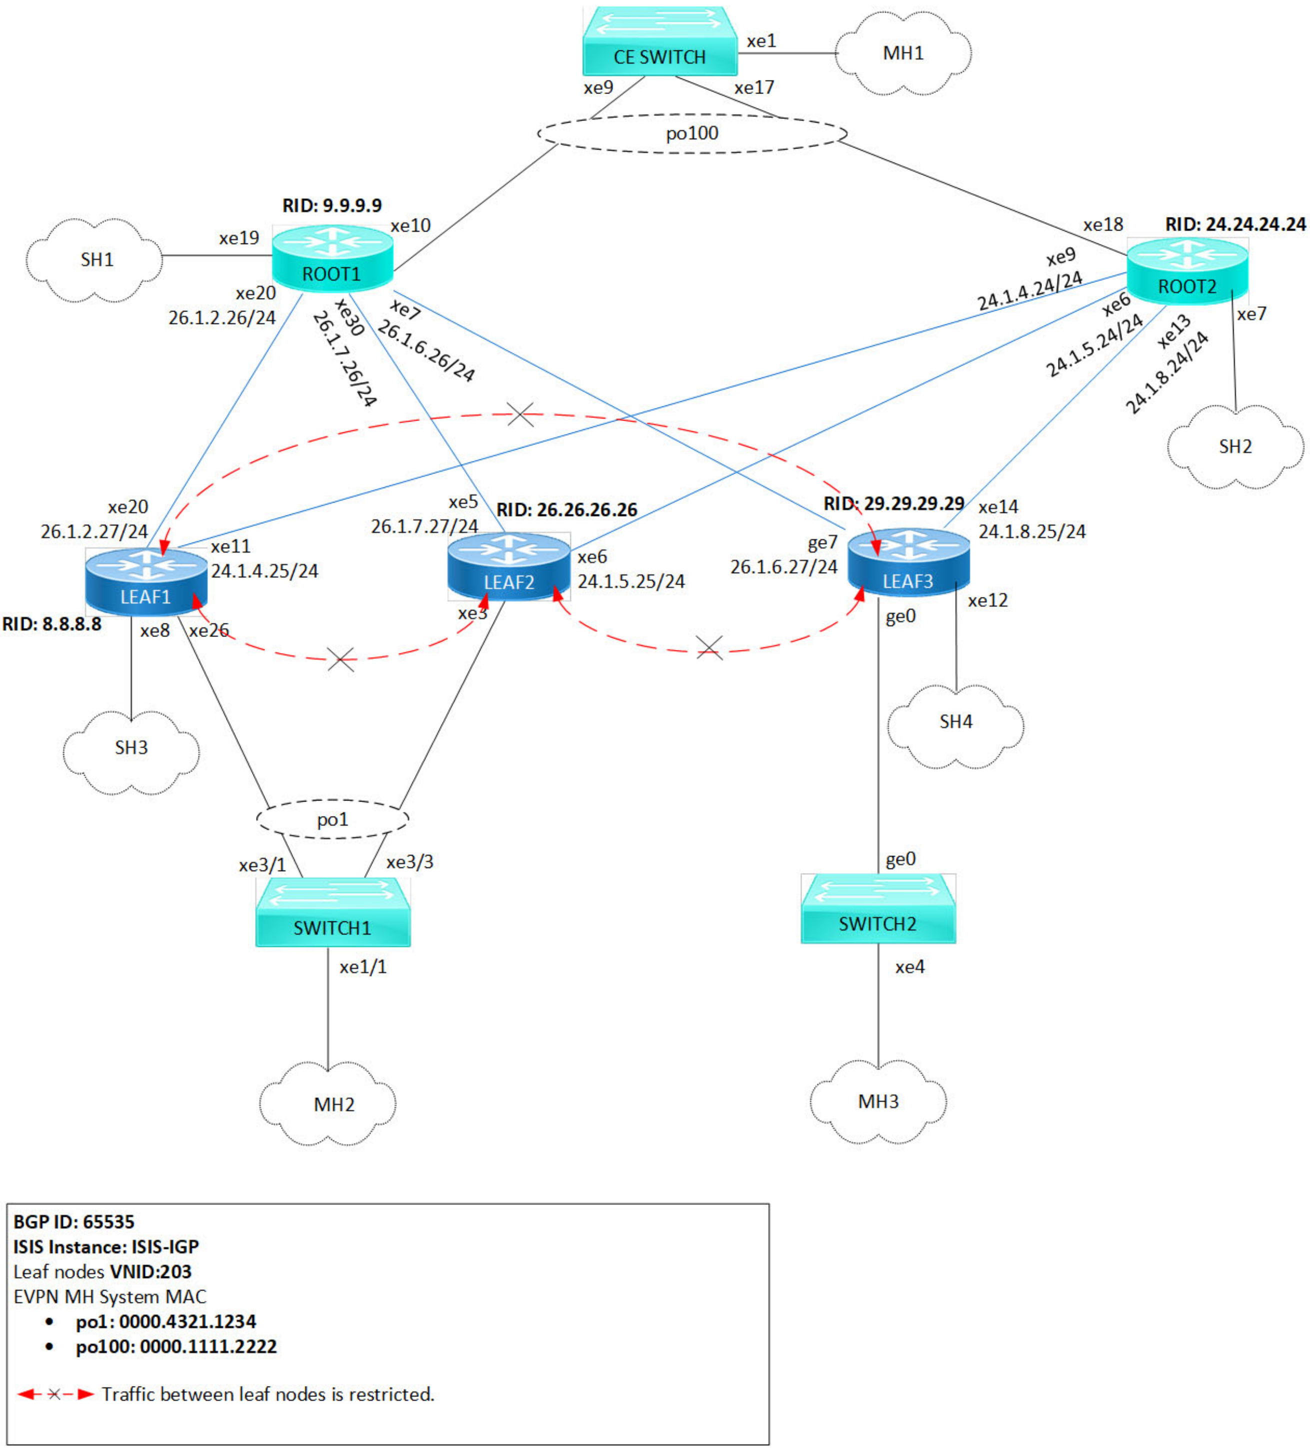
!

Configuration

Configure various nodes within the topology to set up an MPLS EVPN E-Tree network, ensuring EVPN E-Tree for All-Active and Active-Standby redundancy and load balancing.

Topology

In the sample topology, Leaf nodes (LEAF1, LEAF2, LEAF3, and LEAF4), Root nodes (ROOT1 and ROOT2), and Switches (CE SWITCH, SWITCH1, and SWITCH2) form the network architecture. LEAF1 and LEAF2 are part of a Multi-homed group, with both connected to `po1` (MH2). LEAF1 and LEAF3 have single home access-if ports (SH3 and SH4, respectively). Similarly, ROOT1 and ROOT2 are part of a Multi-homed group with `po100` (MH1), and they each have a single home access-if port (SH1 and SH2, respectively). Leaf nodes are interconnected, and CE SWITCH, SWITCH1, and SWITCH2 are configured for Multi-homed connections to Leaf and Root nodes. SWITCH1 connects to LEAF1 and LEAF2, while CE SWITCH links to ROOT1 and ROOT2.



MPLS EVPN E-Tree Topology

Note: Before configuring E-Tree, meet all Prerequisites for the following nodes:

- Leaf nodes: LEAF1, LEAF2, and LEAF3
- Root nodes: ROOT1 and ROOT2
- Switches: CE SWITCH, SWITCH1 and SWITCH2

Enable EVPN E-Tree

The following E-Tree configurations applies to Leaf and Root nodes within the MPLS network.

1. Enable EVPN E-Tree which allows the nodes to participate in E-Tree functionality within the network, controlling traffic and establishing hierarchical connections between Leaf nodes in the network architecture.

   ```
   (config)#evpn etree enable
   ```

2. Set the MAC ageing time (60 seconds) to allow MAC addresses learned over EVPN MPLS to remain in the MAC table before timing out. Configure the global VTEP IP address (8.8.8.8) which serves as the global identifier for MPLS encapsulation and decapsulation within the network, facilitating proper communication and tunnel establishment.

   ```
   (config)#evpn mpls mac-ageing-time 60
   (config)#evpn mpls vtep-ip-global 8.8.8.8
   ```

3. Define MPLS identifier (203) to support hierarchical connectivity and traffic control within the EVPN MPLS network. On the EVPN MPLS node, specify EVPN-BGP as the host reachability protocol for the specified VRF (vrf103) to communicate and exchange reachability information within the network. To enable EVPN E-Tree on Leaf nodes, configure etree-leaf along with the MPLS identifier. This allows for efficient replication of traffic at the ingress point, optimizing the functionality of E-Tree Leaf nodes within the network architecture.

   ```
   (config)#evpn mpls id 203 etree-leaf
   (config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf103
   (config-evpn-mpls)#exit
   ```

4. Enable port-VLAN mapping (po1) with VLAN ID (103) to facilitate multi-homed access. Enable EVPN functionality on the interface, allowing it to participate in MAC address distribution across the network.

   ```
   (config)#interface po1.103 switchport
   (config-if)#encapsulation dot1q 103
   (config-if)#load-interval 30
   (config-access-if)#access-if-evpn
   (config-access-if)#exit
   ```

Validation

Use the show commands described in this section to verify the network for proper MPLS EVPN E-Tree configuration.

Verify LDP sessions on all leaf and root nodes by using the show ldp session command. The state field (OPERATIONAL) indicates that the LDP session between the device and its peers is currently active.

```
LEAF1#show ldp session
Codes: m - MD5 password is not set/unset.
       g - GR configuration not set/unset.
       t - TCP MSS not set/unset.
       Session has to be cleared manually

Code  Peer IP Address      IF Name    My Role    State       KeepAlive  UpTime
       24.24.24.24        xe11       Passive   OPERATIONAL   30    01:13:29
       9.9.9.9            xe20       Passive   OPERATIONAL   30    01:13:29
```

Verify RSVP sessions on all leaf and root nodes by using the show rsvp session command. The State field (UP) indicates that the RSVP session between the ingress and egress routers is active and operational. Identify the different paths established within the network using the LSPName field.

```
LEAF1#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to Secondary
* indicates the session is active with local repair at one or more nodes
(P) indicates the secondary-priority session is acting as primary
```

```
Ingress RSVP:
To              From            Tun-ID   LSP-ID   Type   LSPName                         State Uptime    Rt  Style  Labelin

Total number of neighbors 4

Total number of Established sessions 4
```

Verify ESI information and the forwarding tunnel status on all leaf and root nodes, by examining the `show evpn mpls` command output. The DF- Status field displays the forwarding status as either a `Designated Forwarder (DF) or Non-Designated Forwarder (Non-DF)`, and the ESI field displays the Ethernet Segment Identifier associated with each entry.

```
LEAF1#show evpn mpls

```

Static MAC-IP Advertisement

Configure static MAC-IP advertisement through SH and MH from Root and Leaf nodes. Advertise static MAC addresses for both IPv4 and IPv6 from all MH and SH nodes. Ensure that nodes within the same MH have identical MAC addresses configured under the port-channel access port.

Configure MH Nodes

Configure static MAC addresses for IPv4 (`30.30.30.3`) and IPv6 (`3000::1`) under the MH access-port (`po1`) with VLAN ID (`103`). Repeat the same configurations for other MH nodes using different static MAC addresses for both IPv4 and IPv6.

```
!
interface po1.103 switchport
 access-if-evpn
  map vpn-id 203
  mac 0000.7777.9999
  mac 0000.7777.6666 ip 30.30.30.3
  mac 0000.7777.6666 ipv6 3001::1
!
```

Configure SH Nodes

Configure static MAC addresses for IPv4 (`40.40.40.4`) and IPv6 (`4000::1`) under the SH access-port (`xe27`) with VLAN ID (`103`). This setup ensures that SH advertises these static MAC addresses over the specified access-port. Repeat the same configurations for other SH nodes using different static MAC addresses for both IPv4 and IPv6.

```
!
interface xe27.103 switchport
 encapsulation dot1q 100
 load-interval 30
 access-if-evpn
  map vpn-id 203
  mac 0000.0000.0011
  mac 0000.5544.4455 ip 40.40.40.4
  mac 0000.5544.4455 ipv6 4000::1
!
```

Validation

Verify the MAC table entries on MH nodes (MH1, MH2 and MH3) and the SH nodes (SH1, SH2, SH3, and SH4). MH nodes advertise their MAC addresses using the ESI values. Additionally, verify the IP addresses associated with SH nodes for MAC advertisement.

In the `show evpn mpls mac-table` command output, the MAC entries originated from Leaf Nodes will have the `LeafFlag` field status `set`.

Note:

- MAC IPv4 or IPv6 configured under SH Leaf node access port will be advertised to the Root nodes and other Leaf nodes.
- MAC IPv4 or IPv6 configured under an MH Leaf node access port must be symmetric and will be advertised to both the Root nodes and other leaf nodes.
- MAC IPv4 or IPv6 configured under either SH or MH Root node will be advertised to both the Root nodes and the Leaf nodes.
- The Leaf-to-Leaf communication will display MAC status and tunnel status per VNI as Leaf type. The MAC will be in the discard state in the BCM shell.

```
LEAF1#show evpn mpls mac-table

E-Tree Active-Standby Configuration

To set up an E-Tree network with Active-Standby redundancy and load balancing, follow these steps:

- Connect the Switch (P1) to the Root1, LEAF1, and LEAF2 nodes in the MPLS EVPN E-Tree Topology.
- Set up the VRF, EVPN, Port-Active, and Single-Active Redundancy configuration on Root MH and Leaf MH nodes.

For more details on Active-Standby configuration, refer to the section EVPN Active-Standby.

Validation

To verify the status of the ESI, whether it's active or standby, use the `show evpn load-balance all` command. This command helps debug and understand if the election process is occurring correctly. For the ESI `00:00:00:43:21:12:34:00:00:00`, LEAF1 is active, and LEAF2 is on standby in port-active mode. For the ESI `00:11:22:33:00:00:00:55:66:77`, LEAF2 is active, and LEAF1 is on standby in single-active mode.

```
LEAF1#show evpn load-balance all
ESI                            AC-IF/PE     PE-IP-ADDRESS    Redundancy   Service-carving weight Revertive  AC-DF   Status

Implementation Examples

Here is an example scenario and a solution for implementing EVPN E-Tree.

Scenario 1: Specific traffic isolation and control measures are essential in a network of EVPN L2VPN services or instances. Within a broadcast domain, services communicating with each other may result in flooding BUM traffic to all services within the domain. Moreover, hosts are learned and advertised between different sites/services.

Use Case 1: Implementing an EVPN E-Tree solution defines the network topology with distinct Root and Leaf classifications, BUM traffic flooding can be minimized, and traffic isolation can be achieved. This ensures efficient communication between services while preventing unnecessary traffic propagation and maintaining network integrity.

Scenario 2: An Internet Service Provider (ISP) provides services to multiple subscribers and aims to facilitate communication with them. However, the ISP needs to ensure that subscribers exclusively communicate with the ISP and not among themselves.

Use Case 2: Implementing EVPN E-Tree is essential to fulfill this requirement. By categorizing ISP services as Root and subscribers as Leaf, traffic isolation can be enforced. This configuration enables the ISP to communicate with subscribers while preventing inter-subscriber communication. As a result, network security is enhanced, and the ISP maintains control over communication within its network.

E-Tree CLI Commands

The EVPN E-Tree introduces the following configuration commands in OcNOS.

evpn etree

Use this command to enable E-Tree functionality within the EVPN configuration.

Command Syntax

```
evpn etree enable
```

Parameters

None

Default

Disabled

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example illustrates how to activate E-Tree functionality for EVPN:

```
OcNOS#configure terminal
OcNOS(config)#evpn etree enable
```

Revised CLI Commands

The following is the revised command for configuring MPLS EVPN E-Tree

evpn mpls id

- The existing syntax now includes the newly added parameter for E-Tree, namely `etree-leaf`.
- The command `evpn mpls id <ID> etree-leaf` allows users to tailor MPLS EVPN behavior on a network device, indicating its participation as a leaf node in an E-Tree deployment. For more details, refer to the evpn mpls id command in the EVPN MPLS Commands chapter in the *OcNOS Multi-Protocol Label Switching Guide*.

Troubleshooting

1. When traffic, whether unicast (UC) or broadcast, is passed to the Intra Leaf site:
   - Check the sub-interface or physical interface counters to monitor traffic throughput and potential issues.
   - Verify the Leaf status of the corresponding VNI to ensure proper functionality.
   - Use packet sniffing tools to analyze packets in the egress direction for any anomalies or errors.
   - MAC entries learned via leaf access port should include the `set` keyword in the MAC table output.
2. If UC traffic is routed within inter-PE leaf sites:
   - Check the Leaf status of the VNI at both participating PE devices to confirm operational status.
   - Check if the advertised MAC is in discard or non-discard status using the `show mac table` command and `l2 show` in the BCM shell.
3. Verify if BUM traffic is transmitted between Leaf sites inter-PE:
   - Ensure that a BUM tunnels are not established between inter-PE devices.
   - Validate this by examining the Multicast ingress group, using the `show evpn mpls tunnel` command. For EVPN MPLS, confirm that BUM tunnels are not created.
4. Investigate UC traffic drops from the Root to MH Leaf PE:

- Check if MAC addresses are not installed in discard status within the MH peer's access port. This status could indicate issues with MAC learning or forwarding.

5. Evaluate traffic between Root and Leaf:
    - Confirm the establishment of both UC and BUM tunnels.
    - Ensure that unicast MAC addresses are not marked with a discard status in the MAC table.
6. Validate the exchange of routes between two BGP L2VPN peers:
    - Monitor BGP (Border Gateway Protocol) sessions to verify successful route exchange and propagation between the peers.
7. Convergence: Assess convergence by checking BFD configuration between BGP sessions.

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	**Description**
EVPN E-Tree (Ethernet VPN Ethernet-Tree)	A networking solution designed to manage communication within broadcast domains, incorporating redundancy through multi-homing in a network. It optimizes traffic routing and control, categorizing network nodes based on predefined definitions of EVPN Instances as Leaf or Root, allowing or restricting communication between them.
EVPN (Ethernet Virtual Private Network)	A Layer 2 VPN technology that extends Ethernet services across data centers and wide-area networks using BGP.
Multi-homing (MH)	The ability of a device to connect to multiple network segments simultaneously to increase network availability and redundancy.
Provider Edge (PE) Node	A device at the edge of a service provider network that connects to customer premises equipment (CE) and participates in providing services to customers.
Leaf Node	In the context of EVPN E-Tree, a network node categorized to handle communication within specific broadcast domains and may connect to Root nodes.
Root Node	A network node within EVPN E-Tree that serves as the central point of communication and handles BUM traffic distribution.
Ethernet Segment Identifier (ESI)	A unique identifier used to identify Ethernet segments within a MPLS network.

CHAPTER 5 TWAMP over EVPN Configuration

This chapter contains a complete sample TWAMP over EVPN configuration.

Two-way Active Measurement Protocol (TWAMP) is an open protocol for measuring network performance between any two devices. The TWAMP MPLS transport is implemented as part of supporting TWAMP on routers which acts as MPLS routers both in the roles of LERs as well as intermediate routers. Ocnos 6.0 also supports the end to end statistics calculation when multiple paths are available between sender and reflector with multihop support.

The user can use the link delay metrics such as average, minimum, and maximum delay, and delay variance to determine the network latency. Using link delay metrics will enable troubleshooting latency issues or apply Traffic Engineering (TE) solutions to meet Service Level Agreements (SLAs).

The TWAMP protocol is designed to do such measurements, and a basic implementation of this protocol has already been implemented in ocnos. This feature here is a TWAMP protocol in ocnos where the focus will be on accuracy and configurable advertisement of the measured data.

EVPN (based on MPLS) Supported scenarios:

In general, TWAMP over EVPN works on,

- CE-CE Overlay Only
- CE-PE Overlay Only
- PE-PE Both Under lay and over lay

Topology

Figure 5-9 displays a sample TWAMP over EVPN topology.

- CE1 and CE2 are customer edge routers
- PE1 and PE2 are IPv4 Provider Edge routers
- P1 is the router at the core of the IPv4 MPLS provider network

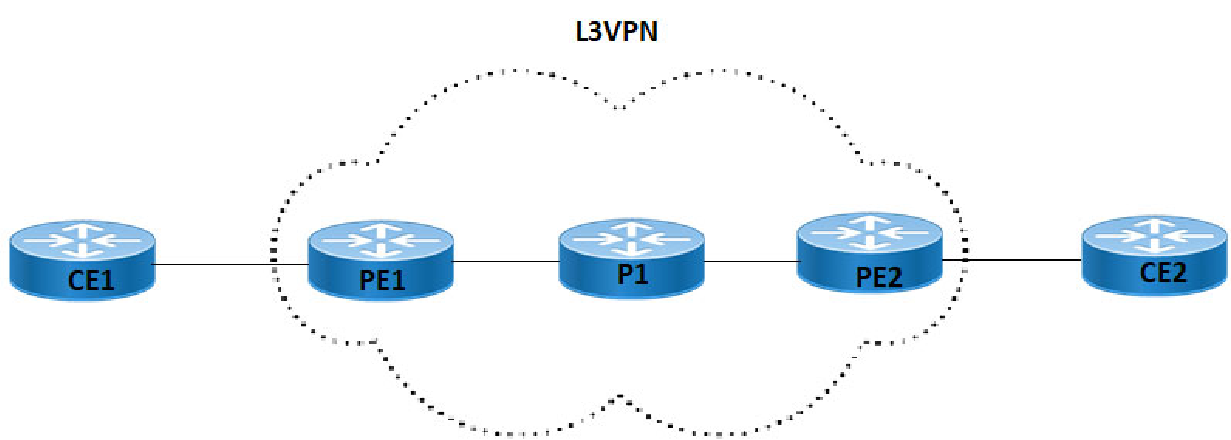

Figure 5-9: TWAMP over EVPN Topology

Configure TWAMP over EVPN for LDP

EVPN-Eline configurations

PE1

#configure terminal	Enter Configure mode.
(config)# evpn mpls enable	Enable EVPN MPLS
(config)# evpn mpls vtep-ip-global 18.18.18.18	Configuring VTEP global IP to loopback IP
(config)# mac vrf eline500	Create a new mac VRF named eline100
(config-vrf)# rd 20.20.20.20:100	Assign the route distinguisher (RD) value as 20.20.20.20:100
(config-vrf)# route-target both 111:111	Configuring import and export value as 111:111 Support: route-target export route-target import
(config-vrf)#exit	Exit VRF mode
(config)#commit	Commit the configurations
9config)# evpn mpls id 500 xconnect tar-get-mpls-id 501	Configure the EVPN-VPWS identifier with source identifier 2 and target identifier 501
(con-fig-evpn-mpls)#host-reachability-protocol evpn-bgp eline500	Mapping vrf "eline500" to EVPN-VPWS identifier
(config-evpn-mpls)#commit	Commit the transaction.
(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.
(config)#router ldp	Enter the Router LDP mode
(config-router)#router-id 18.18.18.18	Configure router id as loopback address
(config-router)#transport-address ipv4 18.18.18.18	Configure ldp transport addess as loopback address
(config-router)#exit	Exit from the router ldp mode
(config)#interface lo	Enter loopback interface mode
(config-if)#ip address 18.18.18.18/32 sec-ondary	Assign IP address to Loopback interface
(config-if)#exit	Exit Interface mode
(config)#interface xe8	Enter Interface mode
(config-if)# ip address 10.1.1.18/24	Assign IP address to interface
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode
(config)#interface xe11.500 switchport	Creating L2 sub interface of physical interface xe11
(config-if)# encapsulation dot1q 500	Setting Encapsulation to dot1q with VLAN ID 2 Supported Encapsulation: dot1ad, dot1q, untagged, default
(config-if)# access-if-evpn	Entering Access mode for EVPN MPLS ID configuration
(config-acc-if-evpn)# map vpn-id 500	Map vpn-id 500 to interface xe11.500 (VPWS)

(config-if)#exit	Exit interface mode
(config)# router ospf 1	Enter Router OSPF mode
(config-router)# ospf router-id 18.18.18.18	Configure OSPF router-id
(config-router)# network 10.1.1.0/24 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)# network 18.18.18.18/32 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)# commit	Commit the configurations
(config-router)# exit	Exit from router OSPF mode
(config)# router bgp 100	Enter BGP router mode
(config-router)# bgp router-id 18.18.18.18	Configure BGP router-id
(config-router)# neighbor 8.8.8.8 remote-as 100	Configure PE2 as an iBGP4+ neighbor
(config-router)# neighbor 8.8.8.8 up-date-source lo	Update the source as loopback for iBGP peering with the remote PE2 router
(config-router)# address-family l2vpn evpn	Entering into address family mode as EVPN
(config-router-af)# neighbor 8.8.8.8 activate	Enabling EVPN Address family for neighbor
(config-router-af)#exit	Exit form address family
(config-router)# commit	Commit the configurations

P1

#configure terminal	Enter Configure mode.
(config)#router ldp	Enter the Router LDP mode
(config-router)#router-id 3.3.3.3	Configure router id as loopback address
(config-router)#transport-address ipv4 3.3.3.3	Configure ldp transport addess as loopback address
(config-router)#exit	Exit from the router ldp mode
(config)#interface lo	Enter loopback interface mode
(config-if)#ip address 3.3.3.3/32 secondary	Assign IP address to Loopback interface
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode
(config)#interface xe14	Enter Interface mode
(config-if)# ip address 10.1.1.3/24	Assign IP address to interface
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode
(config)#interface xe15	Enter Interface mode
(config-if)# ip address 11.1.1.3/24	Assign IP address to interface
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface

(config-if)#exit	Exit interface mode
(config)# router ospf 1	Enter Router OSPF mode
(config-router)# ospf router-id 18.18.18.18	Configure OSPF router-id
(config-router)# network 10.1.1.0/24 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)# network 3.3.3.3/32 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)# network 11.1.1.0/24 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)# commit	Commit the configurations
(config-router)# exit	Exit from router OSPF mode

PE2

#configure terminal	Enter Configure mode.
(config)# evpn mpls enable	Enable EVPN MPLS
(config)# evpn mpls vtep-ip-global 8.8.8.8	Configuring VTEP global IP to loopback IP
(config)# mac vrf eline500	Create a new mac VRF named eline100

(config-router)#exit	Exit from the router ldp mode
(config)#interface xe24	Enter Interface mode
(config-if)# ip address 11.1.1.8/24	Assign IP address to interface
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode
(config)#interface xe25	Enter Interface mode

`(config-if)# ip vrf forwarding vrf100`	Bind the interface connected to the CE1 router with VRF 100
`(config-if)# ip address 101.1.1.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)# router ospf 1`	Enter Router OSPF mode
`(config-router)# ospf router-id 8.8.8.8`	Configure OSPF router-id
`(config-router)# network 11.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`(config-router)# network 8.8.8.8/32 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`(config-router)#exit`	Exit from router OSPF mode
`(config)# router bgp 100`	Enter BGP router mode
`(config-router)# bgp router-id 8.8.8.8`	Configure BGP router-id
`(config-router)# neighbor 18.18.18.18 remote-as 100`	Configure PE2 as an iBGP4+ neighbor
`(config-router)# neighbor 18.18.18.18 update-source lo`	Update the source as loopback for iBGP peering with the remote PE2 router
`(config-router)# address-family l2vpn evpn`	Entering into address family mode as EVPN
`(config-router-af)# neighbor 8.8.8.8 activate`	Enabling EVPN Address family for neighbor
`(config-router-af)#exit`	Exit form address family
`(config-router)# commit`	Commit the configurations

CE1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 37.37.37.37/32 secondary`	Assign IP address to Loopback interface
`(config-if)#exit`	Exit Interface mode
`(config)#interface xe24.500`	Enter Interface mode
`(config-if)#encapsulation dot1q 500`	Setting Encapsulation to dot1q with VLAN ID 500
`(config-if)# ip address 172.16.10.1/24`	Configure IP address on the interface
`(config-if)#exit`	Exit Interface mode
`(config)# router bgp 200`	Enter BGP router mode
`(config-router)# bgp router-id 37.37.37.37`	Configure BGP router-id
`(config-router)#neighbor 100.1.1.1 remote-as 100`	Configure PE1 as an eBGP4+ neighbor
`(config-router)# address-family ipv4 unicast`	Enter address-family IPv4 unicast mode
`(config-router-af)# redistribute connected`	Redistribute the connected route under address family IPv4 unicast
`(config-router-af)# neighbor 100.1.1.1 activate`	Activate the neighbor in the IPv4 address family

`(config-router-af)#exit`	Exit form address family
`(config-router)# commit`	Commit the configurations

CE2

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 2.2.2.2/32 secondary`	Assign IP address to Loopback interface
`(config-if)#exit`	Exit Interface mode
`(config)#interface xe14.500`	Enter Interface mode
`(config-if)#encapsulation dot1q 500`	Setting Encapsulation to dot1q with VLAN ID 500
`(config-if)# ip address 172.16.10.2/24`	Assign IP address to interface
`(config-if)#exit`	Exit Interface mode
`(config)# router bgp 300`	Enter BGP router mode
`(config-router)# bgp router-id 2.2.2.2`	Configure BGP router-id
`(config-router)#neighbor 101.1.1.1 remote-as 100`	Configure PE2 as an eBGP4+ neighbor
`(config-router)# address-family ipv4 unicast`	Enter address-family IPv4 unicast mode
`(config-router-af)# redistribute connected`	Redistribute the connected route under address family
`IPv4 unicast`	
`(config-router-af)# neighbor 101.1.1.1 activate`	Activate the neighbor in the IPv4 address family
`(config-router-af)#exit`	Exit form address family
`(config-router)# commit`	Commit the configurations

TWAMP Configuration on Sender (CE1)

TWAMP sender is configured to measure the delay on interface xe24.500 CE1

`#configure terminal`	Enter Configure mode.
`(config)# hardware-profile filter twamp-ipv4 enable`	Enable hardware filter for ipv4 to configure TWAMP measurement configs
`(config)#commit`	Commit the configuration
`(config)# twamp-light control`	Enable TWAMP light controller on CE1
`(config-twamp-light-con)# control-admin-state enable`	Enable TWAMP Controller admin state
`(config)# interface xe24.500`	Enter Interface Loopback mode
`(config-if)# delay-measurement dynamic twamp reflector-ip 172.16.10.2`	Configure delay measurement on interface to reflector CE2
`(config-if)#commit`	Commit the configurations
`(config-if)#end`	Return to privilege mode

TWAMP Configuration on Reflector (CE2)

Configure TWAMP Reflector as interface xe24.500 on CE2

`#configure terminal`	Enter Configure mode.
`(config)# hardware-profile filter twamp-ipv4 enable`	Enable hardware filter for ipv4 to configure TWAMP measurement configs
`(config)#commit`	Commit the configuration
`(config)# twamp-light reflector`	Enable TWAMP light Reflector on CE2
`(config-twamp-light-ref)# reflec-tor-admin-state enable`	Enable the TWAMP reflector admin state
`(config-twamp-light-ref)# reflector-name pe2 reflector-ip ipv4 172.16.10.2`	Configure TWAMP reflector IP as CE2 interface IP
`(config-twamp-light-ref)#commit`	Commit the configurations
`(config-if)#end`	Return to privilege mode

Validation

1. Verify ping from CE1 to CE2

```
PE1#ping 172.16.10.2
Press CTRL+C to exit
PING 172.16.10.2 (172.16.10.2) 56(84) bytes of data.
64 bytes from 172.16.10.2: icmp_seq=1 ttl=64 time=0.776 ms
    64 bytes from 172.16.10.2: icmp_seq=2 ttl=64 time=0.553 ms
```

2. Verify the TWAMP statistics on all the configured interfaces on CE1

```
In the below verification command, packets sent and received showing as equal. So all
the TWAMP packets received reply for all the sent packets for the delay measurement.
Showing all the Round Trip Delay and Reverse Delay timers.
```

```
PE1#sh twamp-statistics

IPv6 Provider Edge Routers (6PE) /MPLS VPN Configuration

CHAPTER 1 6PE Configuration

This chapter explains about IPv6 islands over IPv4 MPLS using IPv6 Provider Edge Routers (6PE). With this technique, IPv6 islands are connected to each other across an IPv4 backbone enabled with MPLS label stacking while MP-BGP is used to announce the IPv6 routes across these MPLS tunnels. This feature can be implemented with label-switched paths (LSPs) using the Label Distribution Protocol (LDP) or Resource Reservation Protocol (RSVP).

This feature offers the following options to the service providers:

- Connect to other IPv6 networks accessible across the MPLS core.
- Provide access to IPv6 services and resources that service provider provides.
- Provide IPv6 VPN services without going for complete overhaul of existing MPLS/IPv4 core.

The 6PE uses the existing IPv4 MPLS core infrastructure for IPv6 transport. It enables IPv6 sites to communicate with each other over an IPv4 MPLS core network using MPLS label switched paths (LSPs). This feature relies heavily on multiprotocol Border Gateway Protocol (BGP) extensions in the IPv4 network configuration on the provider edge (PE) router to exchange IPv6 reachability information (in addition to an MPLS label) for each IPv6 address prefix. Edge routers are configured as dual-stack, running both IPv4 and IPv6, and use the IPv4 mapped IPv6 address for IPv6 prefix reachability exchange.

Benefits of 6PE

6PE offers the following benefits to service providers:

- Minimal operational cost and risk - No impact on existing IPv4 and MPLS services.
- Only provider edge routers require upgrade - A 6PE router can be an existing PE router or a new one dedicated to IPv6 traffic.
- No impact on IPv6 customer edge (CE) routers - The ISP can connect to any CE router running Static, IGP or EGP.
- Production services ready - An ISP can delegate IPv6 prefixes.
- IPv6 introduction into an existing MPLS service - 6PE routers can be added at any time.

IPv6 on Provider Edge Routers

The 6PE is a technique that provides global IPv6 reachability over IPv4 MPLS. It allows one shared routing table for all other devices. 6PE allows IPv6 domains to communicate with one another over the IPv4 without an explicit tunnel setup, requiring only one IPv4 address per IPv6 domain. While implementing 6PE, the provider edge routers are upgraded to support 6PE, while the rest of the core network is not touched (IPv6 unaware).

This implementation requires no re-configuration of core routers because forwarding is based on labels rather than on the IP header itself. This provides a cost-effective strategy for deploying IPv6.The IPv6 reachability information is exchanged by PE routers using multi-protocol Border Gateway Protocol (mp-iBGP) extensions. 6PE relies on mp-iBGP extensions in the IPv4 network configuration on the PE router to exchange IPv6 reachability information in addition to an MPLS label for each IPv6 address prefix to be advertised. PE routers are configured as dual stacks, running both IPv4 and IPv6, and use the IPv4 mapped IPv6 address for IPv6 prefix reachability exchange. The next hop advertised by the PE router for 6PE prefixes is still the IPv4 address that is used for IPv4 L3 VPN routes.

The following figure illustrates the 6PE topology.

© 2025 IP Infusion Inc. Proprietary

Topology

As shown in Figure 1-10:

- CE1 and CE2 are customer edge routers
- 6PE1 and 6PE2 are IPv6 Provider Edge routers
- P is the router at the core of the IPv4 MPLS provider network

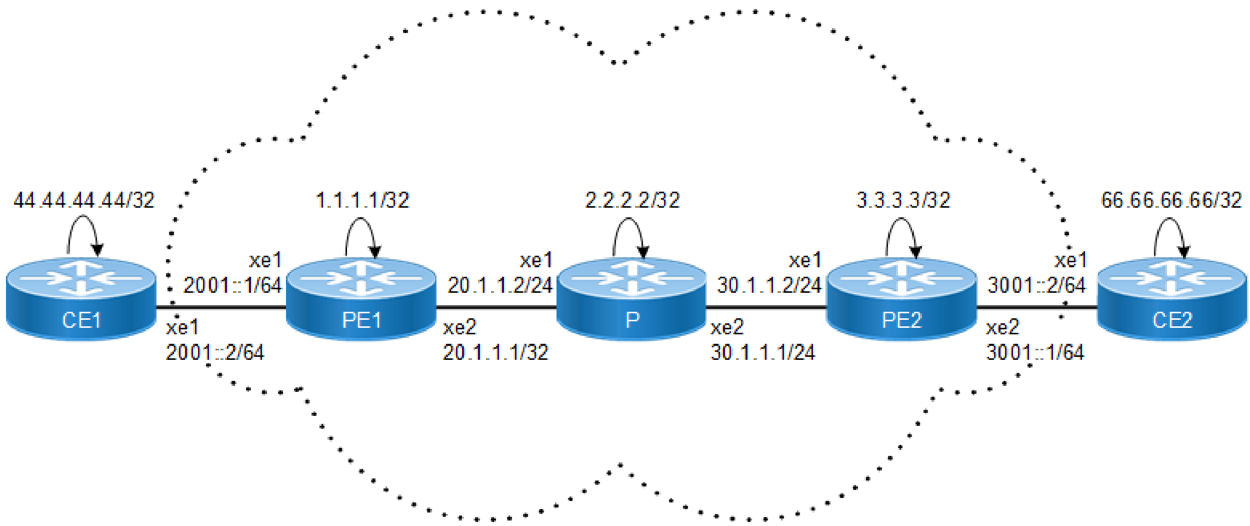

Figure 1-10: 6PE Configuration

Configuration

CE1

`#configure terminal`	Enter configure mode
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 44.44.44.44/32 secondary`	Assign the IPv4 address
`(config-if)#exit`	Exit interface mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ipv6 address 2001::2/64`	Assign the IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Enter router BGP mode.
`(config-router)#bgp router-id 44.44.44.44`	Assign router ID
`(config-router)#neighbor 2001::1 remote-as 100`	Configure 6PE1 as an eBGP4+ neighbor.
`(config-router)#address-family ipv6 unicast`	Enter Address-Family IPv6 unicast mode
`(config-router-af)#redistribute static`	Redistribute static routes
`(config-router-af)#neighbor 2001::1 activate`	Activate the neighbor in the IPv6 address family
`(config-router-af)#exit`	Exit address family

(config-router)#ipv6 route 2ffe::/64 xe1	Configure IPV6 static route
(config-router)#commit	Commit the transaction

CE2

#configure terminal	Enter configure mode
(config)#interface lo	Enter interface mode
(config-if)#ip address 66.66.66.66/32 secondary	Assign the IPv4 address
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter Interface mode
(config-if)#ipv6 address 3002::2/64	Assign IPv6 address
(config-if)#exit	Exit interface mode
(config)#router bgp 300	Enter BGP configure mode
(config-router)#bgp router-id 66.66.66.66	Assign router ID
(config-router)#neighbor 3002::1 remote-as 100	Configure 6PE2 as an eBGP4+ neighbor.
(config-router)#address-family ipv6 unicast	Enter Address-Family IPv6 unicast mode
(config-router-af)#redistribute static	Redistribute static routes
(config-router-af)#neighbor 3002::1 activate	Activate the neighbor in the IPv6 address family.
(config-router-af)#exit	Exit address family
(config-router)#ipv6 route 3ffe::/64 xe1	Configure IPV6 static route
(config-router)#commit	Commit the transaction

PE1

#configure terminal	Enter configure mode
(config)#interface xe1	Enter Interface mode
(config-if)#ipv6 address 2001::1/64	Assign IPv6 address
(config-if)#exit	Exit interface mode
(config)#interface lo	Enter Interface mode
(config-if)#ip address 1.1.1.1/32 secondary	Assign the IP address to loopback interface
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter router ldp mode.
(config-router)#router-id 1.1.1.1	Configure router-id
(config-router)#explicit-null	Configure explicit-null.
(config-router)#transport-address ipv4 1.1.1.1	Configure transport address as loopback address
(config-router)#targeted-peer ipv4 3.3.3.3	Configure targeted peer
config-router-targeted-peer)#exit	Exit router targeted mode
(config-router)#exit	Exit LDP mode
(config)#interface xe2	Enter Interface mode
(config-if)#ip address 20.1.1.1/24	Assign IPv4 address
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable ldp in interface.

(config-if)#exit	Exit interface mode
(config)#router ospf	Enter router ospf mode.
(config-router)#ospf router-id 1.1.1.1	Configure ospf router id same as loopback ip address.
(config-router)#network 1.1.1.1/32 area 0 (config-router)#network 20.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit from router ospf mode.
(config)#mpls label mode 6pe per-prefix	Change label mode to per-prefix, default is per VRF
(config)#router bgp 100	Enter BGP Configure mode.
(config-router)#bgp router-id 1.1.1.1	Configure BGP router-id
(config-router)#neighbor 3.3.3.3 remote-as 100	Configure 6PE2 as an iBGP peer.
(config-router)#neighbor 3.3.3.3 update-source lo	Update the source as loopback for iBGP peering with the remote 6PE router.
(config-router)#neighbor 2001::2 remote-as 200	Configure CE1 as eBGP peer
(config-router)#address-family ipv4 unicast	Enter address family mode
(config-router-af)#neighbor 3.3.3.3 activate	Activate neighbor
(config-router-af)#exit	Exit address family mode
(config-router)#address-family ipv6 labeled-unicast	Enter IPv6 labeled-unicast Address Family mode.
(config-router-af)#neighbor 3.3.3.3 activate	Activate the 6PE neighbor
(config-router-af)#exit-address-family	Exit IPv6 LU Address Family mode.
(config-router)#address-family ipv6 unicast	Enter the IPv6 address family
(config-router-af)#neighbor 2001::2 activate	Activate CE inside IPv6 address family
(config-router-af)#redistribute connected	Redistribute the connected routes
(config-router-af)#exit	Exit IPv6 Address Family mode.
(config-router)#commit	Commit the transaction.

P1

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.2/32 secondary	Assign the IP address to loopback interface
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router ldp mode.
(config-router)#router-id 2.2.2.2	Configure router-id
(config-router)#transport-address ipv4 2.2.2.2	Configure transport address as loopback address
(config-router)#exit	Exit router ldp mode.
(config)#router ospf	Enter router ospf mode.
(config-router)#ospf router-id 2.2.2.2	Configure ospf router id same as loopback ip address.
(config-router)#network 2.2.2.2/32 area 0 (config-router)#network 20.1.1.2/24 area 0 (config-router)#network 30.1.1.1/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit from router ospf mode.

(config)#interface xe2	Enter Interface mode
(config-if)#ip address 30.1.1.1/24	Assign IPv4 address
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable ldp in interface.
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter Interface mode
(config-if)#ip address 20.1.1.2/24	Assign IPv4 address
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable ldp in interface.
(config-if)#commit	Commit the transaction.

PE2

#configure terminal	Enter configure mode
(config)#interface xe2	Enter Interface mode
(config-if)#ipv6 address 3002::1/64	Assign IPv6 address
(config-if)#exit	Exit interface mode
(config)#interface lo	Enter Interface mode
(config-if)#ip address 3.3.3.3/32 secondary	Assign the IP address to loopback interface
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter router ldp mode.
(config-router)#router-id 3.3.3.3	Configure router-id
(config-router)#transport-address ipv4 3.3.3.3	Configure transport address as loopback address
(config-router)#targeted-peer ipv4 1.1.1.1	Configure targeted peer
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#explicit-null	Configure explicit-null.
(config-router)#exit	Exit LDP mode
(config)#interface xe1	Enter Interface mode
(config-if)#ip address 30.1.1.2/24	Assign IPv4 address
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable ldp in interface.
(config-if)#exit	Exit interface mode
(config)#mpls label mode 6pe per-prefix	Change label mode to per-prefix, default is per VRF
(config)#router bgp 100	Enter router BGP mode.
(config-router)#bgp router-id 3.3.3.3	Configure BGP router id
(config-router)#neighbor 1.1.1.1 remote-as 100	Configure 6VPE2 as an iBGP peer.
(config-router)#neighbor 1.1.1.1 update-source lo	Update the source as loopback for iBGP peering with the remote 6VPE router.
(config-router)#address-family ipv4 unicast	Enter address family mode
(config-router-af)#neighbor 1.1.1.1 activate	Activate neighbor
(config-router-af)#exit	Exit address family mode
(config-router)#neighbor 3002::2 remote-as 300	Configure CE1 as eBGP peer

`(config-router)#address-family ipv6 labeled-unicast`	Enter IPv6 labeled-unicast Address Family mode.
`(config-router-af)#neighbor 1.1.1.1 activate`	Activate the 6PE neighbor
`(config-router-af)#exit-address-family`	Exit IPv6 LU Address Family mode.
`(config-router)#address-family ipv6 unicast`	Enter the IPv6 address family
`(config-router-af)#neighbor 3002::2 activate`	Activate CE inside IPv6 address family
`(config-router-af)#redistribute connected`	Redistribute the connected routes
`(config-router-af)#exit-address-family`	Exit IPv6 Address Family mode.
`(config-router)#exit`	Exit Router mode.
`(config)#router ospf`	Enter OSPF router mode
`(config-router)#network 3.3.3.3/32 area 0`	Enable OSPF with specified area ID on interfaces with IP address that matches the specified network address
`(config-router)#network 30.1.1.0/24 area 0`	Enable OSPF with specified area ID on interfaces with IP address that matches the specified network address
`(config-router)#commit`	Commit the transaction

CHAPTER 2 6VPE Configuration

This chapter explains how 6VPE (IPv6 on VPN Provider Edge Routers) can interconnect IPv6 islands over an MPLS-enabled IPv4 cloud. 6VPE enables IPv6 sites to communicate with each other over an MPLS/IPv4 core network using MPLS LSPs. The 6VPE routers exchange IPv6 reachability information over the core using Multi-Protocol Border Gateway Protocol (MP-BGP) over IPv4.

Topology

As shown in Figure 2-11:

- CE1 and CE2 are customer edge routers
- 6VPE1 and 6VPE2 are IPv6 Provider Edge routers
- P is the router at the core of the IPv4 MPLS provider network.

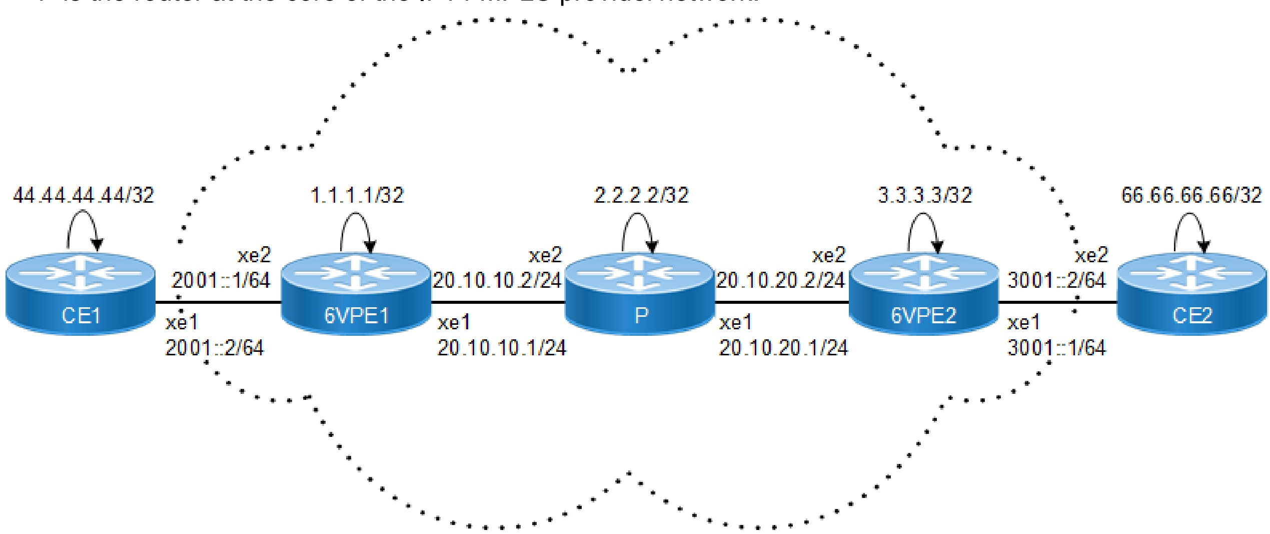

Figure 2-11: 6VPE Configuration

Configuration

CE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 44.44.44.44/32 secondary`	Assign the IPv4 address
`(config-if)#exit`	Exit interface mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ipv6 address 2001::2/64`	Assign the IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#ipv6 route 2ffe::/64 xe1`	Advertise IPv6 static route.
`(config)#router bgp 200`	Enter BGP router mode.

(config-router)#bgp router-id 44.44.44.44	Configure bgp router-id
(config-router)#neighbor 2001::1 remote-as 100	Configure 6VPE1 as an eBGP4+ neighbor.
(config-router)#address-family ipv6 unicast	Enter address-family IPv6 unicast mode.
(config-router-af)#neighbor 2001::1 activate	Activate the neighbor in the IPv6 address family.
(config-router-af)#redistribute connected	Redistribute the connected route under address family IPv6 unicast.
(config-router-af)#redistribute static	Redistribute static routes.
(config-router-af)#commit	Commit the transaction.

CE2

#configure terminal	Enter configure mode
(config)#interface lo	Enter interface mode
(config-if)#ip address 66.66.66.66/32 secondary	Assign the IPv4 address
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter interface mode.
(config-if)#ipv6 address 3001::2/64	Assign the IPv6 address.
(config-if)#exit	Exit interface mode.
(config)#ipv6 route 3ffe::/64 xe1	Configure IPV6 static route
(config)#router bgp 300	Enter BGP router mode.
(config-router)#bgp router-id 66.66.66.66	Configure BGP router-id
(config-router)#neighbor 3001::1 remote-as 100	Configure 6VPE1 as an eBGP4+ neighbor.
(config-router)#address-family ipv6 unicast	Enter address-family IPv6 unicast mode.
(config-router-af)#neighbor 3001::1 activate	Activate the neighbor in the IPv6 address family.
(config-router-af)#redistribute connected	Redistribute the connected route under address family IPv6 unicast.
(config-router-af)#redistribute static	Redistribute static routes.
(config-router-af)#commit	Commit the transaction.

PE1

#configure terminal	Enter configure mode.
(config)#ip vrf IPI	Create a new VRF named IPI.
(config-vrf)#rd 1:100	Assign the route distinguisher (RD) value as 1:100.
(config-vrf)#route-target both 100:200	Import routes between route target (RT) ext-communities 100 and 200.
(config-vrf)#router-id 77.77.77.77	Configure router-id for VRF
(config-vrf)#exit	Exit VRF mode.
(config)#interface xe1	Enter interface mode.
(config-if)#ip vrf forwarding IPI	Bind the interface connected to the CE router with VRF IPI.
(config-if)#ipv6 address 2001::1/64	Assign the IPv6 address.

`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter BGP router mode.
`(config-router)#bgp router-id 1.1.1.1`	Configure BGP router-id
`(config-router)#neighbor 3.3.3.3 remote-as 100`	Configure 6VPE2 as an iBGP peer.
`(config-router)#neighbor 3.3.3.3 update-source lo`	Update the source as loopback for iBGP peering with the remote 6VPE router.
`(config-router)#address-family ipv4 unicast`	Enter address family mode
`(config-router-af)#neighbor 3.3.3.3 activate`	Activate the neighbor
`(config-router-af)#exit-address-family`	Exit address family mode
`(config-router)#address-family vpnv6 unicast`	Enter VPNv6 address family mode.
`(config-router-af)#neighbor 3.3.3.3 activate`	Activate the 6VPE neighbor so that it can accept VPN IPv6 routes.
`(config-router-af)#exit-address-family`	Exit VPNv6 address family mode.
`(config-router)#address-family ipv6 vrf IPI`	Enter the IPv6 address family for VRF IPI.
`(config-router-af)#neighbor 2001::2 remote-as 200`	Activate CE inside IPv6 address family for vrf IPI.
`(config-router-af)#neighbor 2001::2 activate`	Activate the 6VPE neighbor so that it can accept VPN IPv6 routes.
`(config-router-af)#redistribute connected`	Redistribute the connected route under address family IPv6 for VRF IPI.
`(config-router-af)#exit-address-family`	Exit IPv6 Address Family mode.
`(config-router)#exit`	Exit router mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 1.1.1.1/32 secondary`	Assign the IP address to loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router LDP mode.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1
`(config-router)#transport-address ipv4 1.1.1.1`	Configure transport address as loopback address.
`(config-router)#targeted-peer ipv4 3.3.3.3`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router LDP mode.
`(config)#router rsvp`	Enter RSVP router mode.
`(config-router)#exit`	Exit router mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#enable-rsvp`	Enable RSVP in interface.
`(config-if)#enable-ldp ipv4`	Enable LDP in interface.
`(config-if)#ip address 20.10.10.1/24`	Assign IP address to interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Enter OSPF router mode.
`(config-router)#ospf router-id 1.1.1.1`	Configure OSPF router id same as loopback ip address.
`(config-router)#network 1.1.1.1/32 area 0` `(config-router)#network 20.10.10.1/24 area 0`	Define the network on which OSPF runs and associate area id.

(config-router)#exit	Exit OSPF router mode.
(config)#rsvp-trunk toPE2	Enter the trunk mode for RSVP.
(config-trunk)#to 3.3.3.3	Specify IPv4 Egress for the LSP.
(config-trunk)#commit	Commit the transaction.

P1

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 2.2.2.2/32 secondary	Assign the IP address to loopback interface.
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter router LDP mode.
(config-router)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2
(config-router)#transport-address ipv4 2.2.2.2	Configure transport address as loopback address.
(config-router)#exit	Exit router mode.
(config)#router rsvp	Enter RSVP router mode.
(config-router)#exit	Exit router mode.
(config)#interface xe1	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-rsvp	Enable RSVP in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#ip address 20.10.10.2/24	Assign IP address to interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-rsvp	Enable RSVP in interface.
(config-if)#enable-ldp ipv4	Enable ldp in interface.
(config-if)#ip address 20.10.20.1/24	Assign IP address to interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Enter OSPF router mode.
(config-router)#ospf router-id 2.2.2.2	Configure OSPF router id same as loopback ip address.
(config-router)#network 2.2.2.2/32 area 0 (config-router)#network 20.10.20.1/24 area 0 (config-router)#network 20.10.10.2/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#commit	Commit the transaction.

PE2

#configure terminal	Enter configure mode.
(config)#ip vrf IPI	Create a new VRF named IPI.
(config-vrf)#rd 1:101	Assign the route distinguisher (RD) value as 1:101.

(config-vrf)#route-target both 100:200	Import routes between route target (RT) ext-communities 100 and 200.
(config-vrf)#router-id 55.55.55.55	Configure Router-id for VRF
(config-vrf)#exit	Exit VRF mode.
(config)#interface xe2	Enter interface mode.
(config-if)#ip vrf forwarding IPI	Bind the interface connected to the CE router with VRF IPI.
(config-if)#ipv6 address 3001::1/64	Assign the IPv6 address.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter BGP router mode.
(config-router)#bgp router-id 3.3.3.3	Configure BGP router-id
(config-router)#neighbor 1.1.1.1 remote-as 100	Configure 6VPE2 as an iBGP peer.
(config-router)#neighbor 1.1.1.1 update-source lo	Update the source as loopback for iBGP peering with the remote 6VPE router.
(config-router)#address-family ipv4 unicast	Enter address family mode
(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#address-family vpnv6 unicast	Enter VPNv6 address family mode.
(config-router-af)#neighbor 1.1.1.1 activate	Activate the 6VPE neighbor so that it can accept VPN IPv6 routes.
(config-router-af)#exit-address-family	Exit VPNv6 address family mode.
(config-router)#address-family ipv6 vrf IPI	Enter the IPv6 address family for VRF IPI.
(config-router-af)#neighbor 3001::2 remote-as 300	Activate CE inside IPv6 address family for vrf IPI.
(config-router-af)#neighbor 3001::2 activate	Activate the neighbor
(config-router-af)#redistribute connected	Redistribute the connected route under address family IPv6 for VRF IPI.
(config-router-af)#exit-address-family	Exit IPv6 Address Family mode.
(config-router)#exit	Exit router mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 3.3.3.3/32 secondary	Assign the IP address to loopback interface.
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter router LDP mode.
(config-router)#router-id 3.3.3.3	Set the router ID to IP address 3.3.3.3
(config-router)#transport-address ipv4 3.3.3.3	Configure transport address as loopback address.
(config-router)#targeted-peer ipv4 1.1.1.1	Configure targeted peer.
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#exit	Exit router mode
(config)#router rsvp	Enter RSVP router mode.
(config-router)#exit	Exit router mode.
(config)#interface xe1	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface

© 2025 IP Infusion Inc. Proprietary

(config-if)#enable-rsvp	Enable RSVP in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#ip address 20.10.20.2/24	Assign IP address to interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Enter OSPF router mode.
(config-router)#ospf router-id 3.3.3.3	Configure OSPF router id same as loopback ip address.
(config-router)#network 3.3.3.3/32 area 0 (config-router)#network 20.10.20.2/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit OSPF router mode.
(config)#rsvp-trunk toPE1	Enter the trunk mode for RSVP.
(config-trunk)#to 1.1.1.1	Specify IPv4 Egress for the LSP.
(config-trunk)#commit	Commit the transaction.

Multi-Protocol Label Switching Configuration

CHAPTER 1 Understanding Label Space

This chapter contains configurations for Label Space. It also provides an overview of Label Space concepts.

Overview

The Label space refers to the scope of labels in a given LSR. It determines assignment and distribution of labels to a given peer. During data flow, it decides the key for looking up MPLS table and takes appropriate action based on the entry.

OcNOS supports *per-platform* label space, where a label must be unique for the entire platform. A label is interpreted the same way at all the interfaces. The FIB entry in the router does not contain incoming interface-related information. Thus the incoming traffic will be matched only with the label.

Topology

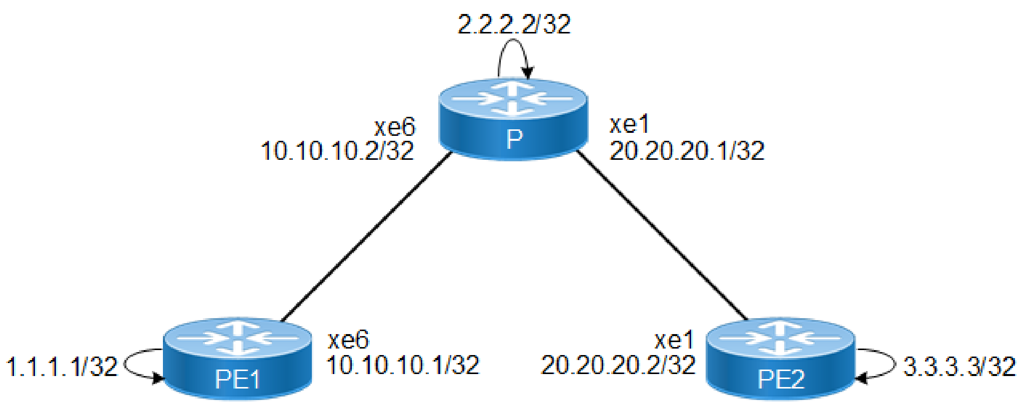

Figure 1-12: LDP Topology

PE1

`PE1#configure terminal`	Enter configure mode
`PE1(config)#interface lo`	Enter interface mode.
`PE1(config-if)#ip address 1.1.1.1/32 secondary`	Configure IP address for the loopback address
`PE1(config-if)#exit`	Exit interface mode
`PE1(config)#interface xe6`	Specify the interface `(xe6)` to be configured
`PE1(config-if)#ip address 10.10.10.1/24`	Configure IP address for the interface
`PE1(config-if)#no shutdown`	Administratively bringing up the interface
`PE1(config-if)#exit`	Exit interface mode
`PE1(config)#router ospf 100`	Configure the routing process and specify the Process ID (100)
`PE1(config-router)#ospf router-id 1.1.1.1`	Configure OSPF router ID same as loopback IP address
`PE1(config-router)#network 10.10.10.0/24 area 0` `PE1(config-router)#network 1.1.1.1/32 area 0`	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface

`PE1(config-router)#exit`	Exit configure mode
`PE1(config)#router ldp`	Enter router mode for LDP
`PE1(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1
`PE1(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
`PE1(config-router)# targeted-peer ipv4 3.3.3.3`	Configure targeted peer.
`PE1(config-router-targeted-peer)#exit`	Exit from router target peer and LDP mode
`PE1(config-if)#exit`	Exit interface mode
`PE1(config)#interface xe6`	Specify the interface (xe6)to be configured
`PE1(config-if)#label-switching`	Enabling label switching capability on router
`PE1(config-if)#enable-ldp ipv4`	Enabling ldp on interface
`PE1(config-if)#commit`	Commit the transaction.

P

`P#configure terminal`	Enter configure mode.
`P(config)#interface lo`	Enter interface mode.
`P(config-if)#ip address 2.2.2.2/32 secondary`	Configure IP address for the loopback address
`P(config-if)#exit`	Exit interface mode
`P(config)#interface xe6`	Specify the interface `(xe6)` to be configured
`P(config-if)#ip address 10.10.10.2/24`	Configure IP address for the interface
`P(config-if)#no shutdown`	Administratively bringing up the interface
`P(config)#interface xe1`	Specify the interface `(xe1)` to be configured
`P(config-if)#ip address 20.20.20.1/24`	Configure IP address for the interface
`P(config)#router ospf 100`	Configure the routing process and specify the Process ID (100)
`P(config-router)#ospf router-id 2.2.2.2`	Configure OSPF router ID same as loopback IP address

`P(config-router)#network 10.10.10.0/24 area 0`
`P(config-router)#network 20.20.20.0/24 area 0`
`P(config-router)#network 2.2.2.2/32 area 0`
	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface

`P(config-router)#exit`	Exit router mode
`P(config)#router ldp`	Enter router mode for LDP
`P(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2
`P(config-router)#transport-address ipv4 2.2.2.2`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
`P(config-router)#exit`	Exit router mode for LDP

`P(config)#mpls min-label-value 1000 max-label-value 50000 label-space 0`	Configure the minimum label value and maximum label value to be used by Platform label space (Label space 0)
`P(config)#interface xe6`	Specify the interface (xe6)to be configured
`P(config-if)#label-switching`	Enabling label switching capability on router
`P(config-if)#enable-ldp ipv4`	Enabling ldp on interface
`P(config-if)#exit`	Exit interface mode
`P(config)#interface xe1`	Specify the interface (xe1) to be configured
`P(config-if)#label-switching`	Enabling label switching capability on router
`P(config-if)#enable-ldp ipv4`	Enabling ldp on interface
`P(config-if)#commit`	Commit the transaction.

PE2

`PE2#configure terminal`	Enter configure mode.
`PE2(config)#interface lo`	Enter interface mode.
`PE2(config-if)#ip address 3.3.3.3/32 secondary`	Configure IP address for the loopback address
`PE2(config-if)#exit`	Exit interface mode
`PE2(config)#interface xe1`	Specify the interface `(xe1)` to be configured
`PE2(config-if)#ip address 20.20.20.2/24`	Configure IP address for the interface
`PE2(config-if)#no shutdown`	Administratively bringing up the interface
`PE2(config-if)#exit`	Exit interface mode
`PE2(config)#router ospf 100`	Configure the routing process and specify the Process ID (100)
`PE2(config-router)#ospf router-id 3.3.3.3`	Configure OSPF router ID same as loopback IP address
`PE2(config-router)#network 20.20.20.0/24 area 0` `PE2(config-router)#network 3.3.3.3/32 area 0`	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface
`PE2(config-router)#exit`	Exit router mode
`PE2(config)#router ldp`	Enter router mode for LDP
`PE2(config-router)#router-id 3.3.3.3`	Set the router ID to IP address 3.3.3.3
`(config-router)#transport-address ipv4 3.3.3.3`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
`PE2(config-router)# targeted-peer ipv4 1.1.1.1`	Configure targeted peer.
`PE1(config-router-targeted-peer)#exit`	Exit from router target peer and LDP mode
`PE2(config-router)#exit`	Exit router mode for LDP
`PE2(config)#interface xe1`	Specify the interface (xe1) to be configured
`PE2(config-if)#label-switching`	Enabling label switching capability on router
`PE2(config-if)#enable-ldp ipv4`	Enabling ldp on interface
`PE2(config-if)#commit`	Commit the transaction.

CHAPTER 2 Understanding MPLS TTL Processing

This chapter contains configurations for MPLS-TTL-Processing. It also provides an overview of MPLS-TTL-Processing concepts.

Overview

This feature performs 'Time To Live' (TTL) processing for Multi-Protocol Label Switching (MPLS) packets. The TTL processing is decided by the model chosen by you. This feature provides TTL processing of MPLS packets on ingress, egress, and intermediate routers. TTL processing is compliant with RFC 3443.

The details of TTL processing vary with the tunnel model that is configured for TTL processing. The incoming and outgoing TTL of the packet is determined by the configured tunnel model. Two Models are supported, pipe model and uniform model. Pipe model is default, where MPLS header TTL Value wont get propagated to IP header.

While pipe mode is the default, you can choose the uniform model with the mpls lsp-model uniform command.

For more about the uniform model and pipe models, see MPLS DiffServ Configuration .

Topology

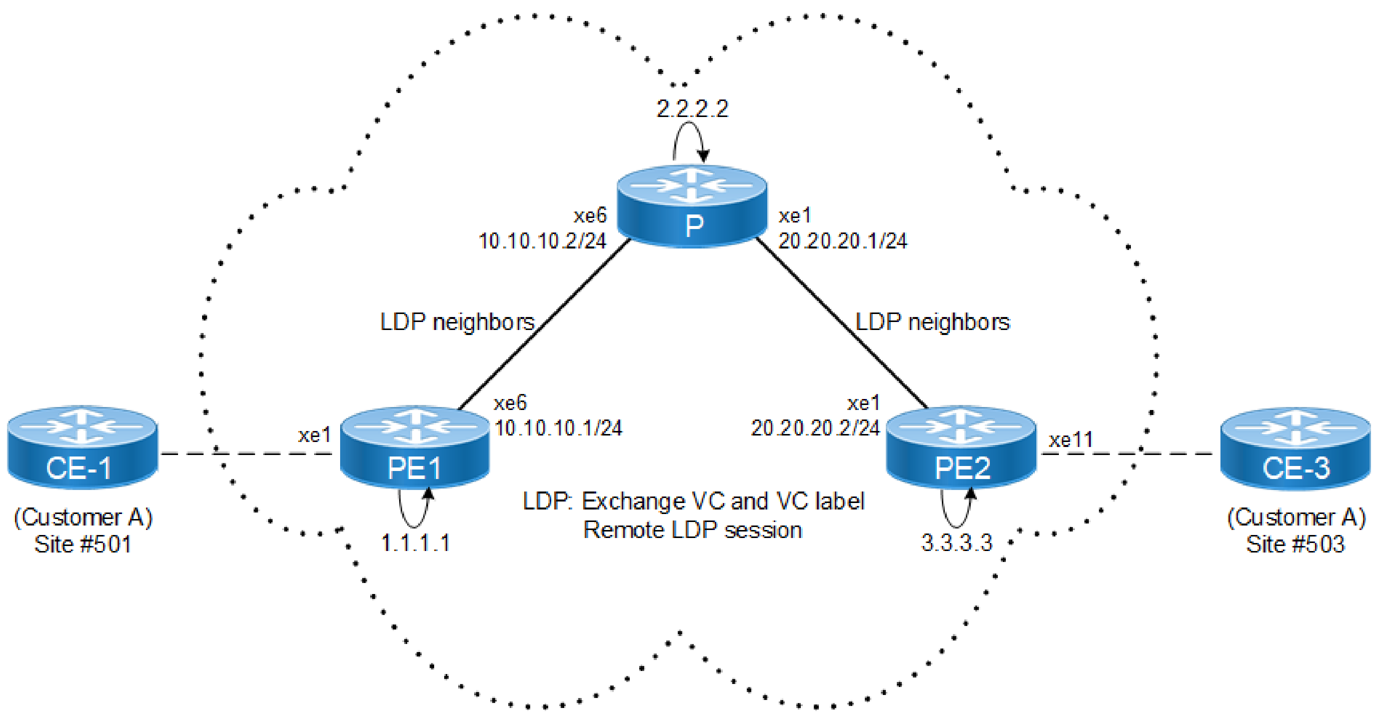

Figure 2-13: TTL Processing Topology

Configuration

PE1

PE1#configure terminal	Enter configure mode
PE1(config)#interface lo	Enter interface mode.
PE1(config-if)#ip address 1.1.1.1/32 secondary	Configure IP address for the loopback address
PE1(config-if)#exit	Exit interface mode
PE1(config)#interface xe6	Specify the interface (xe6) to be configured
PE1(config-if)#ip address 10.10.10.1/24	Configure IP address for the interface
PE1(config-if)#no shutdown	Administratively bringing up the interface
PE1(config-if)#exit	Exit interface mode
PE1(config)#router ospf 100	Configure the routing process and specify the Process ID (100)
PE1(config-router)#ospf router-id 1.1.1.1	Configure ospf router id same as loopback ip address.
PE1(config-router)#network 10.10.10.0/24 area 0 PE1(config-router)#network 1.1.1.1/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface
PE1(config-router)#exit	Exit configure mode
PE1(config)#router ldp	Enter router mode for LDP
PE1(config-router)#router-id 1.1.1.1	Set the router ID to IP address 1.1.1.1
PE1(config-router)#transport-address ipv4 1.1.1.1 0	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. **Note:** It is preferable to use the loopback address as the transport address.
PE1(config-router)#targeted-peer ipv4 3.3.3.3	Configure targeted peer.
PE1(config-router)#exit	Exit router mode for LDP
PE1(config)#interface xe6	Specify the interface (xe6)to be configured
PE1(config-if)#label-switching	Enabling label switching capability on router
PE1(config-if)#enable-ldp ipv4	Enabling ldp on interface
PE1(config-if)#commit	Commit the transaction

P

P#configure terminal	Enter configure mode.
P(config)#interface lo	Enter interface mode.
P(config-if)#ip address 2.2.2.2/32 secondary	Configure IP address for the loopback address
P(config-if)#exit	Exit interface mode
P(config)#interface xe6	Specify the interface (xe6) to be configured
P(config-if)#ip address 10.10.10.2/24	Configure IP address for the interface
P(config-if)#no shutdown	Administratively bringing up the interface
P(config)#interface xe1	Specify the interface (xe1) to be configured

`P(config-if)#ip address 20.20.20.1/24`	Configure IP address for the interface
`P(config)#router ospf 100`	Configure the routing process and specify the Process ID (100)
`P(config-router)#ospf router-id 2.2.2.2`	Configure OSPF router id same as loopback IP address.

`P(config-router)#network 10.10.10.0/24 area 0`
`P(config-router)#network 20.20.20.0/24 area 0`
`P(config-router)#network 2.2.2.2/32 area 0`
	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface

`P(config-router)#exit`	Exit router mode
`P(config)#router ldp`	Enter router mode for LDP
`P(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2
`P(config-router)#transport-address ipv4 2.2.2.2 0`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note:It is preferable to use the loopback address as the transport address.
`P(config-router)#exit`	Exit router mode for LDP
`P(config)#interface xe6`	Specify the interface (xe6)to be configured
`P(config-if)#label-switching`	Enabling label switching capability on router
`P(config-if)#enable-ldp ipv4`	Enabling ldp on interface
`P(config)#interface xe1`	Specify the interface (xe1)to be configured
`P(config-if)#label-switching`	Enabling label switching capability on router
`P(config-if)#enable-ldp ipv4`	Enabling ldp on interface
`P(config-if)#commit`	Commit the transaction

PE2

`PE2#configure terminal`	Enter configure mode.
`PE2(config)#interface lo`	Enter interface mode.
`PE2(config-if)#ip address 3.3.3.3/32 secondary`	Configure IP address for the loopback address
`PE2(config-if)#exit`	Exit interface mode
`PE2(config)#interface xe1`	Specify the interface `(xe1)` to be configured
`PE2(config-if)#ip address 20.20.20.2/24`	Configure IP address for the interface
`PE2(config-if)#no shutdown`	Administratively bringing up the interface
`PE2(config-if)#exit`	Exit interface mode
`PE2(config)#router ospf 100`	Configure the routing process and specify the Process ID (100)
`PE2(config-router)#ospf router-id 3.3.3.3`	Configure OSPF router ID same as loopback IP address.
`PE2(config-router)#network 20.20.20.0/24 area 0` `PE2(config-router)#network 3.3.3.3/32 area 0`	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface
`PE2(config)#router ldp`	Enter router mode for LDP
`PE2(config-router)#router-id 3.3.3.3`	Set the router ID to IP address 3.3.3.3

PE2(config-router)#transport-address ipv4 3.3.3.3 0	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. **Note:** It is preferable to use the loopback address as the transport address.
PE2(config-router)#targeted-peer ipv4 1.1.1.1	Configure targeted peer.
PE2 (config-router-targeted-peer)#exit	Exit-targeted-peer-mode
PE2(config-router)#exit	Exit router mode for LDP
PE2(config)#interface xe1	Specify the interface (xe1)to be configured
PE2(config-if)#label-switching	Enabling label switching capability on router
PE2(config-if)#enable-ldp ipv4	Enabling ldp on interface
PE2(config-if)#commit	Commit the transaction

CHAPTER 3 MPLS Layer-3 VPN Configurations

This chapter contains configurations for MPLS Layer-3 Virtual Private Networks (VPNs).

Overview

The MPLS Layer-3 VPN solution provides address space and routing separation via the use of per-VPN Routing and Forwarding tables (VRFs), and MPLS switching in the core and at the edge of the network. VPN customer routing data is imported into the VRFs utilizing the Route Target BGP extended community. This routing data is identified by a Route Distinguisher (RD) and is distributed among Provider Edge (PE) routers using Multi-Protocol BGP extensions.

Terminology

The following illustrates a Virtual Private Network in a CConnect Service Provider Network. This illustration corresponds to the terms defined in this subsection.

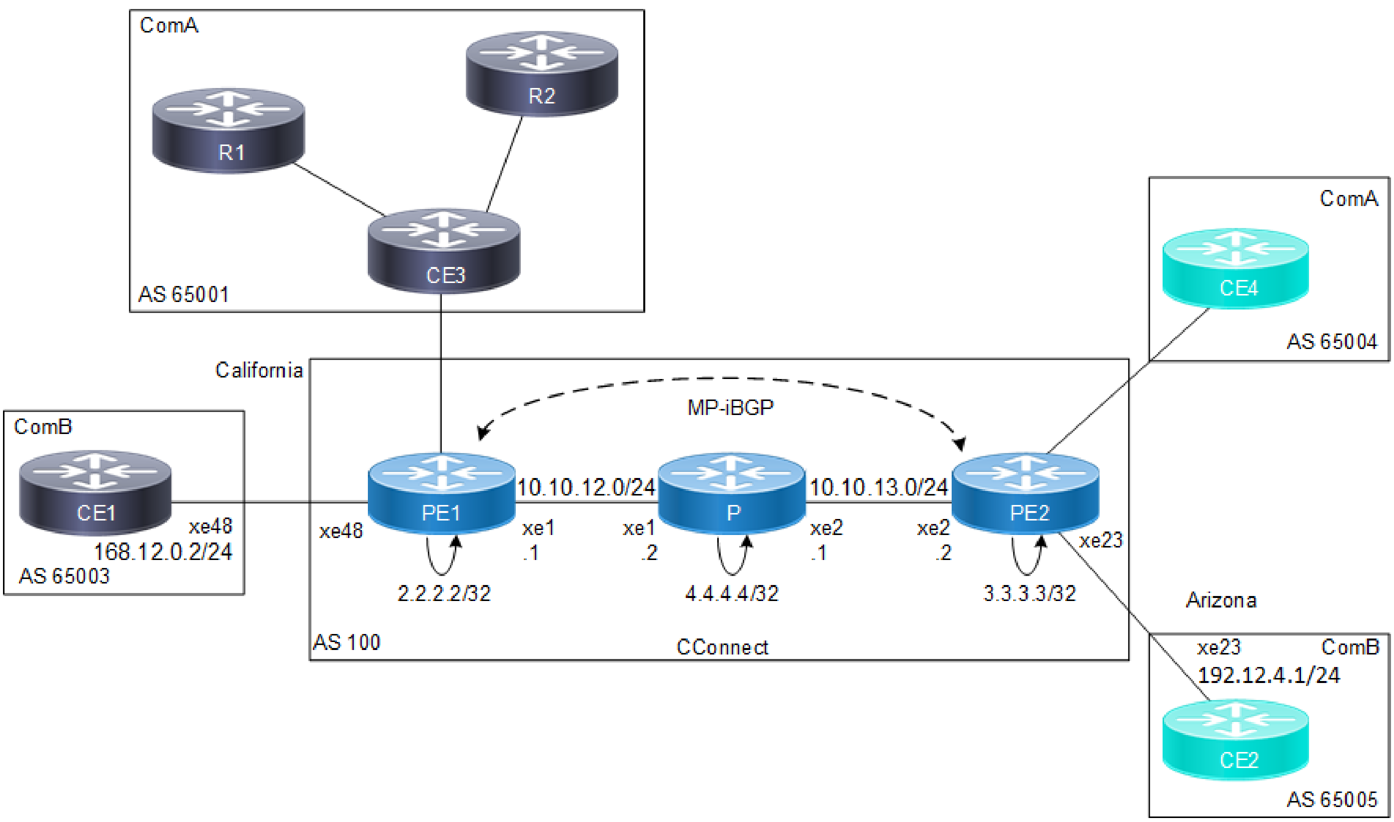

Figure 3-14: CConnect Provider with ComA and ComB Customers

- Service Provider

  The organization that owns the infrastructure that provides leased lines to customers, offering them a Virtual Private Network Service. In the above illustration, CConnect is the service provider providing services to clients ComA and ComB.

- Customer Edge (CE) Router

  A router at a customer's site that connects to the Service Provider via one or more Provider Edge routers. In the above illustration, CE1, CE2, CE3 and CE4 are all CE routers connected directly to the CConnect network.

- Provider Edge (PE) Router

  A provider's router connected to a CE router through a leased line or dial-up connection. In the above illustration, PE1 and PE2 are the PE routers, because they link the CConnect service provider to its clients.

- Provider Core Router (P)

  The devices in the core of the service provider network, which are generally not Provider Edge routers. In the above illustration, the P router is the Provider device, not connected to any customer, and is the core of the CConnect network.

- Site

  A contiguous part of the customer network. A site connects to the provider network through transmission lines, using a CE and PE router. In the above illustration, R1, R2 and CE3 comprise a Customer network, and are seen as a single site by the CConnect network.

- Customer Router

  In the illustration above, R1 and R2 are the Customer routers, and are not directly connected to the CConnect network.

VPN Routing Process

The OcNOS MPLS-VPN Routing process follows these steps:

1. Service Providers provide VPN services from PE routers that communicate directly with CE routers via an Ethernet Link.

2. Each PE router maintains a Routing and Forwarding table (VRF) for each customer. This guarantees isolation, and allows the usage of uncoordinated private addresses. When a packet is received from the CE, the VRF that is mapped to that site is used to determine the routing for the data. If a PE has multiple connections to the same site, a single VRF is mapped to all of those connections.

3. After the PE router learns of the IP prefix, it converts it into a VPN-IPv4 prefix by prepending it with an 8-byte Route Distinguisher (RD). The RD ensures that even if two customers have the same address, two separate routes to that address can be maintained. These VPN-IPv4 addresses are exchanged between the PE routers through MP-BGP.

4. A unique Router ID (usually the loopback address) is used to allocate a label, and enable VPN packet forwarding across the backbone.

5. Based on routing information stored in the VRF table, packets are forwarded to their destination using MPLS. Each PE router allocates a unique label to every route in each VRF (even if they have the same next hop), and propagates these labels, together with 12-byte VPN-IPv4 addresses, through Multi-Protocol BGP.

6. Ingress PE routers prepend a two-level label stack to the VPN packet, which is forwarded across the Provider network. This label stack contains a BGP-specific label from the VRF table (associated with the incoming interface), specifying the BGP next hop and an LDP-specific label from the global FTN table, specifying the IP next hop.

7. The Provider router in the network switches the VPN packet, based on the top label or the LDP-specific label in the stack. This top label is used as the key to lookup in the incoming interface's Incoming Labels Mapping table (ILM). If there is an outbound label, the label is swapped, and the packet is forwarded to the next hop; if not, the router is the penultimate router, and it pops the LDP-specific label, and forwards the packet with only the BGP-specific label to the egress PE router.

8. The egress PE router pops the BGP-specific label, performs a single label lookup in the outbound interface, and sends the packet to the appropriate CE router.

Configure MPLS Layer-3 VPN

The MPLS Layer-3 VPN configuration process can be divided into the following tasks

1. Establish connection between PE routers.
2. Configure PE1 and PE2 as iBGP neighbors.
3. Create VRF.
4. Associate interfaces to VRFs.
5. Configure VRF Route Destination and Route Targets.
6. Configure CE neighbor for the VPN.
7. Verify the MPLS to VPN configuration.

Topology

In this example, the CConnect MPLS-VPN backbone has two customers — ComA and ComB. Both customers have sites in California and Arizona. The following topology shows BGP4 address assignment between PE and CE routers. The steps that follow provision a customer VPN service across the MPLS-VPN backbone.

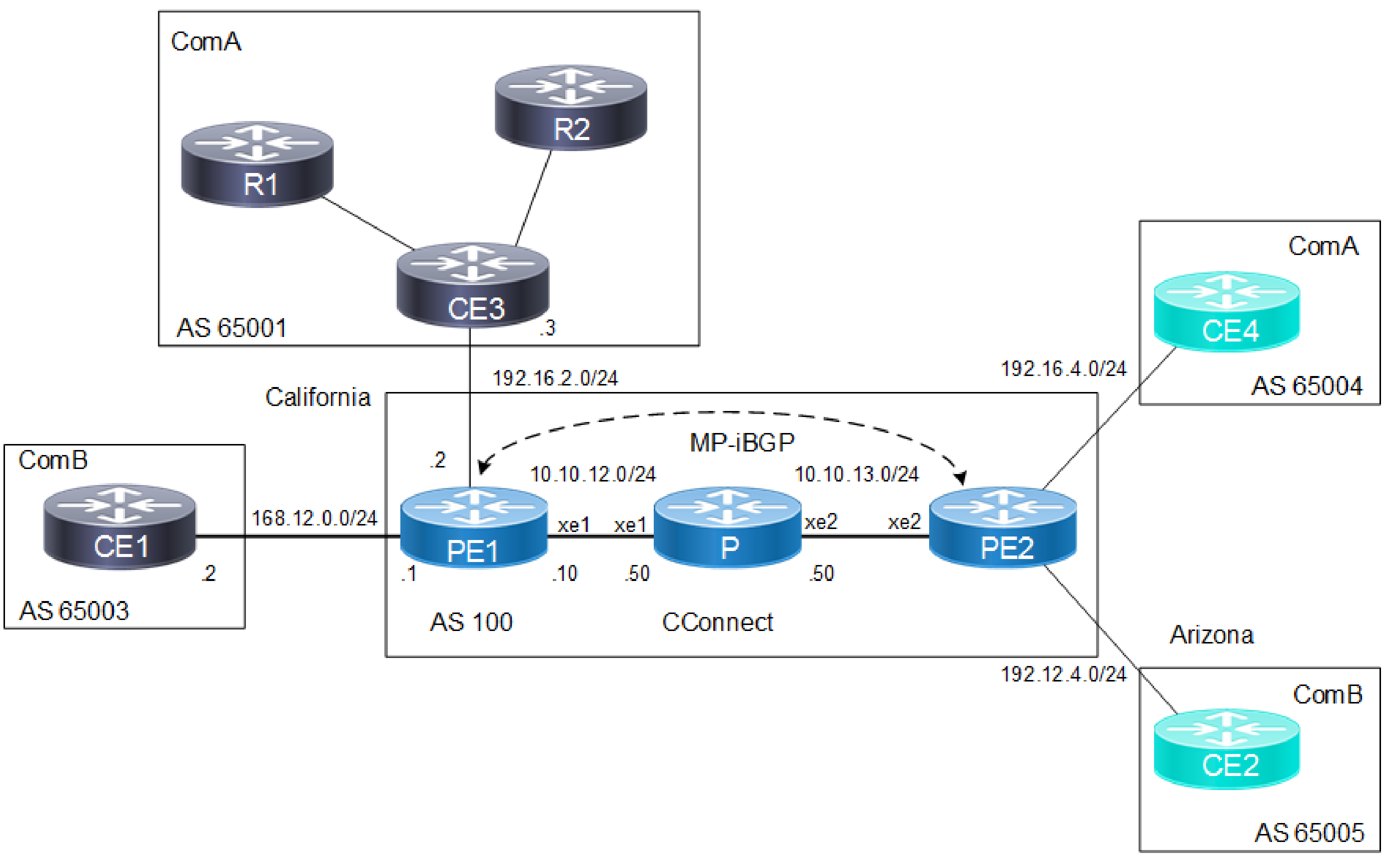

Figure 3-15: Connect Sample Topology

To establish this connection involves three steps:

Enable Label Switching

This is a sample configuration to enable label switching for the Labeled Switched Path (LSP) between PE1 and PE2 (refer to Figure 3-15).

Enable Label Switching: PE1

configure terminal	Enter configure mode
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.2/32 secondary	Assign the IPv4 address
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter Interface mode
(config-if)#ip address 10.10.12.1/24	Assign IPv4 address
(config-if)#label-switching	Enabling label switching capability on router
(config-if)#commit	Commit the transaction.

Enable Label Switching: P

configure terminal	Enter configure mode
(config)#interface lo	Enter interface mode
(config-if)#ip address 4.4.4.4/32 area 0 secondary	Assign the IPv4 address
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter Interface mode
(config-if)#ip address 10.10.12.2/24	Assign IPv4 address
(config-if)#label-switching	Enabling label switching capability on router
(config-if)#commit	Commit the transaction.
(config)#interface xe2	Enter Interface mode
(config-if)#ip address 10.10.13.1/24	Assign IPv4 address
(config-if)#label-switching	Enabling label switching capability on router
(config-if)#commit	Commit the transaction.

Enable Label Switching: PE2

configure terminal	Enter configure mode
(config)#interface lo	Enter interface mode
(config-if)#ip address 3.3.3.3/32 secondary	Assign the IPv4 address
(config-if)#exit	Exit interface mode
(config)#interface xe2	Enter Interface mode
(config-if)#ip address 10.10.13.2/24	Assign IPv4 address
(config-if)#label-switching	Enabling label switching capability on router
(config-if)#commit	Commit the transaction.

Enable IGP

What follows is a sample configuration to establish connections between the two Provider Edge routers PE1 and PE2.

Enable IGP Switching: PE1

`configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100)
`(config-router)#network 10.10.12.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#network 2.2.2.2/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#commit`	Commit the transaction.

Enable IGP Switching: P

`configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100)
`(config-router)#network 10.10.12.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#network 10.10.13.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#network 4.4.4.4/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#commit`	Commit the transaction.

Enable IGP Switching: PE2

`configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100)
`(config-router)#network 3.3.3.3/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#commit`	Commit the transaction.

Enable Label Switching Protocol

Label switching protocols are used to set up a Label-Switched Path (LSP) between PE routers. OcNOS supports LDP and RSVP-TE protocols for label switching. Enable either LDP or RSVP-TE.

This is a sample configuration to enable LDP on the whole path between PE1 and PE2 (see Figure 3-15).

LDP: PE1

`configure terminal`	Enter configure mode
`(config)#router ldp`	Enter router mode for LDP

`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode
`(config-if)#enable-ldp ipv4`	Enabling LDP on interface
`(config-if)#commit`	Commit the transaction.

LDP: P

`configure terminal`	Enter configure mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode
`(config-if)#enable-ldp ipv4`	Enabling LDP on interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode
`(config-if)#enable-ldp ipv4`	Enabling LDP on interface
`(config-if)#commit`	Commit the transaction.

LDP: PE2

`configure terminal`	Enter configure mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#exit`	Exit router mode
`(config)#interface xe2`	Enter interface mode
`(config-if)#enable-ldp ipv4`	Enabling LDP on interface
`(config-if)#commit`	Commit the transaction.

This is a sample configuration to enable RSVP-TE along the entire path between PE1 and PE2 (see Figure 3-15).

RSVP-TE: PE1

`configure terminal`	Enter configure mode
`(config)#router rsvp`	Enter Configure Router mode
`(config-router)#rsvp-path p1 mpls`	Enter the path mode for RSVP P1.
`(config-path)#10.10.12.2 loose`	Configure loose path
`(config-path)#exit`	Exit Configure Router mode
`(config)#rsvp-trunk t1`	Configure RSVP trunk t1
`(config-rsvp)#primary path p1`	Specify an RSVP path to be used
`(config-rsvp)#from 2.2.2.2`	Assign the source loopback address to the RSVP trunk
`(config-rsvp)#to 3.3.3.3`	Assign the source loopback address to the to the RSVP trunk
`(config-rsvp)#exit`	Exit RSVP trunk mode
`(config)#interface xe1`	Enter the interface mode
`(config-if)#enable-rsvp`	Enable RSVP in interface
`(config-if)#commit`	Commit the transaction.

RSVP-TE: P

`configure terminal`	Enter configure mode
`(config)#router rsvp`	Enter Configure Router mode
`(config-router)#exit`	Exit Configure Router mode
`(config)#interface xe1`	Enter the interface mode
`(config-if)#enable-rsvp`	Enable RSVP in interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter the interface mode
`(config-if)#enable-rsvp`	Enable RSVP in interface
`(config-if)#commit`	Commit the transaction.

RSVP-TE: PE2

`configure terminal`	Enter configure mode
`(config)#router rsvp`	Enter Configure Router mode
`(config-router)#rsvp-trunk t1`	Configure RSVP trunk t1
`(config-rsvp)#from 3.3.3.3`	Assign the source loopback address to the RSVP trunk
`(config-rsvp)#to 2.2.2.2`	Assign the source loopback address to the to the RSVP trunk
`(config-rsvp)#exit`	Exit RSVP trunk mode
`(config)#interface xe2`	Enter the interface mode
`(config-if)#enable-rsvp`	Enable RSVP in interface
`(config-if)#commit`	Commit the transaction.

Configure PEs as BGP Neighbors

BGP is the preferred protocol to transport VPN routes because of its multiprotocol capability and its scalability. Its ability to exchange information between indirectly connected routers supports keeping VPN routing information out of the Provider (P) routers. The P routers carry information as an optional BGP attribute. Additional attributes are transparently forwarded by any P router. The MPLS-VPN forwarding model does not require the P routers to make routing decisions based on VPN addresses: They forward packets based on the label value attached to the packet. The P routers do not require a VPN configuration in order to carry this information.

PE1

`#configure terminal`	Enter the configure terminal
`(config)#router bgp 100`	Enter the Router BGP mode, ASN: 100
`(config-router)#bgp router-id 2.2.2.2`	Router identifier for BGP
`(config-router)#exit`	Exit router BGP mode
`(config)#router ldp`	Enter the Router LDP mode
`(config-router)#exit`	Exit the Router LDP mode
`(config)#router bgp 100`	Enter the Router BGP mode, ASN: 100
`(config-router)#neighbor 3.3.3.3 remote-as 100`	Configuring ABR1 as iBGP neighbor using it's loopback IP

(config-router)#neighbor 3.3.3.3 update-source 2.2.2.2	Source of routing updates
(config-router)#address-family vpnv4 unicast	Configure VPNv4 address family
(config-router-af)#neighbor 3.3.3.3 activate	Activate the VPN neighbor
(config-router-af)exit-address-family	Exit address family mode
(config-router)#address-family ipv4 unicast	Configure IPv4 address family
(config-router-af)#neighbor 3.3.3.3 activate	Activate the IPv4 neighbor
(config-router-af)#commit	Commit the transaction.

PE2

#configure terminal	Enter the configure terminal
(config)#router bgp 100	Enter the Router BGP mode, ASN: 100
(config-router)#bgp router-id 3.3.3.3	Router identifier for BGP
(config-router)#exit	Exit router BGP mode
(config)#router ldp	Enter the Router LDP mode
(config-router)#exit	Exit the Router LDP mode
(config)#router bgp 100	Enter the Router BGP mode, ASN: 100
(config-router)#neighbor 2.2.2.2 remote-as 100	Configuring ABR1 as iBGP neighbor using it's loopback IP
(config-router)#neighbor 2.2.2.2 update-source 3.3.3.3	Source of routing updates
(config-router)#address-family vpnv4 unicast	Configure VPNv4 address family
(config-router-af)#neighbor 2.2.2.2 activate	Activate the VPN neighbor
(config-router-af)exit-address-family	Exit address family mode
(config-router)#address-family ipv4 unicast	Configure IPv4 address family
(config-router-af)#neighbor 2.2.2.2 activate	Activate the IPv4 neighbor
(config-router-af)#commit	Commit the transaction.

Create VRF

Each PE router in the MPLS-VPN backbone is attached to a site that receives routes from a specific VPN, so the PE router must have the relevant Virtual Routing and Forwarding (VRF) configuration for that VPN.

This command creates a VRF RIB (Routing Information Base), assigns a VRF-ID, and switches the command mode to `vrf` mode. The following example creates a VRF named `ComB`.

PE1

#configure terminal	Enter the configure terminal
(config)#ip vrf ComB	Configure VRF instance
(config-vrf)#rd 2:1	Configure Router Distinguisher value
(config-vrf)#exit	Exit VRF mode
(config)#ip vrf ComA	Configure VRF instance
(config-vrf)#rd 1:2	Configure Router Distinguisher value

(config-vrf)#exit	Exit VRF mode
(config)#commit	Commit the transaction.

PE2

#configure terminal	Enter the configure terminal
(config)#ip vrf ComB	Configure VRF instance
(config-vrf)#rd 1:2	Configure Router Distinguisher value
(config-vrf)#exit	Exit VRF mode
(config)#ip vrf ComA	Configure VRF instance
(config-vrf)#rd 2:1	Configure Router Distinguisher value
(config-vrf)#exit	Exit VRF mode
(config)#commit	Commit the transaction.

Associate Interfaces to VRFs

After the VRFs are defined on the PE router, the PE router needs to recognize which interfaces belong to which VRF. The VRF is populated with routes from connected sites. More than one interface can belong to the same VRF.

In the following example, interface `xe48` is associated with the VRF named `ComB`.

PE1

#configure terminal	Enter the configure terminal
(config)#interface xe49	Enter interface mode
(config-if)#ip vrf forwarding ComA	Bind the VRF instance to the interface
(config-if)exit	Exit interface mode
(config)#interface xe48	Enter interface mode
(config-if)#ip vrf forwarding ComB	Bind the VRF instance to the interface
(config-if)#ip address 168.12.0.3/24	Assign IPv4 address
PE1(config-if)#ip vrf forwarding ComA	Bind the VRF instance to the interface
(config-if)exit	Exit interface mode
(config)#commit	Commit the transaction.

PE2

#configure terminal	Enter the configure terminal
(config)#interface xe48	Enter interface mode
(config-if)#ip vrf forwarding ComA	Bind the VRF instance to the interface
(config-if)#ip address 192.16.4.2/24	Assign IPv4 address
(config-if)exit	Exit interface mode
(config)#interface xe49	Enter interface mode
(config-if)#ip vrf forwarding ComB	Bind the VRF instance to the interface
(config-if)#ip address 168.12.4.2/24	Assign IPv4 address

(config-if)exit	Exit interface mode
(config)#commit	Commit the transaction.

Configure VRF—RD and Route Targets

After the VRF is created, configure Router Distinguishers and the Route Targets.

Configure Route Distinguishers

Route Distinguishers (RDs) make all customer routes unique. The routes must be unique, so that Multi-Protocol BGP treats the same prefix from two different VPNs as non-comparable routes. To configure RDs, a sequence of 64 bits is prepended to the IPv4 address in the Multi-Protocol BGP update. BGP considers two IPv4 addresses with different RDs as non-comparable, even if they have the same address and mask.

Assign a particular value to the RD for each VRF on the PE router. To display the routing table for a VRF, use the `show ip route vrf` command.

The following example shows adding an RD. Configure a VRF in both PEs with a unique RD value:

PE1

#configure terminal	Enter the configure terminal
(config)#ip vrf ComA	Configure VRF instance
(config-vrf)#rd 2:2	Configure Router Distinguisher value
(config-vrf)#route-target both 200:1	Configure route-target as both
(config-vrf)#exit	Exit VRF mode
(config)#ip vrf ComB	Configure VRF instance
(config-vrf)#rd 1:1	Configure Router Distinguisher value
(config-vrf)#route-target both 100:1	Configure route-target as both
(config-vrf)#exit	Exit VRF mode
(config)#commit	Commit the transaction.

PE2

#configure terminal	Enter the configure terminal
(config)#ip vrf ComA	Configure VRF instance
(config-vrf)#rd 2:1	Configure Router Distinguisher value
(config-vrf)#route-target both 200:1	Configure route-target as both
(config-vrf)#exit	Exit VRF mode
(config)#ip vrf ComB	Configure VRF instance
(config-vrf)#rd 1:2	Configure Router Distinguisher value
(config-vrf)#route-target both 100:1	Configure route-target as both
(config-vrf)#exit	Exit VRF mode
(config)#commit	Commit the transaction.

Configure Route Targets

Any routes learned from customers are advertised across the network through Multi-Protocol BGP, and any routes learned through Multi-Protocol BGP are added into the appropriate VRFs. The route target helps PE routers identify which VRFs should receive the routes.

The `route-target` command creates lists of import and export route-target extended communities for the VRF. It specifies a target VPN extended community. Execute the command once for each community. All routes with the specific route-target extended community are imported into all VRFs with the same extended community as an import route-target.

The following example demonstrates the route-target configuration.

PE1

`#configure terminal`	Enter the configure terminal
`(config)#ip vrf ComA`	Configure VRF instance
`(config-vrf)#rd 2:2`	Configure Router Distinguisher value
`(config-vrf)#route-target both 200:1`	Configure route-target as both
`(config-vrf)#exit`	Exit VRF mode
`(config)#ip vrf ComB`	Configure VRF instance
`(config-vrf)#rd 1:1`	Configure Router Distinguisher value
`(config-vrf)#route-target both 100:1`	Configure route-target as both
`(config-vrf)#exit`	Exit VRF mode
`(config)#commit`	Commit the transaction.

PE2

`#configure terminal`	Enter the configure terminal
`(config)#ip vrf ComA`	Configure VRF instance
`(config-vrf)#rd 2:1`	Configure Router Distinguisher value
`(config-vrf)#route-target both 200:1`	Configure route-target as both
`(config-vrf)#exit`	Exit VRF mode
`(config)#ip vrf ComB`	Configure VRF instance
`(config-vrf)#rd 1:2`	Configure Router Distinguisher value
`(config-vrf)#route-target both 100:1`	Configure route-target as both
`(config-vrf)#exit`	Exit VRF mode
`(config)#commit`	Commit the transaction.

Configure CE Neighbor for the VPN (Using BGP/ OSPF)

To provide a VPN service, the PE-router must be configured so that any routing information learned from a VPN customer interface can be associated with a particular VRF. This is achieved using any standard routing protocol process (OSPF, BGP or static routes etc). Use any one of the following configurations (BGP, or OSPF) to configure the CE neighbor.

Using BGP

The BGP sessions between PE and CE routers can carry different types of routes (VPN-IPv4, IPv4 routes). Address families are used to control the type of BGP session. Configure a BGP address family for each VRF on the PE-router, and a separate address family to carry VPN-IPv4 routes between PE routers. All non-VPN BGP neighbors are defined using the `IPv4 address` mode. Each VPN BGP neighbor is defined under its associated address family mode.

A separate address family entry is used for every VRF, and each address family entry can have multiple CE routers within the VRF.

The PE and CE routers must be directly connected for BGP4 sessions; BGP multihop is not supported between PE and CE routers.

The following example places the router in address family mode, and specifies company names, `ComA` and `ComB`, as the names of the VRF instance to associate with subsequent IPv4 address family configuration mode commands. This configuration is used when BGP is used for PE and CE.

PE1

`configure terminal`	Enter configure mode
`(config)#router bgp 100`	Enter BGP router mode
`(config-router)#address-family ipv4 unicast`	Enter address family mode
`(config-router-af)#redistribute connected`	Redistribute connected addresses
`(config-router-af)#exit-address-family`	Exit address family mode
`(config-router)#address-family ipv4 vrf ComA`	Enter the IPv4 address family for VRF comA
`(config-router)#neighbor 192.16.2.3 remote-as 65001`	Specify the neighbor
`(config-router-af)#neighbor 192.16.2.3 activate`	Activate the neighbor
`(config-router-af)#exit-address-family`	Exit address family mode
`(config-router)#address-family ipv4 vrf ComB`	Enter the IPv4 address family for VRF comA
`(config-router)#neighbor 168.12.0.2 remote-as 65003`	Specify the neighbor
`(config-router-af)#neighbor 192.12.0.2 activate`	Activate the neighbor
`(config-router-af)#exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the transaction

PE2

`configure terminal`	Enter configure mode
`(config)#router bgp 100`	Enter BGP router mode
`(config-router)#address-family ipv4 unicast`	Enter address family mode
`(config-router-af)#redistribute connected`	Redistribute connected addresses
`(config-router-af)#exit-address-family`	Exit address family mode
`(config-router)#address-family ipv4 vrf ComA`	Enter the IPv4 address family for VRF comA
`(config-router)#neighbor 192.16.4.3 remote-as 65004`	Specify the neighbor

(config-router-af)#neighbor 192.16.4.3 activate	Activate the neighbor
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#address-family ipv4 vrf ComB	Enter the IPv4 address family for VRF comA
(config-router)#neighbor 168.12.4.1 remote-as 65005	Specify the neighbor
(config-router-af)#neighbor 192.12.4.1 activate	Activate the neighbor
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#commit	Commit the transaction

CE1: BGP

configure terminal	Enter configure mode
(config)#interface xe48	Enter interface mode for xe48
(config-if)#ip address 168.12.0.2/24	Assign IP address
(config-if)#exit	Exit interface mode
(config)#router bgp 65003	Enter BGP router mode
(config-router)#neighbor 168.12.0.3 remote-as 100	Specify the neighbor
(config-router)#address-family ipv4 unicast	Enter address family mode
(config-router-af)#neighbor 168.12.0.3 activate	Activate the neighbor
(config-router-af)#redistribute connected	Redistribute connected addresses
(config-router-af)#commit	Commit the transaction

CE2: BGP

configure terminal	Enter configure mode
(config)#interface xe23	Enter interface mode for xe48
(config-if)#ip address 192.12.4.1/24	Assign IP address
(config-if)#exit	Exit interface mode
(config)#router bgp 65005	Enter BGP router mode
(config-router)#neighbor 192.12.4.2 remote-as 100	Specify the neightbor
(config-router)#address-family ipv4 unicast	Enter address family mode
(config-router-af)#neighbor 192.12.4.2 activate	Activate the neighbor
(config-router-af)#redistribute connected	Redistribute connected addresses
(config-router-af)#commit	Commit the transaction

Using OSPF

Unlike BGP, OSPF does not run different routing contexts within one process. Thus, for running OSPF between the PE and CE routers, configure a separate OSPF process for each VRF that receives VPN routes through OSPF. The PE

© 2025 IP Infusion Inc. Proprietary

router distinguishes routers belonging to a specific VRF, by associating a particular customer interface to a specific VRF and to a particular OSPF process.

To redistribute VRF OSPF routes into BGP, redistribute OSPF under the BGP VRF address family submode.

PE1

`configure terminal`	Enter configure mode
`(config)#router ospf 101 comA`	Enter OSPF router mode
`(config-router)#network 192.16.3.0/24 area 0`	Define the network on which OSPF runs and associate area ID
`(config-router)#redistribute bgp`	Redistribute BGP
`(config-router)#exit`	Exit router mode
`(config)#router ospf 102 comB`	Enter OSPF router mode
`(config-router)#network 168.12.0.2/24 area 0`	Define the network on which OSPF runs and associate area ID
`(config-router)#redistribute bgp`	Redistribute BGP
`(config-router)#commit`	Commit the transaction
`(config-router)#exit`	Exit router mode
`(config)#router bgp 100`	Enter the Router BGP mode, ASN: 100
`(config-router)#address-family ipv4 vrf ComA`	Configure VRF address family
`(config-router-af)#redistribute ospf`	Redistribute OSPF
`(config-router-af)#exit-address-family`	Exit address family mode
`(config-router)#address-family ipv4 vrf ComB`	Configure VRF address family
`(config-router-af)#redistribute ospf`	Redistribute OSPF
`(config-router-af)#redistribute rip`	Redistribute RIP
`(config-router-af)#commit`	Commit the transaction

PE2

`configure terminal`	Enter configure mode
`(config)#router ospf 101 comA`	Enter OSPF router mode
`(config-router)#network 192.16.4.0/24 area 0`	Define the network on which OSPF runs and associate area ID
`(config-router)#redistribute bgp`	Redistribute BGP
`(config-router)#exit`	Exit router mode
`(config)#router ospf 102 comB`	Enter OSPF router mode
`(config-router)#network 168.12.0.3/24 area 0`	Define the network on which OSPF runs and associate area ID
`(config-router)#redistribute bgp`	Redistribute BGP
`(config-router)#commit`	Commit the transaction
`(config-router)#exit`	Exit router mode
`(config)#router bgp 100`	Enter the Router BGP mode, ASN: 100
`(config-router)#address-family ipv4 vrf ComA`	Configure VRF address family
`(config-router-af)#redistribute ospf`	Redistribute OSPF

(config-router-af)#exit-address-family	Exit address family mode
(config-router)#address-family ipv4 vrf ComB	Configure VRF address family
(config-router-af)#redistribute ospf	Redistribute OSPF
(config-router-af)#redistribute rip	Redistribute RIP
(config-router-af)#commit	Commit the transaction

Verify the MPLS-VPN Configuration

Use the show ip bgp neighbor command to validate the neighbor session between the CE and the PE routers. Use the `show ip bgp vpnv4 all` command to display all the VRFs and the routes associated with them. The following is sample output for the above commands for the PE1, CE1 and PE2 routers (based on the topology in Figure 3-15).

```
PE1#show ip bgp neighbors
BGP neighbor is 3.3.3.3, remote AS 100, local AS 100, internal link
  BGP version 4, local router ID 2.2.2.2, remote router ID 3.3.3.3
  BGP state = Established, up for 00:05:09
  Last read 00:00:13, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family VPNv4 Unicast: advertised and received
  Received 194 messages, 2 notifications, 0 in queue
  Sent 198 messages, 3 notifications, 0 in queue
  Route refresh request: received 2, sent 1
  Minimum time between advertisement runs is 5 seconds
  Update source is 2.2.2.2
 For address family: IPv4 Unicast
  BGP table version 8, neighbor version 8
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  3 accepted prefixes
  3 announced prefixes

 For address family: VPNv4 Unicast

Verify MPLS-L3 VPN VRF Ping and Traceroute

Use the `ping mpls l3vpn` command for the below requirements:

- PE to PE L3VPN ping via VRF
- PE to remote CE Ping via the VRF
- CE to remote PE ping (to the VRF interface facing its customer edge).

- Trace route from PE to PE via VRF
- Trace route from PE to remote CE via VRF
- Commands for ipv6 ping and trace route

1. PE to PE L3VPN Ping via VRF:

```
PE2#ping 168.12.0.1 vrf ComB
Press CTRL+C to exit
PING 168.12.0.1 (168.12.0.1) 56(84) bytes of data.
64 bytes from 168.12.0.1: icmp_seq=1 ttl=64 time=0.695 ms

#
```

2. PE to remote CE Ping via VRF:

```
PE2#ping 168.12.0.2 vrf ComB
Press CTRL+C to exit
PING 168.12.0.2 (168.12.0.2) 56(84) bytes of data.
64 bytes from 168.12.0.2: icmp_seq=1 ttl=63 time=0.776 ms

--- 168.12.0.2 ping statistics ---
1 packets transmitted, 1 received, 0% packet loss, time 0ms
rtt min/avg/max/mdev = 0.776/0.776/0.776/0.000 ms
PE2#
 PE2
```

3. CE to remote PE ping:

```
CE1#ping 168.12.0.1
Press CTRL+C to exit
PING 168.12.0.1 (168.12.0.1) 56(84) bytes of data.
64 bytes from 168.12.0.1: icmp_seq=160 ttl=254 time=0.606 ms
64 bytes from 168.12.0.1: icmp_seq=161 ttl=254 time=0.558 ms
64 bytes from 168.12.0.1: icmp_seq=162 ttl=254 time=0.568 ms
64 bytes from 168.12.0.1: icmp_seq=163 ttl=254 time=0.574 ms
64 bytes from 168.12.0.1: icmp_seq=164 ttl=254 time=0.609 ms

--- 168.12.0.2 ping statistics ---
5 packets transmitted, 5 received, 0 errors, 0% packet loss, time 163002ms
```

4. Trace Route from PE to PE via VRF

```
PE2#traceroute ip 168.12.0.1 vrf ComB
traceroute to 168.12.0.1 (168.12.0.1), 30 hops max, 60 byte packets
1168.12.0.1 (168.12.0.1)  0.706 ms  0.743 ms  0.989 ms
```

5. Trace Route from PE to Remote CE via VRF

```
PE2#traceroute ip 168.12.0.2 vrf ComB
traceroute to 168.12.0.2 (168.12.0.2), 30 hops max, 60 byte packets
 1  168.12.0.1 (168.12.0.1)  0.871 ms  1.006 ms  1.055 ms
2168.12.0.2 (168.12.0.2)  1.965 ms  2.045 ms  2.256 ms
```

CHAPTER 4 MPLS-TE Shared Risk Link Group

Shared Risk Link Groups (SRLG) is a feature which allows the user to establish a backup secondary LSP (label switched path) path or a FRR (fast-reroute) LSP path which is disjoint from the path of the primary LSP. Links which are members of the same SRLG represent resources which share the same risk. For example, fiber links sharing the same conduit or multiple wavelengths sharing the same fiber.

SRLG groups are used to determine which links belong to the same SRLG. To advertise SRLG, the information is part of the IGP TE parameters in an opaque LSA (link state advertisement). It is advertised in a SRLG sub-TLV (type 16) of the existing Link TLV in OSPF.

The SRLG of a path in a label-switched path (LSP) is the set of SRLGs for all the links in the path. When computing the secondary path for an LSP, it is preferable to find a path such that the secondary and primary paths do not have any links in common in case the SRLGs for the primary and secondary paths are disjoint. This ensures that a single point of failure on a particular link does not bring down both the primary and secondary paths in the LSP.

Backup tunnel path selection with SRLG is done so that a backup tunnel can avoid using links that are in the same SRLG as the interfaces it is protecting. Otherwise, when the protected link fails the backup tunnel fails too.

Configure MPLS-TE Shared Risk Link Group

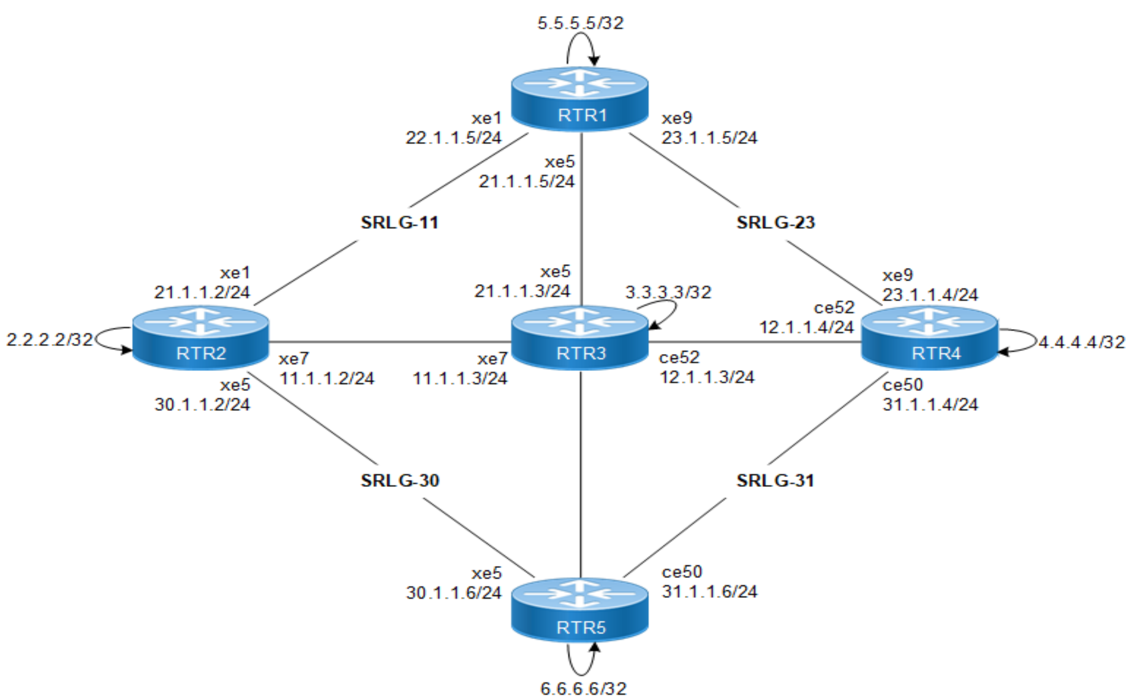

Figure 4-1: Topology for SRLG

RTR2

Loopback Interface

#configure terminal	Enter configure mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 2.2.2.2/32 secondary	Configure IP address on loopback interface.
(config-if)#commit	Commit the transaction.

MPLS Interface

(config)#interface xe1	Enter the Interface mode
(config-if)#ip address 22.1.1.2/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe5	Enter the Interface mode
(config-if)#ip address 30.1.1.2/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe7	Enter the Interface mode
(config-if)#ip address 11.1.1.2/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#commit	Commit the transaction.

OSPF

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)#router-id 2.2.2.2	Configure OSPF router id
(config-router)#network 2.2.2.2/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 11.1.1.0/24area 0	Advertise network address in OSPF.
(config-router)#network 22.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 30.1.1.0/24area 0	Advertise network address in OSPF.
(config-router)#commit	Commit the transaction.

Global RSVP

(config)#router rsvp	Enter the Router RSVP mode.
(config-router)#commit	Commit the transaction.

RSVP Interface

(config)#interface xe1	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface

(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe5	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe7	Enter the Interface mode
(config-if)#enable-rsvp	Enable rsvp on the interface
(config-if)#commit	Commit the transaction.

Global SRLG (Path Type: Forced)

(config)#router rsvp	Enter the Router RSVP mode.
(config-router)#srlg-disjoint forced	Configure SRLG path type forced
(config-router)#commit	Commit the transaction.

Note: Disjoint type “preferred” can be configured globally using the command `srlg-disjoint preferred`.

SRLG Interface

(config)#interface xe1	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 11	Configure SRLG value in the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe7	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 11	Configure SRLG value in the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe5	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 30	Configure SRLG value in the interface
(config-if)#commit	Commit the transaction.

MPLS RSVP Path

(config)#rsvp-path path1	Configure MPLS-path
(config-path)#11.1.1.3 strict	Configure first hop for the path
(config-path)#12.1.1.4 strict	Configure second hop for the path
(config-path)#exit	Exit mpls-path mode and return to Configure mode.
(config)#rsvp-path sec-path1	Configure MPLS-path
(config-path)#4.4.4.4 loose	Configure loose path
(config-path)#exit	Exit mpls-path mode and return to Configure mode.
(config-path)#rsvp-path sec-path2	Configure MPLS-path.
(config-path)#4.4.4.4 loose	Configure loose path
(config-path)#commit	Commit the transaction.

© 2025 IP Infusion Inc. Proprietary

RSVP-TE Tunnel with Secondary Protection and SRLG Disjoint Type Forced:

`#configure terminal`	Enter configure mode.
`(config)#rsvp-trunk lsp1`	Configure rsvp trunk
`(config-trunk)#primary path path1`	Configure primary path
`(config-trunk)#secondary-priority 1 path sec-path1`	Configure secondary path
`(config-trunk)#secondary-priority 1 srlg-disjoint forced`	Configure SRLG for secondary path
`(config-trunk)#secondary-priority 2 path sec-path2`	Configure secondary path
`(config-trunk)#secondary-priority 2 srlg-disjoint forced`	Configure SRLG for secondary path
`(config-trunk)#to 4.4.4.4`	Configure rsvp trunk destination address
`(config-trunk)#commit`	Commit the transaction.

Note: Disjoint type `preferred` can be configured in rsvp-trunk secondary using the command "`secondary-priority 2 srlg-disjoint forced`.

RSVP-TE Tunnel with Fast Reroute Protection One-to-One

`#configure terminal`	Enter configure mode.
`(config)#rsvp-trunk lsp2`	Configure rsvp trunk
`(config-trunk)#primary fast-reroute protection one-to-one`	Configure fast-reroute protection
`(config-trunk)#primary path path1`	Configure primary path
`(config-trunk)#to 4.4.4.4`	Configure rsvp trunk destination address
`(config-trunk)#commit`	Commit the transaction.

RSVP-TE Tunnel with Fast Reroute Protection Facility Backup

`#configure terminal`	Enter configure mode.
`(config)#rsvp-bypass bypass1`	Configure rsvp bypass tunnel
`(config-bypass)#path path1`	Configure path for bypass tunnel
`(config-bypass)#to 4.4.4.4`	Configure destination address for tunnel
`(config-bypass)#exit`	Exit rsvp-bypass tunnel mode
`(config)#rsvp-trunk lsp3`	Configure rsvp trunk
`(config-trunk)#primary fast-reroute protection facility`	Configure fast-reroute protection facility
`(config-trunk)#primary path sec-path1`	Configure path
`(config-trunk)#to 4.4.4.4`	Configure the destination of rsvp trunk
`(config-trunk)#commit`	Commit the transaction.

RTR3

Loopback Interface

#configure terminal	Enter configure mode.
(config)#interface lo	Enter the Interface mode for loopback interface.
(config-if)#ip address 3.3.3.3/32 secondary	Configure IP address on loopback interface.
(config-if)#commit	Commit the transaction.

MPLS Interfaces

(config)#interface xe5	Enter the Interface mode
(config-if)#ip address 21.1.1.3/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe7	Enter the Interface mode
(config-if)#ip address 11.1.1.3/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface ce52	Enter the Interface mode
(config-if)#ip address 12.1.1.3/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#commit	Commit the transaction.

OSPF

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)#router-id 3.3.3.3	Configure OSPF router id
(config-router)#network 3.3.3.3/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 11.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 12.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 21.1.1.0/24 area 0	Advertise network address in OSPF.
(config-if)#commit	Commit the transaction.

Global RSVP

(config)#router rsvp	Enter the Router RSVP mode.
(config-router)#commit	Commit the transaction.

RSVP Interface

(config)#interface xe5	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface

© 2025 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe7`	Enter the Interface mode
`(config-if)#enable-rsvp`	Enable rsvp on the interface
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface ce52`	Enter the Interface mode
`(config-if)#enable-rsvp`	Enable rsvp on the interface
`(config-if)#commit`	Commit the transaction.

Global SRLG (Path Type: Forced)

`(config)#router rsvp`	Enter the Router RSVP mode.
`(config-router)#srlg-disjoint forced`	Configure SRLG path type forced
`(config-router)#commit`	Commit the transaction.

When you use the one-to-one or facility backup protection, you must configure the `srlg- disjoint` type on all routers. When you use the secondary protection type, you only need to configure the `srlg-disjoint` type at the ingress node.de.

SRLG Interface

`(config)#interface xe5`	Enter the Interface mode
`(config-if)#mpls traffic-eng srlg 21`	Configure SRLG value in the interface
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe7`	Enter the Interface mode
`(config-if)#mpls traffic-eng srlg 11`	Configure SRLG value in the interface
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface ce52`	Enter the Interface mode
`(config-if)#mpls traffic-eng srlg 12`	Configure SRLG value in the interface
`(config-if)#commit`	Commit the transaction.

RTR4

Loopback Interface

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter the Interface mode for loopback interface.
`(config-if)#ip address 4.4.4.4/32 secondary`	Configure IP address on the loopback address.
`(config-if)#commit`	Commit the transaction.

MPLS Interface

`(config)#interface xe9`	Enter the Interface mode
`(config-if)#ip address 23.1.1.4/24`	Configure ip address on the interface
`(config-if)#label-switching`	Enable label switching on the interface

(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface ce52	Enter the Interface mode
(config-if)#ip address 12.1.1.4/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface ce50	Enter the Interface mode
(config-if)#ip address 31.1.1.4/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#commit	Commit the transaction.

OSPF

(config)#router ospf 1	Enter Router OSPF mode.
(config-router)#router-id 4.4.4.4	Configure OSPF router id
(config-router)#network 4.4.4.4/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 12.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 23.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 31.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#commit	Commit the transaction.

Global RSVP

(config)#router rsvp	Enter the Router RSVP mode.
(config-router)#commit	Commit the transaction.

RSVP Interface

(config)#interface xe9	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface ce50	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface ce52	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#commit	Commit the transaction.

Global SRLG (Path Type: Forced)

(config)#router rsvp	Enter the Router RSVP mode.
(config-router)#srlg-disjoint forced	Configure SRLG path type forced
(config-router)#commit	Commit the transaction.

© 2025 IP Infusion Inc. Proprietary

SRLG Interface

(config)#interface ce50	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 31	Configure SRLG value in the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface ce52	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 12	Configure SRLG value in the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe9	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 23	Configure SRLG value in the interface
(config-if)#commit	Commit the transaction.

RTR5

Loopback Interface

#configure terminal	Enter configure mode.
(config)#interface lo	Enter the Interface mode for loopback interface.
(config-if)#ip address 5.5.5.5/32 secondary	Configure IP address on the loopback address.
(config-if)#commit	Commit the transaction.

MPLS Interface

(config)#interface xe1	Enter the Interface mode
(config-if)#ip address 22.1.1.5/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe9	Enter the Interface mode
(config-if)#ip address 23.1.1.5/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe5	Enter the Interface mode
(config-if)#ip address 21.1.1.5/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#commit	Commit the transaction.

OSPF

(config)#router ospf 1	Enter Router OSPF mode.
(config-router)#router-id 5.5.5.5	Configure OSPF router id
(config-router)#network 5.5.5.5/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 21.1.1.0/24 area 0	Advertise network address in OSPF.

(config-router)#network 22.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 23.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#commit	Commit the transaction.

Global RSVP

(config)#router rsvp	Enter the Router RSVP mode.
(config)#commit	Commit the transaction.

RSVP Interface

(config)#interface xe1	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe5	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe9	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#commit	Commit the transaction.

Global SRLG (Path Type: Forced)

(config)#router rsvp	Enter the Router RSVP mode.
(config-router)#srlg-disjoint forced	Configure SRLG path type forced
(config-router)#commit	Commit the transaction.

SRLG Interface

(config)#interface xe1	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 11	Configure SRLG value in the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe5	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 21	Configure SRLG value in the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe9	Enter the Interface mode
(config-if)#mpls traffic-eng srlg 23	Configure SRLG value in the interface
(config-if)#commit	Commit the transaction.

RTR6

Loopback Interface

#configure terminal	Enter configure mode.
(config)#interface lo	Enter the Interface mode for loopback interface.
(config-if)#ip address 6.6.6.6/32 secondary	Configure IP address on the loopback address.
(config-if)#commit	Commit the transaction.

MPLS Interface

(config)#interface xe5	Enter the Interface mode
(config-if)#ip address 30.1.1.6/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface ce50	Enter the Interface mode
(config-if)#ip address 31.1.1.6/24	Configure ip address on the interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#commit	Commit the transaction.

OSPF

(config)#router ospf 1	Enter Router OSPF mode.
(config-router)#router-id 6.6.6.6	Configure OSPF router id
(config-router)#network 6.6.6.6/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 30.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 31.1.1.0/24 area 0	Advertise network address in OSPF.
(config-router)#commit	Commit the transaction.

Global RSVP

(config)#router rsvp	Enter the Router RSVP mode.
(config-router)#commit	Commit the transaction.

RSVP Interface

(config)#interface xe5	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface ce50	Enter the Interface mode
(config-if)#enable-rsvp	Enable RSVP on the interface
(config-if)#commit	Commit the transaction.

Global SRLG (Path Type: Forced)

`(config)#router rsvp`	Enter the Router RSVP mode.
`(config-router)#srlg-disjoint forced`	Configure SRLG path type forced
`(config-router)#commit`	Commit the transaction.

SRLG Interface

`(config)#interface xe5`	Enter the Interface mode
`(config-if)#mpls traffic-eng srlg 30`	Configure SRLG value in the interface
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface ce50`	Enter the Interface mode
`(config-if)#mpls traffic-eng srlg 31`	Configure SRLG value in the interface
`(config-if)#commit`	Commit the transaction.

Validation

R1 Configuration (Ingress)

OSPF:

```
RTR2#show ip ospf neighbor
Total number of full neighbors: 3
OSPF process 1 VRF(default):
Neighbor ID     Pri   State            Dead Time   Address         Interface           Instance ID
3.3.3.3           1   Full/DR          00:00:29    11.1.1.3        xe7                      0
5.5.5.5           1   Full/DR          00:00:37    22.1.1.5        xe1                      0
6.6.6.6           1   Full/DR          00:00:35    30.1.1.6        xe5                      0
```

RSVP:

```
RTR2#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to Secondary
* indicates the session is active with local repair at one or more nodes
(P) indicates the secondary-priority session is acting as primary

CHAPTER 5 MPLS DiffServ Configuration

This chapter contains an overview of MPLS DiffServ functionality and terminology, MPLS DiffServ configuration example for a relevant scenario, configuration guidelines, and sample procedures for enabling and configuring MPLS DiffServ.

MPLS Diff-Serv Overview

The initial efforts to provide quality of service (QoS) in IP networks were based on a per application-Flow model (IntServ), in which individual applications requested QoS. With large number of flows traversing IP networks, this approach proved to be un-scalable and overly complex, and a more “coarse-grained” model was developed in the form of DiffServ. DiffServ approaches the problem of QoS by dividing traffic into a small number of classes and allocating network resources on a per-class basis. DiffServ provides differential forwarding treatment to traffic, thus enforcing QoS for different traffic flows. It is a scalable solution that does not require per flow signalling and state maintenance in the core. However, it cannot guarantee QoS if the path followed by the traffic does not have adequate resources to meet the QoS requirements.

DiffServ Tunnelling modes:

RFC 3270 has recommended three QoS models for DiffServ tunnelled traffic in MPLS networks:

OcNOS supports two models:

- Pipe model (default mode): With the Pipe Model, MPLS tunnels (aka LSPs) are used to hide the intermediate MPLS nodes between LSP Ingress and Egress from the Diff-Serv perspective. In this model, tunneled packets must convey two meaningful pieces of Diff-Serv information:
  - The Diff-Serv information which is meaningful to intermediate nodes along the LSP span including the LSP Egress (which we refer to as the “LSP Diff-Serv Information”).This LSP Diff-Serv Information is not meaningful beyond the LSP Egress: Whether Traffic Conditioning at intermediate nodes on the LSP span affects the LSP Diff-Serv information or not, this updated Diff-Serv information is not considered meaningful beyond the LSP Egress and is ignored.
  - The Diff-Serv information which is meaningful beyond the LSP Egress (which we refer to as the “Tunneled Diff-Serv Information”).This information is to be conveyed by the LSP Ingress to the LSP Egress.This Diff-Serv information is not meaningful to the intermediate nodes on the LSP span.
- Uniform model: With the Uniform Model, MPLS tunnels (aka LSPs) are viewed as artifacts of the end-to-end path from the Diff-Serv standpoint. MPLS Tunnels may be used for forwarding purposes but have no significant impact on Diff-Serv. In this model, any packet contains exactly one piece of Diff-Serv information which is meaningful and is always encoded in the outer most label entry (or in the IP DSCP where the IP packet is transmitted unlabeled for instance at the egress of the LSP). Any Diff-Serv information encoded somewhere else (e.g., in deeper label entries) is of no significance to intermediate nodes or to the tunnel egress and is ignored. If Traffic Conditioning at intermediate nodes on the LSP span affects the “outer” Diff-Serv information, the updated Diff-Serv information is the one considered meaningful at the egress of the LSP.
  - The Uniform Model for Diff-Serv over MPLS is such that, from the Diff-Serv perspective, operations are exactly identical to the operations if MPLS was not used. In other words, MPLS is entirely transparent to the Diff-Serv operations.
  - Use of the Uniform Model allows LSPs to span Diff-Serv domain boundaries without any other measure in place than an inter-domain Traffic Conditioning Agreement at the physical boundary between the Diff-Serv domains and operating exclusively on the “outer” header, since the meaningful Diff-Serv information is always visible and modifiable in the outmost label entry.

Terminology

Following is a brief description of terms and concepts used to describe MPLS Diffserv.

EXP Value

The MPLS experimental bits (EXP) field is a 3-bit field in the MPLS header that you can use to define the QoS treatment (per-hop behavior) that a node should give to a packet. In an IP network, the DiffServ Code Point (DSCP) (a 6-bit field) defines a class and drop precedence. The EXP bits can be used to carry some of the information encoded in the IP DSCP and can also be used to encode the dropping precedence.

By default, OcNOS copies the three most significant bits of the DSCP or the IP precedence of the IP packet to the EXP field in the MPLS header. This action happens when the MPLS header is initially imposed on the IP packet. However, you can also set the EXP field by defining a mapping between the DSCP or IP precedence and the EXP bits. This mapping is configured using the set mpls class command in pmap-class mode or qos map class exp in global mode. For more information, see the “Remarking” section.

DSCP Value

Differentiated Services Code Point (DSCP) is a 6-bit value used to classify the priority of Layer-3 packets upon entry into a network. DSCP values range from 0 to 63, 63 being the highest priority, 0 being best-effort traffic.

Classification

Traffic classification allows the network to recognize traffic as it falls into classes that you have configured. Network traffic must be classified to apply specific QoS to it. Classification can be inclusive (for example, all of the traffic passing through an interface) or classification can be very specific (for example, you can use a class map with match commands that recognize specific aspects of the traffic). You can classify and apply QoS (for example, marking) and then, on another interface or network device, classify again based on the marked value and apply other QoS.

Policing

Policing determines whether a packet is in or out of profile by comparing the internal DSCP to the configured policer. Policer limits the bandwidth consumed by a traffic flow with the results given to the marker.

Policing and policers have the following attributes:

- Policers can occur only on a physical port basis.
- Policing can occur on ingress interfaces.
- Only one policer can be applied to a packet per direction.

Marking

Marking determines how to handle a packet when it is out of profile. It assesses the policer and the configuration data to determine the action required for the packet, and then handles the packet using one of the following methods:

- Let the packet through without modification
- Drop the packet

Marking can occur on ingress and egress interfaces.

© 2025 IP Infusion Inc. Proprietary

Class Map

A class map names and isolates specific traffic from other traffic. The class map defines the criteria used to match against a specific traffic flow to classify it further. The criteria can include:

- Matching the access group defined by the ACL
- Matching a specific list of DSCP values

If there is more than one type of traffic to be classified, another class map can be created under a different name. After a packet is matched against the class-map criteria, it is further classified using a policy map.

Policy Map

A policy map specifies on which traffic class to act. This can be implemented as follows:

- Set a specific CoS or DSCP value in the traffic class.
- Specify the traffic bandwidth limitations for each matched traffic class (policer) and the action to take (marking) when the traffic is out of profile.

Policy maps have the following attributes:

- A policy map can contain multiple class statements, each with different match criteria and policers.
- A separate policy-map class can exist for each type of traffic received through an interface.
- There can be only one policy map per interface per direction. The same policy map can be applied to multiple interfaces and directions.
- Before a policy map can be effective, it must be attached to an interface.

MPLS Class

MPLS class or class specifies the class of the frames, for example frames with DSCP 0-7 belongs to class 0, DSCP 8-15 belongs to Class 1, and so on.

In OcNOS, there are 8 classes varying form 0-7. By default, EXP to class is mapped one-to-one.

For more, see Table 5-1

For MPLS Diff-Serv to work, QoS must be enabled at the global level. By default QoS is disabled.

Table 5-1: EXP to class mapping

CoS	DSCP	EXP	Class	Queue
0	0-7	0	0	0
1	8-15	1	1	1
2	16-23	2	2	2
3	24-31	3	3	3
4	32-39	4	4	4
5	40-47	5	5	5
6	48-55	6	6	6
7	56-63	7	7	7

CHAPTER 6 Remarking Configuration

This chapter contains a complete sample of configuring marking on global level and remarking of EXP bits on interface and global level along with LDP LSP for Pipe model and Uniform model.

Configuration

Configuring Remarking for MPLS EXP bits require following configurations:

- Enabling label-switching on the interface on NSM.
- Configuring LSP (Using LDP, Static or RSVP-TE, in this example we are using LDP for setting up LSP).
- Running an IGP (Internal Gateway Protocol), for example, OSPF, to distribute reachability information within the MPLS cloud.
- Enable QoS, Configuring Remarking on interface and Global Level.

Topology

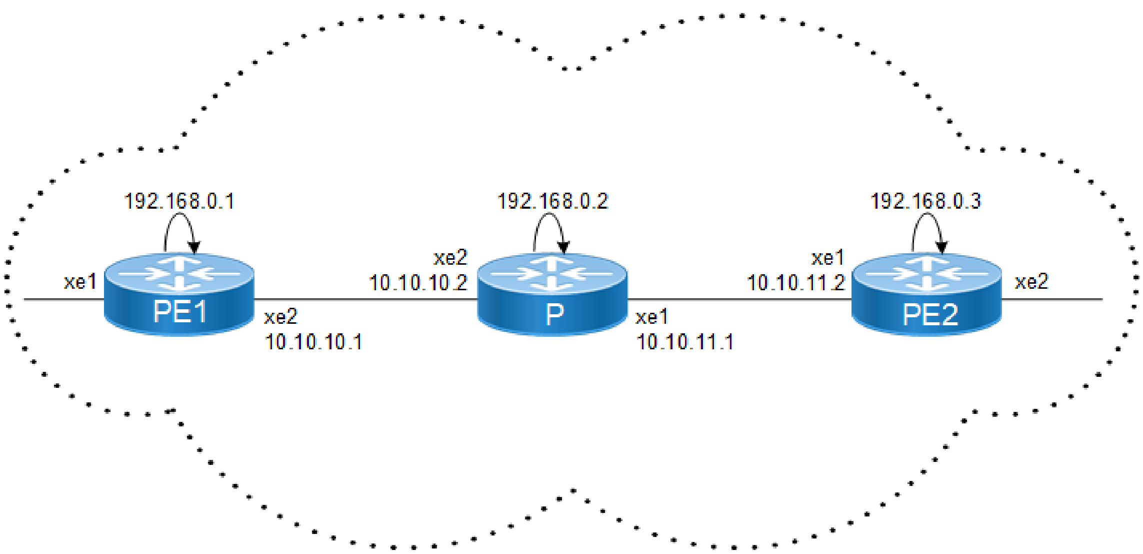

Figure 6-2: Basic LDP Topology

OSPF and LDP Configuration for PE1, P and PE2

PE1: NSM

`#configure terminal`	Enter configure mode.
`(config)#interface xe2`	Specify the interface `(xe2)` to be configured.
`(config-if)#ip address 10.10.10.1/24`	Configure IP address for the interface
`(config-if)#label-switching`	Enable label switching on interface `xe2`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Specify the loopback (`lo`) interface to be configured.

(config-if)#ip address 192.168.0.1/32 secondary	Set the IP address of the loopback interface to 192.168.0.1/32
(config-if)#commit	Commit the transaction.

PE1: OSPF

#configure terminal	Enter configure mode.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.10.10.0/24 area 0 (config-router)#network 192.168.0.1/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

PE1: LDP

#configure terminal	Enter configure mode.
(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 192.168.0.1	Set the router ID to IP address 192.168.0.1.
(config-router)#transport-address ipv4 192.168.0.1	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address.
(config-router)#exit	Exit router mode.
(config)#interface xe1	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe1.
(config-if)#commit	Commit the transaction.

P: NSM

#configure terminal	Enter configure mode.
(config)#interface xe2	Specify the interface (xe2) to be configured.
(config-if)#ip address 10.10.10.2/24	Configure IP address for the interface
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#ip address 10.10.11.1/24	Configure IP address for the interface
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 192.168.0.2/32 secondary	Set the IP address of the loopback interface to 192.168.0.2/32
(config-if)#commit	Commit the transaction.

P: OSPF

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 10.10.10.0/24 area 0`
`(config-router)#network 10.10.11.0/24 area 0`
`(config-router)#network 192.168.0.2/32 area 0`
	Define the interface on which OSPF runs and associate the area ID (0) with the interface.

`(config-router)#commit`	Commit the transaction.

P: LDP

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter Router mode for LDP.
`(config-router)#router-id 192.168.0.2`	Set the router ID to IP address 192.168.0.2.
`(config-router)#transport-address ipv4 192.168.0.2`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address.
`(config-router)#exit`	Exit router mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP on xe1.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP on xe2.
`(config-if)#commit`	Commit the transaction.

PE2: NSM

`#configure terminal`	Enter configure mode.
`(config)#interface xe1`	Specify the interface `(xe2)` to be configured.
`(config-if)#ip address 10.10.11.2/24`	Configure IP address for the interface
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Specify the loopback (`lo`) interface to be configured.
`(config-if)#ip address 192.168.0.3/32 secondary`	`Set the IP address of the loopback interface to 192.168.0.3/32`
`(config-if)#commit`	Commit the transaction.

PE2: OSPF

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.11.0/24 area 0` `(config-router)#network 192.168.0.3/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the transaction.

PE2: LDP

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter Router mode for LDP.
`(config-router)#router-id 192.168.0.3`	Set the router ID to IP address 192.168.0.3.
`(config-router)#explicit-null`	To disable PHP.
`(config-router)#transport-address ipv4 192.168.0.3`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address.
`(config-router)#exit`	Exit `router` mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP on xe2.
`(config-if)#commit`	Commit the transaction.

Configuration of Marking or Remarking

Marking can be done in Global level and Remarking can be done in Global level and in Interface level. Both methods are shown in the following sample configurations.

Global level configuration for PE1

`#configure terminal`	Enter configure mode.
`(config)#qos enable`	Enable QOS.
`(config)#qos profile exp-encap default`	Configure default profile.
`(config-egress-exp-encap-map)#l3 dscp 10 exp 3`	Map dscp value 10 to exp 3.
`(config-egress-exp-encap-map)#commit`	Commit the transaction.

Validation

```

```

Interface level configuration for PE1

`#configure terminal`	Enter configure mode.
`(config)#qos enable`	Enable QOS.
`(config)#qos profile exp-encap TEST1`	Configure non-default profile.
`(config-egress-exp-encap-map)#l3 dscp 5 exp 5`	Map dscp value 5 to exp 5.

`(config-egress-exp-encap-map)#exit`	Exit exp-encap profile mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#qos map-profile exp-encap TEST1`	Mapping qos profile to interface
`(config-if)#commit`	Commit the transaction.

CHAPTER 7 Policing Configuration

This chapter contains a complete sample of configuration of Policing for Pipe and Uniform models.This example shows configurations using LDP.

Configuration

Configuring Remarking for MPLS EXP bits require following configurations:

- Enabling label-switching on the interface on NSM.
- Configuring LSP (Using LDP, Static or RSVP-TE, in this example we are using LDP for setting UP LSP).
- Running an IGP (Internal Gateway Protocol), for example, OSPF, to distribute reachability information within the MPLS cloud.
- Enable QoS, Configuring Policing on interface Level.

Topology

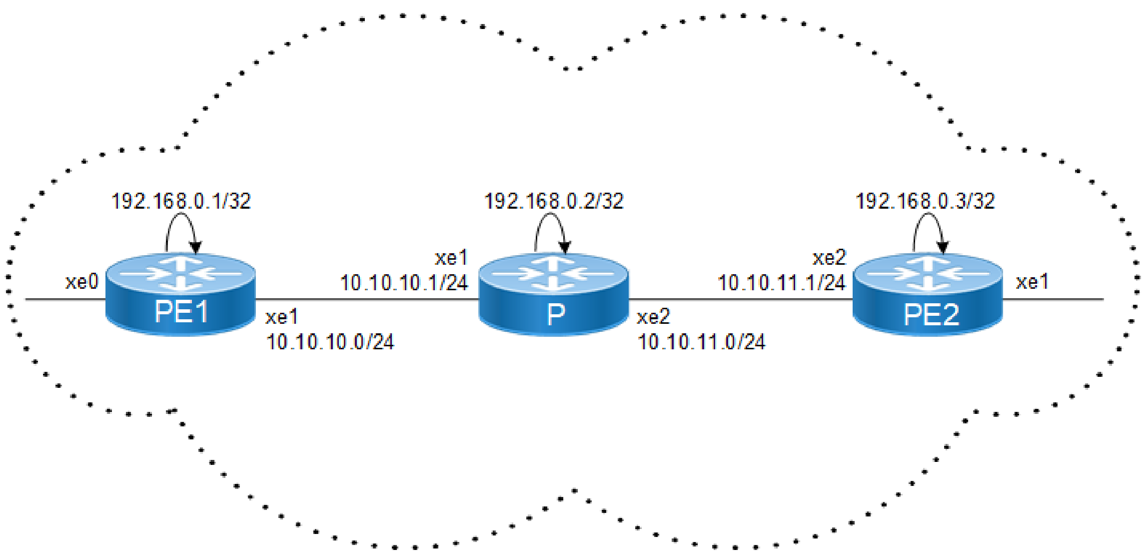

Figure 7-3: Basic Policing Topology

The following steps describes how to configure Policing.

PE1:NSM

`#configure terminal`	Enter configure mode
`(config)#interface xe1`	Specify the interface (xe1) to be configured.
`(config-if)#ip address 10.10.10.1/24`	Configure IP address for the interface
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.

© 2025 IP Infusion Inc. Proprietary

`(config-if)#ip address 192.168.0.1/32 secondary`	Set the IP address of the loopback interface to 192.168.0.1/32
`(config-if)#commit`	Commit the transaction.

PE1:OSPF

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 10.10.10.0/24 area 0`
`(config-router)#network 192.168.0.1/32 area`
`0`
	Define the interface on which OSPF runs and associate the area ID (0) with the interface.

`(config-router)#commit`	Commit the transaction.

PE1:LDP

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter Router mode for LDP.
`(config-router)#router-id 192.168.0.1`	Set the router ID to IP address 192.168.0.1.
`(config-router)#transport-address ipv4 192.168.0.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address.
`(config-router)#exit`	Exit router mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP on xe1.
`(config-if)#commit`	Commit the transaction.

PE1

`#configure terminal`	Enter configure mode.
`(config)#qos enable`	Enable QoS.
`(config)#hardware-profile filter qos enable`	Enable QoS hardware.
`(config)#commit`	Commit candidate configuration to the running configuration.
`(config)#class-map cmap1`	Enter Class-map mode.
`(config-cmap-qos)#match dscp 2`	Configure match criteria as DSCP with Value 2.
`(config-cmap-qos)#exit`	Exit Class-map mode.
`(config)#commit`	Commit candidate configuration to the running configuration.
`(config)#policy-map pmap1`	Enter policy-map mode.
`(config-pmap-qos)#class cmap1`	Assign Class cmap1 to Policy-map pmap1.
`(config-pmap-c-qos)#police cir 1 mbps eir 1 mbps bc 1 kbytes be 1 kbytes`	Police DSCP 2 packets @ Committed information rate 1 mbps.

(config-pmap-c-qos)#exit	Exit out of policy-class-map mode.
(config-pmap-qos)#exit	Exit out of Policy-map mode.
(config)#commit	Commit candidate configuration to the running configuration.
(config)#interface xe1	Enter xe1 interface.
(config-if)#service-policy type qos input pmap1	Assign service-policy to interface on in-direction.
(config-if)#exit	Exit interface mode.
(config)#commit	Commit candidate configuration to the running configuration.

P:NSM

#configure terminal	Enter configure mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#ip address 10.10.10.2/24	Configure IP address for the interface.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Specify the interface (xe2) to be configured.
(config-if)#ip address 10.10.11.1/24	Configure IP address for the interface.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 192.168.0.2/32 secondary	Set the IP address of the loopback interface to 192.168.0.2/32.
(config-if)#commit	Commit the transaction.

P:OSPF

#configure terminal	Enter configure mode.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.10.10.0/24 area 0 (config-router)#network 10.10.11.0/24 area 0 (config-router)#network 192.168.0.2/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

P:LDP

#configure terminal	Enter configure mode.
(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 192.168.0.2	Set the router ID to IP address 192.168.0.2.

(config-router)#transport-address ipv4 192.168.0.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address.
(config-router)#exit	Exit router mode.
(config)#interface xe1	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe1.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe2.
(config-if)#commit	Commit the transaction.

PE2:NSM

#configure terminal	Enter configure mode.
(config)#interface xe2	Specify the interface (xe2) to be configured.
(config-if)#ip address 10.10.11.2/24	Configure IP address for the interface.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 192.168.0.3/32 secondary	Set the IP address of the loopback interface to 192.168.0.3/32.
(config-if)#commit	Commit the transaction.

PE2:OSPF

#configure terminal	Enter configure mode.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.10.11.0/24 area 0 (config-router)#network 192.168.0.3/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

PE2:LDP

#configure terminal	Enter configure mode.
(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 192.168.0.3	Set the router ID to IP address 192.168.0.3.
(config-router)#explicit-null	To disable PHP.
(config-router)#transport-address ipv4 192.168.0.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address.

(config-router)#exit	Exit router mode.
(config)#interface xe2	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe2.
(config-if)#commit	Commit the transaction.

PE2

#configure terminal	Enter configure mode.
(config)#qos enable	Enable QoS.
(config)#hardware-profile filter qos enable	Enable QoS hardware.
(config)#commit	Commit candidate configuration to the running configuration.
(config)#class-map cmap1	Enter Class-map mode.
(config-cmap-qos)#match dscp 2	Configure match criteria as DSCP with Value 2.
(config-cmap-qos)#exit	Exit Class-map mode.
(config)#commit	Commit candidate configuration to the running configuration.
(config)#policy-map pmap1	Enter policy-map mode.
(config-pmap-qos)#class cmap1	Assign Class cmap1 to Policy-map pmap1.
(config-pmap-c-qos)#police cir 1 mbps eir 1 mbps bc 1 kbytes be 1 kbytes	Police DSCP 2 packets @ Committed information rate 1 mbps.
(config-pmap-c-qos)#exit	Exit out of policy-class-map mode.
(config-pmap-qos)#exit	Exit out of Policy-map mode.
(config)#commit	Commit candidate configuration to the running configuration.
(config)#interface xe1	Enter xe1 interface.
(config-if)#service-policy type qos input pmap1	Assign service-policy to interface on in-direction.
(config-if)#exit	Exit interface mode.
(config)#commit	Commit candidate configuration to the running configuration.

CHAPTER 8 MPLS Statistics Configuration

This chapter provides the configuration required for configuring MPLS LSPs and verifying the statistics of packets captured at the supported interfaces, in terms of both packet count and bytes, when traffic is sent.

Configure LDP-LSP

Topology

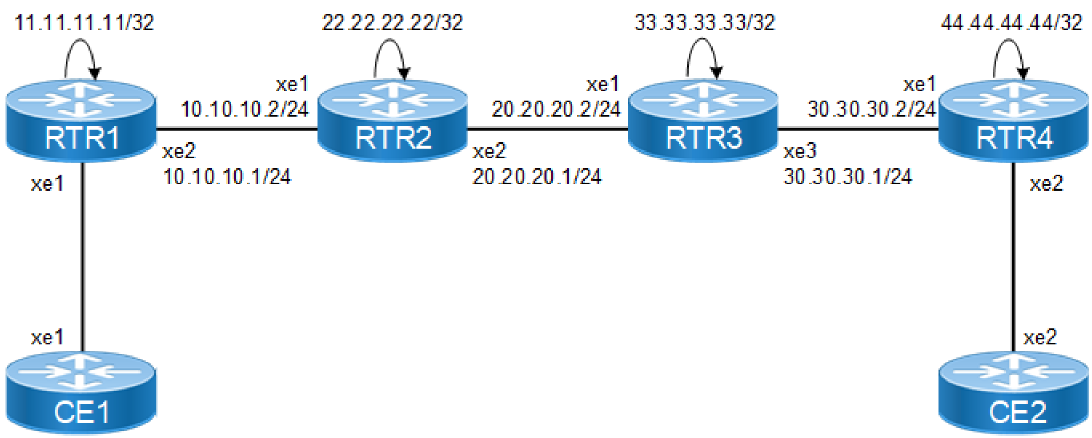

Figure 8-4: MPLS Statistics Topology

RTR1: Loopback Interface configuration

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface `(lo)` to be configured.
`(config-if)#ip address 11.11.11.11/32 secondary`	Configure IP address on loopback interface
`(config-if)#commit`	Commit the transaction.

RTR1: Global LDP configuration

`(config)#router ldp`	Enter `Router` mode for LDP.
`(config-router)#router-id 11.11.11.11`	Configure the router-id
`(config-router)#transport-address ipv4 11.11.11.11`	Configure the loopback address as transport-address
`(config-router)#targeted-peer ipv4 44.44.44.44`	Configure the loopback address of RTR4 as targeted peer.

(config-router-targeted-peer)#exit	Exit router-targeted-peer mode and enter config-router mode
(config-router-targeted-peer)#commit	Commit the transaction.

RTR1: Enabling LDP and label switching on interface

(config)#interface xe2	Enter interface mode for xe2.
(config-if)#enable-ldp ipv4	Enable LDP on the interface.
(config-if)#label-switching	Enable Label switching on the interface.
(config-if)#ip address 10.10.10.1/24	Configure IP address on the interface.
(config-if)#commit	Commit the transaction.

RTR1: Global OSPF configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#network 11.11.11.11/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 10.10.10.0/24 area 0	Advertise network address (xe2) in OSPF.
(config-router)#commit	Commit the transaction.

RTR2: Loopback Interface configuration

#configure terminal	Enter configure mode.
(config)#interface lo	Specify the interface (lo) to be configured.
(config-if)#ip address 22.22.22.22/32 secondary	Configure IP address on loopback interface
(config-if)#commit	Commit the transaction.

RTR2: Global LDP configuration

(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 22.22.22.22	Configure the router-id
(config-router)#transport-address ipv4 22.22.22.22	Configure the loopback address as transport-address
(config-router)#commit	Commit the transaction.

RTR2: Enabling LDP and label switching on interface

(config)#interface xe1	Enter interface mode for xe1.
(config-if)#enable-ldp ipv4	Enable LDP on the interface.

(config-if)#label-switching	Enable Label switching on the interface.
(config-if)#ip address 10.10.10.2/24	Configure IP address on the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#enable-ldp ipv4	Enable LDP on the interface.
(config-if)#label-switching	Enable Label switching on the interface.
(config-if)#ip address 20.20.20.1/24	Configure IP address on the interface.
(config-if)#commit	Commit the transaction.

RTR2: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode
(config-router)#network 22.22.22.22/32 area 0.0.0.0	Advertise loopback address in OSPF
(config-router)#network 10.10.10.2/24 area 0.0.0.0	Advertise network address (xe1) in OSPF.
(config-router)#network 20.20.20.1/24 area 0.0.0.0	Advertise network address (xe2) in OSPF.
(config-router)#commit	Commit the transaction.

RTR3: Loopback Interface configuration

#configure terminal	Enter configure mode.
(config)#interface lo	Specify the interface (lo) to be configured.
(config-if)#ip address 33.33.33.33/32 secondary	Configure IP address on loopback interface
(config-if)#commit	Commit the transaction.

RTR3: Global LDP configuration

(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 33.33.33.33	Configure the router-id
(config-router)#transport-address ipv4 33.33.33.33	Configure the loopback address as transport-address
(config-router)#commit	Commit the transaction.

RTR3: Enabling LDP and label switching on interface

(config)#interface xe1	Enter interface mode for xe1.
(config-if)#enable-ldp ipv4	Enable LDP on the interface.

`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#ip address 20.20.20.2/24`	Configure IP address on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP on the interface.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on the interface.
`(config-if)#commit`	Commit the transaction.

RTR3: OSPF Configuration

`(config)#router ospf 100`	Enter the Router OSPF mode
`(config-router)#network 33.33.33.33/32 area 0.0.0.0`	Advertise loopback address in OSPF
`(config-router)#network 20.20.20.2/24 area 0.0.0.0`	Advertise network address (xe1) in OSPF.
`(config-router)#network 30.30.30.1/24 area 0.0.0.0`	Advertise network address (xe2) in OSPF.
`(config-router)#commit`	Commit the transaction.

RTR4: Loopback Interface configuration

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface `(lo)` to be configured.
`(config-if)#ip address 44.44.44.44/32 secondary`	Configure IP address on loopback interface
`(config-if)#commit`	Commit the transaction.

RTR4: Global LDP configuration

`(config)#router ldp`	Enter `Router` mode for LDP.
`(config-router)#router-id 44.44.44.44`	Configure the router-id
`(config-router)#transport-address ipv4 44.44.44.44`	Configure the loopback address as transport-address
`(config-router)#targeted-peer ipv4 11.11.11.11`	Configure the loopback address of RTR1 as targeted peer.
`(config-router-targeted-peer)#exit`	Exit router-targeted-peer mode and enter config-router mode
`(config-router)#commit`	Commit the transaction.

RTR4: Enabling LDP and label switching on interface

(config)#interface xe1	Enter interface mode for xe1.
(config-if)#enable-ldp ipv4	Enable LDP on the interface.
(config-if)#label-switching	Enable Label switching on the interface.
(config-if)#ip address 30.30.30.2/24	Configure IP address on the interface.
(config-if)#commit	Commit the transaction.

RTR4: Global OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode
(config-router)#network 44.44.44.44/32 area 0.0.0.0	Advertise loopback address in OSPF
(config-router)#network 30.30.30.2/24 area 0.0.0.0	Advertise network address (xe1) in OSPF.
(config-router)#commit	Commit the transaction.

MPLS LDP VPLS Configuration

RTR1: VPLS

(config)#mpls vpls vpls1 1	Enter the VPLS configuration mode
(config-vpls)# signaling ldp	Use LDP signaling for VPLS
(config-vpls-sig)#vpls-type ethernet	Configure the VPLS as Ethernet
(config-vpls-sig)#vpls-peer 44.44.44.44	Configure RTR4 as VPLS peer for RTR1.
(config-vpls-sig)#exit-signaling	Exit signaling mode
(config-vpls)# exit-vpls	Exit VPLS config mode and return to Configure mode
(config-vpls)#commit	Commit the transaction.

RTR1: Interface

(config)#service-template st1	Template configuration
(config-svc)#exit	Exit service template mode
(config)#interface xe1	Enter the Interface mode for xe1
(config-if)#switchport	Enable `switchport` on the interface
(config-if)#mpls-vpls vpls1 service-template st1	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if)#commit	Commit the transaction.

RTR4: VPLS

(config)#mpls vpls vpls1 1	Enter the VPLS configuration mode
(config-vpls)#signaling ldp	Use LDP signaling for VPLS
(config-vpls-sig)#vpls-type ethernet	Configure the VPLS as Ethernet
(config-vpls-sig)#vpls-peer 11.11.11.11	Configure RTR1 as VPLS peer for RTR4.
(config-vpls-sig)#exit-signaling	Exit signaling mode
(config-vpls)#commit	Commit the transaction.

RTR4: Interface

(config)#service-template st1	Template configuration
(config-svc)#exit	Exit service template mode
(config)#interface xe2	Enter the Interface mode for xe2
(config-if)#switchport	Enable `switchport` on the interface
(config-if)#mpls-vpls vpls1 service template st1	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#commit	Commit the transaction.

Virtual Circuit Configuration

RTR1: Global VC Configuration

(config)#mpls l2-circuit t1 100 44.44.44.44	Enter the VC configuration command in router mode.
(config-pseudowire)#exit	Exit service template mode
(config)#bridge 1 protocol ieee vlan-bridge	Creating a VLAN-bridge in router mode.
(config)#commit	Commit the transaction.

RTR1: Interface Configuration

(config)#service-template st1	Template configuration
(config-svc)#exit	Exit service template configuration
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#switchport	Enable switchport on the interface.
(config-if)#mpls-vpls vpls1 service-template st1	Bind the interface to VPLS.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if)#commit	Commit the transaction.

RTR4: Global VC Configuration

(config)#mpls l2-circuit t1 100 11.11.11.11	Enter the VC configuration command in router mode.
(config)#exit	Exit service template mode.
(config)#bridge 1 protocol ieee vlan-bridge	Creating a VLAN-bridge in router mode.
(config)#commit	Commit the transaction.

RTR4: Interface Configuration

(config)#service-template st1	Template configuration
(config-svc)#exit	Exit service template mode
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#switchport	Enable switchport on the interface.
(config-if)#mpls-vpls vpls1 service-template st1	Bind the interface to VPLS.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config)#commit	Commit the transaction.

VPLS Configuration

RTR1: Global VPLS Configuration

(config)#mpls vpls vpls1 1	Enter the VPLS configuration mode.
(config-vpls)#signaling ldp	Use LDP signaling for VPLS.
(config-vpls-sig)#vpls-peer 44.44.44.44	Configure RTR4 as VPLS peer for RTR1.
(config-vpls-sig)#exit-signaling	Exit signaling mode.
(config-vpls)#commit	Commit the transaction.

RTR1: Interface Configuration

(config)#service-template st1	Template configuration
(config-svc)#exit	Exit service template mode
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#switchport	Enable switchport on the interface.
(config-if)#mpls-vpls vpls1 service-template st1	Bind the interface to VPLS.
(config-if-vpls)#commit	Commit the transaction.

RTR4: Global VC Configuration

(config)#mpls vpls vpls1 1	Enter the VPLS configuration mode.
(config-vpls)#signaling ldp	Use LDP signaling for VPLS.
(config-vpls-sig)#vpls-peer 11.11.11.11	Configure RTR4 as VPLS peer for RTR1.

(config-vpls-sig)#exit-signaling	Exit signaling mode.
(config-vpls)#commit	Commit the transaction.

RTR4: Interface Configuration

(config)#service-template st1	Template configuration
(config-svc)#exit	Exit service template mode
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#switchport	Enable switchport on the interface.
(config-if)#mpls-vpls vpls1 service-template st1	Bind the interface to VPLS.
(config-if-vpls)#exit	Exit VPLS mode and return to interface mode.
(config-if)#commit	Commit the transaction.

Configure RSVP-LSP

RTR1: Global RSVP configuration

#configure terminal	Enter configure mode.
(config)#router rsvp	Enter RSVP configuration mode for the router.
(config-router)#commit	Commit the transaction.

RTR1: Enabling RSVP and label switching on interface

(config)#interface xe2	Enter interface mode for xe2.
(config-if)#enable-rsvp	Enable RSVP on the interface.
(config-if)#label-switching	Enable Label switching on the interface.
(config-if)#commit	Commit the transaction.

RTR1: Trunk Configuration

(config)#rsvp-trunk t1	Configure RSVP trunk t1
(config-trunk)#to 44.44.44.44	Configure RTR4 as the end of trunk
(config-trunk)#commit	Commit the transaction.

RTR2: Global RSVP configuration

(config)#router rsvp	Enter RSVP configuration mode for the router.
(config-router)#php	Configure PHP on the end node.
(config-router)#commit	Commit the transaction.

RTR2: Enabling RSVP and label switching on interface

`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#enable-rsvp`	Enable RSVP on the interface.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#enable-rsvp`	Enable RSVP on the interface.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#commit`	Commit the transaction.

RTR3: Global RSVP configuration

`#configure terminal`	Enter configure mode.
`(config)#router rsvp`	Enter RSVP configuration mode for the router.
`(config-router)#php`	Configure PHP on the end node.
`(config-router)#commit`	Commit the transaction.

RTR3: Enabling RSVP and label switching on interface

`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#enable-rsvp`	Enable RSVP on the interface.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe3`	Enter interface mode for xe3.
`(config-if)#enable-rsvp`	Enable RSVP on the interface.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#commit`	Commit the transaction.

RTR4: Global RSVP configuration

`#configure terminal`	Enter configure mode.
`(config)#router rsvp`	Enter RSVP configuration mode for the router.
`(config-router)#commit`	Commit the transaction.

RTR4: Enabling RSVP and label switching on interface

`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#enable-rsvp`	Enable RSVP on the interface.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#commit`	Commit the transaction.

RTR4: Trunk Configuration

(config)#rsvp-trunk t2	Configure RSVP trunk t2.
(config-trunk)#to 11.11.11.11	Configure RTR1 as the end of trunk.
(config-trunk)#commit	Commit the transaction.

Configure Static-LSP

RTR1: Global Static configuration

(config)#mpls ftn-entry 44.44.44.44/32 100 10.10.10.2 xe1	Configure FTN entry for rtr4 loopback.
(config)#mpls ilm-entry 900 pop	Pop the incoming label
(config)#commit	Commit the transaction.

RTR1: Enabling label switching on interface

(config)#interface xe2	Enter interface mode for xe2.
(config-if)#label-switching	Enable Label switching on the interface.
(config)#commit	Commit the transaction.

RTR2: Global Static configuration

mpls ilm-entry 100 swap 200 xe2 20.20.20.2 44.44.44.44/32	Swap the incoming label
mpls ilm-entry 800 swap 900 xe1 10.10.10.1 11.11.11.11/32	Swap the incoming label

RTR2: Enabling label switching on interface

(config)#interface xe1	Enter interface mode for xe1.
(config-if)#label-switching	Enable Label switching on the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#label-switching	Enable Label switching on the interface.
(config-if)#commit	Commit the transaction.

RTR3: Global Static configuration

(config)#mpls ilm-entry 200 swap 300 xe2 30.30.30.2 44.44.44.44/32	Swap the incoming label
(config)#mpls ilm-entry 700 swap 800 xe1 20.20.20.1 11.11.11.11/32	Swap the incoming label
(config)#commit	Commit the transaction.

RTR3: Enabling label switching on interface

`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe3`	Enter interface mode for xe3.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#commit`	Commit the transaction.

RTR4: Global Static configuration

`(config)#mpls ftn-entry 11.11.11.11/32 700 30.30.30.1 xe1`	Configure FTN entry for RTR1 loopback.
`(config)mpls ilm-entry 300 pop`	Pop the incoming label.
`(config)#commit`	Commit the transaction.

RTR4: Enabling label switching on interface

`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#label-switching`	Enable Label switching on the interface.
`(config-if)#commit`	Commit the transaction.

Validation

Here, 1000 packets are transmitted between the PE nodes and the output of counters at each node is mentioned below.

CHAPTER 9 Anycast Gateway Routing for Multiple Subnets in EVPN-IRB

Overview

In the Ethernet VPN Integrated Routing and Bridging (EVPN-IRB) scenario, any two Layer 2 Virtual Network Identifiers (L2 VNID) nodes communicate using the Routing IP Virtual Routing and Forwarding (VRF). This communication is enriched with Anycast Gateway Routing to accommodate communication among multiple subnets under the IRB interface (per VNID).

In the current implementation, the router's primary IPv4 or IPv6 address is either Router Media Access Control (MAC) or Anycast MAC, and the secondary IPv4 or IPv6 address is always the Router MAC address. Hence, Anycast MAC support was only for the primary IP with a single subnet.

Additionally, the BGP router cannot establish a connection with the primary IP as it is in Anycast mode, and the TCP connection is possible only with any of the routers, as both the routes have the IP as Anycast.

To overcome this drawback, the feature is enhanced to configure both Router MAC or Anycast MAC for both primary and secondary subnets.

By default, each subnet uses the Router MAC address received from the ARP/ND cache. The `anycast` argument in `evpn irb-if forwarding anycast gateway` CLI is used to configure the Anycast MAC for primary or secondary subnets. The argument helps to update the ARP/ND cache with Anycast MAC. This enables the user to use Anycast MAC for multiple subnets under L2 VNID. For example, users can have Subnets A, B, C with Anycast MAC and Subnet D with Router MAC.

Feature Characteristics

This feature enhancement provides the following support:

- Enables configuration of either a Router MAC or an Anycast MAC address for primary or secondary subnets.
- Use of Anycast or Routing IP Gateway for multiple subnets under the Layer-2 VNID's.
- Flexibility to have Anycast Gateway for multiple subnets (for example, Subnet A, B, and C) while allowing the other subnet (for example, Subnet D) to be reserved for BGP.
- The InterfaceFull model that provides the flexibility to respond to the ARP/ND requests from the ARP/ND table.
- The InterfaceLess model that use the kernel interface with a unique MAC per interface, either Router MAC or Anycast MAC for all the subnets.

LIMITATIONS:

In InterfaceLess model, the kernel IRB interface has a single MAC that is either Router MAC or Anycast MAC, however, the response message always has Anycast MAC irrespective of whether the interface's IP address is Anycast or Router MAC.

Benefits

Allows users to have primary and secondary subnets with either Router MAC or Anycast MAC. This flexibility provides support for Anycast Gateway for multiple subnets under Layer 2 VNIDs.

Configuration

Following configuration illustrates how to use the `anycast` argument in `evpn irb-if forwarding anycast gateway` CLI to configure the Anycast MAC for both primary or secondary subnets.

Topology

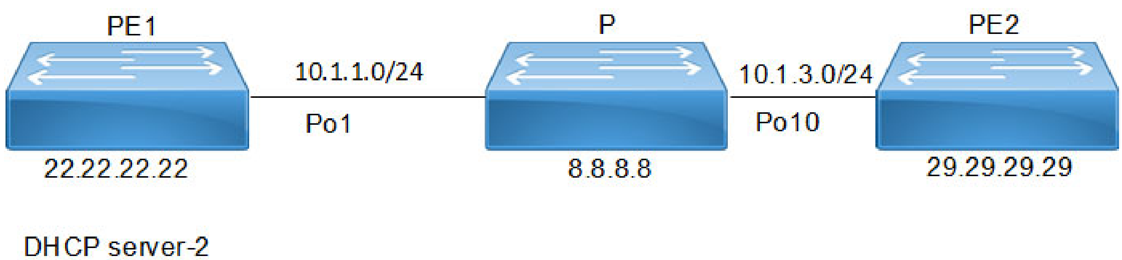

Figure 9-1: Anycast Gateway support for subnets

PE1 Configuration

PE1: Loopback Interface

`PE1(config)#interface lo`	Enter the loopback interface mode.
`PE1(config-if)#ip address 22.22.22.22/32 secondary`	Configure the IP address on loopback interface.
`PE1(config-if)#ip router isis ISIS-100`	Enable the IS-IS routing on an interface for area 49 (ISIS-100).
`PE1(config-if)#enable-ldp ipv4`	Enable the LDP IPv4.
`PE1(config-if)#Commit`	Commit the configurations
`PE1(config-if)#exit`	Exit the configuration mode.

PE1: Global LDP

`PE1(config)#router ldp`	Enter the Router LDP mode.
`PE1(config-router)#router-id 22.22.22.22`	Enter the LDP router-id.
`PE1(config-router)#targeted-peer ipv4 29.29.29.29`	Configure the LDP target peer address.
`PE1(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted peer mode.

`PE1(config-router)#transport-address ipv4 22.22.22.22`	Configure the LDP transport address.
`PE1(config-router)#Commit`	Commit the configurations
`PE1(config-router)#exit`	Exit the configuration mode.

PE1: Interface Configuration on Network Side

`PE1(config)#interface po1`	Enter the Interface mode for the port channel interface
`PE1(config-if)#ip address 10.1.1.22/24`	Configure the IP address on port channel interface
`PE1(config-if)#label-switching`	Enable the label switching
`PE1(config-if)#ip router isis ISIS-100`	Enable the IS-IS routing on an interface for area 49 (ISIS-100)
`PE1(config-if)#enable-ldp ipv4`	Enable the LDP IPv4
`PE1(config-if)#interface xe22`	Enter interface mode
`PE1(config-if)#channel-group 1 mode active`	Moving interface to Dynamic LAG 1
`PE1(config-if)#Commit`	Commit the configurations
`PE1(config-if)#exit`	Exit the configuration mode.

PE1: IGP-ISIS Configuration

`PE1(config)#router isis ISIS-100`	Create an ISIS routing instance for area 49 (ISIS-100).
`PE1(config-router)#is-type level-1`	Configure instance as level-1 routing.
`PE1(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`PE1(config-router)#mpls traffic-eng router-id 22.22.22.22`	Configure MPLS-TE unique router-id TLV.
`PE1(config-router)#mpls traffic-eng level-1`	Enable the MPLS-TE in is-type Level-1.
`PE1(config-router)#capability cspf`	Enable the Constrained Shortest Path First (CSPF).
`PE1(config-router)#dynamic-hostname`	Configure the host name to be advertised for an ISIS instance.
`PE1(config-router)#net 49.0001.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`PE1(config-router)#Commit`	Commit the configurations
`PE1(config-router)#exit`	Exit the configuration mode.

PE1: BGP Configuration

`PE1(config)#router bgp 65535`	Enter into Router BGP mode.
`PE1(config-router)#bgp router-id 22.22.22.22`	Configure router-id as 22.22.22.22 (loopback ip address).
`PE1(config-router)#neighbor 29.29.29.29 remote-as 65535`	Configuring PE2 as iBGP neighbor using it's loopback IP.
`PE1(config-router)#neighbor 29.29.29.29 update- source lo`	Source of routing updates as loopback.
`PE1(config-router)#neighbor 29.29.29.29 advertisement-interval 0`	Configure advertisement-interval as 0 for fast convergence for PE2

PE1(config-router)#address-family l2vpn evpn	Enter into l2vpn EVPN address family mode.
PE1(config-router-af)#neighbor 29.29.29.29 active	Enabling EVPN Address family for neighbor.
PE1(config-router-af)#exit-address-family	Exiting of Address family mode.
PE1(config-router)#address-family ipv4 vrf ip_vrf205_mgmt	Entering into VRF address family mode.
PE1(config-router-af)#redistribute connected	Redistribute connected routes to the network.
PE1(config-router-af)#exit-address-family	Exiting of Address family mode.
PE1(config-router)#Commit	Commit the configurations
PE1(config-router)#exit	Exit the configuration mode.

PE1: Global EVPN MPLS Command

PE1(config)#evpn mpls enable	Enable the EVPN MPLS globally.
PE1(config)#evpn mpls irb	Enable the EVPN MPLS IRB globally.
PE1(config)#evpn mpls multihoming enable	Enable the Multi homing, save configures and reboot the board for multi homing to be effective.
PE1(config)#qos enable	Enable the QOS.
PE1(config)#evpn irb-forwarding anycast-gateway-mac 0011.2233.4455	Configure anycast gateway MAC globally.
PE1(config)#evpn mpls vtep-ip-global 22.22.22.22	Configure VTEP global IP.
PE1(config)#Commit	Commit the configurations
PE1(config)#exit	Exit the configuration mode.

PE1: MAC VRF Configuration

PE1(config)#mac vrf vrf205_mgmt	Enter Mac VRF mode.
PE1(config-vrf)#rd 22.22.22.22:205	Configuring Route-Distinguisher value.
PE1(config-vrf)#route-target both evpn-auto-rt	Configuring import and export value as evpn-auto-rt. Route targets will be derived automatically.
PE1(config-vrf)#Commit	Commit the configurations
PE1(config-vrf)#exit	Exit the configuration mode.

PE1: IP VRF Configuration

`PE1(config)#ip vrf ip_vrf205_mgmt`	Enter IP VRF mode
`PE1(config-vrf)#rd 22.22.22.22:305`	Configuring Route-Distinguisher value
`PE1(config-vrf)#route-target both 305:305`	Configuring route target values i.e import and export values
`PE1(config-vrf)#l3vni 305`	Configure L3 VNID for routing
`PE1(config-vrf)#Commit`	Commit the configurations
`PE1(config-vrf)#exit`	Exit the configuration mode.

PE1: IRB Interface Configuration with multiple IPs

`PE1(config)#interface irb127`	Create IRB interface irb127
`PE1(config-irb-if)#ip vrf forwarding ip_vrf205_mgmt`	Bind the VRF instance to the interface
`PE1(config-irb-if)#evpn irb-if-forwarding anycast-gateway-mac`	Enable an IRB interface to use the global anycast IRB mac-address
`PE1(config-irb-if)#ip address 98.98.101.1/24 anycast`	Configure the IPv4 primary address and use anycast mac address
`PE1(config-irb-if)#ip address 103.103.102.1/24 secondary`	Configure secondary IPv4 secondary address
`PE1(config-irb-if)#ip address 104.104.103.1/24 secondary anycast`	Configure secondary IPv4 secondary address and use as anycast mac address
`PE1(config-irb-if)#Commit`	Commit the configurations
`PE1(config-irb-if)#exit`	Exit the configuration mode.

PE1: EVPN MPLS Id Configuration

`PE1(config)#evpn mpls id 127`	Configure secondary IPv4 secondary address
`PE1(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf205_mgmt`	Map the MAC VRF red
`PE1(config-evpn-mpls)#evpn irb irb127`	Map the IRB interface
`PE1(config-evpn-mpls)#commit`	Commit the configurations
`PE1(config-evpn-mpls)#exit`	Exit the configuration mode.

© 2025 IP Infusion Inc. Proprietary

PE1: Interface Configuration on Access Side

`PE1(config)#interface xe72.127 switchport`	Creating L2 sub interface of physical interface xe72
`PE1(config-if)#encapsulation dot1q 127`	Setting Encapsulation to dot1q with VLAN ID 127 Supported Encapsulation: dot1ad, dot1q, untagged, default
`PE1(config-if)#rewrite pop`	Configure rewrite with action pop
`PE1(config-if)#access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration
`PE1(config-acc-if-evpn)#map vpn-id 127`	Map VPN-ID 127
`PE1(config-acc-if-evpn)#Commit`	Commit the configurations
`PE1(config-acc-if-evpn)#exit`	Exit the configuration mode.

P Configuration

P: Loopback Interface

`P(config)#interface lo`	Enter the Interface mode for the loopback interface.
`P(config-if)#ip address 8.8.8.8/32 secondary`	Configure the IP address on loopback interface.
`P(config-if)#ip router isis ISIS-100`	Enable the IS-IS routing on an interface for area 49 (ISIS-100).
`P(config-if)#enable-ldp ipv4`	Enable the LDP IPv4.
`P(config-if)#Commit`	Commit the configurations
`P(config-if)#exit`	Exit the configuration mode.

© 2025 IP Infusion Inc. Proprietary

P: Global LDP

P(config)#router ldp	Enter the Router LDP mode.
P(config-router)#router-id 8.8.8.8	Enter the LDP router-id.
P(config-router)#transport-address ipv4 8.8.8.8	Configure the LDP transport address.
P(config-router)#Commit	Commit the configurations
P(config-router)#exit	Exit the configuration mode.

P: Interface Configuration on Network Side

P(config)#interface po1	Enter the Interface mode for the port channel interface.
P(config-if)#ip address 10.1.1.8/24	Configure the IP address on port channel interface.
P(config-if)#label-switching	Enable the label switching.
P(config-if)#ip router isis ISIS-100	Enable the IS-IS routing on an interface for area 49 (ISIS-100).
P(config-if)#enable-ldp ipv4	Enable the LDP IPv4.
P(config-if)#Commit	Commit the configurations
P(config-if)#exit	Exit the configuration mode.
P(config)#interface xe22	Enter interface mode.
P(config-if)#channel-group 1 mode active	Moving interface to Dynamic LAG 1.
P(config-if)#Commit	Commit the configurations
P(config-if)#exit	Exit the configuration mode.
P(config)#interface po10	Enter the Interface mode for the port channel interface.
P(config-if)#ip address 10.1.3.8/24	Configure the IP address on port channel interface.
P(config-if)#label-switching	Enable the label switching.
P(config-if)#ip router isis ISIS-100	Enable the IS-IS routing on an interface for area 49 (ISIS-100).
P(config-if)#enable-ldp ipv4	Enable the LDP IPv4.
P(config-if)#interface xe10	Enter interface mode.
P(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10.
P(config-if)#Commit	Commit the configurations
P(config-if)#exit	Exit the configuration mode.

P: IGP-ISIS Configuration

P(config)#router isis ISIS-100	Create an IS-IS routing instance for area 49 (ISIS-100).
P(config-router)#is-type level-1	Configure the instance as level-1 routing.
P(config-router)#metric-style wide	Configure the new style of metric type as wide.
P(config-router)#mpls traffic-eng router-id 8.8.8.8	Configure MPLS-TE unique router-id TLV.
P(config-router)#mpls traffic-eng level-1	Enable the MPLS-TE in is-type Level-1.
P(config-router)#capability cspf	Enable the CSPF (Constrained Shortest Path First).
P(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.

`P(config-router)#net 49.0001.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`P(config-router)#Commit`	Commit the configurations
`P(config-router)#exit`	Exit the configuration mode.

PE2 Configuration

PE2: Loopback Interface

`PE2(config)#interface lo`	Enter the Interface mode for the loopback interface.
`PE2(config-if)#ip address 29.29.29.29/32 secondary`	Configure the IP address on loopback interface.
`PE2(config-if)#ip router isis ISIS-100`	Enable the IS-IS routing on an interface for area 49 (ISIS-100).
`PE2(config-if)#enable-ldp ipv4`	Enable the LDP IPv4.
`PE2(config-if)#Commit`	Commit the configurations
`PE2(config-if)#exit`	Exit the configuration mode.

PE2: Global LDP

`PE2(config)#router ldp`	Enter the Router LDP mode.
`PE2(config-router)#router-id 29.29.29.29`	Enter the LDP router-id.
`PE2(config-router)#targeted-peer ipv4 22.22.22.22`	Configure the LDP target peer address.
`PE2(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted peer mode.
`PE2(config-router)#transport-address ipv4 29.29.29.29`	Configure the LDP transport address.
`PE2(config-router)#Commit`	Commit the configurations
`PE2(config-router)#exit`	Exit the configuration mode.

PE2: Global LDP

`PE2(config)#router ldp`	Enter the Router LDP mode.
`PE2(config-router)#router-id 29.29.29.29`	Enter the LDP router-id.
`PE2(config-router)#targeted-peer ipv4 22.22.22.22`	Configure the LDP target peer address.
`PE2(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted peer mode.
`PE2(config-router)#transport-address ipv4 29.29.29.29`	Configure the LDP transport address.
`PE2(config-router)#Commit`	Commit the configurations
`PE2(config-router)#exit`	Exit the configuration mode.

PE2: Interface Configuration on Network Side

`PE2(config)#interface po10`	Enter the Interface mode for the port channel interface.
`PE2(config-if)#ip address 10.1.3.29/24`	Configure the IP address on port channel interface.
`PE2(config-if)#label-switching`	Enable the label switching.
`PE2(config-if)#ip router isis ISIS-100`	Enable the IS-IS routing on an interface for area 49 (ISIS-100).
`PE2(config-if)#enable-ldp ipv4`	Enable the LDP IPv4.
`PE2(config-if)#interface ge1`	Enter interface mode.

`PE2(config-if)#channel-group 10 mode active`	Moving interface to Dynamic LAG 10.
`PE2(config-if)#Commit`	Commit the configurations
`PE2(config-if)#exit`	Exit the configuration mode.

PE2: IGP-ISIS Configuration

PE2(config)#router isis ISIS-100	Create an IS-IS routing instance for area 49 (ISIS-100).
PE2(config-router)#is-type level-1	Configure instance as level-1 routing.
PE2(config-router)#metric-style wide	Configure the new style of metric type as wide.
PE2(config-router)#mpls traffic-eng router-id 29.29.29.29	Configure MPLS-TE unique router-id TLV.
PE2(config-router)#mpls traffic-eng level-1	Enable the MPLS-TE in is-type Level-1.
PE2(config-router)#capability cspf	Enable the CSPF (Constrained Shortest Path First).
PE2(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
PE2(config-router)#net 49.0001.0000.0000.0029.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
PE2(config-router)#Commit	Commit the configurations
PE2(config-router)#exit	Exit the configuration mode.

PE2: BGP Configuration

PE2(config)#router bgp 65535	Enter into Router BGP mode.
PE2(config-router)#bgp router-id 29.29.29.29	Configure router-id as 29.29.29.29 (loopback ip address).
PE2(config-router)#neighbor 22.22.22.22 remote-as 65535	Configuring PE2 as iBGP neighbor using it's loopback IP.
PE2(config-router)#neighbor 22.22.22.22 update- source lo	Source of routing updates as loopback.
PE2(config-router)#neighbor 22.22.22.22 advertisement-interval 0	Configure advertisement-interval as 0 for fast convergence for PE2.
PE2(config-router)#address-family l2vpn evpn	Enter into l2vpn EVPN address family mode.
PE2(config-router-af)#neighbor 22.22.22.22 active	Enabling EVPN Address family for neighbor.
PE2(config-router-af)#exit-address-family	Exiting of Address family mode.
PE2(config-router)#address-family ipv4 vrf ip_vrf205_mgmt	Entering into VRF address family mode.
PE2(config-router-af)#redistribute connected	Redistribute connected routes to the network.
PE2(config-router-af)#exit-address-family	Exiting of Address family mode.
PE2(config-router-af)#commit	Commit the configurations
PE2(config-router-af)#exit	Exit the configuration mode.

PE2: Global EVPN MPLS Command

PE2(config)#evpn mpls enable	Enable the EVPN MPLS globally.
PE2(config)#evpn mpls irb	Enable the EVPN MPLS IRB globally.
PE2(config)#evpn mpls multihoming enable	Enable the Multihoming, save configs and reboot the board for multihoming to be effective.
PE2(config)#qos enable	Enable the QOS.

`PE2(config)#evpn irb-forwarding anycast-gateway-mac 0011.2233.4567`	Configure anycast gateway MAC globally.
`PE2(config)#evpn mpls vtep-ip-global 29.29.29.29`	Configure VTEP global IP.
`PE2(config)#Commit`	Commit the configurations
`PE2(config)#exit`	Exit the configuration mode.

PE2: MAC VRF Configuration

PE2(config)#mac vrf vrf205_mgmt	Enter Mac VRF mode.
PE2(config-vrf)#rd 29.29.29.29:205	Configuring Route-Distinguisher value.
PE2(config-vrf)#route-target both evpn-auto-rt	Configuring import and export value as evpn-auto-rt. Route target will be derived automatically.
PE2(config-vrf)#Commit	Commit the configurations
PE2(config-vrf#exit	Exit the configuration mode.

PE2: IP VRF Configuration

PE2(config)#ip vrf ip_vrf205_mgmt	Enter IP VRF mode.
PE2(config-vrf)#rd 29.29.29.29:305	Configuring Route-Distinguisher value.
PE2(config-vrf)#route-target both 305:305	Configuring route target values i.e import and export values.
PE2(config-vrf)#l3vni 305	Configure L3 VNID for routing.
PE2(config-vrf)#Commit	Commit the configurations
PE2(config-vrf)#exit	Exit the configuration mode.

PE2: IRB Interface Configuration with multiple IPs

PE2(config)#interface irb127	Create IRB interface irb127.
PE2(config-irb-if)#ip vrf forwarding ip_vrf205_mgmt	Bind the VRF instance to the interface.
PE2(config-irb-if)#evpn irb-if-forwarding anycast-gateway-mac	Enable an IRB interface to use the global anycast IRB mac-address.
PE2(config-irb-if)#ip address 99.99.101.1/24 anycast	Configure the IPv4 primary address and use anycast mac address.
PE2(config-irb-if)#ip address 103.103.103.1/24 secondary	Configure secondary IPv4 secondary address.
PE2(config-irb-if)#ip address 104.104.104.1/24 secondary anycast	Configure secondary IPv4 secondary address and use as anycast mac address.
PE2(config-rib-if)#Commit	Commit the configurations
PE2(config-rib-if)#exit	Exit the configuration mode.

PE2: EVPN MPLS Id Configuration

PE2(config)#evpn mpls id 127	Configure secondary IPv4 secondary address.
PE2(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf205_mgmt	Map the MAC VRF red.
PE2(config-evpn-mpls)#evpn irb irb127	Map the IRB interface.
PE2(config-evpn-mpls)#commit	Commit the configurations
PE2(config-evpn-mpls)#exit	Exit the configuration mode.

PE2: Interface Configuration on Access Side

`PE2(config)#interface xe12.127 switchport`	Creating L2 sub interface on physical interface xe12.
`PE2(config-if)#encapsulation dot1q 127`	Setting Encapsulation to dot1q with VLAN ID 127 Supported Encapsulation: dot1ad, dot1q, untagged, default.
`PE2(config-if)#rewrite pop`	Configure rewrite with action pop.
`PE2(config-if)#access-if-evpn`	Entering Access mode for EVPN MPLS ID configuration.
`PE2(config-acc-if-evpn)#map vpn-id 127`	Map VPN-ID 127.
`PE2(config-acc-if-evpn)#Commit`	Commit the configurations
`PE2(config-acc-if-evpn)#exit`	Exit the configuration mode.

Validation

Verify installed EVPN MPLS tunnels information.

PE1:

```
#show evpn mpls
EVPN-MPLS Information

Verify EVPN route count information as per VPN-ID or Route type:

PE1 verification:

```
#show evpn mpls route-count
EVPN-MPLS Active route count information
====================================
Max supported route count   : 131072
Active route count: 8

--------------------------------------------
 VNID     Total    MACONLY  MACIPv4  MACIPv6
```

```
---------------------------------------------
127             8           0                  6          2
```

PE2 verification:

```
#show evpn mpls route-count
EVPN-MPLS Active route count information
====================================
Max supported route count   : 131072
Active route count: 8

---------------------------------------------
 VNID     Total    MACONLY  MACIPv4  MACIPv6
--------------------------------------
 127             8           0                  6          2
```

Verify in the BGP EVPN table:

PE1 Verification:

```
#show bgp l2vpn evpn
BGP table version is 2, local router ID is 22.22.22.22
Status codes: s suppressed, d damped, h history, a add-path, * valid, > best, i -
internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

MAC	Media Access Control address

CHAPTER 10 CFM over EVPN-MPLS for ELINE MultiHoming

Overview

The Connectivity Fault Management (CFM) enhances the product offering for the Ethernet LINE (ELINE) services in MultiHoming scenarios. Based on the 802.1ag standard, CFM encompasses Continuity Check Message (CCM), Ping, and Trace functions that help in network fault detection and isolation. This feature extends CFM over EVPN-MPLS from being solely for Single-Homing deployments to a MultiHoming scenario, where a Remote Maintenance End Point (R-MEP) is treated as a single instance by MultiHoming peers.

The Topology illustrates the configuration of User-to-Provider (UP) MEP on PE2 and PE3 Access Circuit (AC) ports, along with the corresponding UP MEP configured on the remote AC port (PE1). This configuration results in the establishment of a CFM session between the PE VTEPs and the remote VTEP.

Feature Characteristics

Functional requirements for CFM over ELINE MultiHoming:

Continuity Check Message

Continuity Check Message (CCM) provides the following capabilities:

- Ensures error-free base configuration for EVPN-MPLS MultiHoming.
- Maintains uniformity of R-MEP and remote-MAC on MultiHoming nodes.
- Enables the data plane to notify the control plane of CCM timeout, port/interface state changes, and Remote Defect Indication (RDI).
- Configures the data plane to send and process CCMs at specified intervals, with options to enable/disable CCM transmission.
- Detects connectivity failures when no CCM frames are received within a set interval and notifies the control plane.
- Programs the data plane to include Port and Interface Status Type-Length-Values (TLVs) in transmitted CCM frames.
- Transmits CC Protocol Data Unit (PDU) frames with IEEE 802.1ag-2007 compliance and supports RDI bit set or reset operations.

Ping and Trace

Ping and Trace provide the following capabilities:

- Facilitates data plane snooping of LBM or Linktrace Message (LTM) received on MEP.
- Traps LTR PDUs received on MEP and processes/replies to LBM received on User-to-Provider (UP) MEP.
- Uplifts CFM PDUs from the data plane to the control plane, and sends CFM PDUs from the control plane to the data plane.
- Provides statistics counters for transmitted Loopback Replies (LBR) and encodes service frame counts in LBM and LBR PDUs.

Benefits

Enhanced Network Monitoring: CFM enables continuous monitoring of network connections, providing real-time insights into connectivity status and performance. This ensures that any issues are quickly detected and addressed.

Quick Fault Detection: Through CCM, the system promptly identifies any disruptions or faults in the network. This swift detection allows for rapid response and minimized downtime.

Efficient Troubleshooting: CFM's Ping and Trace functions help troubleshoot network problems by pinpointing the origin of issues and the paths taken by data packets. This capability streamlines the resolution process.

Robust MultiHoming Support: The extension of CFM support to MultiHoming scenarios ensures that complex network setups remain resilient and well-monitored, even in challenging environments.

Prerequisites

Before configuring and utilizing CFM for ELINE MultiHoming, ensure the following prerequisites are met:

- **Hardware Profiles Configuration**
  - Enable the required hardware profiles to facilitate CFM operations. These include `cfm-domain-name-str`, `cfm-ccm`, and `evpn-mpls-mh` profiles.
  - Establish the hardware-profile filter (`evpn-mpls-mh)` for EVPN-MPLS MultiHoming.
- **EVPN-MPLS Configuration**
  - Enable and configure EVPN MPLS on the relevant devices and enable MultiHoming support within EVPN MPLS.
- **ELINE Service Setup**
  - Establish the ELINE service and assign the corresponding VPN identifiers (VPN-ID).
  - Configure the host-reachability-protocol using EVPN BGP with the associated Virtual Routing and Forwarding (VRF).
- **ELINE AC MultiHoming Configuration**
  - Configure ELINE MultiHoming features with proper encapsulation settings (e.g., `dot1q`) and `access-if-evpn` settings on relevant interfaces.
  - Define the necessary mapping of VPN identifiers (VPN-ID) for the EVPN service.

For more information on the EVPN MPLS configurations, refer to the EVPN MPLS Configuration and EVPN MPLS Commands chapters in the *Multi-Protocol Label Switching Guide*.

- **MAC and MEP Considerations**
  - Ensure that the MEP on MultiHoming nodes has the same MAC. Consistent Media Access Control (MAC) addressing across Access Circuit (AC) ports is essential to facilitate single R-MEP consideration on MultiHoming peers.

For more information on the CFM configurations, refer to the Carrier Ethernet configuration section and CFM and Y.1731 Commands chapters in the *Carrier Ethernet Guide*.

Meeting these prerequisites ensures a successful setup of CFM for ELINE MultiHoming, enabling enhanced network fault detection and isolation capabilities.

Configuration

This section illustrates the MultiHomed setup for the CFM over EVPN MPLS feature, showcasing examples for ELINE services with LDP as the underlay MPLS path.

Topology

Figure 10-2 consists of customer edge routers CE1 and CE2, and with IPv4 Provider Edge routers PE1, PE2, and PE3, all interconnected through the core router P in the IPv4 MPLS provider network.

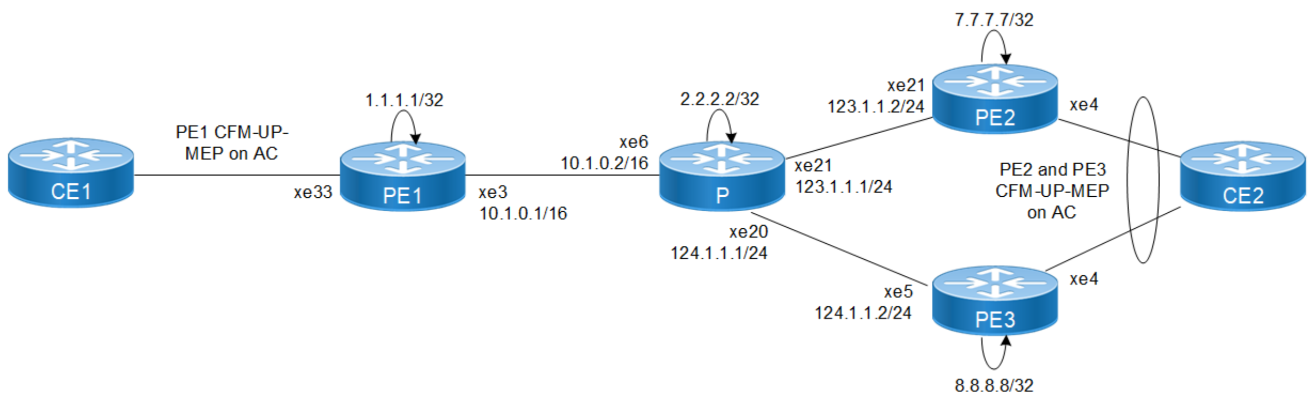

Figure 10-2: CFM over EVPN-MPLS for ELINE MH configuration

CFM Configuration

To enhance network management, monitoring, performance, and fault detection, configure the following hardware-profile commands on PE1, PE2, and PE3 devices, and here are the steps for the configurations: PE1: CFM and PE2/PE3: CFM.

- Enable the filter for CFM domain name strings with the command `hardware-profile filter cfm-domain-name-str enable`. This filter enhances the network devices ability to process CFM domain name strings, facilitating better network management and service identification.
- Enable statistics collection for CFM Continuity Check Messages (CCM) using the command `hardware-profile statistics cfm-ccm enable`. This feature allows the network devices to gather valuable insights into network performance and fault detection by collecting and analyzing data related to CFM CCMs.

PE1: Loopback Interface

The configuration on PE1 for a loopback interface with IP address `1.1.1.1/32` secondary is set up to provide IP connectivity for the router.

`PE1#configure terminal`	Enter configure mode.
`PE1(config)#interface lo`	Enter the interface mode for the loopback interface `lo`.
`PE1(config-if)#ip address 1.1.1.1/32 secondary`	Configure a secondary IP address, `1.1.1.1/32`, on the loopback interface.
`PE1(config-if)#exit`	Exit interface mode `lo`.
`PE1(config)#commit`	Commit the transaction.

PE1: Global LDP

The configuration on PE1 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

PE1(config)#router ldp	Enter the Router LDP mode.
PE1(config-router)#router-id 1.1.1.1	Set the router ID for LDP to 1.1.1.1.
PE1(config-router)#targeted-peer ipv4 7.7.7.7	Configure targeted peer for LDP using IPv4 addresses.
PE1(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE1(config-router)#targeted-peer ipv4 8.8.8.8	Configure targeted peer for LDP using IPv4 addresses.
PE1(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE1(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE1(config)#commit	Commit the transaction.

PE1: Global EVPN MPLS Command

The configuration on PE1 for the Global EVPN MPLS includes activating EVPN MPLS defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multihoming, and activating EVPN MPLS multihoming functionality, all of which are crucial for enabling EVPN MPLS features.

PE1(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE1, enabling it to participate in EVPN MPLS services.
PE1(config)#commit	Commit candidate configuration to be running configuration.
PE1(config)#evpn mpls vtep-ip-global 1.1.1.1	Configure the global VTEP IP address 1.1.1.1, associating it with the loopback IP.
PE1(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multihoming.
PE1(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multihoming functionality, allowing PE1 to support multihomed EVPN MPLS services.
PE1(config)#commit	Commit the transaction.

PE1: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE1 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE1(config)#interface xe3	Enter interface mode xe3.
PE1(config-if)#ip address 10.1.0.1/16	Configure an IP address, 10.1.0.1/16, on the interface xe3.
PE1(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE1(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE1(config-if)#exit	Exit interface mode xe3.
PE1(config)#commit	Commit the transaction.

PE1: OSPF Configuration

The below configuration is performed to set up OSPF on PE1, specifying the router ID and defining network interfaces.

`PE1(config)#router ospf 1`	Enter the router OSPF mode. Configure PE1 to run OSPF with process ID 1.
`PE1(config-router)#ospf router-id 1.1.1.1`	Set the OSPF router ID to `1.1.1.1`, identifying PE1 within the OSPF network.
`PE1(config-router)#network 1.1.1.1/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`PE1(config-router)#network 10.1.0.0/16 area 0.0.0.0`	Advertise network address in OSPF.
`PE1(config-router)#exit`	Exit router OSPF mode and return to configure mode.
`PE1(config)#commit`	Commit the transaction.

PE1: BGP Configuration

The below BGP configuration on PE1 is established to enable BGP routing with ASN 1, set the BGP router ID, define iBGP neighbors, and enable the EVPN address family for efficient routing in an EVPN environment.

`PE1(config)#router bgp 1`	Enter the Router BGP mode, ASN: 1
`PE1(config-router)#bgp router-id 1.1.1.1`	Configure BGP router ID `1.1.1.1`, identifying PE1 within the BGP network.
`PE1(config-router)#neighbor 7.7.7.7 remote-as 1`	Configure neighbor `7.7.7.7` as an iBGP neighbor with their remote AS number `1`.
`PE1(config-router)#neighbor 7.7.7.7 update-source lo`	Configure neighbor `7.7.7.7` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE1(config-router)#neighbor 8.8.8.8 remote-as 1`	Configure neighbor `8.8.8.8` as an iBGP neighbor with their remote AS number `1`.
`PE1(config-router)#neighbor 8.8.8.8 update-source lo`	Configure neighbor `8.8.8.8` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE1(config-router)#address-family l2vpn evpn`	Enter into address family mode for L2VPN EVPN.
`PE1(config-router-af)#neighbor 7.7.7.7 activate`	Activate EVPN for iBGP neighbor `7.7.7.7` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE1(config-router-af)#neighbor 8.8.8.8 activate`	Activate EVPN for iBGP neighbor `8.8.8.8` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE1(config-router-af)#exit`	Exit address family mode and return to the router BGP mode.
`PE1(config-router)#commit`	Commit the transaction.
`PE1(config-router)#exit`	Exit router BGP mode and return to the configure mode.

PE1: MAC VRF Configuration

The below MAC VRF configuration on PE1 is carried out to define and set up VRF named `vrf2` with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

`PE1(config)#mac vrf vrf2`	Enter VRF mode named `vrf2`.
`PE1(config-vrf)#rd 1.1.1.1:2`	Configure Route-Distinguisher value of `1.1.1.1:2`.
`PE1(config-vrf)#route-target both 2:2`	Configure import and export values for the `vrf2` as `2:2`.

PE1(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE1(config)#commit	Commit the transaction.

PE1: EVPN and VRF Mapping

The EVPN and VRF mapping configuration on PE1 establishes mappings between the EVPN identifier and VRF, facilitating efficient routing and connectivity in an EVPN network environment.

PE1(config)#evpn mpls id 52 xconnect target-mpls-id 2	Configure the EVPN-VPWS identifier with a source identifier of 52 and a target identifier of 2.
PE1(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Map VRF vrf2 to the EVPN-VPWS identifier
PE1(config-evpn-mpls)#commit	Commit the transaction.
PE1(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE1: Access Port Configuration

The below access port configuration on PE1 is carried out to create a Layer 2 sub-interface within the physical interface, description the interface, configure the encapsulation with VLAN ID, and map VPN-ID for efficient network access and connectivity.

PE1(config)#interface xe33	Enter interface mode xe33.
PE1(config-if)#interface xe33.2 switchport	Create a Layer 2 sub-interface xe33.2 within the physical interface xe33.
PE1(config-if)#description access-side-int	Provide a description for the interface.
PE1(config-if)#encapsulation dot1q 2	Set encapsulation to dot1q with VLAN ID 2.
PE1(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE1(config-acc-if-evpn)#map vpn-id 52	Map VPN-ID 52.
PE1(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE1(config-if)#exit	Exit interface mode xe33 and return to the configure mode.
PE1(config)#commit	Commit the transaction.

P: Loopback Interface

The configuration on P for a loopback interface with IP address 2.2.2.2/32 secondary is set up to provide IP connectivity for the router.

P#configure terminal	Enter configure mode.
P(config)#interface lo	Enter the interface mode for the loopback interface lo.
P(config-if)#ip address 2.2.2.2/32 secondary	Configure a secondary IP address, 2.2.2.2/32, on the loopback interface.
P(config-if)#exit	Exit interface mode lo.
P(config)#commit	Commit the transaction.

P: Global LDP

The configuration on P for the Global LDP router, specifying router ID to set up Label Distribution Protocol (LDP) settings for MPLS.

`P(config)#router ldp`	Enter the Router LDP mode.
`P(config-router)#router-id 2.2.2.2`	Set the router ID for LDP to `2.2.2.2`.
`P(config-router)#exit`	Exit router LDP mode and return to the configure mode.
`P(config)#commit`	Commit the transaction.

P: Interface Configuration

The below configuration is performed to set up interfaces on P and enable LDP for IPv4, ensuring proper routing and labeling functionality.

`P(config)#interface xe6`	Enter interface mode `xe6`.
`P(config-if)#ip address 10.1.0.2/16`	Configure an IP address, `10.1.0.2/16`, on the interface `xe6`.
`P(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P(config-if)#exit`	Exit interface mode `xe6`.
`P(config)#commit`	Commit the transaction.
`P(config)#interface xe21`	Enter interface mode `xe21`.
`P(config-if)#ip address 123.1.1.1/24`	Configure an IP address, `123.1.1.1/24`, on the interface `xe21`.
`P(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P(config-if)#exit`	Exit interface mode `xe21`.
`P(config)#commit`	Commit the transaction.
`P(config)#interface xe20`	Enter interface mode `xe20`.
`P(config-if)#ip address 124.1.1.1/24`	Configure an IP address, `124.1.1.1/24`, on the interface `xe20`.
`P(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`P(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`P(config-if)#exit`	Exit interface mode `xe20`.
`P(config)#commit`	Commit the transaction.

P: OSPF Configuration

The below configuration is performed to set up OSPF on P, specifying the router ID and defining network interfaces for efficient routing.

`P(config)#router ospf 1`	Enter the router OSPF mode. Configure P to run OSPF with process ID `1`.
`P(config-router)#ospf router-id 2.2.2.2`	Set the OSPF router ID to `2.2.2.2`, identifying P within the OSPF network.
`P(config-router)#network 2.2.2.2/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`P(config-router)#network 10.1.0.2/16 area 0.0.0.0`	Advertise network address in OSPF.
`P(config-router)#network 123.1.1.1/24 area 0.0.0.0`	Advertise network address in OSPF.
`P(config-router)#network 124.1.1.1/24 area 0.0.0.0`	Advertise network address in OSPF.
`P(config-router)#exit`	Exit router OSPF mode and return to the configure mode.
`P(config)#commit`	Commit the transaction.

PE2: Loopback Interface

The configuration on PE2 for a loopback interface with IP address `7.7.7.7/32` secondary is set up to provide IP connectivity for the router.

`PE2#configure terminal`	Enter configure mode.
`PE2(config)#interface lo`	Enter the interface mode for the loopback interface `lo`.
`PE2(config-if)#ip address 7.7.7.7/32 secondary`	Configure a secondary IP address, `7.7.7.7/32`, on the loopback interface.
`PE2(config-if)#exit`	Exit interface mode `lo`.
`PE2(config)#commit`	Commit the transaction.

PE2: Global LDP

The configuration on PE2 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

`PE2(config)#router ldp`	Enter the Router LDP mode.
`PE2(config-router)#router-id 7.7.7.7`	Set the router ID for LDP to `7.7.7.7`.
`PE2(config-router)#targeted-peer ipv4 1.1.1.1`	Configure targeted peer for LDP using IPv4 addresses.
`PE2(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit router targeted-peer-mode.
`PE2(config-router)#targeted-peer ipv4 8.8.8.8`	Configure targeted peer for LDP using IPv4 addresses.
`PE2(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit router targeted-peer-mode.
`PE2(config-router)#exit`	Exit router LDP mode and return to the configure mode.
`PE2(config)#commit`	Commit the transaction.

PE2: Global EVPN MPLS Command

The configuration on PE2 for the Global EVPN MPLS, includes activating EVPN MPLS defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multihoming, and activating EVPN MPLS multihoming functionality, all of which are crucial for enabling EVPN MPLS features.

`PE2(config)#evpn mpls enable`	Activate the EVPN MPLS functionality on `PE2`, enabling it to participate in EVPN MPLS services.
`PE2(config)#commit`	Commit candidate configuration to be running configuration.
`PE2(config)#evpn mpls vtep-ip-global 7.7.7.7`	Configure the global VTEP IP address `7.7.7.7`, associating it with the loopback IP.
`PE2(config)#hardware-profile filter evpn-mpls-mh enable`	Enable hardware-profile filter for EVPN MPLS multihoming.
`PE2(config)#evpn mpls multihoming enable`	Activate the EVPN MPLS multihoming functionality, allowing `PE2` to support multihomed EVPN MPLS services.
`PE2(config)#commit`	Commit the transaction.

PE2: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE2 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

`PE2(config)#interface xe21`	Enter interface mode `xe21`.
`PE2(config-if)#ip address 123.1.1.2/24`	Configure an IP address, `123.1.1.2/24`, on the interface `xe21`.
`PE2(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
`PE2(config-if)#label-switching`	Enable label switching on the interface to enable MPLS-based packet forwarding.
`PE2(config-if)#exit`	Exit interface mode `xe21`.
`PE2(config)#commit`	Commit the transaction.

PE2: OSPF Configuration

The below configuration is performed to set up OSPF on PE2, specifying the router ID and defining network interfaces.

`PE2(config)#router ospf 1`	Enter the router OSPF mode. Configure PE2 to run OSPF with process ID 1.
`PE2(config-router)#ospf router-id 7.7.7.7`	Set the OSPF router ID to `7.7.7.7`, identifying PE2 within the OSPF network.
`PE2(config-router)#network 7.7.7.7/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`PE2(config-router)#network 123.1.1.0/24 area 0.0.0.0`	Advertise network address in OSPF.
`PE2(config-router)#exit`	Exit router OSPF mode and return to configure mode.
`PE2(config)#commit`	Commit the transaction.

PE2: BGP Configuration

The below BGP configuration on PE2 is established to enable BGP routing with ASN 1, set the BGP router ID, define iBGP neighbors, and enable the EVPN address family for efficient routing in an EVPN environment.

`PE2(config)#router bgp 1`	Enter the Router BGP mode, ASN: 1
`PE2(config-router)#bgp router-id 7.7.7.7`	Configure BGP router ID `7.7.7.7`, identifying PE2 within the BGP network.
`PE2(config-router)#neighbor 1.1.1.1 remote-as 1`	Configure neighbor `1.1.1.1` as an iBGP neighbor with their remote AS number `1`.
`PE2(config-router)#neighbor 1.1.1.1 update-source lo`	Configure neighbor `1.1.1.1` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE2(config-router)#neighbor 8.8.8.8 remote-as 1`	Configure neighbor `8.8.8.8` as an iBGP neighbor with their remote AS number `1`.
`PE2(config-router)#neighbor 8.8.8.8 update-source lo`	Configure neighbor `8.8.8.8` as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
`PE2(config-router)#address-family l2vpn evpn`	Enter into address family mode for L2VPN EVPN.
`PE2(config-router-af)#neighbor 1.1.1.1 activate`	Activate EVPN for iBGP neighbor `1.1.1.1` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE2(config-router-af)#neighbor 8.8.8.8 activate`	Activate EVPN for iBGP neighbor `8.8.8.8` within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
`PE2(config-router-af)#exit`	Exit address family mode and return to the router BGP mode.
`PE2(config-router)#commit`	Commit the transaction.
`PE2(config-router)#exit`	Exit router BGP mode and return to the configure mode.

PE2: MAC VRF Configuration

The below MAC VRF configuration on PE2 is carried out to define and set up VRF named `vrf2` with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

`PE2(config)#mac vrf vrf2`	Enter VRF mode named `vrf2`.
`PE2(config-vrf)#rd 7.7.7.7:2`	Configure Route-Distinguisher value of `7.7.7.7:2`.
`PE2(config-vrf)#route-target both 2:2`	Configure import and export values for the `vrf2` as `2:2`.
`PE2(config-vrf)#exit`	Exit VRF mode and return to the configure mode.
`PE2(config)#commit`	Commit the transaction.

PE2: EVPN and VRF Mapping

The EVPN and VRF mapping configuration on PE2 establishes mappings between the EVPN identifier and VRF, facilitating efficient routing and connectivity in an EVPN network environment.

`PE2(config)#evpn mpls id 2 xconnect target-mpls-id 52`	Configure the EVPN-VPWS identifier with a source identifier of `2` and a target identifier of `52`.
`PE2(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Map VRF `vrf2` to the EVPN-VPWS identifier

PE2(config-evpn-mpls)#commit	Commit the transaction.
PE2(config-evpn-mpls)#exit	Exit the EVPN MPLS mode and return to the configure mode.

PE2: Access Port Configuration

The below access port configuration on PE2 is carried out to create a Layer 2 sub-interface within the port channel interface, set the load balancing, configure system MAC and the encapsulation with VLAN ID, map VPN-ID for efficient network access and connectivity.

PE2(config)#interface po1	Enter the port channel interface mode for po1
PE2(config-if)#load-interval 30	Set the load interval to 30.
PE2(config-if)#evpn multi-homed system-mac 0000.aaaa.bbbc	Configure the system-mac address 0000.aaaa.bbbc which plays a role in load balancing.
PE2(config-if)#interface po1.2 switchport	Create a Layer 2 sub-interface po1.2 within the port channel.
PE2(config-if)#encapsulation dot1q 2	Set encapsulation to dot1q with VLAN ID 2.
PE2(config-if)#access-if-evpn	Enter the access mode for EVPN MPLS ID configuration.
PE2(config-acc-if-evpn)#map vpn-id 2	Map VPN-ID 2.
PE2(config-acc-if-evpn)#exit	Exit the access mode and return to the interface mode.
PE2(config-if)#exit	Exit interface mode po1 and return to the configure mode.
PE2(config)#commit	Commit the transaction.

PE3: Loopback Interface

The configuration on PE3 for a loopback interface with IP address 8.8.8.8/32 secondary is set up to provide IP connectivity for the router.

PE3#configure terminal	Enter configure mode.
PE3(config)#interface lo	Enter the interface mode for the loopback interface lo.
PE3(config-if)#ip address 8.8.8.8/32 secondary	Configure a secondary IP address, 8.8.8.8/32, on the loopback interface.
PE3(config-if)#exit	Exit interface mode lo.
PE3(config)#commit	Commit the transaction.

PE3: Global LDP

The configuration on PE3 for the Global LDP router, specifying router ID and targeted peers, is done to set up Label Distribution Protocol (LDP) settings for MPLS.

PE3(config)#router ldp	Enter the Router LDP mode.
PE3(config-router)#router-id 8.8.8.8	Set the router ID for LDP to 7.7.7.7.
PE3(config-router)#targeted-peer ipv4 1.1.1.1	Configure targeted peer for LDP using IPv4 addresses.
PE3(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE3(config-router)#targeted-peer ipv4 7.7.7.7	Configure targeted peer for LDP using IPv4 addresses.

© 2025 IP Infusion Inc. Proprietary

PE3(config-router-targeted-peer)#exit-targeted-peer-mode	Exit router targeted-peer-mode.
PE3(config-router)#exit	Exit router LDP mode and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: Global EVPN MPLS Command

The configuration on PE3 for the Global EVPN MPLS, includes activating EVPN MPLS defining the global VTEP IP address, enabling hardware profile filtering for EVPN MPLS multihoming, and activating EVPN MPLS multihoming functionality, all of which are crucial for enabling EVPN MPLS features.

PE3(config)#evpn mpls enable	Activate the EVPN MPLS functionality on PE3, enabling it to participate in EVPN MPLS services.
PE3(config)#commit	Commit candidate configuration to be running configuration.
PE3(config)#evpn mpls vtep-ip-global 8.8.8.8	Configure the global VTEP IP address 8.8.8.8, associating it with the loopback IP.
PE3(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware-profile filter for EVPN MPLS multihoming.
PE3(config)#evpn mpls multihoming enable	Activate the EVPN MPLS multihoming functionality, allowing PE3 to support multihomed EVPN MPLS services.
PE3(config)#commit	Commit the transaction.

PE3: Interface Configuration Network Side

The below configuration is performed to set up network interfaces on PE3 and enable LDP for IPv4, ensuring proper routing and labeling functionality.

PE3(config)#interface xe5	Enter interface mode xe5.
PE3(config-if)#ip address 124.1.1.2/24	Configure an IP address, 124.1.1.2/24, on the interface xe5.
PE3(config-if)#enable-ldp ipv4	Enable LDP on the physical interface, facilitating the exchange of label information between devices in the network.
PE3(config-if)#label-switching	Enable label switching on the interface to enable MPLS-based packet forwarding.
PE3(config-if)#exit	Exit interface mode xe5.
PE3(config)#interface xe4	Enter the interface mode for xe4.
PE3(config-if)#channel-group 1 mode active	Attach LAG interface xe4.
PE3(config-if)#exit	Exit interface mode xe4 and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: OSPF Configuration

The below configuration is performed to set up OSPF on PE3, specifying the router ID and defining network interfaces.

PE3(config)#router ospf 1	Enter the router OSPF mode. Configure PE3 to run OSPF with process ID 1.
PE3(config-router)#ospf router-id 8.8.8.8	Set the OSPF router ID to 8.8.8.8, identifying PE3 within the OSPF network.

PE3(config-router)#network 8.8.8.8/32 area 0.0.0.0	Advertise loopback address in OSPF.
PE3(config-router)#network 124.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
PE3(config-router)#exit	Exit router OSPF mode and return to configure mode.
PE3(config)#commit	Commit the transaction.

PE3: BGP Configuration

The below BGP configuration on PE3 is established to enable BGP routing with ASN 1, set the BGP router ID, define iBGP neighbors, and enable the EVPN address family for efficient routing in an EVPN environment.

PE3(config)#router bgp 1	Enter the Router BGP mode, ASN: 1
PE3(config-router)#bgp router-id 8.8.8.8	Configure BGP router ID 8.8.8.8, identifying PE3 within the BGP network.
PE3(config-router)#neighbor 1.1.1.1 remote-as 1	Configure neighbor 1.1.1.1 as an iBGP neighbor with their remote AS number 1.
PE3(config-router)#neighbor 1.1.1.1 update-source lo	Configure neighbor 1.1.1.1 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE3(config-router)#neighbor 7.7.7.7 remote-as 1	Configure neighbor 7.7.7.7 as an iBGP neighbor with their remote AS number 1.
PE3(config-router)#neighbor 7.7.7.7 update-source lo	Configure neighbor 7.7.7.7 as an iBGP neighbor, specifying the source of routing updates as the loopback interface.
PE3(config-router)#address-family l2vpn evpn	Enter into address family mode for L2VPN EVPN.
PE3(config-router-af)#neighbor 1.1.1.1 activate	Activate EVPN for iBGP neighbor 1.1.1.1 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE3(config-router-af)#neighbor 7.7.7.7 activate	Activate EVPN for iBGP neighbor 7.7.7.7 within the address family mode, ensuring that EVPN address family is enabled for the neighbor.
PE3(config-router-af)#exit	Exit address family mode and return to the router BGP mode.
PE3(config-router)#commit	Commit the transaction.
PE3(config-router)#exit	Exit router BGP mode and return to the configure mode.

PE3: MAC VRF Configuration

The below MAC VRF configuration on PE3 is carried out to define and set up VRF named vrf2 with specific Route-Distinguisher (RD) and route-target values, ensuring segregated MAC address spaces for distinct network services.

PE3(config)#mac vrf vrf2	Enter VRF mode named vrf2.
PE3(config-vrf)#rd 8.8.8.8:2	Configure Route-Distinguisher value of 8.8.8.8:2.
PE3(config-vrf)#route-target both 2:2	Configure import and export values for the vrf2 as 2:2.
PE3(config-vrf)#exit	Exit VRF mode and return to the configure mode.
PE3(config)#commit	Commit the transaction.

PE3: EVPN and VRF Mapping

The EVPN and VRF mapping configuration on PE3 establishes mappings between the EVPN identifier and VRF, facilitating efficient routing and connectivity in an EVPN network environment.

`PE3(config)#evpn mpls id 2 xconnect target-mpls-id 52`	Configure the EVPN-VPWS identifier with a source identifier of `2` and a target identifier of `52`.
`PE3(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2`	Map VRF `vrf2` to the EVPN-VPWS identifier
`PE3(config-evpn-mpls)#commit`	Commit the transaction.
`PE3(config-evpn-mpls)#exit`	Exit the EVPN MPLS mode and return to the configure mode.

PE3: Access Port Configuration

The below access port configuration on PE3 is carried out to create a Layer 2 sub-interface within the port channel interface, set the load balancing, configure system MAC and the encapsulation with VLAN ID, map VPN-ID for efficient network access and connectivity.

`PE3(config)#interface po1`	Enter the port channel interface mode for `po1`
`PE3(config-if)#load-interval 30`	Set the load interval to `30`.
`PE3(config-if)#evpn multi-homed system-mac 0000.aaaa.bbbc`	Configure the system-mac address `0000.aaaa.bbbc` which plays a role in load balancing.
`PE3(config-if)#interface po1.2 switchport`	Create a Layer 2 sub-interface `po1.2` within the port channel.
`PE3(config-if)#encapsulation dot1q 2`	Set encapsulation to dot1q with VLAN ID `2`.
`PE3(config-if)#access-if-evpn`	Enter the access mode for EVPN MPLS ID configuration.
`PE3(config-acc-if-evpn)#map vpn-id 2`	Map VPN-ID `2`.
`PE3(config-acc-if-evpn)#exit`	Exit the access mode and return to the interface mode.
`PE3(config-if)#exit`	Exit interface mode `po1` and return to the configure mode.
`PE3(config)#commit`	Commit the transaction.

PE1: CFM

The following configuration enables CFM monitoring and maintenance for EVPN services on PE1.

`PE1(config)#hardware-profile filter cfm-domain-name-str enable`	Enable the CFM domain name as a character string profile for CFM filtering.
`PE1(config)#ethernet cfm domain-type character-string domain-name evpn1 level 7 mip-creation none`	Create a CFM domain for EVPN ELINE with a character string type and set MIP creation to `none`.
`PE1(config-ether-cfm)#service ma-type string ma-name evp1`	Define a maintenance association (MA) type with the string `evp1`.
`PE1(config-ether-cfm-ma)#evpn 52`	Configure the MA for EVPN ID `52`.
`PE1(config-ether-cfm-ma)#ethernet cfm mep up mpid 20 active true evpn 52`	Create an up-maintenance endpoint (MEP) for local EVPN ID `52`.
`PE1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable multicast continuity check (CC) state for the MEP.
`PE1(config-ether-cfm-ma-mep)#cc interval 100`	Set the CC interval to 100 milliseconds.

`PE1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit Ethernet MA MEP mode.
`PE1(config-ether-cfm-ma)#mep crosscheck mpid 10`	Configure cross-check to the remote MEP.
`PE1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet MA mode.
`PE1(config-ether-cfm)#exit`	Exit Ethernet CFM mode and return to the configure mode.
`PE1(config)#commit`	Commit candidate configuration to be running configuration.

PE2/PE3: CFM

The following configuration enables CFM monitoring and maintenance for EVPN services on PE2 and PE3 devices.

Note: Apply the same set of configurations to the PE3 device.

`PE2(config)#hardware-profile filter cfm-domain-name-str enable`	Enable the CFM domain name as a character string profile for CFM filtering.
`PE2(config)#ethernet cfm domain-type character-string domain-name evpn1 level 7 mip-creation none`	Create a CFM domain for EVPN ELINE with a character string type and set MIP creation to `none`.
`PE2(config-ether-cfm)#service ma-type string ma-name evp1`	Define a maintenance association (MA) type with the string `evp1`.
`PE2(config-ether-cfm-ma)#evpn 2`	Configure the MA for EVPN ID `2`.
`PE2(config-ether-cfm-ma)#ethernet cfm mep up mpid 10 active true evpn 2`	Create an up-maintenance endpoint (MEP) for local EVPN ID `2`.
`PE2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable multicast continuity check (CC) state for the MEP.
`PE2(config-ether-cfm-ma-mep)#cc interval 100`	Set the CC interval to 100 milliseconds.
`PE2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit Ethernet MA MEP mode.
`PE2(config-ether-cfm-ma)#mep crosscheck mpid 20`	Configure cross-check to the remote MEP.
`PE2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet MA mode.
`PE2(config-ether-cfm)#exit`	Exit Ethernet CFM mode and return to the configure mode.
`PE2(config)#commit`	Commit candidate configuration to be running configuration.

Validation

The following output displays the validation results for PE1, PE2, and PE3 in an EVPN setup, which includes EVPN xconnect status, Ethernet CFM errors, remote maintenance points, local maintenance points, and successful ping tests.

PE1: Display xConnect Status

```
PE1#show evpn mpls xconnect
EVPN Xconnect Info
========================
AC-AC: Local-Cross-connect
AC-NW: Cross-connect to Network
AC-UP: Access-port is up
AC-DN: Access-port is down
NW-UP: Network is up
NW-DN: Network is down
NW-SET: Network and AC both are up
```

```

Implementation Examples

Here is a practical scenario and use case for CFM (802.1ag) implementation for ELINE MultiHoming in the context of a telecommunications service provider who offers Ethernet-based Virtual Private Network (EVPN) services to various enterprises.

Use Case: Ensuring Service Reliability and Quality

Scenario: Consider a company with several branch offices that rely heavily on its ELINE connections to ensure smooth communication and data exchange between offices. The company subscribes to an EVPN service provided by a telecommunications service provider.

Use Case Details

1. **MultiHoming Resilience:** The company's critical applications and services require high availability. MultiHoming ensures redundancy by connecting each branch office to the provider's network through multiple paths. This way, if one path fails due to network issues, the traffic can be rerouted through the alternative path without causing a disruption.

2. **Continuous Monitoring:** CFM implementation allows the service provider to continuously monitor the connectivity and performance of the ELINE connections between the branch offices. By sending CCMs, the provider can quickly identify any interruptions in connectivity.

3. **Swift Issue Detection and Resolution:** In case of a network disruption or fault, the service provider receives immediate alerts through CFM CCMs. This enables the provider's network operations team to pinpoint the issue's location and take prompt action to restore services, minimizing downtime for the company.

4. **Troubleshooting Efficiency:** The CFM Ping and Trace functions assist in troubleshooting network issues. If the company's IT team reports a performance issue or communication problem, use CFM diagnostic capabilities to trace the path of packets and identify bottlenecks or faulty segments.

In this use case, the CFM implementation for ELINE MultiHoming provides a robust solution for ensuring reliable and high-quality connectivity for the company's distributed offices. It enables proactive monitoring and rapid issue resolution, which are critical for maintaining the company's communication and operational efficiency.

Troubleshooting

Follow the troubleshooting steps below to resolve connectivity issues related to CFM EVPN-ID and crosscheck local and remote MEP ID matching.

1. **Check Local EVPN-ID:** Verify the EVPN-ID configured on the local device (Example: PE1) and ensure that it matches the intended EVPN-ID for the target service or connection.

2. **Verify Remote EVPN-ID:** Check the EVPN-ID configured on the remote device (Example: PE2) and confirm that it matches the EVPN-ID expected by the local device.
3. **Crosscheck MEP ID:** Examine the MEP ID configured on the local device (PE1) and ensure it matches the expected R-MEP ID on the remote device (PE2).
4. **Validate Remote MEP ID:** Verify the MEP ID configured on the remote device (PE2) and ensure it matches the R-MEP ID expected by the local device (PE1).
5. **Reconfigure If Needed:** If there are discrepancies between the local and remote EVPN-IDs or MEP IDs, reconfigure the devices to match.
6. **Test the Connection:** After ensuring that EVPN-IDs and MEP IDs match on both devices, test the connection to confirm it is established correctly.

Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

Acronym	Description
CFM	Continuity Fault Management
CCM	Continuity Check Messages
EVPN	Ethernet Virtual Private Network
ELINE	Ethernet-LINE
MPLS	Multi-Protocol Label Switching
UP	User-to-Provider
MEP	Maintenance End Point
MH	MultiHoming
R-MEP	Remote Maintenance End Point
MAC	Media Access Control
AC	Access Circuit
TLV	Type-Length-Value
RDI	Remote Defect Indicator
LB	Loopback
LBM	Loopback Message
LTR	Looptrace Reply

Glossary

The following provides definitions for key terms used throughout this document.

Continuity Fault Management (CFM)	A protocol (802.1ag) that facilitates the monitoring of network connectivity by using Continuity Check Messages (CCM) to detect faults.
Continuity Check Messages (CCM)	Periodic messages are used in CFM to check the continuity of a network connection.
Ethernet Virtual Private Network (EVPN)	A technology that enables the extension of Layer 2 Ethernet networks over a Layer 3 infrastructure.
Multi-Protocol Label Switching (MPLS)	In telecommunications networks, a routing technique is employed to guide data from one node to the next using concise path labels rather than relying on lengthy network addresses.
User-to-Provider (UP)	Refers to the connection between the user's and service provider's networks.
Maintenance End Point (MEP)	A point in a network where maintenance operations are initiated or terminated.
MultiHoming (MH)	A networking architecture that allows a device to be connected to multiple network paths or points of attachment.
Remote Maintenance End Point (R-MEP)	A maintenance end point located remotely from the originating point.
Media Access Control (MAC)	A unique identifier assigned to a network interface card.
Attachment Circuit (AC)	A circuit that connects a customer's equipment to a provider's network.
Type-Length-Value (TLV)	A format used to encapsulate data in a variety of protocols.
Remote Defect Indication (RDI)	A signal used to indicate a fault condition in a network link.
Loopback Message (LBM)	A message used in loopback testing to check connectivity.

CHAPTER 11 Inter-AS VPN Configuration Overview

MPLS VPN architecture typically runs within an AS. Routes of any VPN can be flooded within the AS, but not to other ASs. To implement the exchange of VPN routes between different ASs, the inter-AS MPLS VPN model is used. The inter-AS MPLS VPN model is an extension to MPLS VPN framework. Route prefixes and labels can be advertised over links between different carrier networks through the inter-AS MPLS model.

The MPLS VPN solution serves an increasing number of users across many applications. A site at one geographical location often needs to connect to an ISP network at another geographical location. In this situation, for example, inter-AS issues may arise for operators who manage different metropolitan area networks (MANs) or backbone networks that span different autonomous systems (AS).

Types of Inter-AS VPN

1. Inter-AS VPN Option A: Autonomous system boundary routers (ASBRs) manage VPN routes for in-ter-AS VPNs through dedicated interfaces.

2. Inter-AS VPN Option B: ASBRs advertise labeled VPN-IPv4 routes to each other through MP-EBGP.

3. Inter-AS VPN Option C: PE devices advertise labeled VPN-IPv4 routes to each other through Mul-ti-hop MP-EBGP.

CHAPTER 12 Inter-AS VPN Option-A Configuration

This chapter explain about Inter-AS VPN Option-A. Option A is the simplest of the options to inter-connect the ASBRs Option A has the following characteristics:

- Each customer VRF requires either a physical interface or more likely a subinterface.
- Each ASBR thinks the other is a CE.
- One logical interface per VPN.
- Link may use any supported PE-CE protocol.
- Packets are sent unlabelled between the ASBRs.
- The most secure and easy option to provision.
- Does not scale well to a large number of VPNs.

Topology

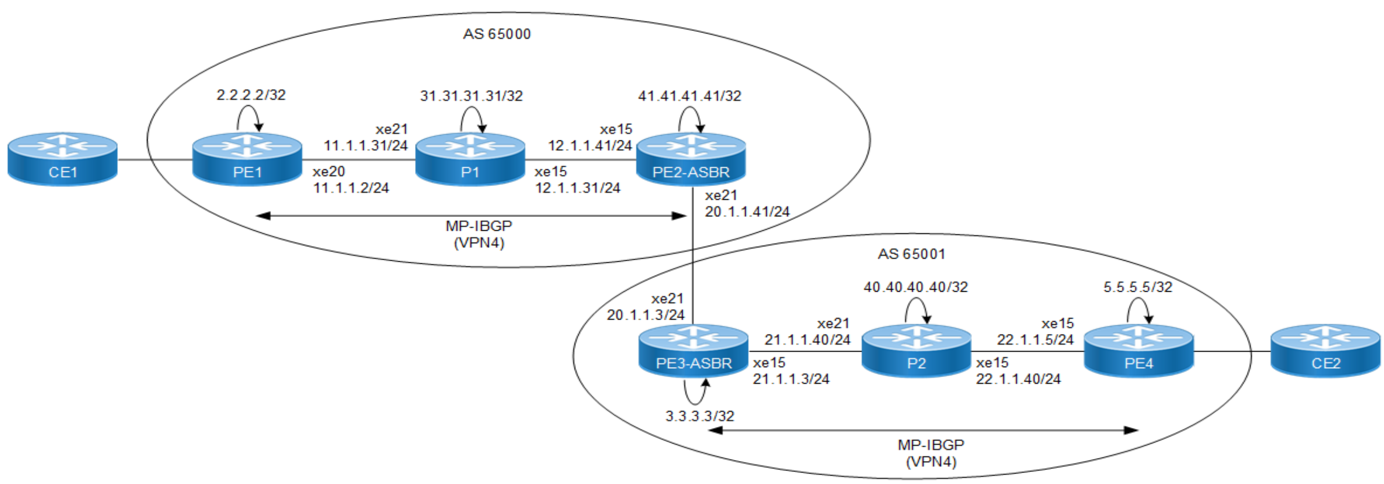

Figure 12-3: InterAS-VPN Option-A

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 2.2.2.2/32 secondary`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#ip vrf vrf1`	Create a new VRF named vrf1.
`(config-vrf)#rd 1:1`	Assign the route distinguisher (RD) value as 1:1.
`(config-vrf)#route-target both 1:1`	Import routes between route target (RT) ext-communities.
`(config-vrf)#exit`	Exit interface mode.
`(config)#interface xe22`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf1`	Bind the interface connected to the CE router with VRF vrf1
`(config-if)#ip address 10.1.1.2/24`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode

(config)#interface xe20	Enter interface mode
(config-if)#ip address 11.1.1.2/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode
(config)#router ospf 1	Enter router OSPF mode.
(config-router)#ospf router-id 2.2.2.2	Configure OSPF router id same as loopback ip address.
(config-router)#network 2.2.2.2/32 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 11.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit OSPF router mode.
(config)#router ldp	Enter router LDP mode.
(config-router)#router-id 2.2.2.2	Configure the router ID same as loopback IP address.
(config-router)#transport-address ipv4 2.2.2.2	Configure LDP transport address same as loopback address.
(config-router)#exit	Exit LDP mode.
(config)#interface xe20	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 65000	Enter BGP router mode.
(config-router)#bgp router-id 2.2.2.2	Configure BGP router-id.
(config-router)#neighbor 41.41.41.41 remote-as 65000	Configure PE2-ASBR1 as an iBGP peer.
(config-router)#neighbor 41.41.41.41 update-source lo	Update the source as loopback for iBGP peering with the remote PE2 router.
(config-router)#address-family vpnv4	Enter VPNv4 address family mode.
(config-router-af)#neighbor 41.41.41.41 activate	Activate the PE neighbor so that it can accept VPN IPv4 routes.
(config-router-af)#exit	Exit VPNv4 address family mode.
(config-router)#address-family ipv4 vrf vrf1	Enter the IPv4 address family for VRF vrf1.
(config-router-af)#redistribute connected	Redistribute connected route.
(config-router-af)#commit	Commit the transaction.
(config-router-af)#exit	Exit VPNv4 address family mode.
(config-router)#exit	Exit OSPF router mode.
(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

P1 Configuration

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 31.31.31.31/32 secondary	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.

(config)#interface xe21	Enter interface mode.
(config-if)#ip address 11.1.1.31/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#ip address 12.1.1.31/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Enter router OSPF mode.
(config-router)#ospf router-id 31.31.31.31	Configure OSPF router ID same as loopback IP address.
(config-router)#network 31.31.31.31/32 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 11.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 12.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit OSPF router mode.
(config)#router ldp	Enter router LDP mode.
(config-router)#router-id 31.31.31.31	Configure the router id same as loopback ip address.
(config-router)#transport-address ipv4 31.31.31.31	Configure LDP transport address same as loopback address.
(config-router)#exit	Exit LDP mode.
(config)#interface xe21	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-router)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#commit	Commit the transaction.
(config-if)#exit	Exit interface mode.
(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

PE2-ASBR1

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 41.41.41.41/32 secondary	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#ip vrf vrf1	Create a new VRF named vrf1.
(config-vrf)#rd 1:1	Assign the route distinguisher (RD) value as 1:1.
(config-vrf)#route-target both 1:1	Import routes between route target (RT) ext-communities.
(config-vrf)#exit	Exit interface mode.

(config)#interface xe21	Enter interface mode.
(config-if)#ip vrf forwarding vrf1	Bind the interface connected to the CE router with VRF vrf1.
(config-if)#ip address 20.1.1.41/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#ip address 12.1.1.41/24	Assign the IPv4 address.
(config-if)#	Exit interface mode.
(config)#router ospf 1	Enter router OSPF mode.
(config-router)#ospf router-id 41.41.41.41	Configure OSPF router ID same as loopback IP address.
(config-router)#network 41.41.41.41/32 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 12.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit OSPF router mode.
(config)#router ldp	Enter router LDP mode.
(config-router)#transport-address ipv4 41.41.41.41	Configure LDP transport address same as loopback address.
(config-router)#exit	Exit LDP mode.
(config)#interface xe15	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-router)#exit	Exit interface mode.
(config)#router bgp 65000	Enter BGP router mode.
(config-router)#bgp router-id 41.41.41.41	Configure BGP router-id.
(config-router)#neighbor 2.2.2.2 remote-as 65000	Configure PE1 as an iBGP peer.
(config-router)#neighbor 2.2.2.2 update-source lo	Update the source as loopback for iBGP peering with the remote PE2 router.
(config-router)#address-family vpnv4	Enter VPNv4 address family mode.
(config-router-af)#neighbor 2.2.2.2 activate	Activate the PE neighbor so that it can accept VPN IPv4 routes.
(config-router-af)#exit	Exit VPNv4 address family mode.
(config-router)#address-family ipv4 vrf vrf1	Enter the IPv4 address family for VRF vrf1.
(config-router-af)#neighbor 20.1.1.3 remote-as 65001	Configure eBGP neighbor.
(config-router-af)#redistribute connected	Redistribute connected route.
(config-router-af)#commit	Commit the transaction.
(config-router-af)#exit-address-family	Exit address family mode.
(config-router)#exit	Exit the router mode.
(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

PE3-ASBR2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#ip vrf vrf1`	Create a new VRF named vrf1.
`(config-vrf)#rd 1:1`	Assign the route distinguisher (RD) value as 1:1.
`(config-vrf)#route-target both 1:1`	Import routes between route target (RT) ext-communities.
`(config-vrf)#exit`	Exit interface mode.
`(config)#interface xe21`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf1`	Bind the interface connected to the CE router with VRF vrf1.
`(config-if)#ip address 20.1.1.3/24`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#ip address 21.1.1.3/24`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 1`	Enter router OSPF mode.
`(config-router)#ospf router-id 3.3.3.3`	Configure OSPF router id same as loopback ip address.
`(config-router)#network 3.3.3.3/32 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#network 21.1.1.0/24 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ldp`	Enter router LDP mode.
`(config-router)#router-id 3.3.3.3`	Configure the router ID same as loopback IP address.
`(config-router)#transport-address ipv4 3.3.3.3`	Configure LDP transport address same as loopback address.
`(config-router)#exit`	Exit LDP mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#enable-ldp ipv4`	Enable LDP in interface.
`(config-router)#exit`	Exit interface mode.
`(config)#router rsvp`	Enter router RSVP mode.
`(config-router)#rsvp-trunk lsp1`	Create an RSVP trunk lsp1 and enter the Trunk mode.
`(config-trunk)#to 5.5.5.5`	Specify the IPv4 egress (destination point-PE4 loopback address) for the LSP.
`(config-trunk)#exit`	Exit interface mode.
`(config)#router bgp 65001`	Enter BGP router mode.
`(config-router)#bgp router-id 3.3.3.3`	Configure BGP router-id.
`(config-router)#neighbor 5.5.5.5 remote-as 65001`	Configure PE4 as an iBGP peer.

(config-router)#neighbor 5.5.5.5 update-source lo	Update the source as loopback for iBGP peering with the remote PE2 router.
(config-router)#address-family vpnv4	Enter VPNv4 address family mode.
(config-router-af)#neighbor 5.5.5.5 activate	Activate the PE neighbor so that it can accept VPN IPv4 routes.
(config-router-af)#exit	Exit VPNv4 address family mode.
(config-router)#address-family ipv4 vrf vrf1	Enter the IPv4 address family for VRF vrf1.
(config-router-af)#neighbor 20.1.1.41 remote-as 65000	Configure eBGP neighbor.
(config-router-af)#neighbor 20.1.1.41 activate	Activate the eBGP neighbor under address family.
(config-router-af)#redistribute connected	Redistribute connected route.
(config-router-af)#commit	Commit the transaction.
(config-router-af)#exit-address-family	Exit address family mode.
(config-router)#exit	Exit the router mode.
(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

P2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 40.40.40.40/32 secondary	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe21	Enter interface mode.
(config-if)#ip address 21.1.1.40/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#ip address 22.1.1.40/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Enter router OSPF mode.
(config-router)#ospf router-id 40.40.40.40	Configure OSPF router ID same as loopback IP address.
(config-router)#network 40.40.40.40/32 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 21.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 22.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit OSPF router mode
(config)#router ldp	Enter router LDP mode.
(config-router)#router-id 40.40.40.40	Configure the router ID same as loopback IP address.
(config-router)#transport-address ipv4 40.40.40.40	Configure LDP transport address same as loopback address.
(config-router)#exit	Exit LDP mode.

(config)#interface xe21	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#commit	Commit the transaction.
(config-if)#exit	Exit interface mode.
(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

PE4

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 5.5.5.5/32 secondary	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#ip vrf vrf1	Create a new VRF named vrf1.
(config-vrf)#rd 1:1	Assign the route distinguisher (RD) value as 1:1.
(config-vrf)#route-target both 1:1	Import routes between route target (RT) ext-communities.
(config-vrf)#exit	Exit VRF mode.
(config)#interface xe22	Enter interface mode.
(config-if)#ip vrf forwarding vrf1	Bind the interface connected to the CE router with VRF vrf1.
(config-if)#ip address 30.1.1.5/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#ip address 22.1.1.5/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Enter router OSPF mode.
(config-router)#ospf router-id 5.5.5.5	Configure OSPF router ID same as loopback IP address.
config-router)#network 5.5.5.5/32 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 22.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit router OSPF mode.
(config)#router ldp	Enter router LDP mode.
(config-router)#router-id 5.5.5.5	Configure the router ID same as loopback IP address.
(config-router)#transport-address ipv4 5.5.5.5	Configure LDP transport address same as loopback address.
(config-router)#exit	Exit LDP mode.
(config)#interface xe15	Enter interface mode.

(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 65001	Enter BGP router mode.
(config-router)#bgp router-id 5.5.5.5	Configure BGP router-id.
(config-router)#neighbor 3.3.3.3 remote-as 65001	Configure PE2-ASBR1 as an iBGP peer.
(config-router)#neighbor 3.3.3.3 update-source lo	Update the source as loopback for iBGP peering with the remote PE2 router.
(config-router)#address-family vpnv4	Enter VPNv4 address family mode.
(config-router-af)#neighbor 3.3.3.3 activate	Activate neighbor.
(config-router-af)#exit	Exit VPNv4 Address Family mode.
(config-router)#address-family ipv4 vrf vrf1	Enter IPv4 VRF Address Family mode.
(config-router-af)#redistribute connected	Redistribute connected route.
(config-router-af)#commit	Commit the transaction.
(config-router-af)#exit-address-family	Exit address family mode.
(config-router)#exit	Exit the router mode
(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

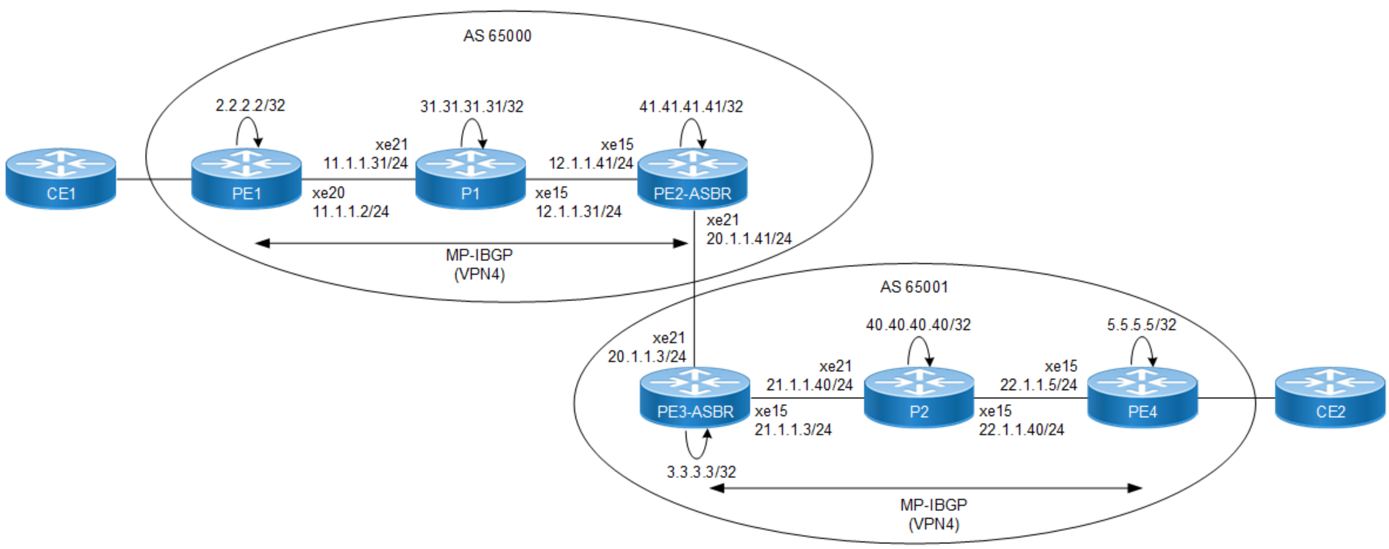
CHAPTER 13 Inter-AS VPN Option-B Configuration

- Inter-AS Option B is a more scalable solution compared to Option A. It does not require any VRFs on the ASBRs, it uses VPNv4 eBGP to exchange VPNv4 updates.
- Single interface to connect the ASBRs.
- Packets are sent labelled between the ASBRs.
- No need for VRFs on the ASBR.
- ASBRs must be directly connected.
- Scales better than Option A.

Note: ASBR BGP label allocation mode uses per-prefix label allocation, and per-VRF label allocation cannot be achieved in ASBRs (VPNv4 and VPNv6).

Topology



PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 2.2.2.2/32 secondary`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#ip vrf vrf1`	Create a new VRF named vrf1.
`(config-vrf)#rd 1:1`	Assign the route distinguisher (RD) value as 1:1.
`(config-vrf)#route-target both 1:1`	Import routes between route target (RT) ext-communities.
`(config-vrf)#exit`	Exit VRF mode.
`(config)#interface xe22`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf1`	Bind the interface connected to the CE router with VRF vrf1.
`(config-if)#ip address 10.1.1.2/24`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.

`(config)#interface xe20`	Enter interface mode.
`(config-if)#ip address 11.1.1.2/24`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Enter router OSPF mode.
`(config-router)#ospf router-id 2.2.2.2`	Configure OSPF router id same as loopback ip address.
`(config-router)#network 2.2.2.2/32 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#network 11.1.1.0/24 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ldp`	Enter router LDP mode.
`(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2
`(config-router)#transport-address ipv4 2.2.2.2`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address
`(config-router)#targeted-peer ipv4 41.41.41.41`	Configure targeted peer.
`(config-router)#targeted-peer ipv4 3.3.3.3`	Configure targeted peer.
`(config-router-targeted-peer)#targeted-peer ipv4 5.5.5.5`	Configure targeted peer.
`(config-router-targeted-peer)#targeted-peer ipv4 41.41.41.41`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode.
`(config-router)#exit`	Exit router mode
`(config)#interface xe20`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#enable-ldp ipv4`	Enable LDP in interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 65000`	Enter BGP router mode.
`(config-router)#bgp router-id 2.2.2.2`	Configure BGP router-id.
`(config-router)#neighbor 41.41.41.41 remote-as 65000`	Configure PE2-ASBR1 as an iBGP peer.
`(config-router)#neighbor 41.41.41.41 update-source lo`	Update the source as loopback for iBGP peering with the remote PE2 router.
`(config-router)#address-family vpnv4`	Enter VPNv4 address family mode.
`(config-router-af)#neighbor 41.41.41.41 activate`	Activate the PE neighbor so that it can accept VPN IPv4 routes.
`(config-router-af)#exit`	Exit VPNv4 address family mode.
`(config-router)#address-family ipv4 vrf vrf1`	Enter the IPv4 address family for VRF vrf1.
`(config-router-af)#redistribute connected`	Redistribute connected route.
`(config-router-af)#commit`	Commit the transaction.
`(config-router-af)#exit-address-family`	Exit address family mode.
`(config-router)#exit`	Exit the router mode.

(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

P1

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 31.31.31.31/32 secondary	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe21	Enter interface mode.
(config-if)#ip address 11.1.1.31/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#ip address 12.1.1.31/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Enter router OSPF mode.
(config-router)#ospf router-id 31.31.31.31	Configure OSPF router id same as loopback ip address.
(config-router)#network 31.31.31.31/32 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 11.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#network 12.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit OSPF router mode.
(config)#router ldp	Enter router LDP mode.
(config-router)#router-id 31.31.31.31	Set the router ID to IP address 31.31.31.31
(config-router)#transport-address ipv4 31.31.31.31	Configure LDP transport address same as loopback address.
(config-router)#exit	Exit LDP mode.
(config)#interface xe21	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-if)#commit	Commit the transaction.
(config-if)#exit	Exit interface mode.
(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

PE2-ASBR

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 41.41.41.41/32 secondary`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 41.41.41.41`	Set the router ID to IP address 41.41.41.41
`(config-router)#transport-address ipv4 41.41.41.41`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 2.2.2.2`	Configure targeted peer.
`(config-router-targeted-peer)#targeted-peer ipv4 3.3.3.3`	Configure targeted peer.
`(config-router-targeted-peer)#targeted-peer ipv4 5.5.5.5`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#ip address 12.1.1.41/24`	Assign ipv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Enter router OSPF mode.
`(config-router)#ospf router-id 41.41.41.41`	Configure OSPF router id same as loopback ip address.
`(config-router)#network 41.41.41.41/32 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#network 12.1.1.0/24 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#enable-ldp ipv4`	Enable LDP in interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe21`	Enter interface mode.
`(config-if)#ip address 20.1.1.41/24`	Assign the IPv4 address.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 65000`	Enter BGP router mode.
`(config-router)#bgp router-id 41.41.41.41`	Configure BGP router-id.
`(config-router)#no bgp inbound-route-filter`	Disable inbound route filter.
`(config-router)#neighbor 2.2.2.2 remote-as 65000`	Configure PE1 as an iBGP peer.

(config-router)#neighbor 2.2.2.2 update-source lo	Update the source as loopback for iBGP peering with the remote PE1 router.
(config-router)#neighbor 20.1.1.3 remote-as 65001	Configure eBGP neighbor with ASBR2.
(config-router)#address-family vpnv4	Enter VPNv4 address family mode.
(config-router-af)#neighbor 2.2.2.2 activate	Activate the PE neighbor so that it can accept VPN IPv4 routes.
(config-router-af)#neighbor 2.2.2.2 next-hop-self	Configure this to make the router the next hop for a BGP neighbor.
(config-router-af)#neighbor 20.1.1.3 activate	Activate the ASBR eBGP neighbor.
(config-router-af)#neighbor 20.1.1.3 allow-ebgp-vpn	Configure this to allow exchange of VPN updates between eBGP peers.
(config-router-af)#neighbor 20.1.1.3 activate	Activate the ASBR eBGP neighbor.
(config-router-af)#commit	Commit candidate configuration to the running configuration.

PE3-ASBR

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 3.3.3.3/32 secondary	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter router mode for LDP.
(config-router)#router-id 3.3.3.3	Set the router ID to IP address 3.3.3.3
(config-router)#transport-address ipv4 3.3.3.3	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#targeted-peer ipv4 2.2.2.2	Configure targeted peer.
(config-router-targeted-peer)#targeted-peer ipv4 41.41.41.41	Configure targeted peer.
(config-router-targeted-peer)#targeted-peer ipv4 5.5.5.5	Configure targeted peer.
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#exit	Exit router mode
(config)#interface xe21	Enter interface mode.
(config-if)#ip address 20.1.1.3/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe15	Enter interface mode.
(config-if)#ip address 21.1.1.3/24	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Enter router OSPF mode.
(config-router)#ospf router-id 3.3.3.3	Configure OSPF router id same as loopback ip address.
(config-router)#network 3.3.3.3/32 area 0	Define the network on which OSPF runs and associate area id.

(config-router)#network 21.1.1.0/24 area 0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit OSPF router mode.
(config)#router ldp	Enter router ldp mode.
(config-router)#transport-address ipv4 3.3.3.3	Configure LDP transport address same as loopback address
(config-router)#exit	Exit LDP mode.
(config)#interface xe15	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#enable-ldp ipv4	Enable LDP in interface.
(config-router)#exit	Exit LDP mode.
(config)#interface xe21	Enter interface mode.
(config-if)#label-switching	Enable label switching in interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 65001	Enter BGP router mode.
(config-router)#bgp router-id 3.3.3.3	Configure BGP router-id.
(config-router)#no bgp inbound-route-filter	Disable inbound route filter.
(config-router)#neighbor 5.5.5.5 remote-as 65001	Configure PE4 as an iBGP peer.
(config-router)#neighbor 5.5.5.5 update-source lo	Update the source as loopback for iBGP peering with the remote PE1 router.
(config-router)#neighbor 20.1.1.41 remote-as 65000	Configure eBGP neighbor with PE4.
(config-router)#address-family vpnv4	Enter VPNv4 address family mode.
(config-router-af)#neighbor 5.5.5.5 activate	Activate the PE neighbor so that it can accept VPN IPv4 routes.
(config-router-af)#neighbor 5.5.5.5 next-hop-self	Configure this to make the router the next hop for a BGP neighbor.
(config-router-af)#neighbor 20.1.1.41 activate	Activate the ASBR eBGP neighbor.
(config-router-af)#neighbor 20.1.1.41 allow-ebgp-vpn	Configure this to allow exchange of vpn updates between eBGP peers.
(config-router-af)#neighbor 20.1.1.41 activate	Activate the ASBR eBGP neighbor.
(config-router-af)#commit	Commit candidate configuration to be running configuration.

P2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 40.40.40.40/32 secondary	Assign the IPv4 address.
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter router mode for LDP.
(config-router)#router-id 40.40.40.40	Set the router ID to IP address 40.40.40.40

© 2025 IP Infusion Inc. Proprietary

`(config-router)#transport-address ipv4 40.40.40.40`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 40.40.40.40`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode
`(config)#interface xe21`	Enter interface mode.
`(config-if)#ip address 21.1.1.40/24`	Assign the IPv4 address.
`(config-if)#exit (config-router)#targeted-peer ipv4 40.40.40.40`	Exit interface mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#ip address 22.1.1.40/24`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Enter router OSPF mode.
`(config-router)#ospf router-id 40.40.40.40`	Configure OSPF router id same as loopback ip address.
`(config-router)#network 40.40.40.40/32 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#network 21.1.1.0/24 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#network 22.1.1.0/24 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ldp`	Enter router LDP mode.
`(config-router)#transport-address ipv4 40.40.40.40`	Configure LDP transport address same as loopback address.
`(config-router)#exit`	Exit LDP mode.
`(config)#interface xe21`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#enable-ldp ipv4`	Enable ldp in interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#enable-ldp ipv4`	Enable LDP in interface.
`(config-if)#commit`	Commit the transaction.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit candidate configuration to be running configuration.
`(config)#exit`	Exit the config mode.

PE4

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 5.5.5.5/32 secondary`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 5.5.5.5`	Set the router ID to IP address 5.5.5.5
`(config-router)#transport-address ipv4 5.5.5.5`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 5.5.5.5`	Configure targeted peer.
`(config-router-targeted-peer)# targeted-peer ipv4 2.2.2.2`	Configure targeted peer.
`(config-router-targeted-peer)# targeted-peer ipv4 41.41.41.41`	Configure targeted peer.
`(config-router-targeted-peer)# targeted-peer ipv4 3.3.3.3`	Configure targeted peer.
`(config-router)#exit`	Exit router mode
`(config)#ip vrf vrf1`	Create a new VRF named vrf1.
`(config-vrf)#rd 1:1`	Assign the route distinguisher (RD) value as 1:1.
`(config-vrf)#route-target both 1:1`	Import routes between route target (RT) ext-communities.
`(config-vrf)#exit`	Exit VRF mode.
`(config)#interface xe22`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf1`	Bind the interface connected to the CE router with VRF vrf1.
`(config-if)#ip address 30.1.1.5/24`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#ip address 22.1.1.5/24`	Assign the IPv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Enter router OSPF mode.
`(config-router)#ospf router-id 5.5.5.5`	Configure OSPF router id same as loopback ip address.
`(config-router)#network 5.5.5.5/32 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#network 22.1.1.0/24 area 0`	Define the network on which OSPF runs and associate area id.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#enable-ldp ipv4`	Enable LDP in interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 65001`	Enter BGP router mode.

(config-router)#bgp router-id 5.5.5.5	Configure BGP router-id.
(config-router)#neighbor 3.3.3.3 remote-as 65001	Configure PE2-ASBR1 as an iBGP peer.
(config-router)#neighbor 3.3.3.3 update-source lo	Update the source as loopback for iBGP peering with the remote PE2 router.
(config-router)#address-family vpnv4	Enter VPNv4 address family mode.
(config-router-af)#neighbor 3.3.3.3 activate	Activate the PE neighbor so that it can accept VPN IPv4 routes.
(config-router-af)#exit	Exit VPNv4 address family mode.
(config-router)#address-family ipv4 vrf vrf1	Enter the IPv4 address family for VRF vrf1.
(config-router-af)#redistribute connected	Redistribute connected route.
(config-router-af)#commit	Commit the transaction.
(config-router-af)#exit-address-family	Exit address family mode.
(config-router)#exit	Exit the router mode.
(config)#commit	Commit candidate configuration to be running configuration.
(config)#exit	Exit the config mode.

CHAPTER 14 Inter-AS VPN Option-C Configuration

This is an option which enables BGP VPNv4 routes exchange between the two or more Provider Edge routers residing in different AS'es. There is no VPNv4 route exchange between the ASBRs and hence the ASBRs are completely transparent of the VPNs provisioned on the connecting AS'es. This option is more scalable than the previous two options because it removes the restriction of installing VPNv4 LFIB entries on the ASBRs hence reducing the resource requirements on them. ASBRs are only required to forward data based on the transport LSPs configured.

Pre-requisites to successfully configure this option.

- There should be end to end transport LSP between the two PE's residing in different AS'es.
- Could use BGP Labeled-unicast to exchange labels for the two PE's residing in different AS'es.
- This option can utilize RR's to exchange VPNv4 routes between the two AS'es and hence should have capability to keep the next-hops unchanged when reflecting routes from iBGP to eBGP
- LDP/RSVP/SR can be used as a transport within the AS.

There are multiple ways in which this option can be configured.

- Inter-AS Option-C with VPNv4 Routes exchange between the two RRs in different AS'es
- Inter-AS Option-C with VPNv4 Routes exchange between two PE's in different AS.
- Inter-AS Option-C with VPNv4 Routes exchange between PE of one AS and RR of another AS.

This section explains the configuration for the first two points.

Inter-AS Option-C with RR

This sub-option enables VPNv4 routes exchange between the Route-Reflectors of different AS'es and thus requires

1. Remote PE loopback addresses to be known in the AS - This is accomplished using BGP-LU and is advertised inside the AS using the Route-reflector and outside the AS using the eBGP Peering between the ASBRs.
2. MP-eBGP peering between the two RRs of different AS'es in order to exchange VPNv4 routes.
3. To be able to have an eBGP session between RR's, Remote Route-reflector Loopback addresses are required to be known in the local AS and vice-versa. This is accomplished using the mutual redistribution between OSPF and bgp on the two ASBRs. The redistribution is controlled using the route-maps and only permits the
    1. Local Route-reflectors Loopback address to be redistributed from local OSPF to BGP.
    2. Remote Route-reflectors Loopback address to be redistributed from bgp to local OSPF.
4. Next-hop attribute should not be changed when RR reflects the VPNv4 route from iBGP peering to the remote RR over an eBGP peering. This is accomplished using the configuration "attribute-unchanged next-hop" for the eBGP neighbor.
5. Next-hop attribute should be changed when ASBR advertises the remote PE's Loopback address as LU route to the RR. This is accomplished using the configuration "next-hop self" for the iBGP RR neighbor

(1) and (5) enables an end to end LSP between the two PE's which needs to run the L3VPN service and (2), (3) and (4) enables the RR's to form BGP neighborship with each other and successfully exchange the VPNv4 Routes.

Topology

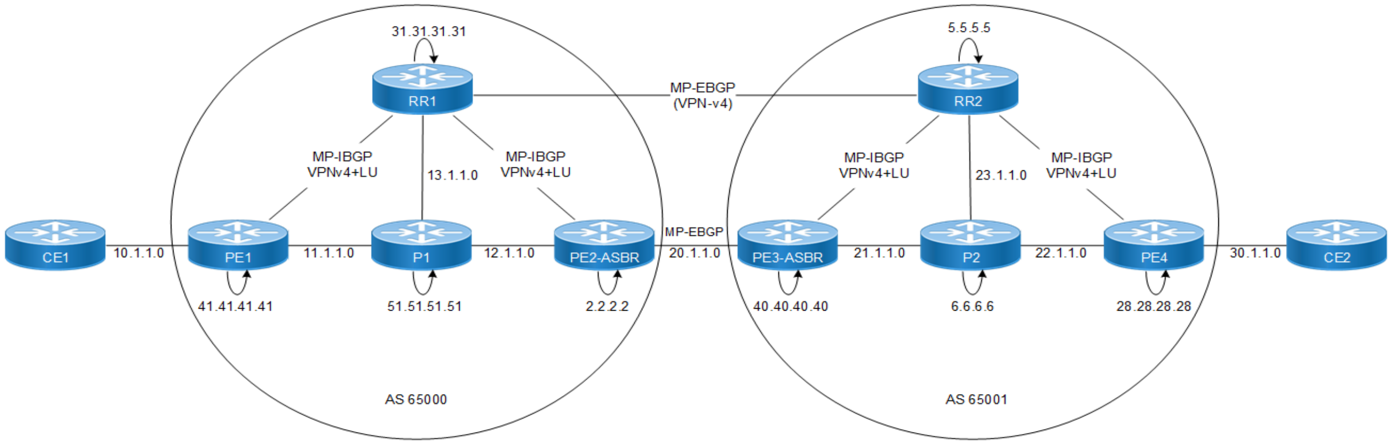

Figure 14-4: InterAS-VPN Option-C with RR

PE1

`PE1(#configure terminal`	Enter configure mode.
`PE1(config-router)#interface lo`	Enter interface mode.
`PE1(config-if)# ip address 41.41.41.41/32 secondary`	Assign the IPv4 address.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config)#ip vrf vrf1`	Create a new VRF named vrf1.
`PE1(config-vrf)# rd 1:1`	Assign the route distinguisher (RD) value as 1:1.
`PE1(config-vrf)# route-target both 1:1`	Configure import and export route-target values
`PE1(config-vrf)#exit`	Exit VRF mode.
`PE1(config-if)#interface xe23`	Enter interface mode.
`PE1(config-if)# ip vrf forwarding vrf1`	Bind the interface connected to the CE router with VRF vrf1.
`PE1(config-if)# ip address 10.1.1.2/24`	Assign the IPv4 address.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config-if)#interface xe15`	Enter interface mode.
`PE1(config-if)# ip address 11.1.1.2/24`	Assign the IPv4 address.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config-if)#router ospf 1`	Enter router OSPF mode.
`PE1(config-router)# ospf router-id 41.41.41.41`	Configure OSPF router id same as loopback ip address.
`PE1(config-router)# network 11.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`PE1(config-router)# network 41.41.41.41/32 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`PE1(config)#router ldp`	Enter router LDP mode.
`PE1(config-router)#router-id 41.41.41.41`	Set the router ID to IP address 41.41.41.41
`PE1(config-router)#transport-address ipv4 41.41.41.41`	Configure LDP transport address same as loopback address.

`PE1(config-router)#exit`	Exit LDP mode.
`PE1(config-if)#interface xe15`	Enter interface mode.
`PE1(config-if)# label-switching`	Enable label switching in interface.
`PE1(config-if)# enable-ldp ipv4`	Enable LDP in interface.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config-router)#router bgp 65000`	Enter BGP router mode.
`PE1(config-router)# bgp router-id 41.41.41.41`	Configure BGP router-id.
`PE1(config-router)# no bgp default ipv4-unicast`	Configure BGP peer to have no ipv4 unicast capability exchange by default.
`PE1(config-router)# neighbor 31.31.31.31 remote-as 65000`	Configure neighbor with remote AS.
`PE1(config-router)# neighbor 31.31.31.31 update-source lo`	Update the loopback as the source of BGP session.
`PE1(config-router)# allocate-label all`	Allocate the label for all advertised networks.
`PE1(config-router)# address-family ipv4 labeled-unicast`	Enter the IPv4 labeled-unicast address family
`PE1(config-router-af)# neighbor 31.31.31.31 activate`	Activate the neighbor under the address-family.
`PE1(config-router-af)# exit-address-family`	Exit IPv4 labeled-unicast Address Family mode.
`PE1(config-router)# address-family vpnv4 unicast`	Enter vpnv4 unicast address-family mode.
`PE1(config-router-af)# neighbor 31.31.31.31 activate`	Activate the neighbor under vpnv4 unicast address-family.
`PE1(config-router-af)# exit-address-family`	Exit vpnv4 unicast address-family.
`PE1(config-router)# address-family ipv4 vrf vrf1`	Enter ipv4 VRF address-family mode.
`PE1(config-router-af)# redistribute connected`	Redistribute connected networks under VRF address-family.
`PE1(config-router-af)# exit-address-family`	Exit ipv4 VRF address-family.
`PE1(config-router)#exit`	Exit the router mode.
`PE1(config)#commit`	Commit candidate configuration to be running configuration.
`PE1(config)#exit`	Exit the config mode.

P1

`P1(config)#interface lo`	Enter interface mode.
`P1(config-if)# ip address 51.51.51.51/32 secondary`	Assign the secondary IPv4 address on loopback interface.
`P1(config-if)#interface xe15`	Enter interface mode.
`P1(config-if)# ip address 11.1.1.31/24`	Assign the IPv4 address.
`P1(config-if)#interface xe21`	Enter interface mode.
`P1(config-if)# ip address 12.1.1.31/24`	Assign the IPv4 address.
`P1(config-if)#interface xe22`	Enter interface mode.
`P1(config-if)# ip address 13.1.1.1/24`	Assign the IPv4 address.

`P1(config-if)#router ospf 1`	Enter router OSPF mode.
`P1(config-router)# ospf router-id 51.51.51.51`	Configure OSPF router-id (optional).
`P1(config-router)# network 11.1.1.0/24 area 0.0.0.0`	Enable networks for OSPF protocol.
`P1(config-router)# network 12.1.1.0/24 area 0.0.0.0`	Enable networks for OSPF protocol.
`P1(config-router)# network 13.1.1.0/24 area 0.0.0.0`	Enable networks for OSPF protocol.
`P1(config-router)# network 51.51.51.51/32 area 0.0.0.0`	Enable networks for OSPF protocol.
`P1(config-router)#router ldp`	Enter router LDP mode. This is required to enable LDP globally on the router.
`P1(config-router)#router-id 51.51.51.51`	Set the router ID to IP address 51.51.51.51
`P1(config-router)#transport-address ipv4 51.51.51.51`	Configure LDP transport address same as loopback address.
`P1(config-router)#interface xe15`	Enter interface configuration mode.
`P1(config-if)# label-switching`	Configure label-switching on the interface.
`P1(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`P1(config-if)#interface xe21`	Enter interface configuration mode.
`P1(config-if)# label-switching`	Configure label-switching on the interface.
`P1(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`P1(config-if)#exit`	Exit interface mode.
`P1(config)#commit`	Commit candidate configuration to the running configuration.
`P1(config)#exit`	Exit the config mode.

RR1

`#configure terminal`	Enter configure mode.
`RR1(config)#interface lo`	Enter interface mode.
`RR1(config-if)# ip address 31.31.31.31/32 secondary`	Assign the IPv4 address.
`RR1(config-if)#interface xe22`	Exit interface mode.
`RR1(config-if)# ip address 13.1.1.2/24`	Assign the IPv4 address.
`RR1(config-if)#router ospf 1`	Enter router OSPF mode.
`RR1(config-router)# ospf router-id 31.31.31.31`	Configure OSPF router-id explicitly (optional).
`RR1(config-router)# network 13.1.1.0/24 area 0.0.0.0`	Enable networks for OSPF protocol under area 0.
`RR1(config-router)# network 31.31.31.31/32 area 0.0.0.0`	Enable networks for OSPF protocol under area 0.
`RR1(config-router)#router bgp 65000`	Enter BGP router mode.
`RR1(config-router)# bgp router-id 31.31.31.31`	Configure BGP router-id.
`RR1(config-router)# no bgp default ipv4-unicast`	Disable default ipv4-unicast capability exchange with BGP neighbors.

`RR1(config-router)# no bgp inbound-route-filter`	Disable inbound route-filtering for bgp VPNV4 routes. This is required for Route-reflectors.
`RR1(config-router)# neighbor 2.2.2.2 remote-as 65000`	Configure PE2-ASBR as iBGP neighbor.
`RR1(config-router)# neighbor 2.2.2.2 update-source lo`	Configure BGP speaker to use loopback address as source for BGP session.
`RR1(config-router)# neighbor 5.5.5.5 remote-as 65001`	Configure RR2 as an eBGP neighbor.
`RR1(config-router)# neighbor 5.5.5.5 ebgp-multihop`	Enable multihop on eBGP session.
`RR1(config-router)# neighbor 5.5.5.5 update-source lo`	Configure BGP speaker to use loopback address as source for this BGP session.
`RR1(config-router)# neighbor 41.41.41.41 remote-as 65000`	Configure PE1 as an iBGP neighbor.
`RR1(config-router)# neighbor 41.41.41.41 update-source lo`	Configure BGP speaker to use loopback address as source for this BGP session.
`RR1(config-router)# allocate-label all`	Configure this peer to allocate label for all advertised networks.
`RR1(config-router)# address-family ipv4 labeled-unicast`	Enter ipv4 labeled-unicast address-family.
`RR1(config-router-af)# neighbor 2.2.2.2 activate`	Activate PE2-ASBR for this AFI/SAFI.
`RR1(config-router-af)# neighbor 2.2.2.2 route-reflector-client`	Configure PE2-ASBR as Route-reflector client.
`RR1(config-router-af)# neighbor 41.41.41.41 activate`	Activate PE1 for this AFI/SAFI.
`RR1(config-router-af)# neighbor 41.41.41.41 route-reflector-client`	Configure PE1 as Route-reflector client.
`RR1(config-router-af)# exit-address-family`	Exit ipv4 labeled-unicast address-family.
`RR1(config-router)# address-family vpnv4 unicast`	Enter vpnv4 unicast address-family.
`RR1(config-router-af)# neighbor 5.5.5.5 allow-ebgp-vpn`	Allow eBGP VPN route exchange for the RR2 eBGP neighbor.
`RR1(config-router-af)# neighbor 5.5.5.5 activate`	Activate the RR2 eBGP neighbor.
`RR1(config-router-af)# neighbor 5.5.5.5 attribute-unchanged next-hop`	Configure next-hop unchanged for this eBGP neighbor for all vpnv4 NLRIs to keep original next-hop while advertising to this eBGP neighbor.
`RR1(config-router-af)# neighbor 41.41.41.41 activate`	Activate PE1 iBGP neighbor.
`RR1(config-router-af)# neighbor 41.41.41.41 route-reflector-client`	Configure PE1 as Route-reflector client for this AFI/SAFI.
`RR1(config-router-af)# exit-address-family`	Exit Address-family mode.
`RR1(config-router)#exit`	Exit the router mode.
`RR1(config)#commit`	Commit candidate configuration to be running configuration.
`RR1(config)#exit`	Exit the config mode.

© 2025 IP Infusion Inc. Proprietary

PE2-ASBR

`PE2-ASBR#configure terminal`	Enter configure mode.
`PE2-ASBR(config)#interface lo`	Enter interface mode.
`PE2-ASBR(config-if)# ip address 2.2.2.2/32 secondary`	Assign a secondary IPv4 address to the loopbacl interface.
`PE2-ASBR(config-if)#interface xe20`	Enter interface mode.
`PE2-ASBR(config-if)# ip address 12.1.1.2/24`	Assign an IPv4 address to the interface.
`PE2-ASBR(config-if)#interface xe5`	Enter interface mode.
`PE2-ASBR(config-if)# ip address 20.1.1.2/24`	Assign an IPv4 address to the interface.
`PE2-ASBR(config-if)#ip access-list standard RR1_LO`	Create an IP standard access list to permit RR1s loopbacl address. This is required to redistribute RR1 Lo from OSPF to BGP.
`PE2-ASBR(config-ip-acl-std)# permit host 31.31.31.31`	Permit RR1 loopback address.
`PE2-ASBR(config-ip-acl-std)#ip access-list standard RR2_LO`	Create an IP standard access list to permit RR2 Lo address. This is required to redistribute RR2 Lo from BGP to OSPF.
`PE2-ASBR(config-ip-acl-std)# permit host 5.5.5.5`	Permit RR2s Loopback address.
`PE2-ASBR(config-ip-acl-std)#route-map RR1_LO permit 10`	Create a Route-map to allow RR1-LO address . This is required when redistributing from OSPF to BGP.
`PE2-ASBR(config-route-map)# match ip address RR1_LO`	match the RR1_LO access list.
`PE2-ASBR(config-route-map)#route-map RR2_LO permit 10`	Create a Route-map to allow RR2-LO address . This is required when redistributing from BGP to OSPF.
`PE2-ASBR(config-route-map)# match ip address RR2_LO`	match the RR2_LO access list.
`PE2-ASBR(config-route-map)#router ospf 1`	Enter router OSPF mode.
`PE2-ASBR(config-router)# ospf router-id 2.2.2.2`	Configure OSPF router-id explicitly (optional).
`PE2-ASBR(config-router)# redistribute bgp route-map RR2_LO`	Redistribute RR2's Lo from BGP to OSPF. This is required for eBGP session between RR1 and RR2.
`PE2-ASBR(config-router)# network 2.2.2.2/32 area 0.0.0.0`	Enable OSPF networks/links in area 0.
`PE2-ASBR(config-router)# network 12.1.1.0/24 area 0.0.0.0`	Enable OSPF networks/links in area 0.
`PE2-ASBR(config-router)#router ldp`	Enter Router ldp mode. This is required to enable ldp globally on the router.
`PE2-ASBR(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2
`PE2-ASBR(config-router)#transport-address ipv4 2.2.2.2`	Configure LDP transport address same as loopback address.
`PE2-ASBR(config-router)#interface xe20`	Enter interface mode.
`PE2-ASBR(config-if)# label-switching`	Configure label-switching to enable MPLS forwarding on this interface.
`PE2-ASBR(config-if)# enable-ldp ipv4`	Enable LDP on this interface.
`PE2-ASBR(config-if)#interface xe5`	Enter interface mode.
`PE2-ASBR(config-if)# label-switching`	Configure label-switching to enable MPLS forwarding on this interface.

© 2025 IP Infusion Inc. Proprietary

`PE2-ASBR(config-if)#router bgp 65000`	Enter router BGP configuration mode.
`PE2-ASBR(config-router)# bgp router-id 2.2.2.2`	Configure BGP router-id.
`PE2-ASBR(config-router)# no bgp default ipv4-unicast`	Configure BGP to disable default exchange of ipv4 unicast AFI/SAFI capability.
`PE2-ASBR (config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`PE2-ASBR(config-router-af)# redistribute ospf route-map RR1_LO`	Redistribute RR1 Lo from OSPF to BGP. This is required for eBGP session between RR1 and RR2.
`PE2-ASBR(config-router-af)#exit`	Exit address-family mode
`PE2-ASBR(config-router)# neighbor 20.1.1.40 remote-as 65001`	Configure PE3-ASBR as eBGP neighbor.
`PE2-ASBR(config-router)# neighbor 20.1.1.40 activate`	Activate PE3-ASBR neighbor for IPv4 unicast AFI/SAFI. This is required to exchange the redistributed RR1 Lo prefix to PE3-ASBR eBGP peer.
`PE2-ASBR(config-router)# neighbor 31.31.31.31 remote-as 65000`	Configure RR1 as an iBGP neighbor.
`PE2-ASBR(config-router)# neighbor 31.31.31.31 update-source lo`	Update the source of the iBGP session to loopbacl address.
`PE2-ASBR(config-router)# allocate-label all`	Configure this command to allocate label for all advertised networks.
`PE2-ASBR(config-router)# address-family ipv4 labeled-unicast`	Enter ipv4 labeled-unicast AFI/SAFI.
`PE2-ASBR(config-router-af)# neighbor 20.1.1.40 activate`	Activate PE3-ASBR neighbor for IPv4 labeled-unicast.
`PE2-ASBR(config-router-af)# neighbor 31.31.31.31 activate`	Activate RR1 neighbor for IPv4 labeled-unicast.
`PE2-ASBR(config-router-af)# neighbor 31.31.31.31 next-hop-self`	Configure next-hop-self for the RR1 neighbor.
`PE2-ASBR(config-router-af)# exit-address-family`	Exit this address-family.
`PE2-ASBR(config-router)#exit`	Exit the router mode.
`PE2-ASBR (config)#commit`	Commit candidate configuration to be running configuration.
`PE2-ASBR(config)#exit`	Exit the config mode.

PE3-ASBR

`#configure terminal`	Enter configure mode.
`PE3-ASBR(config)#interface lo`	Enter interface mode.
`PE3-ASBR(config-if)# ip address 40.40.40.40/32 secondary`	Assign a secondary IPv4 address to the loopbacl interface.
`PE3-ASBR(config-if)#interface xe5`	Enter interface mode.
`PE3-ASBR(config-if)# ip address 20.1.1.40/24`	Assign an IPv4 address to the interface.
`PE3-ASBR(config-if)#interface xe1`	Enter interface mode.
`PE3-ASBR(config-if)# ip address 21.1.1.40/24`	Assign an IPv4 address to the interface.
`PE3-ASBR(config-if)#ip access-list standard RR1_LO`	Create an IP standard access list to permit RR1s loopbacl address. This is required to redistribute RR1 Lo from BGP to OSPF.

PE3-ASBR(config-ip-acl-std)# permit host 31.31.31.31	Permit RR1 loopback address.
PE3-ASBR(config-ip-acl-std)#ip access-list standard RR2_LO	Create an IP standard access list to permit RR2 Lo address. This is required to redistribute RR2 Lo from OSPF to BGP.
PE3-ASBR(config-ip-acl-std)# permit host 5.5.5.5	Permit RR2s Loopback address.
PE3-ASBR(config-ip-acl-std)#route-map RR1_LO permit 10	Create a Route-map to allow RR1-LO address . This is required when redistributing from BGP to OSPF.
PE3-ASBR(config-route-map)# match ip address RR1_LO	match the RR1_LO access list.
PE3-ASBR(config-route-map)#route-map RR2_LO permit 10	Create a Route-map to allow RR2-LO address . This is required when redistributing from OSPF to BGP.
PE3-ASBR(config-route-map)# match ip address RR2_LO	match the RR2_LO access list.
PE3-ASBR(config-route-map)#router ospf 1	Enter router OSPF mode.
PE3-ASBR(config-router)# ospf router-id 40.40.40.40	Configure OSPF router-id explicitly (optional).
PE3-ASBR(config-router)# redistribute bgp route-map RR1_LO	Redistribute RR2's Lo from OSPF to BGP. This is required for eBGP session between RR1 and RR2.
PE3-ASBR(config-router)# network 21.1.1.0/24 area 0.0.0.0	Enable OSPF networks/links in area 0.
PE3-ASBR(config-router)# network 40.40.40.40/32 area 0.0.0.0	Enable OSPF networks/links in area 0.
PE3-ASBR(config-router)#router ldp	Enter Router LDP mode. This is required to enable LDP globally on the router.
PE3-ASBR(config-router)#router-id 40.40.40.40	Set the router ID to IP address 40.40.40.40
PE3-ASBR(config-router)#transport-address ipv4 40.40.40.40	Configure LDP transport address same as loopback address
PE3-ASBR(config-router)#interface xe5	Enter interface mode.
PE3-ASBR(config-if)# label-switching	Configure label-switching to enable MPLS forwarding on this interface.
PE3-ASBR(config-if)#interface xe1	Enter interface mode.
PE3-ASBR(config-if)# label-switching	Configure label-switching to enable MPLS forwarding on this interface.
PE3-ASBR(config-if)# enable-ldp ipv4	Enable LDP on this interface.
PE3-ASBR(config-if)#router bgp 65001	Enter router BGP configuration mode.
PE3-ASBR(config-router)# bgp router-id 40.40.40.40	Configure BGP router-id.
PE3-ASBR(config-router)# no bgp default ipv4-unicast	Configure BGP to disable default exchange of ipv4 unicast AFI/SAFI capability.
PE3-ASBR(config-router)# redistribute ospf route-map RR2_LO	Redistribute RR2 Lo from OSPF to BGP. This is required for eBGP session between RR1 and RR2.
PE3-ASBR(config-router)# neighbor 5.5.5.5 remote-as 65001	Configure RR2 as eBGP neighbor.
PE3-ASBR(config-router)# neighbor 5.5.5.5 update-source lo	Update the source of the iBGP session to loopback address.
PE3-ASBR(config-router)# neighbor 20.1.1.2 remote-as 65000	Configure PE2-ASBR as an eBGP neighbor.

`PE3-ASBR(config-router)# neighbor 20.1.1.2 activate`	Activate PE2-ASBR neighbor for IPv4 unicast AFI/SAFI. This is required to exchange the redistributed RR1 Lo prefix to PE2-ASBR eBGP peer.
`PE3-ASBR(config-router)# allocate-label all`	Configure this command to allocate label for all advertised networks.
`PE3-ASBR(config-router)# address-family ipv4 labeled-unicast`	Enter ipv4 labeled-unicast AFI/SAFI.
`PE3-ASBR(config-router-af)# neighbor 5.5.5.5 activate`	Activate RR1 neighbor for IPv4 labeled-unicast.
`PE3-ASBR(config-router-af)# neighbor 5.5.5.5 next-hop-self`	Configure next-hop-self for the RR2 neighbor.
`PE3-ASBR(config-router-af)# neighbor 20.1.1.2 activate`	Activate PE2-ASBR neighbor for IPv4 labeled-unicast.
`PE3-ASBR(config-router-af)# ex-it-address-family`	Exit this address-family.
`PE3-ASBR(config-router)#exit`	Exit the router mode.
`PE3-ASBR(config)#commit`	Commit candidate configuration to be running configuration.
`PE3-ASBR(config)#exit`	Exit the config mode.

RR2

`#configure terminal`	Enter configure mode.
`RR2(config)#interface lo`	Enter interface mode.
`RR2(config-if)# ip address 5.5.5.5/32 secondary`	Assign the IPv4 address.
`RR2(config-if)#interface xe22`	Enter interface mode.
`RR2(config-if)# ip address 23.1.1.2/24`	Assign the IPv4 address.
`RR2(config-if)#router ospf 1`	Enter router OSPF mode.
`RR2(config-router)# ospf router-id 5.5.5.5`	Configure OSPF router-id explicitly (optional).
`RR2(config-router)# network 5.5.5.5/32 area 0.0.0.0`	Enable networks for OSPF protocol under area 0.
`RR2(config-router)# network 23.1.1.0/24 area 0.0.0.0`	Enable networks for OSPF protocol under area 0.
`RR2(config-router)#router bgp 65001`	Enter BGP router mode.
`RR2(config-router)# bgp router-id 5.5.5.5`	Configure BGP router-id.
`RR2(config-router)# no bgp default ipv4-unicast`	Disable default ipv4-unicast capability exchange with BGP neighbors.
`RR2(config-router)# no bgp inbound-route-filter`	Disable inbound route-filtering for bgp VPNV4 routes. This is required for Route-reflectors.
`RR2(config-router)# neighbor 28.28.28.28 remote-as 65001`	Configure PE2-ASBR as iBGP neighbor.
`RR2(config-router)# neighbor 28.28.28.28 update-source lo`	Configure BGP speaker to use loopback address as source for BGP session.
`RR2(config-router)# neighbor 31.31.31.31 remote-as 65000`	Configure RR2 as an eBGP neighbor.
`RR2(config-router)# neighbor 31.31.31.31 ebgp-multihop`	Enable multihop on eBGP session.

`RR2(config-router)# neighbor 31.31.31.31 update-source lo`	Configure BGP speaker to use loopback address as source for this BGP session.
`RR2(config-router)# neighbor 40.40.40.40 remote-as 65001`	Configure PE1 as an iBGP neighbor.
`RR2(config-router)# neighbor 40.40.40.40 update-source lo`	Configure BGP speaker to use loopback address as source for this BGP session.
`RR2(config-router)# allocate-label all`	Configure this peer to allocate label for all advertised networks.
`RR2(config-router)# address-family ipv4 labeled-unicast`	Enter ipv4 labeled-unicast address-family.
`RR2(config-router-af)# neighbor 28.28.28.28 activate`	Activate PE2-ASBR for this AFI/SAFI.
`RR2(config-router-af)# neighbor 28.28.28.28 route-reflector-client`	Configure PE2-ASBR as Route-reflector client.
`RR2(config-router-af)# neighbor 40.40.40.40 activate`	Activate PE1 for this AFI/SAFI.
`RR2(config-router-af)# neighbor 40.40.40.40 route-reflector-client`	Configure PE1 as Route-reflector client.
`RR2(config-router-af)# exit-address-family`	Exit ipv4 labeled-unicast address-family.
`RR2(config-router)# address-family vpnv4 unicast`	Enter vpnv4 unicast address-family.
`RR2(config-router-af)# neighbor 28.28.28.28 activate`	Allow eBGP vpn route exchange for the RR2 eBGP neighbor.
`RR2(config-router-af)# neighbor 28.28.28.28 route-reflector-client`	Activate the RR2 eBGP neighbor.
`RR2(config-router-af)# neighbor 31.31.31.31 allow-ebgp-vpn`	Configure next-hop unchanged for this eBGP neighbor for all vpnv4 NLRIs to keep original next-hop while advertising to this eBGP neighbor.
`RR2(config-router-af)# neighbor 31.31.31.31 activate`	Activate PE1 iBGP neighbor.
`RR2(config-router-af)# neighbor 31.31.31.31 attribute-unchanged next-hop`	Configure PE1 as Route-reflector client for this AFI/SAFI.
`RR2(config-router-af)# exit-address-family`	Exit Address-family mode.
`RR2(config-router)#exit`	Exit the router mode.
`RR2(config)#commit`	Commit candidate configuration to be running configuration.
`RR2(config)#exit`	Exit the config mode.

P2

`P2(config)#interface lo`	Enter interface mode.
`P2(config-if)# ip address 6.6.6.6/32 secondary`	Assign the secondary IPv4 address on loopback interface.
`P2(config-if)#interface xe22`	Enter interface mode.
`P2(config-if)# ip address 23.1.1.1/24`	Assign the IPv4 address.
`P2(config-if)#interface xe0`	Enter interface mode.
`P2(config-if)# ip address 21.1.1.5/24`	Assign the IPv4 address.
`P2(config-if)#interface xe11`	Enter interface mode.

`P2(config-if)# ip address 22.1.1.5/24`	Assign the IPv4 address.
`P2(config-if)#router ospf 1`	Enter router OSPF mode.
`P2(config-router)# ospf router-id 6.6.6.6`	Configure OSPF router-id (optional).
`P2(config-router)# network 6.6.6.6/32 area 0.0.0.0`	Enable networks for OSPF protocol.
`P2(config-router)# network 21.1.1.0/24 area 0.0.0.0`	Enable networks for OSPF protocol.
`P2(config-router)# network 22.1.1.0/24 area 0.0.0.0`	Enable networks for OSPF protocol.
`P2(config-router)# network 23.1.1.0/24 area 0.0.0.0`	Enable networks for OSPF protocol.
`P2(config-router)#router ldp`	Enter router ldp mode. This is required to enable LDP globally on the router.
`P2(config-router)#router-id 6.6.6.6`	Set the router ID to IP address 6.6.6.6
`P2(config-router)#transport-address ipv4 6.6.6.6`	Configure LDP transport address same as loopback address.
`P2(config-router)#interface xe0`	Enter interface configuration mode.
`P2(config-if)# label-switching`	Configure label-switching on the interface.
`P2(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`P2(config-if)#interface xe11`	Enter interface configuration mode.
`P2(config-if)# label-switching`	Configure label-switching on the interface.
`P2(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`P2(config-if)#exit`	Exit interface mode.
`P2(config)#commit`	Commit candidate configuration to be running configuration.
`P2(config)#exit`	Exit the config mode.

PE4

`#configure terminal`	Enter configure mode.
`PE4(config)#interface lo`	Enter interface mode.
`PE4(config-if)# ip address 28.28.28.28/32 secondary`	Assign the secondary IPv4 address on the loopback interface.
`PE4(config-if)#ip vrf vrf1`	Create a new VRF named vrf1.
`PE4(config-vrf)# rd 1:1`	Assign the route distinguisher (RD) value as 1:1.
`PE4(config-vrf)# route-target both 1:1`	Configure import and export route-target values.
`PE4(config-vrf)#interface xe21`	Enter interface mode.
`PE4(config-if)# ip vrf forwarding vrf1`	Bind the interface connected to the CE router with VRF vrf1.
`PE4(config-if)# ip address 30.1.1.1/24`	Assign the IPv4 address.
`PE4(config-if)#interface xe11`	Enter interface mode.
`PE4(config-if)# ip address 22.1.1.28/24`	Assign the IPv4 address.
`PE4(config-if)#router ospf 1`	Enter router OSPF mode.
`PE4(config-router)# ospf router-id 28.28.28.28`	Configure OSPF router id same as loopback ip address.
`PE4(config-router)# network 22.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.

`PE4(config-router)# network 28.28.28.28/32 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`PE4(config-router)#router ldp`	Enter router LDP mode.
`PE4(config-router)#router-id 28.28.28.28`	Set the router ID to IP address 28.28.28.28
`PE4(config-router)#transport-address ipv4 28.28.28.28`	Configure LDP transport address same as loopback address.
`PE4(config-router)#interface xe11`	Enter interface mode.
`PE4(config-if)# label-switching`	Enable label switching in interface.
`PE4(config-if)# enable-ldp ipv4`	Enable LDP in interface.
`PE4(config-if)#router bgp 65001`	Enter BGP router mode.
`PE4(config-router)# bgp router-id 28.28.28.28`	Configure BGP router-id.
`PE4(config-router)# no bgp default ipv4-unicast`	Configure BGP peer to have no ipv4 unicast capability exchange by default.
`PE4(config-router)# address-family ipv4 unicast`	Enter the IPv4 unicast address family.
`PE4(config-router-af)# network 28.28.28.28/32`	advertise the network of this BGP speaker.
`PE4(config-router-af)# exit-address-family`	Exit address family mode.
`PE4(config-router)# neighbor 5.5.5.5 remote-as 65001`	configure neighbor with remote AS.
`PE4(config-router)# neighbor 5.5.5.5 update-source lo`	Update the loopback as the source of BGP session.
`PE4(config-router)# allocate-label all`	Allocate the label for all advertised networks.
`PE4(config-router)# address-family ipv4 labeled-unicast`	Enter the IPv4 labeled-unicast address family.
`PE4(config-router-af)# neighbor 5.5.5.5 activate`	Activate the neighbor under the address-family.
`PE4(config-router-af)# exit-address-family`	Exit IPv4 labeled-unicast Address Family mode.
`PE4(config-router)# address-family vpnv4 unicast`	Enter vpnv4 unicast address-family mode.
`PE4(config-router-af)# neighbor 5.5.5.5 activate`	Activate the neighbor under vpnv4 unicast address-family.
`PE4(config-router-af)# exit-address-family`	Exit vpnv4 unicast address-family.
`PE4(config-router)# address-family ipv4 vrf vrf1`	Enter ipv4 VRF address-family mode.
`PE4(config-router-af)# redistribute connected`	Redistribute connected networks under VRF address-family.
`PE4(config-router-af)# exit-address-family`	Exit ipv4 VRF address-family.
`PE4(config-router)#exit`	Exit the router mode.
`PE4(config)#commit`	Commit candidate configuration to be running configuration.
`PE4(config)#exit`	Exit the config mode.

Validation

Inter-AS VPN Option-C Configuration (Without RR)

This sub-option enables VPNv4 routes exchange between the Provider Edge Routers of different AS'es and thus requires

1. Remote PE loopback addresses to be known in the AS - This is accomplished using BGP-LU and is advertised inside the AS using the Route-reflector and outside the AS using the eBGP Peering between the ASBRs.

2. Next-hop attribute should be changed when ASBR advertises the remote PE's Loopback address as LU route to the RR. This is accomplished using the configuration "next-hop self" for the iBGP RR neighbor.

3. MP-eBGP session between the two PE's in different AS's to exchange the VPNv4 routes.

(1) and (2) enables an end to end LSP between the two PE's which needs to run the L3VPN service and (3) enables the PE's in different AS'es to form BGP neighborship with each other and successfully exchange the VPNv4 Routes.

Topology

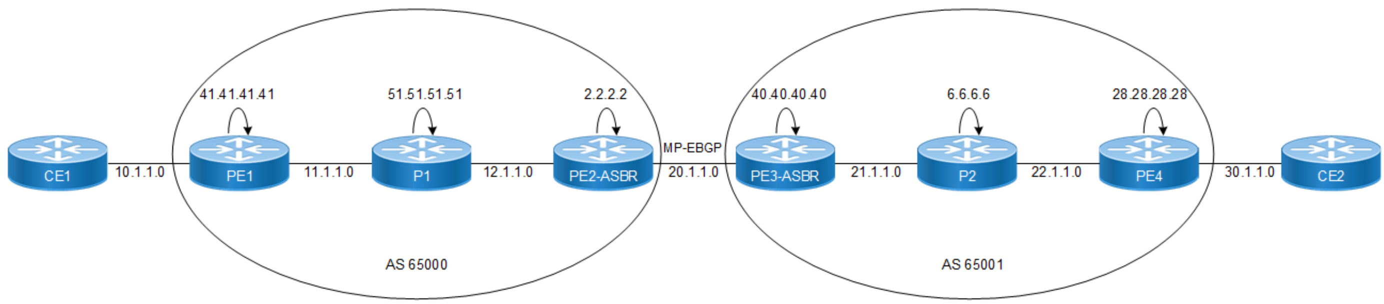

Figure 14-5: InterAS-VPN Option-C without RR

PE1

`#configure terminal`	Enter configure mode.
`PE1(config)#interface lo`	Enter interface mode.
`PE1(config-if)#ip address 41.41.41.41/32 secondary`	Assign the IPv4 address.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config)#ip vrf vrf1`	Create a new VRF named vrf1.
`PE1(config-vrf)#rd 1:1`	Assign the route distinguisher (RD) value as 1:1.
`PE1(config-vrf)#route-target both 1:1`	Configure import and export RT for this VRF.
`PE1(config-vrf)#exit`	Exit interface mode.
`PE1(config)#interface xe23`	Enter interface mode.
`PE1(config-if)#ip vrf forwarding vrf1`	Bind the interface connected to the CE router with VRF vrf1.
`PE1(config-if)#ip address 10.1.1.1/24`	Assign the IPv4 address.
`PE1(config)#interface xe15`	Enter interface mode.
`PE1(config-if)#ip address 11.1.1.41/24`	Assign the IPv4 address.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config)#router ospf 1`	Enter router OSPF mode.
`PE1(config-router)#ospf router-id 41.41.41.41`	Configure OSPF router id same as loopback ip address.
`PE1(config-router)#network 11.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`PE1(config-router)#network 41.41.41.41/32 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`PE1(config-router)#exit`	Exit OSPF router mode.
`PE1(config-router)#router ldp`	Enter router LDP mode.

`PE1(config-router)#router-id 41.41.41.41`	Set the router ID to IP address 41.41.41.41
`PE1(config-router)#transport-address ipv4 41.41.41.41`	Configure LDP transport address same as loopback address
`PE1(config-router)#exit`	Exit LDP mode.
`(config)#interface xe15`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching in interface.
`(config-if)#enable-ldp ipv4`	Enable LDP in interface.
`(config-if)#exit`	Exit interface mode.
`PE1(config-if)#router bgp 65000`	Enter BGP router mode.
`PE1(config-router)# bgp router-id 41.41.41.41`	Configure BGP router-id.
`PE1(config-router)# no bgp default ipv4-unicast`	Configure BGP peer to have no ipv4 unicast capability exchange by default.
`PE1(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast.
`PE1(config-router-af)# network 41.41.41.41/32`	Advertise loopback address.
`PE1(config-router-af)# exit-address-family`	Exit address-family ipv4 labeled-unicast.
`PE1(config-router)# neighbor 2.2.2.2 remote-as 65000`	Configure PE2-ASBR1 as an iBGP peer.
`PE1(config-router)# neighbor 2.2.2.2 update-source lo`	Update the source as loopback for iBGP peering with the remote PE2 router.
`PE1(config-router)# neighbor 28.28.28.28 remote-as 65001`	Configure PE4 as an eBGP peer.
`PE1(config-router)# neighbor 28.28.28.28 ebgp-multihop`	Configure eBGP multichip for eBGP peer PE4.
`PE1(config-router)# neighbor 28.28.28.28 update-source lo`	Update the source as loopback for eBGP peering with the remote PE4 router.
`PE1(config-router)# allocate-label all`	Configure allocate-label.
`PE1(config-router)# address-family ipv4 labeled-unicast`	Enter address-family ipv4 labeled-unicast.
`PE1(config-router-af)# neighbor 2.2.2.2 activate`	Activate iBGP neighbor.
`PE1(config-router-af)# exit-address-family`	Exit address-family ipv4 labeled-unicast.
`PE1(config-router)# address-family vpnv4 unicast`	Enter address-family vpnv4.
`PE1(config-router-af)# neighbor 28.28.28.28 allow-ebgp-vpn`	Configure allow-ebgp-vpn for ebgp neighbor PE4.
`PE1(config-router-af)# neighbor 28.28.28.28 activate`	Activate eBGP neighbor PE4.
`PE1(config-router-af)# exit-address-family`	Exit address-family vpnv4.
`PE1(config-router)# address-family ipv4 vrf vrf1`	Enter the IPv4 address family for VRF vrf1.
`PE1(config-router-af)# redistribute connected`	Redistribute connected route.
`PE1(config-router-af)# exit-address-family`	Exit IPv4 VRF Address Family mode.
`PE1(config-router)#exit`	Exit the router mode.

`PE1(config)#commit`	Commit candidate configuration to be running configuration.
`PE1(config)#exit`	Exit the config mode.

P1

`P1#configure terminal`	Enter configure mode.
`P1(config)#interface lo`	Enter interface mode.
`P1(config-if)# ip address 51.51.51.51/32 secondary`	Assign the IPv4 address.
`P1(config-if)#exit`	Exit interface mode.
`P1(config)#interface xe15`	Enter interface mode.
`P1(config-if)#ip address 11.1.1.31/24`	Assign the IPv4 address.
`P1(config-if)#exit`	Exit interface mode.
`P1(config)#interface xe21`	Enter interface mode.
`P1(config-if)#ip address 12.1.1.31/24`	Assign the IPv4 address.
`P1(config-if)#exit`	Exit interface mode.
`P1(config)#router ospf 1`	Enter router OSPF mode.
`P1(config-router)#ospf router-id 51.51.51.51`	Configure OSPF router id same as loopback ip address.
`P1(config-router)#network 11.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`P1(config-router)#network 12.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`P1(config-router)#network 51.51.51.51/32 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`P1(config-router)#exit`	Exit router OSPF mode.
`P1(config-router)#router ldp`	Enter router LDP mode.
`P1(config-router)#router-id 51.51.51.51`	Set the router ID to IP address 51.51.51.51
`P1(config-router)#transport-address ipv4 51.51.51.51`	Configure LDP transport address same as loopback address
`P1(config-router)#exit`	Exit LDP mode.
`P1(config)#interface xe15`	Enter interface mode.
`P1(config-if)#label-switching`	Enable label switching in interface.
`P1(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`P1(config-if)#exit`	Exit interface mode.
`P1(config)#interface xe21`	Enter interface mode.
`P1(config-if)#label-switching`	Enable label switching in interface.
`P1(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`P1(config-if)#exit`	Exit interface mode.
`P1(config)#commit`	Commit candidate configuration to be running configuration.
`P1(config)#exit`	Exit the config mode.

PE2-ASBR1

`#configure terminal`	Enter configure mode.
`PE2-ASBR(config)#interface lo`	Enter interface mode.
`PE2-ASBR(config-if)#ip address 2.2.2.2/32 secondary`	Assign the IPv4 address.
`PE2-ASBR(config-if)#exit`	Exit interface mode.
`PE2-ASBR(config)#router ospf 1`	Enter router OSPF mode.
`PE2-ASBR(config-router)#ospf router-id 2.2.2.2`	Configure OSPF router id same as loopback ip address.
`PE2-ASBR(config-router)#network 2.2.2.2/32 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`PE2-ASBR(config-router)#network 12.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`PE2-ASBR(config-router)#exit`	Exit router OSPF mode.
`PE2-ASBR(config-router)#router ldp`	Enter router LDP mode.
`PE2-ASBR(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2
`PE2-ASBR(config-router)#transport-address ipv4 2.2.2.2`	Configure LDP transport address same as loopback address.
`PE2-ASBR(config-router)#exit`	Exit LPD mode.
`PE2-ASBR(config)#interface xe5`	Enter interface mode.
`PE2-ASBR(config-if)#ip address 20.1.1.2/24`	Assign the IPv4 address.
`PE2-ASBR(config-if)#label-switching`	Enable label switching in interface.
`PE2-ASBR(config-if)#exit`	Exit interface mode.
`PE2-ASBR(config)#interface xe20`	Enter interface mode.
`PE2-ASBR(config-if)#ip address 12.1.1.2/24`	Assign the IPv4 address.
`PE2-ASBR(config-if)#label-switching`	Enable label switching in interface.
`PE2-ASBR(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`PE2-ASBR(config-if)#exit`	Exit interface mode
`PE2-ASBR(config-if)#router bgp 65000`	Enter BGP router mode.
`PE2-ASBR(config-router)# bgp router-id 2.2.2.2`	Configure BGP router-id.
`PE2-ASBR(config-router)# no bgp default ipv4-unicast`	Configure BGP to have no default ipv4 unicast capability exchange between neighbors.
`PE2-ASBR(config-router)# neighbor 20.1.1.40 remote-as 65001`	Configure PE3-ASBR2 as an eBGP peer.
`PE2-ASBR(config-router)# neighbor 41.41.41.41 remote-as 65000`	Configure PE1 as an iBGP peer.
`PE2-ASBR(config-router)# neighbor 41.41.41.41 update-source lo`	Update the source as loopback for iBGP peering with the remote PE1 router.
`PE2-ASBR(config-router)# allocate-label all`	Configure allocate-label.
`PE2-ASBR(config-router)# address-family ipv4 labeled-unicast`	Enter address-family ipv4 labeled-unicast.
`PE2-ASBR(config-router-af)# neighbor 20.1.1.40 activate`	Activate eBGP neighbor PE3-ASBR2.

PE2-ASBR(config-router-af)# neighbor 41.41.41.41 activate	Activate iBGP neighbor PE1.
PE2-ASBR(config-router-af)# neighbor 41.41.41.41 next-hop-self	Configure next-hop-self for iBGP neighbor PE1.
PE2-ASBR(config-router-af)# exit-address-family	Exit address-family ipv4 labeled-unicast.
PE2(config-router)#exit	Exit the router mode.
PE2(config)#commit	Commit candidate configuration to be running configuration.
PE2(config)#exit	Exit the config mode.

PE3-ASBR

PE3-ASBR#configure terminal	Enter configure mode.
PE3-ASBR(config)#interface lo	Enter interface mode.
PE3-ASBR(config-if)#ip address 40.40.40.40/32 secondary	Assign the IPv4 address.
PE3-ASBR(config-if)#exit	Exit interface mode.
PE3-ASBR(config)#interface xe5	Enter interface mode.
PE3-ASBR(config-if)#ip address 20.1.1.40/24	Assign the IPv4 address.
PE3-ASBR(config-if)#exit	Exit interface mode.
PE3-ASBR(config)#interface xe1	Enter interface mode.
PE3-ASBR(config-if)#ip address 21.1.1.40/24	Assign the IPv4 address.
PE3-ASBR(config-if)#exit	Exit interface mode.
PE3-ASBR(config)#router ospf 1	Enter router OSPF mode.
PE3-ASBR(config-router)#ospf router-id 40.40.40.40	Configure OSPF router id same as loopback ip address.
PE3-ASBR(config-router)#network 21.1.1.0/24 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
PE3-ASBR(config-router)#network 40.40.40.40/32 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
PE3-ASBR(config-router)#exit	Exit router OSPF mode.
PE3-ASBR(config-router)#router ldp	Enter router LDP mode.
PE3-ASBR(config-router)#router-id 40.40.40.40	Set the router ID to IP address 40.40.40.40
PE3-ASBR(config-router)#transport-address ipv4 40.40.40.40	Configure LDP transport address same as loopback address
PE3-ASBR(config)#interface xe1	Enter interface mode.
PE3-ASBR(config-if)#label-switching	Enable label switching in interface.
PE3-ASBR(config-if)#enable-ldp ipv4	Enable LDP on the interface.
PE3-ASBR(config)#interface xe5	Enter interface mode.
PE3-ASBR(config-if)#label-switching	Enable label switching in interface.
PE3-ASBR(config-if)#router bgp 65001	Enter BGP router mode.
PE3-ASBR(config-router)# bgp router-id 40.40.40.40	Configure BGP router-id.

`PE3-ASBR(config-router)# no bgp default ipv4-unicast`	Configure BGP to have no default ipv4 unicast capability exchange with the neighbors.
`PE3-ASBR(config-router)# neighbor 20.1.1.2 remote-as 65000`	Configure PE2-ASBR as an eBGP peer.
`PE3-ASBR(config-router)# neighbor 28.28.28.28 remote-as 65001`	Configure PE4 as an iBGP peer.
`PE3-ASBR(config-router)# neighbor 28.28.28.28 update-source lo`	Update the source as loopback for iBGP peering with the remote PE4 router.
`PE3-ASBR(config-router)# allocate-label all`	Configure allocate-label.
`PE3-ASBR(config-router)# address-family ipv4 labeled-unicast`	Enter address-family ipv4 labeled-unicast.
`PE3-ASBR(config-router-af)# neighbor 20.1.1.2 activate`	Activate eBGP neighbor PE2-ASBR1.
`PE3-ASBR(config-router-af)# neighbor 28.28.28.28 activate`	Activate iBGP neighbor PE4.
`PE3-ASBR(config-router-af)# neighbor 28.28.28.28 next-hop-self`	Configure next-hop-self for iBGP neighbor PE4.
`PE3-ASBR(config-router-af)# exit-address-family`	Exit address-family ipv4 labeled-unicast.
`PE3-ASBR(config-router)#exit`	Exit the router mode.
`PE3-ASBR(config)#commit`	Commit candidate configuration to be running configuration.
`PE3-ASBR(config)#exit`	Exit the config mode.

P2

`#configure terminal`	Enter configure mode.
`P2(config)#interface lo`	Enter interface mode.
`P2(config-if)# ip address 6.6.6.6/32 secondary`	Assign the IPv4 address.
`P2(config-if)#exit`	Exit interface mode.
`P2(config)#interface xe0`	Enter interface mode.
`P2(config-if)#ip address 21.1.1.5/24`	Assign the IPv4 address.
`P2(config-if)#exit`	Exit interface mode.
`P2(config)#interface xe11`	Enter interface mode.
`P2(config-if)#ip address 22.1.1.5/24`	Assign the IPv4 address.
`P2(config-if)#exit`	Exit interface mode.
`P2(config)#router ospf 1`	Enter router OSPF mode.
`P2(config-router)#ospf router-id 6.6.6.6`	Configure OSPF router id same as loopback ip address.
`P2(config-router)# network 6.6.6.6/32 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`P2(config-router)#network 21.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`P2(config-router)#network 22.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`P2(config-router)#exit`	Exit router OSPF mode.
`P2(config)#router ldp`	Enter router LDP mode.

P2(config-router)#router-id 6.6.6.6	Set the router ID to IP address 6.6.6.6
P2(config-router)#transport-address ipv4 6.6.6.6	Configure LDP transport address same as loopback address
P2(config-router)#exit	Exit LDP mode.
P2(config)#interface xe0	Enter interface mode.
P2(config-if)#label-switching	Enable label switching in interface.
P2(config-if)# enable-ldp ipv4	Enable LDP on the interface.
P2(config-if)#exit	Exit interface mode.
P2(config)#interface xe11	Enter interface mode.
P2(config-if)#label-switching	Enable label switching in interface.
P2(config-if)# enable-ldp ipv4	Enable LDP on the interface.
P2(config-if)#exit	Exit interface mode.
P2(config)#commit	Commit candidate configuration to be running configuration.
P2(config)#exit	Exit the config mode.

PE4

#configure terminal	Enter configure mode.
PE4(config)#interface lo	Enter interface mode.
PE4(config-if)#ip address 28.28.28.28/32 secondary	Assign the IPv4 address.
PE4(config-if)#exit	Exit interface mode.
PE4(config)#ip vrf vrf1	Create a new VRF named vrf1.
PE4(config-vrf)#rd 1:1	Assign the route distinguisher (RD) value as 1:1.
PE4(config-vrf)#route-target both 1:1	Configure import and export RTs for the VRF.
PE4(config-vrf)#exit	Exit VRF mode.
PE4(config)#interface xe23	Enter interface mode.
PE4(config-if)#ip vrf forwarding vrf1	Bind the interface connected to the CE router with VRF vrf1.
PE4(config-if)#ip address 30.1.1.1/24	Assign the IPv4 address.
PE4(config-if)#exit	Exit interface mode.
PE4(config)#interface xe11	Enter interface mode.
PE4(config-if)#ip address 22.1.1.28/24	Assign the IPv4 address.
PE4(config-if)#exit	Exit interface mode.
PE4(config)#router ospf 1	Enter router OSPF mode.
PE4(config-router)#ospf router-id 28.28.28.28	Configure OSPF router id same as loopback ip address.
PE4(config-router)#network 22.1.1.0/24 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
PE4(config-router)#network 28.28.28.28/32 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
PE4(config-router)#exit	Exit OSPF router mode.
PE4(config)# router ldp	Enter router LDP mode.
PE4(config-router)#router-id 28.28.28.28	Set the router ID to IP address 28.28.28.28

PE4(config-router)#transport-address ipv4 28.28.28.28	Configure LDP transport address same as loopback address
PE4(config-router)#exit	Exit LDP mode.
PE4(config)#interface xe11	Enter interface mode.
PE4(config-if)#label-switching	Enable label switching in interface.
PE4(config-if)# enable-ldp ipv4	Enable LDP on the interface.
PE4(config-if)#exit	Exit interface mode.
PE4(config-if)#router bgp 65001	Enter BGP router mode.
PE4(config-router)# bgp router-id 28.28.28.28	Configure BGP router-id.
PE4(config-router)# no bgp default ipv4-unicast	Configure BGP speaker to have no default ipv4 unicast capability exchange between neighbors.
PE4(config-router)#address-family ipv4 unicast	Enter the IPv4 unicast address family.
PE4(config-router-af)#network 28.28.28.28/32	Advertise loopback address.
PE4(config-router-af)#exit-address-family	Exit address family mode
PE4(config-router)# neighbor 40.40.40.40 remote-as 65001	Configure PE3-ASBR2 as an iBGP peer.
PE4(config-router)# neighbor 40.40.40.40 update-source lo	Update the source as loopback for iBGP peering with the remote PE3-ASBR router.
PE4(config-router)# neighbor 41.41.41.41 remote-as 65000	Configure PE1 as an eBGP peer.
PE4(config-router)# neighbor 41.41.41.41 ebgp-multihop	Configure eBGP multichip for eBGP peer PE1.
PE4(config-router)# neighbor 41.41.41.41 update-source lo	Update the source as loopback for eBGP peering with the remote PE1 router.
PE4(config-router)# allocate-label all	Configure allocate-label.
PE4(config-router)# address-family ipv4 labeled-unicast	Enter address-family ipv4 labeled-unicast.
PE4(config-router-af)# neighbor 40.40.40.40 activate	Activate iBGP neighbor.
PE4(config-router-af)# exit-address-family	Exit address-family ipv4 labeled-unicast.
PE4(config-router)# address-family vpnv4 unicast	Enter address-family vpnv4.
PE4(config-router-af)# neighbor 41.41.41.41 allow-ebgp-vpn	Activate eBGP neighbor PE1.
PE4(config-router-af)# neighbor 41.41.41.41 activate	Configure allow-ebgp-vpn for ebgp neighbor PE1.
PE4(config-router-af)# exit-address-family	Exit address-family vpnv4.
PE4(config-router)# address-family ipv4 vrf vrf1	Enter the IPv4 address family for VRF vrf1.
PE4(config-router-af)# redistribute connected	Redistribute connected route.
PE4(config-router-af)# exit-address-family	Exit IPv4 VRF Address Family mode.
PE4(config-router)#exit	Exit the router mode.

PE4(config)#commit	Commit candidate configuration to be running configuration.
PE4(config)#exit	Exit the config mode.

CHAPTER 15 MPLS Service Mapping Configuration

This chapter includes step-by-step configurations for tunnel policy configuration for all the MPLS services.

Overview

This feature enables MPLS services L2VPN, L3VPN, EVPN traffic steering with SR-policy as the underlying transport using local-tunnel-policy configuration. This is achieved with the help of color coding and association between service and MPLS transport.

A local-tunnel-policy is created which specifies the color of the transport-tunnel in order to be selected for a VPN service. The created tunnel-policy is now applied for the VPN service so that it will select the preferred tunnel. The destination address of the preferred tunnel identifies a peer PE so the PE will forward traffic destined for that peer PE over the preferred tunnel. If you specify multiple preferred tunnels that have the same destination address in a tunnel policy, only the first configured tunnel takes effect and if the first tunnel is not available, the second tunnel is used, and so forth. No load balancing will be performed on these tunnels.

The tunnels selected by 2 methods, dedicated and best-effort. By default, tunnel policy uses dedicated method. If you configure dedicated method for a tunnel policy, the tunnel policy uses the preferred tunnel to forward traffic destined for the peer PE. If not, the MPLS VPN service will be down. If you configure best-effort method for a tunnel policy, the tunnel policy uses the preferred tunnel to forward traffic destined for the peer PE. If not, the MPLS VPN selects the available MPLS transport in MPLS forwarding table.

Topology

The diagram depicts the topology for the configuration examples that follow.

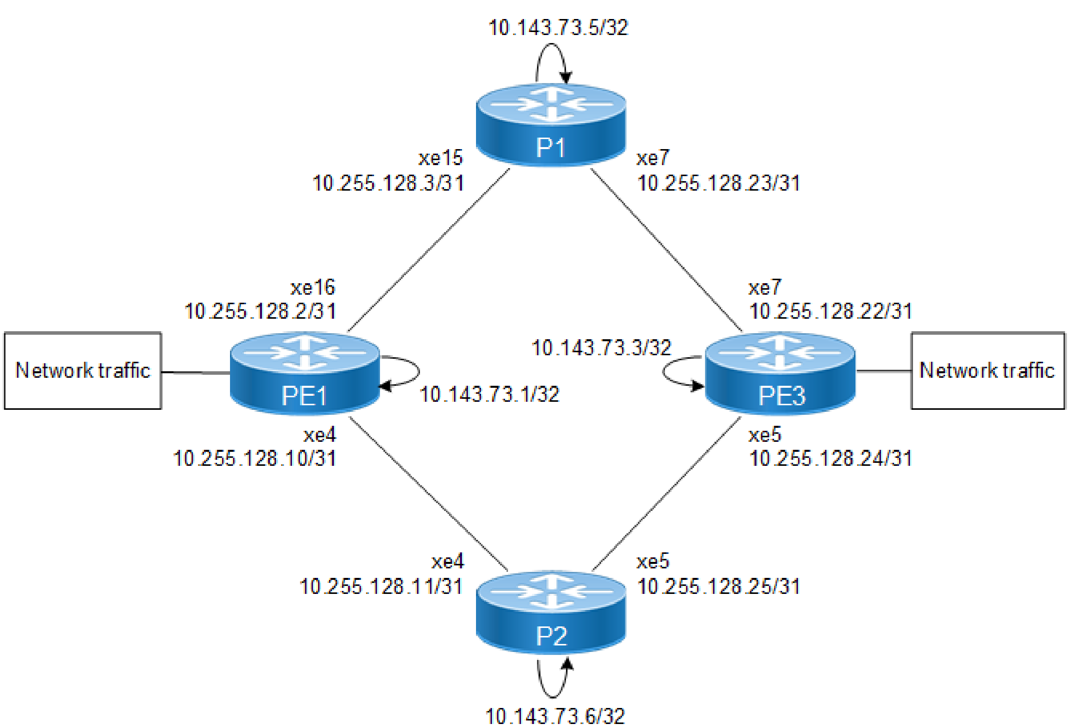

Figure 15-6: Service mapping to Tunnel

Configuration

Below are the sample configuration for EVPN (E-LINE, E-LAN), L3VPN, 6VPE, VPWS, and VPLS services with Tunnel Policy along with SR as transport.

PE1: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 10.143.73.1/32 secondary`	Configure IP address on loopback interface.
`(config-if)#prefix-sid index 1`	Configure prefix sid index value
`(config-if)#exit`	Exit interface mode

PE1: Global EVPN MPLS Command:

`#configure terminal`	Enter configuration mode.
`(config)#evpn mpls enable`	Enable EVPN MPLS. Note: Reload is required after Enabling/ Disabling EVPN MPLS Feature.
`(config)#evpn mpls vtep-ip-global 10.143.73.1`	Configuring loopback IP as VTEP global IP
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Ending config mode
`#write memory`	Save config to startup config
`#reload`	Reload device after enabling evpn

PE1: LDP Configuration

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 10.143.73.1`	Set the router ID to IP address 10.143.73.1.
`(config-router)#transport-address ipv4 10.143.73.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
`(config-router)# targeted-peer ipv4 10.143.73.3`	Configure targeted peer
`(config-router-targeted-peer)# exit-targeted-peer-mode`	Exit from router target peer and LDP mode

PE1: Interface Configuration Network Side

`(config)#interface xe16`	Enter the Interface mode for xe16
`(config-if)# ip address 10.255.128.2/31`	Configure IP address on the interface.
`(config-if)#mtu 9900`	Configure mtu at interface level
`(config-if)# label-switching`	Enable label switching on the interface.
`(config-if)# enable-ldp ipv4`	Enable ldp on the interface.
`(config-if)#exit`	Exit interface mode

(config)#interface xe4	Enter the Interface mode for xe4.
(config-if)# ip address 10.255.128.10/31	Configure IP address on the interface.
(config-if)#mtu 9900	Configure mtu at interface level
(config-if)# label-switching	Enable label switching on the interface.
(config-if)# enable-ldp ipv4	Enable ldp on the interface.
(config-if)#exit	Exit interface mode

PE1: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.1	Router-id configurations
(config-router)# bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-router)# network 10.143.73.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 10.255.128.2/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# network 10.255.128.10/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# ospf segment-routing global block 16000 17000	Enable SRGB under ospf process 100
(config-router)#segment-routing mpls	Enable segment routing
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.

PE1: BGP Configuration

(config)# router bgp 100	Enter the Router BGP mode, ASN: 100.
(config-router)# neighbor 10.143.73.3 remote-as 100	Configuring PE3 as iBGP neighbor using it's loopback ip.
(config-router)# neighbor 10.143.73.3 fall-over bfd multihop	Configure neighbor bfd multihop
(config-router)# neighbor 10.143.73.3 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 10.143.73.3 advertisement-interval 0	Configure advertisement interval
(config-router)# address-family vpnv4 unicast	Enter VPNv4 Address family mode
(config-router-af)# neighbor 10.143.73.3 activate	Enabling VPNv4 Address family for neighbor..
(config-router-af)# exit-address-family	Exit Address-family mode.
(config-router)# address-family l2vpn vpls	Enter l2vpn Address family mode
(config-router-af)# neighbor 10.143.73.3 activate	Enabling l2vpn Address family for neighbor..
(config-router-af)# exit-address-family	Exit Address-family mode.
(config-router)# address-family l2vpn evpn	Enter evpn Address family mode
(config-router-af)# neighbor 10.143.73.3 activate	Enabling evpn Address family for neighbor..

(config-router-af)# exit-address-family	Exit Address-family mode.
(config-router)# address-family vpnv6 unicast	Enter VPNv6 Address family mode
(config-router-af)# neighbor 10.143.73.3 activate	Enabling VPNv6 Address family for neighbor..
(config-router-af)# exit-address-family	Exit Address-family mode.

PE1: SR policy Configuration

(config)#segment-routing	Enter the segment routing mode.
(config-sr)# mpls sr-prefer	prefer segment routing MPLS entries for forwarding.
((config-sr)#traffic-engineering	Enter traffic engineering mode.
(config-sr-te)# policy PE1-P1-PE3	Configure SR policy
(config-sr-pol)# color 1 end-point 10.143.73.3	Configure color with destination address.
(config-sr-pol)#candidate-path 1	Enter candidate path mode.
(config-sr-pol-cp)#dynamic-path ospf 100	Configure dynamic path ospf
(config-sr-pol-cp)#constraints	Enter constraint mode
(config-sr-dyn-cp-cons)# 10.143.73.5 loose	Configure P1 as next-hop loose mode.
(config-sr-dyn-cp-cons)#exit-pol-cp	Exit candidate path mode.
(config-sr-pol-cp)#exit-sr-pol	Exit SR policy mode.
(config-sr-te)# policy PE1-P2-PE3	Configure SR policy
(config-sr-pol)# color 2 end-point 10.143.73.3	Configure color with destination address.
(config-sr-pol)#candidate-path 1	Enter candidate path mode.
(config-sr-pol-cp)#dynamic-path ospf 100	Configure dynamic path ospf
(config-sr-pol-cp)#constraints	Enter constraint mode
(config-sr-dyn-cp-cons)# 10.143.73.6 loose	Configure P2 as next-hop loose mode.
(config-sr-dyn-cp-cons)#exit-pol-cp	Exit candidate path mode.
(config-sr-pol-cp)#exit-sr-pol	Exit SR policy mode.

PE1: Tunnel Policy Configuration

(config)# tunnel-policy PE1-P1-PE3	Configure tunnel policy
(config-tnl-policy)#color 1	Map the color with the SR policy to be used..
(config-tnl-policy)#exit	Exiting tunnel policy mode
(config)# tunnel-policy PE1-P2-PE3	Configure tunnel policy
(config-tnl-policy)#color 2	Map the color with the SR policy to be used..
(config-tnl-policy)#exit	Exiting tunnel policy mode

PE1: VPWS Configuration

`(config)# mpls l2-circuit pe1-to-pe3 2002 10.143.73.3`	Configure the VC for PE3. In this example, pe1-to-pe3 is the VC name, 2002 is the VC ID, and 10.143.73.3 is the VC endpoint IP address.
`(config-pseudowire)# tunnel-select-policy PE1-P1-PE3`	Configure Tunnel-Policy on VC pe1-to-pe3
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)#exit`	Exiting from config mode
`(config)#service-template pe1-to-pe3`	Template configuration.
`(config-svc)# match outer-vlan 2002`	Match criteria under template configuration
`(config)#exit`	Exiting from config mode

PE1: VPLS Configuration

`(config)# mpls vpls vpls-pe1-to-pe3pe4-1 2502`	Enter VPLS config mode
`(config-vpls)#signaling ldp`	Define Signaling as LDP
`(config-vpls-sig)#vpls-type ethernet`	Type ethernet configuration for VPLS
`(config-vpls-sig)# vpls-peer 10.143.73.3 tunnel-select-policy PE1-P2-PE3`	Configure VPLS Peer with tunnel-policy
`(config-vpls-sig)#exit-signaling`	Exit Signaling LDP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#service-template vpls-pe1-to-pe3pe4-1`	Template configuration.
`(config-svc)# match outer-vlan 2502`	Match criteria under template configuration
`(config-svc)# rewrite ingress translate 2600 outgoing-tpid dot1.q`	Action performed for service template.
`(config)# mpls vpls vpls-pe1-to-pe3pe4-2 2503`	Enter VPLS config mode
`(config-vpls)#signaling bgp`	Enter the Signaling bgp mode for BGP VPLS.
`(config-vpls-sig)# ve-id 3`	Configure VE ID, which is mandatory for BGP VPLS, otherwise, signaling does not take place. VE ID should be unique per VPLS instance
`(config-vpls-sig)# tunnel-select-policy PE1-P1-PE3`	Configure tunnel-policy for a VPLS instance
`(config-vpls-sig)#exit-signaling`	Exit Signaling LDP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#service-template vpls-pe1-to-pe3pe4-2`	Template configuration.
`(config-svc)# match double-tag outer-vlan 2503 inner-vlan 2504`	Match criteria under template configuration
`(config-svc)# rewrite ingress push 2505`	Action performed for service template.

PE1: MAC VRF and IP VRF Configuration for EVPN and L3VPN services

Note: For EVPN Service, Tunnel Policy can be applied at mac vrf level and VNID level, When Configured at both levels, Preference is given to VNID level.

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)# tunnel-select-policy PE1-P1-PE3	Map tunnel policy to mac vrf
(config-vrf)#rd 10.143.73.1:2	Configuring Route-Distinguisher value 10.143.73.1:2
(config-vrf)#route-target both 2:2	Configuring import and export value as 2:2
(config-vrf)#exit	Exiting VRF Mode.
(config)#mac vrf elan500	Enter VRF mode
(config-vrf)#rd 10.143.73.1:500	Configuring Route-Distinguisher value 10.143.73.1:500
(config-vrf)#route-target both 500:500	Configuring import and export value as 500:500
(config)# ip vrf vrf600	Enter VRF mode
(config-vrf)# tunnel-select-policy PE1-P1-PE3	Configure tunnel-policy to be used for the VRF.
(config-vrf)# rd 10.143.73.1:600	Configuring Route-Distinguisher value 10.143.73.1:600
(config-vrf)#route-target both 600:600	Configuring import and export value as 600:600
(config-vrf)#exit	Exiting VRF Mode.

PE1: EVPN and MAC-VRF mapping for ELAN and ELINE

(config)#evpn mpls id 2 xconnect target-mpls-id 252	Configure the EVPN-ELINE identifier with source identifier 2 and target identifier 252.
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-VPWS identifier.
(config-evpn-mpls)#exit	Exiting from evpn-mpls mode
(config)# evpn mpls id 500	Configure evpn mpls id 500
(config-evpn-mpls)#tunnel-select-policy PE1-P2-PE3	Map tunnel-policy to EVI
(config-evpn-mpls)#host-reachability-protocol evpn-bgp elan500	Mapping vrf " elan500" to EVPN-VPLS identifier.

PE1: Access side Configuration

(config)#interface xe8	Enter the Interface mode for xe8
(config-if)# switchport	Configure interface as switch port
(config-if)# mpls-l2-circuit pe1-to-pe3 service-template pe1-to-pe3 primary	Bind the interface to the VC with service template
(config-if)# mpls-vpls vpls-pe1-to-pe3pe4-1 service-template vpls-pe1-to-pe3pe4-1	Bind the VPLS instance to the interface
(config-if-vpls)# exit-if-vpls	Exit VPLS attachment-circuit mode
(config-if)# mpls-vpls vpls-pe1-to-pe3pe4-2 service-template vpls-pe1-to-pe3pe4-2	Bind the VPLS instance to the interface
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)# exit-if-vpls	Exit VPLS attachment-circuit mode
(config-if)# exit	Exit from the interface
(config)#interface xe8.2 switchport	Configure Interface xe8.2 as switchport

(config-if)#encapsulation dot1q 2	Setting Encapsulation to dot1q with VLAN ID 2
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration.
(config-access-if)#map vpn-id 2	Map vpn-id 2 to interface xe8.2 (VPWS).
(config-access-if)#exit	Exiting out of access interface mode.
(config)#interface xe8.500 switchport	Configure Interface xe8.500 as switchport
(config-if)#encapsulation dot1q 500	Setting Encapsulation to dot1q with VLAN ID 500
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration.
(config-access-if)#map vpn-id 500	Map vpn-id 500 to interface xe8.500 (VPLS).
(config-access-if)#exit	Exiting out of access interface mode.
(config)#interface xe8.600	Enter Interface mode xe8.600
(config-if)# ip vrf forwarding vrf600	Bind the VRF instance to the interface
(config-if)# ip address 170.1.1.1/24	Configure IP address
(config-if)# ipv6 address 1111::1/64	Configure ipv6 address
(config-if)#encapsulation dot1q 600	Setting Encapsulation to dot1q with VLAN ID 600
(config-if)#exit	Exiting interface Mode.
(config)# router bgp 100	Enter BGP router mode
(config-router)#address-family ipv4 vrf vrf600	Configure VRF address family
(config-router-af)redistribute connected	Redistribute connected router
(config-router-af)#neighbor 170.1.1.2 remote-as 200	Configure neighbor with remote-as
(config-router-af)#neighbor 170.1.1.2 activate	Activate the VPN neighbour
(config-router-af)exit-address-family	Exit VRF address family
(config-router)#address-family ipv6 vrf vrf600	Configure ipv6 VRF address family
(config-router-af)redistribute connected	Redistribute connected router
(config-router-af)#neighbor 1111::2 remote-as 200	Configure neighbor with remote-as
(config-router-af)#neighbor 1111::2 activate	Activate the VPN neighbour
(config-router-af)exit-address-family	Exit VRF address family
(config-router-af)exit	End
(config-router)#commit	Commit the candidate configuration to the running configuration

P1: Loopback Interface

(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.5/32 secondary	Configure IP address on loopback interface.
(config-if)#prefix-sid index 5	Configure prefix sid index value
(config-if)#exit	Exit interface mode

P1: Interface Configuration Network Side

(config)#interface xe15	Enter the Interface mode for xe15
(config-if)# ip address 10.255.128.3/31	Configure IP address on the interface.
(config-if)# mtu 9900	Configure mtu
(config-if)# label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe7	Enter the Interface mode for xe7.
(config-if)# ip address 10.255.128.23/31	Configure IP address on the interface.
(config-if)# label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode

P1: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.5	Router-id configurations
(config-router)# bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-router)# network 10.143.73.5/32 area	
0.0.0.0	Advertise network address in OSPF.
(config-router)# network 10.255.128.2/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# network 10.255.128.22/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# ospf segment-routing global block 16000 17000	Enable SRGB under ospf process 100
(config-router)#segment-routing mpls	Enable segment routing
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the candidate configuration to the running configuration

P2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 10.143.73.6/32 secondary	Configure IP address on loopback interface.
(config-if)#prefix-sid index 6	Configure prefix sid index value
(config-if)#exit	Exit interface mode

P2: Interface Configuration Network Side

(config)#interface xe4	Enter the Interface mode for xe4
(config-if)# ip address 10.255.128.11/31	Configure IP address on the interface.
(config-if)# mtu 9900	Configure mtu

(config-if)# label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe5	Enter the Interface mode for xe5.
(config-if)# ip address 10.255.128.25/31	Configure IP address on the interface.
(config-if)# label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode

P2: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.6	Router-id configurations
(config-router)# bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-router)# network 10.143.73.6/32 area	
0.0.0.0	Advertise network address in OSPF.
(config-router)# network 10.255.128.10/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# network 10.255.128.24/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# ospf segment-routing global block 16000 17000	Enable SRGB under ospf process 100
(config-router)#segment-routing mpls	Enable segment routing
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the candidate configuration to the running configuration

PE3: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 10.143.73.3/32 secondary	Configure IP address on loopback interface.
(config-if)#prefix-sid index 3	Configure prefix sid index value
(config-if)#exit	Exit interface mode

PE3: Global EVPN MPLS Command

#configure terminal	Enter configuration mode.
(config)#evpn mpls enable	Enable EVPN MPLS. Note: Reload is required after Enabling/ Disabling EVPN MPLS Feature.
(config)#evpn mpls vtep-ip-global 10.143.73.3	Configuring vtep global ip to loopback IP.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	End configuration mode

#write memory	Saving configs to startup config
#reload	Reload device after enabling evpn

PE3: LDP Configuration

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 10.143.73.3	Set the router ID to IP address 10.143.73.3.
(config-router)#transport-address ipv4 10.143.73.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)# targeted-peer ipv4 10.143.73.1	Configure targeted peer
(config-router-targeted-peer)# exit-targeted-peer-mode	Exit from router target peer and LDP mode

PE3: Interface Configuration Network Side

(config)#interface xe5	Enter the Interface mode for xe5
(config-if)# ip address 10.255.128.24/31	Configure IP address on the interface.
(config-if)#mtu 9900	Configure mtu at interface level
(config-if)# label-switching	Enable label switching on the interface.
(config-if)# enable-ldp ipv4	Enable ldp on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe7	Enter the Interface mode for xe7.
(config-if)# ip address 10.255.128.22/31	Configure IP address on the interface.
(config-if)# label-switching	Enable label switching on the interface.
(config-if)# enable-ldp ipv4	Enable ldp on the interface.
(config-if)#exit	Exit interface mode

PE3: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 10.143.73.3	Router-id configurations
(config-router)# bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-router)# network 10.143.73.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 10.255.128.22/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# network 10.255.128.24/31 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# ospf segment-routing global block 16000 17000	Enable SRGB under ospf process 100
(config-router)#segment-routing mpls	Enable segment routing
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.

PE3: BGP Configuration

(config)# router bgp 100	Enter the Router BGP mode, ASN: 100.
(config-router)# neighbor 10.143.73.1 remote-as 100	Configuring PE3 as iBGP neighbor using it's loopback ip.
(config-router)# neighbor 10.143.73.1 fall-over bfd multihop	Configure neighbor bfd multihop
(config-router)# neighbor 10.143.73.1 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 10.143.73.1 advertisement-interval 0	Configure advertisement interval
(config-router)# address-family vpnv4 unicast	Enter VPNv4 Address family mode
(config-router-af)# neighbor 10.143.73.1 activate	Enabling VPNv4 Address family for neighbor..
(config-router-af)# exit-address-family	Exit Address-family mode.
(config-router)# address-family l2vpn vpls	Enter l2vpn Address family mode
(config-router-af)# neighbor 10.143.73.1 activate	Enabling l2vpn Address family for neighbor..
(config-router-af)# exit-address-family	Exit Address-family mode.
(config-router)# address-family l2vpn evpn	Enter evpn Address family mode
(config-router-af)# neighbor 10.143.73.1 activate	Enabling evpn Address family for neighbor..
(config-router-af)# exit-address-family	Exit Address-family mode.
(config-router)# address-family vpnv6 unicast	Enter VPNv6 Address family mode
(config-router-af)# neighbor 10.143.73.1 activate	Enabling VPNv6 Address family for neighbor..
(config-router-af)# exit-address-family	Exit Address-family mode.

PE3: VPWS Configuration

(config)# mpls l2-circuit pe3-to-pe1 2002 10.143.73.1	Configure the VC for PE-1. In this example, pe3-to-pe1 is the VC name, 2002 is the VC ID, and 10.143.73.1 is the VC endpoint IP address.
(config)#exit	Exiting from config mode
(config)#service-template pe3-to-pe1	Template configuration.
(config-svc)# match outer-vlan 2002	Match criteria under template configuration
(config)#exit	Exiting from config mode

PE3: VPLS Configuration

(config)# mpls vpls vpls-pe3-to-pe1pe4-1 2502	Enter VPLS config mode
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type Ethernet	Type ethernet configuration for VPLS
(config-vpls-sig)# vpls-peer 10.143.73.1	Configure VPLS Peer

(config-vpls-sig)#exit-signaling	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#service-template vpls-pe3-to-pe1pe4-1	Template configuration.
(config-svc)# match outer-vlan 2502	Match criteria under template configuration
(config-svc)# rewrite ingress translate 2600 outgoing-tpid dot1.q	Action performed for service template.
(config)# mpls vpls vpls-pe3-to-pe1pe4-2 2503	Enter VPLS config mode
(config-vpls)#signaling bgp	Enter the Signaling bgp mode for BGP VPLS.
(config-vpls-sig)# ve-id 4	Configure VE ID, which is mandatory for BGP VPLS, otherwise, signaling does not take place. VE ID should be unique per VPLS instance
(config-vpls-sig)#exit-signaling	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#service-template vpls-pe3-to-pe1pe4-2	Template configuration.
(config-svc)# match double-tag outer-vlan 2503 inner-vlan 2504	Match criteria under template configuration
(config-svc)# rewrite ingress push 2505	Action performed for service template.

PE3: MAC and IP VRF Configuration

(config)#mac vrf vrf2	Enter VRF mode
(config-vrf)#rd 10.143.73.3:2	Configuring Route-Distinguisher value 10.143.73.3:2
(config-vrf)#route-target both 2:2	Configuring import and export value as 2:2
(config-vrf)#exit	Exiting VRF Mode.
(config)#mac vrf elan500	Enter VRF mode
(config-vrf)#rd 10.143.73.3:500	Configuring Route-Distinguisher value 10.143.73.3:500
(config-vrf)#route-target both 500:500	Configuring import and export value as 500:500
(config)# ip vrf vrf600	Enter VRF mode
(config-vrf)# rd 10.143.73.3:600	Configuring Route-Distinguisher value 10.143.73.3:600
(config-vrf)#route-target both 600:600	Configuring import and export value as 600:600
(config-vrf)#exit	Exiting VRF Mode.

PE3: EVPN and mac vrf mapping Configuration

(config)#evpn mpls id 252 xconnect target-mpls-id 2	Configure the EVPN-ELINE identifier with source identifier 252 and target identifier 2.
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf2	Mapping vrf "vrf2" to EVPN-VPWS identifier.
(config-evpn-mpls)#exit	Exiting from evpn-mpls mode
(config)# evpn mpls id 500	Configure evpn mpls id 500
(config-evpn-mpls)#host-reachability-protocol evpn-bgp elan500	Mapping vrf " elan500" to EVPN-VPLS identifier.

PE3: Access side Configuration

(config)#interface xe4	Enter the Interface mode for xe8
(config-if)# switchport	Configure interface as switch port
(config-if)# mpls-l2-circuit pe3-to-pe1 service-template pe3-to-pe1 primary	Bind the VPWS instance to the interface
(config-if)# mpls-vpls vpls-pe3-to-pe1pe4-1 service-template vpls-pe3-to-pe1pe4-1	Bind the VPLS instance to the interface
(config-if-vpls)# exit-if-vpls	Exit VPLS attachment-circuit mode
(config-if)# mpls-vpls vpls-pe3-to-pe1pe4-2 service-template vpls-pe3-to-pe1pe4-2	Bind the VPLS instance to the interface
(config-if-vpls)# exit-if-vpls	Exit VPLS attachment-circuit mode
(config-if)# exit	Exit from the interface
(config)#interface xe4.2 switchport	Configure Interface xe4.2 as switchport
(config-if)#encapsulation dot1q 2	Setting Encapsulation to dot1q with VLAN ID 2
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration.
(config-access-if)#map vpn-id 252	Map vpn-id 252 to interface xe4.2 (VPWS).
(config-access-if)#exit	Exiting out of access interface mode.
(config)#interface xe4.500 switchport	Configure Interface xe4.500 as switchport
(config-if)#encapsulation dot1q 500	Setting Encapsulation to dot1q with VLAN ID 500
(config-if)#access-if-evpn	Entering Access mode for EVPN MPLS ID configuration.
(config-access-if)#map vpn-id 500	Map vpn-id 500 to interface xe4.500 (VPLS).
(config-access-if)#exit	Exiting out of access interface mode.
(config)#interface xe4.600	Enter Interface mode xe4.600
(config-if)# ip vrf forwarding vrf600	Bind the VRF instance to the interface
(config-if)# ip address 180.1.1.1/24	Configure IP address
(config-if)# ipv6 address 2222::1/64	Configure ipv6 address
(config-if)#encapsulation dot1q 600	Setting Encapsulation to dot1q with VLAN ID 600
(config-if)#exit	Exiting interface Mode.
(config)# router bgp 100	Enter BGP router mode
(config-router)#address-family ipv4 vrf vrf600	Configure VRF address family
(config-router-af)redistribute connected	Redistribute connected router
(config-router-af)#neighbor 180.1.1.2 remote-as 300	Configure neighbor with remote-as
(config-router-af)#neighbor 180.1.1.2 activate	Activate the VPN neighbour
(config-router-af)exit-address-family	Exit VRF address family
(config-router)#address-family ipv6 vrf vrf600	Configure ipv6 VRF address family
(config-router-af)redistribute connected	Redistribute connected router
(config-router-af)#neighbor 2222::2 remote-as 300	Configure neighbor with remote-as
(config-router-af)#neighbor 2222::2 activate	Activate the VPN neighbour

© 2025 IP Infusion Inc. Proprietary

(config-router-af)exit-address-family	Exit VRF address family
(config-router-af)end	End
(config)#commit	Commit the candidate configuration to the running configuration

CHAPTER 16 Mapping RSVP Tunnel Name to L2VPN Service

This chapter shows configurations of mapping of rsvp tunnel-name to L2VPN service.

An MPLS Layer 2 Virtual Circuit (VC) is a point-to-point Layer 2 connection transported via MPLS on the service provider's network. The Layer 2 circuit is transported over a single Label Switched Path (LSP) tunnel between two Provider Edge (PE) routers

Virtual Private LAN Service (VPLS) is a way to provide Ethernet-based multipoint-to-multipoint communication over IP-MPLS networks. It allows geographically-dispersed sites to share an Ethernet broadcast domain by connecting sites through pseudowires. A set of Martini circuits is grouped by a common VPLS identifier to achieve this service objective

Overview

This topology will be applicable for both VPWS and VPLS services.

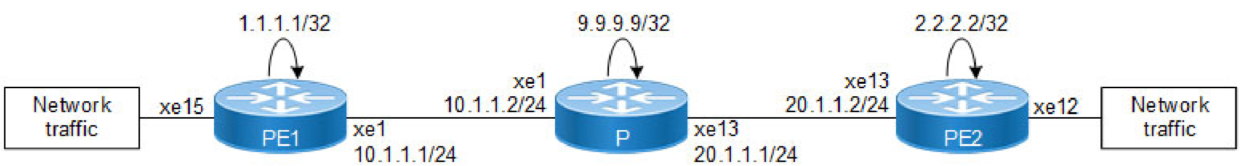

Figure 16-7: Mapping of RSVP Tunnel-name to L2VPN services

Configuring the VC:

Note: Loopback addresses being used should be advertised through OSPF, or should be statically routed.

1. Configure the IP address and OSPF for the PE1, P (Provider), and PE2 routers.
2. Configure MPLS and LDP on PE1, P, and PE2, and LDP targeted peer for the PE1 and PE2 routers. (If RSVP is used for configuring trunks, LDP must be configured on PE1 and PE2, and RSVP must be configured on PE1, P, and PE2).
3. Configure the VC with trunk-name.
4. Bind the customer interface to the VC.

Configure IP Address and OSPF on Routers

Configure the IP addresses and OSPF on the PE1, P, and PE2 routers.

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface (lo0) to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to 1.1.1.1/32.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Specify the interface (xe1) to be configured.

`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#ip address 10.1.1.1/24`	Set the IP address of the interface to 10.1.1.1/24.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the transaction.

P

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface (lo0) to be configured.
`(config-if)#ip address 9.9.9.9/32 secondary`	Set the IP address of the loopback interface to 9.9.9.9/32.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Specify the interface (xe1) to be configured.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#ip address 10.1.1.2/24`	Set the IP address of the interface to 10.1.1.2/24.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe13`	Specify the interface (xe13) to be configured.
`(config-if)#label-switching`	Enable label switching on interface xe13.
`(config-if)#ip address 20.1.1.1/24`	Set the IP address of the interface to 20.1.1.1/24.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 20.1.1.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 9.9.9.9/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the transaction.

PE2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface (lo0) to be configured.
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to 2.2.2.2/32.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe13`	Specify the interface (xe13) to be configured.
`(config-if)#label-switching`	Enable label switching on interface xe13.

(config-if)#ip address 20.1.1.2/24	Set the IP address of the interface to 20.1.1.2/24.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 20.1.1.0/24 area 0	Define the interface on which OSPF runs, and associate the area ID (0) with the interface.
(config-router)#network 2.2.2.2/32 area 0	Define the interface on which OSPF runs, and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

Configure MPLS, RSVP, and LDP Targeted Peer on Routers

Configure MPLS and LDP on PE1, P, and PE2, and LDP targeted peers on PE1 and PE2.

Note: If RSVP is used for configuring trunks, LDP must be configured on PE1 and PE2, and RSVP must be configured on PE1, P, and PE2.

PE1

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the Router mode.
(config-router)#router-id 1.1.1.1	Configure the router-id
(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#targeted-peer ipv4 2.2.2.2	Specify the targeted LDP peer on PE1.
(config-router-targeted-peer)# exit	Exit the Router targeted peer mode.
(config-router)#exit	Exit the Router mode.
(config)#router rsvp	Enter RSVP configuration mode for the router.
(config-router)#exit	Exit configuration mode of the router.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe1.
(config-if)#enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)#rsvp-trunk t2	Configure RSVP trunk t2
(config-trunk)#to 2.2.2.2	Configure PE2 as the end of trunk
(config-trunk)#commit	Commit the transaction.

P

#configure terminal	Enter configure mode.
(config)#router rsvp	Enter RSVP configuration mode for the router.
(config)#exit	Exit configuration mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.

(config-if)#enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe13	Specify the interface (xe13) to be configured.
(config-if)#enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)#rsvp-trunk t5	Configure RSVP trunk t5
(config-trunk)#to 2.2.2.2	Configure PE2 as the end of trunk
(config-trunk)#exit	Exit configuration mode
(config)#rsvp-trunk t6	Configure RSVP trunk t6
(config-trunk)#to 1.1.1.1	Configure PE2 as the end of trunk
(config-trunk)#commit	Commit the transaction.

PE2

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the Router mode.
(config-router)#router-id 2.2.2.2	Configure the router-id
(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#targeted-peer ipv4 1.1.1.1	Specify the targeted LDP peer on PE2.
(config-router-targeted-peer)# exit	Exit the Router targeted peer mode.
(config-router)#exit	Exit the Router mode.
(config)#router rsvp	Enter RSVP configuration mode for the router.
(config-router)#exit	Exit configuration mode of the router.
(config)#interface xe13	Specify the interface(xe13) to be configured.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe13.
(config-if)#enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)#rsvp-trunk t3	Configure RSVP trunk t3
(config-trunk)#to 1.1.1.1	Configure PE1 as the end of trunk
(config-trunk)#commit	Commit the transaction.

Configure VC

Configure the VC. Each VC ID uniquely identifies the Layer-2 circuit among all the Layer-2 circuits.

Note: Both PE routers (endpoints) must be configured with the same VC-ID (100 in this example).

PE1

#configure terminal	Enter configure mode.
(config)#mpls l2-circuit t2 100 2.2.2.2	Configure the VC for PE2. In this example, t2 is the VC name, 200 is the VC ID, and 2.2.2.2 is the VC endpoint IP address

(config-pseudowire)#tunnel-name t2	Configure the RSVP Trunk name as t2
(config-pseudowire)#exit	Exit pseudowire config mode.
(config)#mpls l2-circuit t3 300 2.2.2.2 mode raw	Configure the VC for PE2. In this example, t3 is the VC-name, 300 is the VC ID and 2.2.2.2 is the VC endpoint IP address
(config-pseudowire)#tunnel-name t2	Configure RSVP Trunk name as t2
(config-pseudowire)#commit	Commit the transaction.

PE2

#configure terminal	Enter configure mode.
(config)#mpls l2-circuit t2 100 1.1.1.1	Configure the VC for PE1. In this example, t2 is the VC name, 200 is the VC ID, and 1.1.1.1 is the VC endpoint IP address
(config-pseudowire)#tunnel-name t3	Configure RSVP Tunnel name as t3
(config-pseudowire)#exit	Exit pseudowire config mode.
(config)#mpls l2-circuit t2 100 1.1.1.1	Configure the VC for PE1. In this example, t2 is the VC name, 200 is the VC ID, and 1.1.1.1 is the VC endpoint IP address using rsvp trunk name t2
(config-pseudowire)#tunnel-name t3	Configure RSVP Tunnel name as t2
(config-pseudowire)#exit	Exit pseudowire config mode.
(config)#mpls l2-circuit t3 300 1.1.1.1 mode raw	Configure the VC for PE1. In this example, t3 is the VC name, 300 is the VC ID, and 1.1.1.1 is the VC endpoint IP address
(config-pseudowire)#tunnel-name t3	Configure RSVP Tunnel name as t3
(config-pseudowire)#commit	Commit the transaction.

Bind Customer Interface to VC

The following configuration allows only VLAN 2 and 3 traffic.

PE1

(config)#service-template ST1	Create a service template ST1
(config-svc)#match outer-vlan 2	Allow VLAN 2 traffic on this VC.
(config-svc)#exit	Exit the service template mode
(config)#service-template ST2	Create a service template ST2
(config-svc)#match outer-vlan 3	Allow VLAN 3 traffic on this VC.
(config-svc)#exit	Exit the service template mode
(config)#interface xe15	Specify the interface (xe15) to be configured.
(config-if)#switchport	Switch to Layer-2 mode.
(config-if)#mpls-l2-circuit t2 service-template ST1	Bind the interface to the VC with service template.
(config-if)#mpls-l2-circuit t3 service-template ST2	Bind the interface to the VC with service template.
(config-if)#commit	Commit the transaction.

PE2

(config)#service-template ST1	Create a service template ST1
(config-svc)#match outer-vlan 2	Allow VLAN 2 traffic on this VC.
(config-svc)#exit	Exit the service template mode
(config)#service-template ST2	Create a service template ST2
(config-svc)#match outer-vlan 3	Allow VLAN 3 traffic on this VC.
(config-svc)#exit	Exit the service template mode
(config)#interface xe12	Specify the interface (xe12) to be configured.
(config-if)#switchport	Switch to Layer-2 mode.
(config-if)#mpls-l2-circuit t2 service-template ST1	Bind the interface to the VC with service template.
(config-if)#mpls-l2-circuit t3 service-template ST2	Bind the interface to the VC with service template.
(config-if)#commit	Commit the transaction.

Validation

Use the show ldp mpls-l2-circuit (Control Plane) command, and the show mpls vc-table (Forwarding Plane) command, to display complete information about the Layer 2 VC.

If the VC State is UP in the output from the show ldp mpls-l2 circuit command, and the Status is Active in the output of the show mpls vc-table command, a ping from CE1 to CE2 should be successful.

Below are the sample output for VPWS service with Tunnel name:

```
PE1#show mpls vc-table
VC-ID       Vlan-ID  Inner-Vlan-ID  Access-Intf   Network-Intf  Out Label  Tunnel-Label  Nexthop         Status
100         N/A      N/A            xe15          xe1           24320      24321         2.2.2.2         Active
300         N/A      N/A            xe15          xe1           24321      24321         2.2.2.2         Active
PE1#

```

Configuring a MPLS Static Layer-2 VC

1. Configure the VC with the manual option using tunnel name
2. Configure the VC FIB entry.
3. Bind the VC; all steps are in the configurations that follow.

PE1

`#configure terminal`	Enter configure mode.
`PE1(config)#mpls l2-circuit t5 500 2.2.2.2`	Configure the VC for PE1
`PE1(config-pseudowire)#tunnel-name t2`	Configure the RSVP Tunnel name as t2
`PE1(config-pseudowire)#manual-pseudowire`	Configure the VC as manual (no signaling is used)
`PE1(config-pseudowire)#exit`	Exit pseudowire config mode.
`PE1(config)#service-template ST5`	Create a service template ST5
`PE1(config-svc)#match outer-vlan 5`	Configure single match criteria vlan 5
`PE1(config-svc)#exit`	Exit the service template mode
`PE1(config)#interface xe15`	Access interface xe15
`(config-if)#switchport`	Switch to Layer-2 mode.
`PE1(config-if)#mpls-l2-circuit t5 service-template ST5`	Bind the interface to the VC with service template.
`PE1(config-if)#exit`	Exit interface mode
`PE1(config-if)#commit`	Commit the transaction.
`PE1(config)#mpls l2-circuit-fib-entry 500 1000 2000 2.2.2.2 xe1 xe15`	Add an FTN entry; where 1000 is the incoming label, 2000 is the outgoing label, 2.2.2.2 is the endpoint, xe1 is the Provider facing interface name, and xe15 is access interface name
`PE1(config)#commit`	Commit the transaction.

PE2

`#configure terminal`	Enter configure mode.
`PE2(config)#mpls l2-circuit t5 500 1.1.1.1`	Configure the VC for PE2
`PE2(config-pseudowire)#tunnel-name t3`	Configure RSVP Tunnel name as t3
`PE2(config-pseudowire)#manual-pseudowire`	Configure VC as manual (no signaling used)
`PE2(config-pseudowire)#exit`	Exit pseudowire config mode.
`PE2(config)#service-template ST5`	Create a service template ST5
`PE2(config-svc)#match outer-vlan 5`	Configure single match criteria vlan 5
`PE2(config-svc)#exit`	Exit the service template mode
`PE2(config)#interface xe12`	Access interface xe12
`(config-if)#switchport`	Switch to Layer-2 mode.
`PE2(config-if)#mpls-l2-circuit t5 service-template ST5`	Bind the interface to the VC with service template.
`PE2(config-if)#exit`	Exit interface mode.
`PE2(config-if)#commit`	Commit the transaction.
`PE1(config)#mpls l2-circuit-fib-entry 500 2000 1000 1.1.1.1 xe13 xe12`	Add an FTN entry; where 2000 is the incoming label, 1000 is the outgoing label, 1.1.1.1 is the endpoint, xe12 is the Provider facing interface name, and xe13 access interface name
`PE1(config)#commit`	Commit the transaction.
`PE2(config)#exit`	Exit configure mode

Validation

This example shows number of configured VCs and its status.

```

Configure Dynamic VPLS

PE1: LDP VPLS Configuration

(config)#mpls vpls v1 25	Enter VPLS config mode
(config-vpls)#service-tpid dot1.ad	Service tp-id configuration.
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type vlan	Type VLAN configuration for VPLS
(config-vpls-sig)#vpls-peer 2.2.2.2 tunnel-name t2	Configure VPLS Peer with trunk-name t2
(config-vpls-sig)#exit	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#mpls vpls v2 26	Enter VPLS config mode
(config-vpls)#service-tpid dot1.ad	Service tp-id configuration.
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type ethernet	Type ethernet configuration for VPLS
(config-vpls-sig)#vpls-peer 2.2.2.2 tunnel-name t2	Configure VPLS Peer
(config-vpls-sig)#commit	Commit the transaction.
(config-vpls)#exit	Exit VPLS mode

PE2: LDP VPLS Configuration

(config)#mpls vpls v1 25	Enter VPLS config mode
(config-vpls)#service-tpid dot1.ad	Service tp-id configuration.
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type vlan	Type VLAN configuration for VPLS

(config-vpls-sig)#vpls-peer 1.1.1.1 tunnel-name t3	Configure VPLS Peer
(config-vpls-sig)# exit-signaling	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#mpls vpls v2 26	Enter VPLS config mode
(config-vpls)#service-tpid dot1.ad	Service tp-id configuration.
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type ethernet	Type ethernet configuration for VPLS
(config-vpls-sig)#vpls-peer 1.1.1.1 tunnel-name t3	Configure VPLS Peer with tunnel-name t2
(config-vpls-sig)#commit	Commit the transaction.
(config-vpls)#exit	Exit VPLS mode

LDP VPLS Service Mapping Configuration

PE1

#configure terminal	Configure mode
(config)#service-template template1	Template configuration
(config-svc)# match double-tag outer-vlan 2024 inner-vlan 2023	Match criteria under template configuration
(config-svc)# rewrite ingress pop outgoing-tpid dot1.q	Action to be performed for the match.
(config-svc)#exit	Exit template configuration mode
(config)#service-template template4	Template configuration
(config-svc)# match outer-vlan 700	Allow VLAN 700 traffic on this VC
(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200	Allow double tag match with s+c tags
(config-svc)# match untagged	Allow untagged traffic
(config-svc)# rewrite ingress push 300	Push Action performed for service template
(config-svc)#commit	Commit the transaction.

PE1: Access port Configuration

(config)#interface xe15	Enter the access interface xe15.
(config-if)#switchport	Configure interface as a layer 2 port.
(config-if)#mpls-vpls v1 service-template template1	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#exit-if-vpls	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v2 service-template template4	Bind the VPLS to the Access Interface.

(config-if-vpls)#commit	Commit the transaction.
(config-if)#exit	Exit Interface mode and return to Configure mode.

PE2

#configure terminal	Configure mode
(config)#service-template template1	Template configuration
(config-svc)# match double-tag outer-vlan 2024 inner-vlan 2023	Match criteria under template configuration
(config-svc)# rewrite ingress pop outgoing-tpid dot1.q	Action to be performed for the match.
(config-svc)#exit	Exit template configuration mode
(config)#service-template template4	Template configuration
(config-svc)# match outer-vlan 700	Allow VLAN 700 traffic on this VC
(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200	Allow double tag match with s+c tags
(config-svc)# match untagged	Allow untagged traffic
(config-svc)# rewrite ingress push 300	Push Action performed for service template
(config-svc)#commit	Commit the transaction.

PE2: Access port Configuration

(config)#interface xe12	Enter access Interface xe12
(config-if)#switchport	Configure interface as a layer 2 port.
(config-if)#mpls-vpls v1 service-template template1	Bind the VPLS to the Access Interface.
(config-if-vpls)#exit-if-vpls	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v2 service-template template4	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#commit	Commit the transaction.
(config-if)#exit	Exit Interface mode and return to Configure mode.

CHAPTER 17 MPLS BFD Configuration

This chapter shows how to configure MPLS-LSP-BFD and PW-VCCV-BFD

BFD can be used to track the liveliness of MPLS LSP and also can be used as one of the CV mechanisms in VCCV for PW fault detection and status signaling.

Qumran1 and Qumran2 series platforms support VCCV BFD with the following restrictions:

Qumran 1 Series Platforms	Qumran 2 Series Platforms
Supports both cc-type 1 and 2	Supports only cc-type 1 and cv-type 1 and 3

Topology

Figure 17-8 shows the configuration required to enable MPLS LSP BFD.

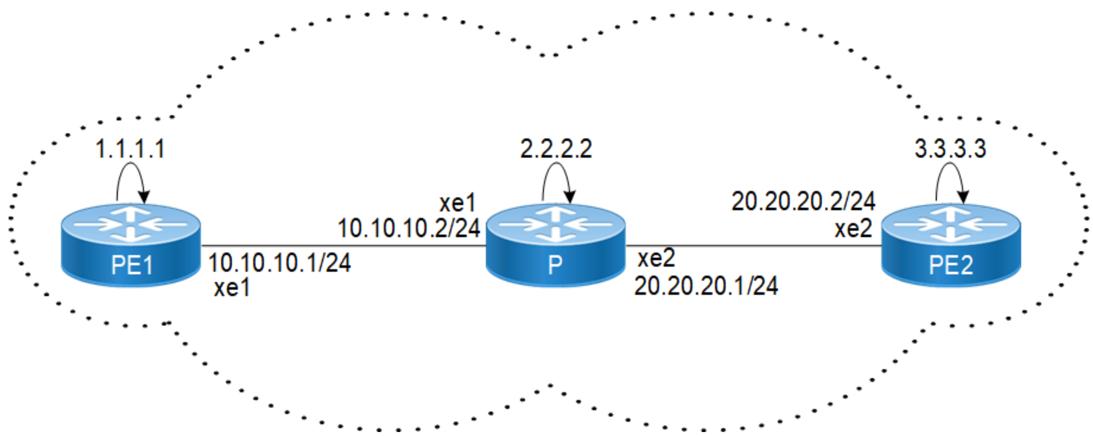

Figure 17-8: MPLS LSP BFD Topology

Configuring MPLS BFD LSP over LDP

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to 1.1.1.1/32.
`(conf)#interface eth1`	Enter interface mode
`(conf-if)#ip address 10.10.10.1/24`	Assign IP address to eth1 interface
`(config-if)#label-switching`	Enable label switching on interface eth1.
`(config-if)#enable-ldp ipv4`	Enable LDP on eth1.
`(confi-if)#exit`	Exit interface mode

`(config)#router ldp`	Enter Router mode for LDP.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
`(config-router)#exit`	Exit the Router mode and return to the Configure mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Advertise the eth1 interface in OSPF area 0.
`(config-router)#network 1.1.1.1/32 area 0`	Advertise the lo interface in OSPF area 0.
`(config-router)#exit`	Exit router mode
`(config)#mpls bfd ldp all`	Configure mpls bfd for ldp
`(config-mpls-bfd)#exit`	Exit mpls bfd mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit out of configuration terminal mode

P

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to 2.2.2.2/32.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Specify the interface (eth1) to be configured.
`(conf-if)#ip address 10.10.10.2/24`	Assign IP address to eth1 interface
`(config-if)#label-switching`	Enable label switching on interface eth1.
`(config-if)#enable-ldp ipv4`	Enable LDP on a specified interface (eth1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Specify the interface (eth2) to be configured.
`(conf-if)#ip address 20.20.20.1/24`	Assign IP address to eth2 interface
`(config-if)#label-switching`	Enable label switching on interface eth2.
`(config-if)#enable-ldp ipv4`	Enable LDP on a specified interface (eth2).
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter Router mode.
`(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2.
`(config-router)#transport-address ipv4 2.2.2.2`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
`(config-router)#exit`	Exit Router mode and return to Configure mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

(config-router)#network 10.10.10.0/24 area 0	Define the interfaces on which OSPF runs and associate the area ID (0) with them.
(config-router)#network 20.20.20.0/24 area 0	Define the interfaces on which OSPF runs and associate the area ID (0) with them.
(config-router)#network 2.2.2.2/32 area 0	Define the interfaces on which OSPF runs and associate the area ID (0) with them.
(config)#mpls bfd ldp all	Configure mpls bfd for ldp
(config-mpls-bfd)#exit	Exit mpls bfd mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	Exit out of configuration terminal mode

PE2

#configure terminal	Enter configure mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 3.3.3.3/32 secondary	Set the IP address of the loopback interface to 3.3.3.3/32.
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Specify the interface (eth2) to be configured.
(conf-if)#ip address 20.20.20.2/24	Assign IP address to eth2 interface
(config-if)#label-switching	Enable label switching on interface eth2.
(config-if)#enable-ldp ipv4	Enable LDP on a specified interface (eth2).
(config-if)#commit	Commit the transaction.
(config-if)#exit	Exit Interface mode
(config)#router ldp	Enter Router mode.
(config-router)#router-id 3.3.3.3	Set the router ID for IP address 3.3.3.3.
(config-router)#transport-address ipv4 3.3.3.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 20.20.20.0/24 area 0	Define the interfaces on which OSPF runs and associate the area ID (0) with them.
(config-router)#network 3.3.3.3/32 area 0	Define the interfaces on which OSPF runs and associate the area ID (0) with them.
(config-router)#commit	Commit the transaction.
(config)#mpls bfd ldp all	Configure mpls bfd for ldp
(config-mpls-bfd)#exit	Exit mpls bfd mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	Exit out of configuration terminal mode

Validation

Validation 1

Verify OSPF neighbor adjacency between all 5 routers.

```
PE1#show ip ospf neighbor

Total number of full neighbors: 1
OSPF process 1 VRF(default):
Neighbor ID     Pri   State            Dead Time   Address         Interface
Instance ID
2.2.2.2          1   Full/DR         00:00:32   10.10.10.2     eth1
0

P#show ip ospf neighbor

Total number of full neighbors: 2
OSPF process 1 VRF(default):
Neighbor ID     Pri   State            Dead Time   Address         Interface
Instance ID
1.1.1.1          1   Full/Backup     00:00:35   10.10.10.1     eth1
0
3.3.3.3          1   Full/Backup     00:00:32   20.20.20.2     eth2
0

PE2#show ip ospf neighbor

Total number of full neighbors: 1
OSPF process 1 VRF(default):
Neighbor ID     Pri   State            Dead Time   Address         Interface
Instance ID
2.2.2.2          1   Full/DR         00:00:31   20.20.20.1     eth1
0
```

Validation 2

Verify that ldp session on all 3 nodes have come up.

```
PE1#show ldp session
Peer IP Address           IF Name    My Role    State      KeepAlive  UpTime
2.2.2.2                   eth1        Passive   OPERATIONAL   30    01:30:57

P#show ldp session
Peer IP Address           IF Name    My Role    State      KeepAlive  UpTime
1.1.1.1                   eth1        Active    OPERATIONAL   30    01:48:34
3.3.3.3                   eth2        Passive   OPERATIONAL   30    03:01:14

PE2#show ldp session
Peer IP Address           IF Name    My Role    State      KeepAlive  UpTime
2.2.2.2                   eth2        Active    OPERATIONAL   30    03:01:14
```

Validation 3

The command output below displays the LSP sessions with LDP as signaling protocol.

```
PE1# #show bfd mpls lsp sessions
 Peer Addr                  Path      Tunnel-name                      State    Local
Local  Min         Min        Encap   Last
                                                                                Disc
Multi  Tx          Rx                 Dn-Time
 2.2.2.2                    LDP LSP                                    Up       1281
3      10000       10000      IP/UDP  00:00:00

Configuring MPLS BFD LSP over RSVP

This section shows how to configure RSVP session between PE1 and PE2 and MPLS BFD.

Note: For OSPF configurations, please refer 'Configuring MPLS BFD LSP over LDP' section.

PE1

`(config)#router rsvp`	Enter Router mode for RSVP.
`(config-router)#exit`	Exit RSVP router mode
`(conf)#interface eth1`	Enter interface mode
`(config-if)#label-switching`	Enable label switching on interface eth1.
`(config-if)#enable-rsvp`	Enable RSVP on eth1.
`(confi-if)#exit`	Exit interface mode
`(config)#rsvp-trunk T1 ipv4`	Configure Trunk for RSVP
`(config-trunk)# from 1.1.1.1`	Specify tunnel ingress for RSVP
`(config-trunk)# to 3.3.3.3`	Specify tunnel egress for RSVP
`(config-trunk)#exit`	Exit RSVP trunk configuration mode
`(config)#mpls bfd rsvp all`	Configure mpls bfd for RSVP
`(config-mpls-bfd)#exit`	Exit mpls bfd mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit out of configuration terminal mode

P

`(config)#router rsvp`	Enter Router mode for RSVP.
`(config-router)#exit`	Exit RSVP router mode
`(conf)#interface eth1`	Enter interface mode
`(config-if)#label-switching`	Enable label switching on interface eth1.
`(config-if)#enable-rsvp`	Enable RSVP on eth1.
`(confi-if)#exit`	Exit interface mode
`(conf)#interface eth2`	Enter interface mode
`(config-if)#label-switching`	Enable label switching on interface eth2.
`(config-if)#enable-rsvp`	Enable RSVP on eth2.
`(confi-if)#exit`	Exit interface mode
`(config)#mpls bfd rsvp all`	Configure mpls bfd for RSVP
`(config-mpls-bfd)#exit`	Exit mpls bfd mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit out of configuration terminal mode

PE2

(config)#router rsvp	Enter Router mode for RSVP.
(config-router)#exit	Exit RSVP router mode
(conf)#interface eth2	Enter interface mode
(config-if)#label-switching	Enable label switching on interface eth2.
(config-if)#enable-rsvp	Enable RSVP on eth2.
(confi-if)#exit	Exit interface mode
(config)#rsvp-trunk T1 ipv4	Configure Trunk for RSVP
(config-trunk)# from 3.3.3.3	Specify tunnel ingress for RSVP
(config-trunk)# to 1.1.1.1	Specify tunnel egress for RSVP
(config-trunk)#exit	Exit RSVP trunk configuration mode
(config)#mpls bfd rsvp all	Configure mpls bfd for RSVP
(config-mpls-bfd)#exit	Exit mpls bfd mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	Exit out of configuration terminal mode

Validation

Validation 1

Verify RSVP session is up and running between PE nodes.

```
PE1#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to
Secondary
* indicates the session is active with local repair at one or more nodes
(P) indicates the secondary-priority session is acting as primary

Ingress RSVP:
To              From            Type    LSPName                        State Uptime    Rt
Style  Labelin  Labelout  DSType
3.3.3.3          1.1.1.1          PRI     T1-Primary                       UP    00:35:38
1 1 SE     -        24321     DEFAULT
Total 1 displayed, Up 1, Down 0.

Egress RSVP:
To              From            Type    LSPName                        State Uptime    Rt
Style  Labelin  Labelout  DSType
1.1.1.1          3.3.3.3          PRI     T1-Primary                       UP    00:35:51
1 1 SE     24320    -         ELSP_CON
Total 1 displayed, Up 1, Down 0.

PE2#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
```

```
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to
Secondary
* indicates the session is active with local repair at one or more nodes
(P) indicates the secondary-priority session is acting as primary

Ingress RSVP:
To              From            Type    LSPName                         State Uptime    Rt
Style  Labelin  Labelout  DSType
1.1.1.1         3.3.3.3          PRI     T1-Primary                         UP    00:37:51
1 1 SE     -        24320     DEFAULT
Total 1 displayed, Up 1, Down 0.

Egress RSVP:
To              From            Type    LSPName                         State Uptime    Rt

Configuring Static MPLS BFD

This section shows how to configure MPLS BFD statically.

Note: For OSPF configurations, please refer 'Configuring MPLS BFD LSP over LDP' section.

PE1

(config)#interface eth1	Enter interface mode
(config-if)#label-switching	Enable label switching on interface eth1.
(config-if)#exit	Exit interface mode
(conf)#mpls ftn-entry 3.3.3.3/32 102 10.10.10.2 eth1	Configure MPLS FTN entry for the creation of a static LSP to

PE-2.	
(config)#mpls ilm-entry 401 pop	Configure ILM entry
(config)#mpls bfd static all	Configure mpls bfd for static MPLS
(config-mpls-bfd)#exit	Exit mpls bfd mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	Exit out of configuration terminal mode

P

(config)#interface eth1	Enter interface mode
(config-if)#label-switching	Enable label switching on interface eth1.
(confi-if)#exit	Exit interface mode
(conf)#interface eth2	Enter interface mode
(config-if)#label-switching	Enable label switching on interface eth2.
(config-if)#exit	Exit interface mode
mpls ilm-entry 201 swap 401 eth1 10.10.10.1 1.1.1.1/32	Swap the incoming label
mpls ilm-entry 102 swap 301 eth2 mpls ftn-entry 1.1.1.1/32 201 20.20.20.1 eth2 20.20.20.2 3.3.3.3/32	Swap the incoming label
(config)#mpls bfd static all	Configure mpls bfd for static MPLS
(config-mpls-bfd)#exit	Exit mpls bfd mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	Exit out of configuration terminal mode

PE2

(conf)#interface eth2	Enter interface mode
(config-if)#label-switching	Enable label switching on interface eth2.
(config-if)#exit	Exit interface mode
(config)#mpls ftn-entry 1.1.1.1/32 201 20.20.20.1 eth2	Configure MPLS FTN entry for the creation of a static LSP to
PE-1	
(config)#mpls bfd static all	Configure mpls bfd for static MPLS
(config-mpls-bfd)#exit	Exit mpls bfd mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	Exit out of configuration terminal mode

Validations

Validation 1

Verify static MPLS BFD session is up and running between PE nodes.

```
PE1#show bfd mpls lsp sessions
 Peer Addr                  Path      Tunnel-name                         State    Local
Local  Min        Min        Encap   Last
                                                                                   Disc
Multi  Tx         Rx                 Dn-Time
 3.3.3.3                    Static LSP                                    Up       1281
3      10000      10000      IP/UDP  00:00:00

PE2#show bfd mpls lsp sessions
 Peer Addr                  Path      Tunnel-name                         State    Local
Local  Min        Min        Encap   Last
                                                                                   Disc
Multi  Tx         Rx                 Dn-Time
 1.1.1.1                    Static LSP                                    Up       1281
3      10000      10000      IP/UDP  00:00:00
```

Configuring PW VCCV BFD

This section shows how to configure PW VCCV BFD.

Note: For OSPF configurations, please refer 'Configuring MPLS BFD LSP over LDP' section.

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to 1.1.1.1/32.
`(conf)#interface eth1`	Enter interface mode
`(conf-if)#ip address 10.10.10.1/24`	Assign IP address to eth1 interface
`(config-if)#label-switching`	Enable label switching on interface eth1.
`(config-if)#enable-ldp ipv4`	Enable LDP on eth1.
`(confi-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter Router mode for LDP.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
`(config-router)#exit`	Exit the Router mode and return to the Configure mode.
`(config)#service-template st1`	Service template configuration
`(config-svc)#exit`	Exit service-template configuration mode
`(config)#mpls l2-circuit pw1 3.3.3.3`	Configure the VC for PE2

(config-pseudowire)#control-word	Configure control-word
(config-pseudowire)#vccv cc-type type-1	Configure cc-type type-1
(config-pseudowire)#vccv cv-type type-3	Configure cv-type type-3
(confi- pseudowire)#exit	Exit pw configuration mode
(config)#commit	Commit the candidate configuration to the running configuration

P

#configure terminal	Enter configure mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 2.2.2.2/32 secondary	Set the IP address of the loopback interface to 2.2.2.2/32.
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Specify the interface (eth1) to be configured.
(conf-if)#ip address 10.10.10.2/24	Assign IP address to eth1 interface
(config-if)#label-switching	Enable label switching on interface eth1.
(config-if)#enable-ldp ipv4	Enable LDP on a specified interface (eth1).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Specify the interface (eth2) to be configured.
(conf-if)#ip address 20.20.20.1/24	Assign IP address to eth2 interface
(config-if)#label-switching	Enable label switching on interface eth2.
(config-if)#enable-ldp ipv4	Enable LDP on a specified interface (eth2).
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter Router mode.
(config-router)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2.
(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#pw-status-tlv	Configure PW Status TLV to signal the pseudowire status
(config-router)#exit	Exit Router mode and return to Configure mode.
(config)#commit	Commit the candidate configuration to the running configuration

PE2

#configure terminal	Enter configure mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 3.3.3.3/32 secondary	Set the IP address of the loopback interface to 3.3.3.3/32.
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Specify the interface (eth1) to be configured.
(conf-if)#ip address 20.20.20.2/24	Assign IP address to eth1 interface
(config-if)#label-switching	Enable label switching on interface eth2.
(config-if)#enable-ldp ipv4	Enable LDP on a specified interface (eth2).
(config-if)#commit	Commit the transaction.

`(config-if)#exit`	Exit Interface mode
`(config)#router ldp`	Enter Router mode.
`(config-router)#router-id 3.3.3.3`	Set the router ID for IP address 3.3.3.3.
`(config-router)#transport-address ipv4 3.3.3.3`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
`(config-router)#exit`	Exit the Router mode and return to the Configure mode.
`(config)#service-template st1`	Service template configuration
`(config-svc)#exit`	Exit service-template configuration mode
`(config)#mpls l2-circuit pw1 1.1.1.1`	Configure the VC for PE1
`(config-pseudowire)#control-word`	Configure control-word
`(config-pseudowire)#vccv cc-type type-1`	Configure cc-type type-1
`(config-pseudowire)#vccv cv-type type-3`	Configure cv-type type-3
`(confi- pseudowire)#exit`	Exit pw configuration mode

Validation

Validation 1

Verify PW VCCV BFD sessions are up between PE nodes.

```
PE1#show bfd mpls pw-vccv sessions

CHAPTER 18 BGP Peer Groups for Address-Family L2VPN EVPN

BGP peer groups are used to simplify configuration and to improve performance. This is achieved by assigning the same outbound policy to each of the neighbors. Because UPDATEs are generated only once per peer group rather than multiple times for each neighboring router, peer groups save processing time when building neighbor updates. It reduces the amount of system resources (CPU and memory) necessary in an update generation.

A BGP peer group reduces the load on system resources by allowing the routing table to be checked only once, and updates to be replicated to all peer group members instead of being done individually for each peer in the peer group.

Topology

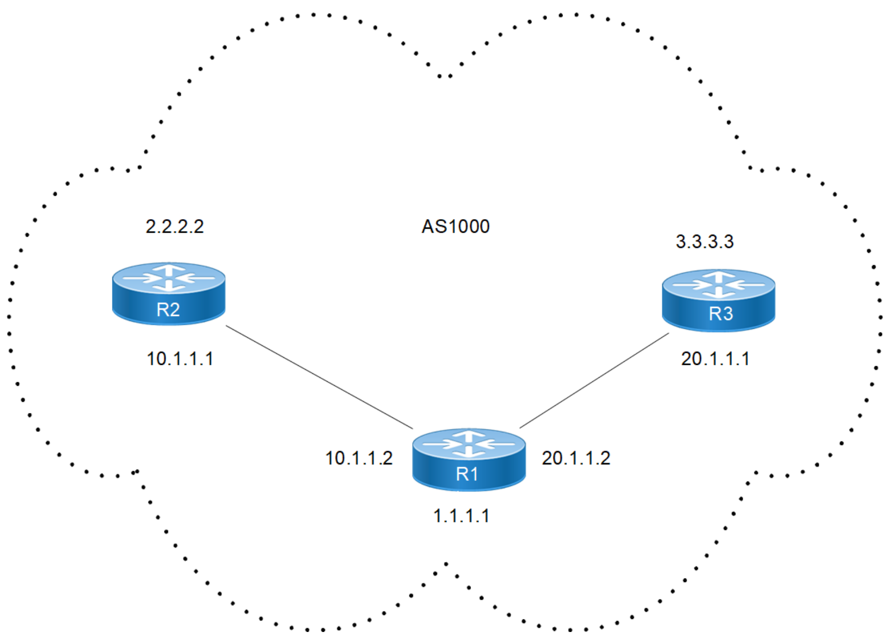

Figure 18-9: BGP Peer-Groups with L2VPN EVPN address-family

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure ip address for Loopback interface
`(config-if)#exit`	Exit interface mode
`(config)# interface xe15`	Enter interface mode for xe15
`(config-if)#ip address 10.1.1.2/24`	Configure ip address
`(config-if)#exit`	Exit interface mode

`(config)# interface ce0`	Enter interface mode for ce0
`(config-if)#ip address 20.1.1.2`	Configure ip address
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 100`	Configure the OSPF process (100)
`(config-router)# ospf router-id 1.1.1.1`	Configure OSPF router-id
`(config-router)#network 1.1.1.1/32 area 0`	Advertise the network in Area 0
`(config-router)#network 10.1.1.0/24 area 0`	Advertise the network in Area 0
`(config-router)#network 20.1.1.0/24 area 0`	Advertise the network in Area 0
`(config-router)#exit`	Exit Router mode and return to Configure mode
`(config)#router bgp 100`	Define the routing process. The number 100 specifies the AS number of R1.
`(config-router)# bgp router-id 1.1.1.1`	Configure BGP router-id
`(config-router)#neighbor PG  peer-group`	Create a peer group named PG
`(config-router)#neighbor PG remote-as 100`	Assign options to the peer group named PG
`(config-router)#neighbor PG update-source lo`	Assign options to the peer group named PG
`(config-router)#neighbor 2.2.2.2 peer-group PG`	Define neighbor 2.2.2.2 (R2) as a peer group
`(config-router)#neighbor 3.3.3.3 peer-group PG`	Define neighbor 3.3.3.3 (R3) as a peer group member.
`(config-router)#address-family l2vpn evpn`	Enter address-family l2vpn evpn mode
`(config-router-af)#neighbor PG activate`	Activate the peer-group ABC for address-family l2vpn evpn
`(config-router-af)# exit-address-family`	Exit address-family ipv4 unicast mode
`(config-router)#exit`	Exit router bgp mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback
`(config-if)#ip address 2.2.2.2/32 secondary`	Configure ip address for Loopback interface
`(config-if)#exit`	Exit interface mode
`(config)# interface xe15`	Enter interface mode for xe15
`(config-if)#ip address 10.1.1.2/24`	Configure ip address
`(config-if)#exit`	Exit interface mode
`(config)# interface xe10`	Enter interface mode for xe10
`(config-if)#ip address 10.1.1.1/24`	Configure ip address
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 100`	Configure the OSPF process (100)
`(config-router)# ospf router-id 2.2.2.2`	Configure OSPF router-id
`(config-router)#network 2.2.2.2/32 area 0`	Advertise the network in Area 0
`(config-router)#network 10.1.1.0/24 area 0`	Advertise the network in Area 0
`(config-router)#exit`	Exit Router mode and return to Configure mode

(config)#router bgp 100	Define the routing process. The number 100 specifies the AS number of R1.
(config-router)# bgp router-id 2.2.2.2	Configure BGP router-id
(config-router)#neighbor PG peer-group	Create a peer group named PG
(config-router)#neighbor PG remote-as 100	Assign options to the peer group named PG
(config-router)#neighbor PG update-source lo	Assign options to the peer group named PG
(config-router)#neighbor 1.1.1.1 peer-group PG	Define neighbor 1.1.1.1 (R1) as a peer group member.
(config-router)#address-family l2vpn evpn	Enter address-family l2vpn evpn mode
(config-router-af)#neighbor PG activate	Activate the peer-group ABC for address-family l2vpn evpn
(config-router-af)# exit-address-family	Exit address-family ipv4 unicast mode
(config-router)#exit	Exit router bgp mode
(config)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode.
(config)# interface lo	Enter interface mode for Loopback
(config-if)#ip address 3.3.3.3/32 secondary	Configure ip address for Loopback interface
(config-if)#exit	Exit interface mode
(config)# interface ce15	Enter interface mode for ce15
(config-if)#ip address 20.1.1.1/24	Configure ip address
(config-if)#exit	Exit interface mode
(config)# interface xe10	Enter interface mode for xe10
(config-if)#ip address 10.1.1.1/24	Configure ip address
(config-if)#exit	Exit interface mode
(config)#router ospf 100	Configure the OSPF process (100)
(config-router)# ospf router-id 3.3.3.3	Configure OSPF router-id
(config-router)#network 20.1.1.0/24 area 0	Advertise the network in Area 0
(config-router)#exit	Exit Router mode and return to Configure mode
(config)#router bgp 100	Define the routing process. The number 100 specifies the AS number of R1.
(config-router)# bgp router-id 3.3.3.3	Configure BGP router-id
(config-router)#neighbor PG peer-group	Create a peer group named PG
(config-router)#neighbor PG remote-as 100	Assign options to the peer group named PG
(config-router)#neighbor PG update-source lo	Assign options to the peer group named PG
(config-router)#neighbor 1.1.1.1 peer-group PG	Define neighbor 1.1.1.1 (R1) as a peer group member.
(config-router)#address-family l2vpn evpn	Enter address-family l2vpn evpn mode
(config-router-af)#neighbor PG activate	Activate the peer-group ABC for address-family l2vpn evpn
(config-router-af)# exit-address-family	Exit address-family ipv4 unicast mode

(config-router)#exit	Exit router bgp mode
(config)#commit	Commit the candidate configuration to the running configuration.

Validation

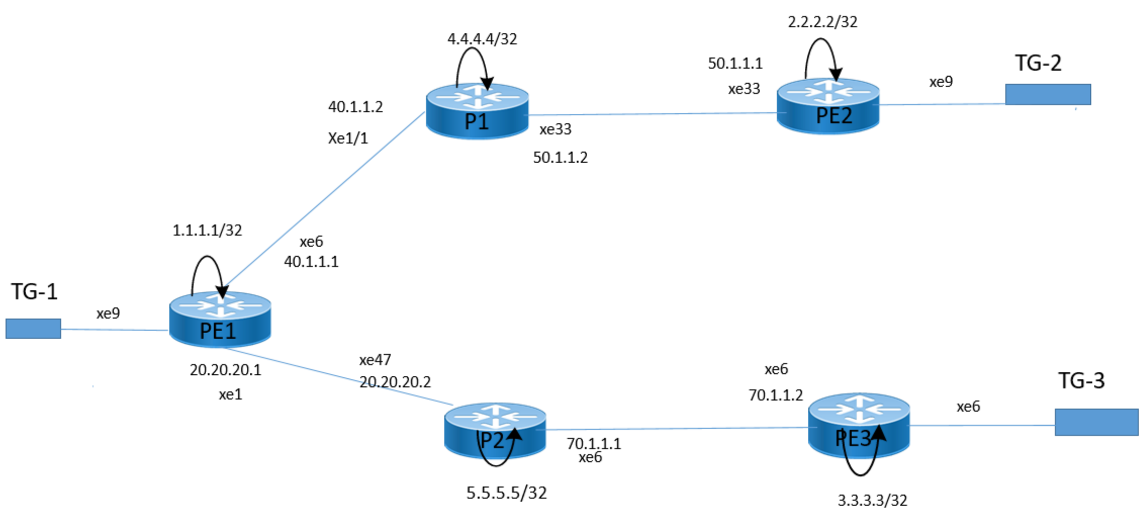
CHAPTER 19 Point-to-Point Connections Over MPLS

Overview

An MPLS Layer 2 Virtual Circuit (VC) facilitates efficient point-to-point Layer 2 connectivity in a service providers MPLS network. It enables Layer 2 circuit transport across the providers infrastructure, ensuring secure communication between remote sites through a single Label Switched Path (LSP) tunnel connecting Provider Edge (PE) routers. This feature optimizes network performance and supports diverse applications and services.

Topology



The VC configuration process can be divided into the following steps:

Note: Loopback addresses being used should be advertised through OSPF, or must be statically routed.

1. Configure the IP address and OSPF for the PE-1, P (Provider), and PE-2 routers.
2. Configure MPLS and LDP on PE-1, P, and PE-2, and LDP targeted peer for the PE-1 and PE-2 routers. (If RSVP is used for configuring trunks, LDP must be configured on PE-1 and PE-2, and RSVP must be configured on PE-1, P, and PE-2.)
3. Configure the VC.
4. Bind the customer interface to the VC.

Configure IP Address and OSPF on Routers

Configure the IP addresses and OSPF on the PE-1, P1,P2, PE2 and PE-3 routers.

PE-1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface `(lo0)` to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to `1.1.1.1/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe6`	Specify the interface `(xe6)` to be configured.
`(config-if)#ip address 40.1.1.1/24`	Set the IP address of the interface to `40.1.1.1/24`
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#ip address 20.20.20.1/24`	Set the IP address of the interface to 20.20.20.1/24
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 40.1.1.0/24 area 0`
`(config-router)#network 1.1.1.1/32 area 0`
`(config-router)# network 20.20.20.0/24 area 0`
	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface.

P1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface `(lo0)` to be configured.
`(config-if)#ip address 4.4.4.4/32 secondary`	Set the IP address of the loopback interface to `9.9.9.9/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1/1`	Specify the interface `(xe1/1)` to be configured.
`(config-if)#ip address 40.1.1.2/24`	Set the IP address of the interface to `40.1.1.2/24`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe33`	Specify the interface `(xe33)` to be configured.
`(config-if)#ip address 50.1.1.2/24`	Set the IP address of the interface to `50.1.1.1/24`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network  40.1.1.0/24  area  0`
`(config-router)#network  50.1.1.0/24  area  0`
`(config-router)#network 4.4.4.4/32 area 0`
	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface.

P2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface `(lo0)` to be configured.
`(config-if)#ip address 5.5.5.5/32 secondary`	Set the IP address of the loopback interface to `5.5.5.5/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe6`	Specify the interface `(xe1/1)` to be configured.
`(config-if)#ip address 70.1.1.1/24`	Set the IP address of the interface to `70.1.1.1/24`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe47`	Specify the interface `(xe47)` to be configured.
`(config-if)#ip address 20.20.20.2/24`	Set the IP address of the interface to `20.20.20.2/24`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 20.20.20.20/24 area 0`
`(config-router)#network  70.1.1.0/24  area  0`
`(config-router)#network 5.5.5.5/32 area 0`
	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface.

PE-2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface `(lo0)` to be configured.
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to `2.2.2.2/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe33`	Specify the interface `(xe33)` to be configured.
`(config-if)#ip address 50.1.1.1/24`	Set the IP address of the interface to 50.1.1.1/24
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 50.1.1.0/24 area 0` `(config-router)#network 2.2.2.2/32 area 0`	Define the interface on which OSPF runs, and associate the area ID `(0)` with the interface.

PE-3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface `(lo0)` to be configured.

(config-if)#ip address 3.3.3.3/32 secondary	Set the IP address of the loopback interface to 3.3.3.3/32.
(config-if)#exit	Exit interface mode.
(config)#interface xe6	Specify the interface (xe33) to be configured.
(config-if)#ip address 70.1.1.2/24	Set the IP address of the interface 70.1.1.2/24
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 70.1.1.0/24 area 0 (config-router)#network 3.3.3.3/32 area 0	Define the interface on which OSPF runs, and associate the area ID (0) with the interface.

Configure MPLS, LDP, and LDP Targeted Peer on Routers

PE-1

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the Router mode.
(config)# router-id 1.1.1.1	Configure LDP router ID.
(config-router)#pw-status-tlv	Set PW status TLV
(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#targeted-peer ipv4 2.2.2.2	Specify the targeted LDP peer on PE-1.
(config-router)#targeted-peer ipv4 3.3.3.3	Specify the targeted LDP peer on PE-1.
(config-router-targeted-peer)# exit	Exit the Router targeted peer mode.
(config-router)#exit	Exit the Router mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe1.
(config)#interface xe6	Specify the interface (xe6) to be configured.
(config-if)#label-switching	Enable label switching on interface xe6
(config-if)#enable-ldp ipv4	Enable LDP on interface xe6.

PE2

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the Router mode.
(config)# router-id 2.2.2.2	Configure LDP router ID.
(config-router)#pw-status-tlv	Set PW status TLV

(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#targeted-peer ipv4 1.1.1.1	Specify the targeted LDP peer on PE-1.
(config-router-targeted-peer)# exit	Exit the Router targeted peer mode.
(config-router)#exit	Exit the `Router` mode.
(config)#interface xe33	Specify the interface `(xe33)` to be configured.
(config-if)#label-switching	Enable label switching on interface `xe1`.
(config-if)#enable-ldp ipv4	Enable LDP on interface `xe33`.

PE3

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the `Router` mode.
(config)# router-id 3.3.3.3	Configure LDP router ID.
(config-router)#pw-status-tlv	Set PW status TLV
(config-router)#transport-address ipv4 3.3.3.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#targeted-peer ipv4 1.1.1.1	Specify the targeted LDP peer on PE-1.
(config-router-targeted-peer)# exit	Exit the Router targeted peer mode.
(config-router)#exit	Exit the `Router` mode.
(config)#interface xe6	Specify the interface `(xe6)` to be configured.
(config-if)#label-switching	Enable label switching on interface `xe6`.
(config-if)#enable-ldp ipv4	Enable LDP on interface `xe6`.

P1

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the `Router` mode.
(config)# router-id 4.4.4.4	Configure LDP router ID.
(config-router)#exit	Exit the `Router` mode.
(config)#interface xe1/1	Specify the interface `(xe1/1)` to be configured.
(config-if)#label-switching	Enable label switching on interface `xe1/1`.
(config-if)#enable-ldp ipv4	Enable LDP on interface `xe1`.
(config)#interface xe33	Specify the interface `(xe6)` to be configured.
(config-if)#label-switching	Enable label switching on interface `xe33`.
(config-if)#enable-ldp ipv4	Enable LDP on interface `xe33`.

P2

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the Router mode.
(config)# router-id 5.5.5.5	Configure LDP router ID.
(config-router)#exit	Exit the Router mode.
(config)#interface xe6	Specify the interface (xe6) to be configured.
(config-if)#label-switching	Enable label switching on interface xe6.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe1.
(config)#interface xe47	Specify the interface (xe47) to be configured.
(config-if)#label-switching	Enable label switching on interface xe47.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe47.

Configure VC

Configure the VC. Each VC ID uniquely identifies the Layer-2 circuit among all the Layer-2 circuits.

PE-1

#configure terminal	Enter configure mode.
(config)# mpls l2-circuit VPLS-100-1 10000100 3.3.3.3	Configure the VC for PE-3. In this example, VPLS-100-1 is the VC name, 10000100is the VC ID, and 3.3.3.3 is the VC endpoint IP address.
(config-pseudowire)# mpls l2-circuit VPLS-200-3 30000200 2.2.2.2	Configure the VC for PE-2. In this example, VPLS-200-3 is the VC name, 30000200 is the VC ID, and 2.2.2.2 is the VC endpoint IP address.

PE-2

#configure terminal	Enter configure mode.
(config)# mpls l2-circuit VPLS-200-3 30000200 1.1.1.1	Configure the VC for PE-1. In this example, VPLS-200-3 is the VC name, 30000200is the VC ID, and 1.1.1.1is the VC endpoint IP address.

PE-3

#configure terminal	Enter configure mode.
(config)# mpls l2-circuit VPLS-100-1 10000100 1.1.1.1 mode tagged	Configure the VC for PE-1. In this example, VPLS-100-1 is the VC name, 10000100is the VC ID, and 1.1.1.1is the VC endpoint IP address.

Bind Customer Interface to VC

PE-1

`#configure terminal`	Enter configure mode.
`(config)# mpls l2-circuit VPLS-100-1 10000100 3.3.3.3`	Configure the VC for PE-3. In this example, VPLS-100-1 is the VC name, 10000100is the VC ID, and 3.3.3.3 is the VC endpoint IP address.
`(config-pseudowire)# mpls l2-circuit VPLS-200-3 30000200 2.2.2.2`	Configure the VC for PE-2. In this example, VPLS-200-3 is the VC name, 30000200 is the VC ID, and 2.2.2.2 is the VC endpoint IP address.
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)#interface xe9.10 switchport`	Creates a L2 sub-interface as xe9.10
`(config-if)#encapsulation dot1q 10`	Configure the encapsulation as dot1q matching vlan 10
`(config-if)#access-if-vpws`	Configure access-if-vpws on interface mode
`(config-acc-if-vpws)#mpls-l2-circuit VPLS-200-3 primary`	Configure the VC for PE-1 In this example, VPLS-200-3 is the VC name
`(config-acc-if-vpws)#mpls-l2-circuit VPLS-100-1 secondary`	Configure the VC for PE-1 In this example, VPLS-200-3 is the VC name
`(config-acc-if-vpws)#vc-mode revertive`	Configured the vc-mode revertive

PE-2

`#configure terminal`	Enter configure mode.
`(config)# mpls l2-circuit VPLS-200-3 30000200 1.1.1.1`	Configure the VC for PE-1. In this example, VPLS-200-3 is the VC name, 30000200is the VC ID, and 1.1.1.1is the VC endpoint IP address.
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)#interface xe9.10 switchport`	Creates a L2 sub-interface as xe9.10
`(config-if)#encapsulation dot1q 10`	Configure the encapsulation as dot1q matching vlan 10
`(config-if)#access-if-vpws`	Configure access-if-vpws on interface mode
`(config-acc-if-vpws)#mpls-l2-circuit VPLS-200-3 primary`	Configure the VC for PE-12 In this example, VPLS-200-3 is the VC name.

PE-3

`#configure terminal`	Enter configure mode.
`(config)# mpls l2-circuit VPLS-200-3 30000200 1.1.1.1`	Configure the VC for PE-1. In this example, VPLS-200-3 is the VC name, 30000200is the VC ID, and 1.1.1.1is the VC endpoint IP address.
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)#interface xe6.100 switchport`	Creates a L2 sub-interface as xe6.100

(config-if)#encapsulation dot1q 100	Configure the encapsulation as dot1q matching vlan 100
(config-if)#access-if-vpws	Configure access-if-vpws on interface mode
(config-acc-if-vpws)# mpls-l2-circuit VPLS-100-1 primary	Configure the VC for PE-12 In this example, VPLS-100-1 is the VC name

Validation

```
   PE1#sh ldp session
      Codes: m - MD5 password is not set/unset.
       g - GR configuration not set/unset.
       t - TCP MSS not set/unset.
       Session has to be cleared manually

Code  Peer IP Address      IF Name    My Role    State      KeepAlive  UpTime
       2.2.2.2            xe6        Passive   OPERATIONAL   30    02:30:38
       3.3.3.3            xe1        Passive   OPERATIONAL   30    02:30:40

CHAPTER 20 Deep Packet Inspection

Overview

Deep Packet Inspection (DPI) performs a granular check on the inner headers beyond the MPLS bottom of the label stack (BOS) to load-balance the network traffic. The load balancing key is generated after deep analysis of the MPLS header.

The DPI can be configured in the Qumran1 series platforms, and a system reboot is required after enabling and disabling the feature. In Qumran2 series platforms, it is always enabled by default.

Benefits

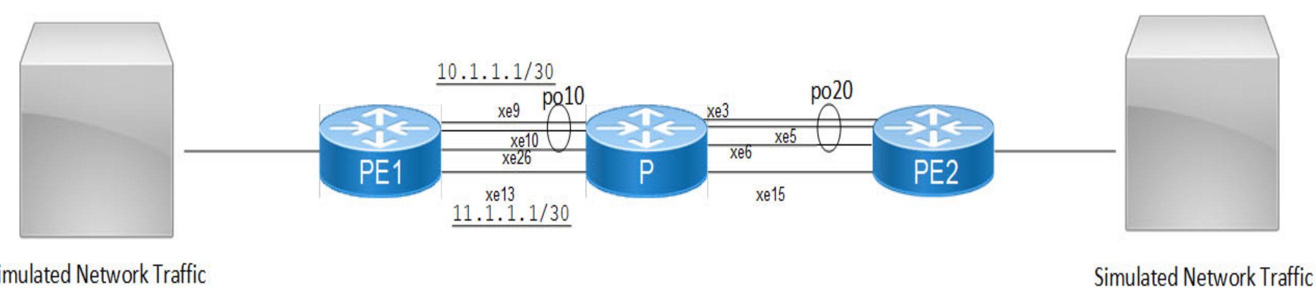
The DPI feature optimizes network performance by preventing traffic congestion by distributing traffic across available pathways.

Configuration

This section shows the configuration of the DPI.

Topology

In this topology, the traffic flows from one Provider Edge (PE1) to another Provider Edge router (PE2) through a transit Provider router (P). From P to PE2, there is a Link Aggregation Group (LAG) consisting of `xe3`, `xe5`, and `xe6` and a physical interface connection through `xe15`. When DPI is enabled, the traffic is load-balanced through the ECMP next-hops `po` and (`xe15`) and also among the LAG member ports (`xe3`, `xe5`, and `xe6`).



T

Figure 20-10: DPI Configuration

Configuring DPI

Follow the steps to configure the DPI on Qumran1 series platforms.

PE1

1. Configure IP address secondary on loopback.

```
(config)#interface lo
(config-if)#ip address 3.3.3.3/32 secondary
```

2. Configure prefix SID on the loopback interface to add the prefix SID global block to forward the packet.

```
(config)#interface lo
(config-if)#prefix-sid index 3 no-php
```

3. Configure the ISIS on the node with some paths having the Link Aggregation Group (LAG) member port. This allows the DPI feature to run on the LAG member ports.

```
(config)#interface po10
(config-if)#load-interval 30
(config-if)#ip address 10.1.1.1/30
(config-if)#mtu 9216
(config-if)#label-switching
(config-if)#ip router isis 1
(config-if)#isis wide-metric 50
(config-if)#exit
(config)#interface xe9
(config-if)#channel-group 10 mode active
(config-if)#exit
(config)#interface xe10
(config-if)#channel-group 10 mode active
(config-if)#exit
(config)#interface xe26
(config-if)#channel-group 10 mode active
(config-if)#exit
```

4. Configure the ISIS on the physical interface.

```
(config)#interface xe13
(config-if)#load-interval 30
(config-if)#ip address 11.1.1.1/30
(config-if)#mtu 9216
(config-if)#label-switching
(config-if)#ip router isis 1
(config-if)#isis wide-metric 50
```

5. Configure router ISIS on the loopback interface to advertise it.

```
(config-if)#interface lo
(config-if)#ip router isis 1
(config-if)#exit
```

6. Configure the router ISIS sessions to establish the neighborship between the routers.

```
(config)#router isis 1
(config-router)#is-type level-1-2
(config-router)#metric-style wide
(config-router)#mpls traffic-eng router-id 3.3.3.3
(config-router)#mpls traffic-eng level-1
(config-router)#mpls traffic-eng level-2
(config-router)#capability cspf
(config-router)#bfd all-interfaces
(config-router)#net 49.0001.0000.0001.0003.00
(config-router)#passive-interface lo
```

7. Enable the Segment Routing (SR), SR entropy, and Topology Independent Loop Free Alternate (TILFA).

```
(config)#router isis 1
(config-router)#fast-reroute ti-lfa level-1 proto ipv4
(config-router)#fast-reroute ti-lfa level-2 proto ipv4
(config-router)#isis segment-routing global block 20000 23000
(config-router)#segment-routing entropy-label
(config-router)#segment-routing mpls
```

8. Configure any of the MPLS services. In this configuration, we are configuring L3VPN service.

```
(config)#ip vrf 1001
(config-vrf)#rd 3.3.3.3:1001
(config-vrf)#route-target both 1001:1001
(config-vrf)#exit
(config)#interface xe6.1001
(config-if)#encapsulation dot1q 1001
(config-if)#load-interval 30
(config-if)#ip vrf forwarding 1001
(config-if)#ip address 201.1.1.1/24
(config-if)#ipv6 address 201::1/64
(config-if)#mtu 9216
(config-if)#exit
(config)#router bgp 65010
(config-router)#bgp router-id 3.3.3.3
(config-router)#neighbor 6.6.6.6 remote-as 65010
(config-router)#neighbor 6.6.6.6 update-source lo
(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 6.6.6.6 activate
(config-router-af)#exit-address-family
(config-router)# address-family vpnv6 unicast
(config-router-af)#neighbor 6.6.6.6 activate
(config-router-af)exit-address-family
(config-router)#address-family ipv4 vrf 1001
(config-router-af)redistribute connected
(config-router-af)neighbor 201.1.1.2 remote-as 65011
(config-router-af)neighbor 201.1.1.2 activate
(config-router-af)exit-address-family
(config-router)#address-family ipv6 vrf 1001
(config-router-af)#redistribute connected
(config-router-af)#neighbor 201::2 remote-as 65011
(config-router-af)#neighbor 201::2 activate
(config-router-af)#exit-address-family
```

9. Enable the SR Equi-Cost-Multiple-Path (ECMP) Forwarding Table Notification (FTN) to load-balance the traffic within the LAG and physical ports.

```
(config)#mpls ftn-ecmp sr
```

10. Enable the DPI on Qumran1 series platforms.

```
(config)#advanced parser enable
```

Note: DPI is enabled by default on Qumran2 series platforms.

P

1. Configure IP address secondary on the loopback.

```
P(config)#interface lo
(config-if)#ip address 2.2.2.2/32 secondary
```

2. Configure prefix SID on the loopback interface to add the prefix SID global block to forward the packet.

```
(config)#interface lo
(config-if)#prefix-sid index 2 no-php
```

3. Configure the ISIS on the node with some paths having the Link Aggregation Group (LAG) member port. This allows the DPI feature to run on the LAG member ports.

```
(config)#interface po10
(config-if)#load-interval 30
(config-if)#ip address 10.1.1.2/30
```

```
(config-if)#mtu 9216
(config-if)#label-switching
(config-if)#ip router isis 1
(config-if)#isis wide-metric 50
(config-if)#exit
(config)#interface xe9
(config-if)#channel-group 10 mode active
(config-if)#exit
(config)#interface xe10
(config-if)#channel-group 10 mode active
(config-if)#exit
(config)#interface xe26
(config-if)#channel-group 10 mode active
(config-if)#exit
```

4. Configure the ISIS on the physical interface.

```
(config)#interface xe13
(config-if)#load-interval 30
(config-if)#ip address 11.1.1.2/30
(config-if)#mtu 9216
(config-if)#label-switching
(config-if)#ip router isis 1
(config-if)#isis wide-metric 50
```

5. Configure router ISIS on the loopback interface to advertise it.

```
(config-if)#interface lo
(config-if)#ip router isis 1
(config-if)#exit
```

6. Configure the router ISIS sessions to establish the neighborship between the routers.

```
(config)#router isis 1
(config-router)#is-type level-1-2
(config-router)#metric-style wide
(config-router)#mpls traffic-eng router-id 2.2.2.2
(config-router)#mpls traffic-eng level-1
(config-router)#mpls traffic-eng level-2
(config-router)#capability cspf
(config-router)#bfd all-interfaces
(config-router)#net 49.0001.0000.0001.0002.00
(config-router)#passive-interface lo
```

7. Enable the SR, SR entropy, and TILFA.

```
(config)#router isis 1
(config-router)#fast-reroute ti-lfa level-1 proto ipv4
(config-router)#fast-reroute ti-lfa level-2 proto ipv4
(config-router)#isis segment-routing global block 20000 23000
(config-router)#segment-routing entropy-label
(config-router)#segment-routing mpls
```

8. Enable the SR ECMP Incoming Label Map (ILM).

```
(config)#mpls ilm-ecmp sr
```

9. Enable the DPI on Qumran1 series platforms.

```
(config)#advanced parser enable
```

Note: DPI is enabled by default on Qumran2 series platforms.

PE2

1. Configure IP address secondary on the loopback interface
```
(config)#interface lo
(config-if)#ip address 6.6.6.6/32 secondary
```
2. Configure prefix SID on the loopback interface to add the prefix SID global block to forward the packet.
```
(config)#interface lo
(config-if)#prefix-sid index 6 no-php
```
3. Configure the ISIS on the node with some paths having the Link Aggregation Group (LAG) member port. This allows the DPI feature to run on the LAG member ports.
```
(config)#interface po20
(config-if)#load-interval 30
(config-if)#ip address 12.1.1.2/30
(config-if)#mtu 9216
(config-if)#label-switching
(config-if)#ip router isis 1
(config-if)#isis wide-metric 100
(config-if)#exit
(config)#interface xe3
 (config-if)#channel-group 10 mode active
(config-if)#exit
(config)#interface xe5
(config-if)#channel-group 10 mode active
(config-if)#exit
(config)#interface xe6
(config-if)#channel-group 10 mode active
(config-if)#exit
```
4. Configure the ISIS on the physical interface.
```
(config)#interface xe15
(config-if)#load-interval 30
(config-if)#ip address 13.1.1.2/30
(config-if)#mtu 9216
(config-if)# label-switching
(config-if)#ip router isis 1
(config-if)#isis wide-metric 100
```
5. Configure router ISIS on the loopback interface to advertise it.
```
(config-if)#interface lo
(config-if)#ip router isis 1
(config-if)#exit
```
6. Configure the router ISIS sessions to establish the neighborship between the routers.
```
(config)#router isis 1
(config-router)#is-type level-1-2
(config-router)#metric-style wide
(config-router)#mpls traffic-eng router-id 6.6.6.6
(config-router)#mpls traffic-eng level-1
(config-router)#mpls traffic-eng level-2
(config-router)#capability cspf
(config-router)#bfd all-interfaces
(config-router)#net 49.0001.0000.0001.0006.00
(config-router)#passive-interface lo
```
7. Enable the SR, SR entropy, and TILFA.
```
(config)#router isis 1
```

```
(config-router)#fast-reroute ti-lfa level-1 proto ipv4
(config-router)#fast-reroute ti-lfa level-2 proto ipv4
(config-router)#isis segment-routing global block 20000 23000
(config-router)#segment-routing entropy-label
(config-router)#segment-routing mpls
```

8. Configure any of the MPLS services. In this configuration, we are configuring L3VPN service.

```
(config)#ip vrf 1001
(config-vrf)#rd 6.6.6.6:1001
(config-vrf)#route-target both 1001:1001
(config-vrf)#exit
(config)#interface xe2.1001
(config-if)#encapsulation dot1q 1001
(config-if)#load-interval 30
(config-if)#ip vrf forwarding 1001
(config-if)#ip address 101.1.1.1/24
(config-if)#ipv6 address 101::1/64
(config-if)#mtu 9216
(config-if)#exit
(config)#router bgp 65010
(config-router)#bgp router-id 6.6.6.6
(config-router)#neighbor 3.3.3.3 remote-as 65010
(config-router)#neighbor 3.3.3.3 update-source lo
(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 3.3.3.3 activate
(config-router-af)#exit-address-family
(config-router)#address-family vpnv6 unicast
(config-router-af)#neighbor 3.3.3.3 activate
(config-router-af)#exit-address-family
(config-router)#address-family ipv4 vrf 1001
(config-router-af)#redistribute connected
(config-router-af)#neighbor 101.1.1.2 remote-as 65011
(config-router-af)#neighbor 101.1.1.2 activate
(config-router-af)#exit-address-family
(config-router)# address-family ipv6 vrf 1001
(config-router-af)#redistribute connected
(config-router-af)#neighbor 101::2 remote-as 65011
(config-router-af)#neighbor 101::2 activate
(config-router-af)#exit-address-family
```

9. Enable the SR ECMP FTN to load-balance the traffic within the LAG and physical ports.

```
(config)#mpls ftn-ecmp sr
```

10. Enable the DPI on Qumran1 series platforms.

```
(config)#advanced parser enable
```

Note: DPI is enabled by default on Qumran2 series platforms.

Running configurations

The running configuration for the PE1 is as follows:

```
#show running-config

DPI Command

The DPI feature introduces the following configuration command.

advanced parser enable

Use this command to enable the DPI on Qumran1 series platforms.

Command Syntax

```
advanced parser enable
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.3 and applicable to Qumran1 series platforms.

Example

This example shows how to enable the DPI on Qumran1 series platforms:

```
OcNOS#configure terminal
OcNOS#(config)#advanced parser enable
OcNOS#(config)#commit
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
ECMP	Equal-Cost-Multiple-Path (ECMP) is a network routing technique that uses multiple paths when the paths have equal cost for packet transfer.
FTN	FEC to NHLFE Map is a networking concept that maps the incoming packet to the relevant routing path using the forwarding table.
ILM	Incoming Label Map (ILM) is a networking concept that checks the incoming packet labels and identifies the appropriate outgoing labels for the next hop.
ISIS	Intermediate System to Intermediate System (IS-IS) is an Interior Gateway Protocol used in computer networks to route data within an autonomous system.
LAG	Link Aggregation Group (LAG) is a collection of multiple network connections into a single logical link. This networking technique enhances bandwidth, provides redundancy, and improves fault tolerance.
MPLS	Multi-Protocol Label Switching (MPLS) is a networking protocol that labels the packet to direct traffic through a network.
MPLS header	MPLS header is a 32-bit header containing 20-bit MPLS label value and other related information.
SR	Segment routing is a technique where the sender of a packet can partially or entirely specify a route in a network through which a packet is sent. It is a form of source routing where nodes and links are represented as segments.
SR entropy	Segment Routing Entropy is a mechanism in SR that enables load-balancing across multiple paths.
TILFA	Topology Independent Loop Free Alternate (TILFA) paths are redundant backup paths that transfer the data packet without looping back to the source.

CHAPTER 21 Bridge Virtual Interface (BVI) Over L3VPN

Overview

A Bridge Virtual Interface (BVI) is a virtual interface on a router that acts like a routed interface and is associated with a single bridge domain.

BVI Interface acts as L3 routed interface gateway between bridge domain and L3VPN for traffic exchange. The incoming tagged packet from the L2 sub-interface consolidated itself into a bridge domain. The bridge domain in turn uses the BVI interface to forward the IP traffic to the L3VPN tunnel.

Characteristics of BVI Over L3VPN

- The BVI functions as an L3 routed interface for a bridge domain, allowing IP traffic from L2 subinterfaces within the domain to be routed to L3VPN tunnels.
- L2 subinterfaces can be grouped into a bridge domain under the BVI. The BVI aggregates traffic from multiple subinterfaces within the same domain and routes it as required.
- The BVI remains operationally “up” as long as at least one of the subinterfaces in the bridge domain is active.
- BVI supports unicast forwarding of IPv4 traffic between other L3 interfaces and L3VPNs. The BVI can function as a DHCP server or relay for IP address allocation within the network.

Benefits

- The BVI enables seamless communication between L2 bridge domains and L3 networks (e.g., L3VPN), allowing for flexible traffic forwarding between the two layers.
- The BVI serves as an L3 gateway for M-plane traffic, routing it efficiently to L3VPN tunnels for further processing or external routing.
- The BVI remains operational even if only one subinterface is active, ensuring high availability and fault tolerance.

Limitations

- Only Q2-based platforms are supported.
- Everything related to ipv6 is not supported
- L2 sub interfaces support only pop and pop2-tag vlan rewrite translations and for the purpose of bridge-domain support, all member L2 sub interfaces should have relevant rewrite configurations to make sure that all traffic for bridge-domain has uniform encapsulation.
- The dot1q and dot1ad encapsulations with range are not supported for the BVI.
- BVI is a generic L3 interface and allows users to configure any / all existing OcNOS features. However, only a few of these are supported in release 6.6.0 and those are IP address related, VRF, any routing protocol specific commands (OSPF/IS-IS/BGP related), MTU, DHCP server/relay, Ingress/Egress ACL and QoS commands related to marking.
- L3 ACL applied at BVI is only relevant for routed traffic. Bridged traffic between L2 sub-interfaces will not be subjected to L3 ACL configured at BVI.
- No Interface counters are supported for BVI Interface.
- BVI can’t be used as a network interface for all transports in MPLS core network.

© 2025 IP Infusion Inc. Proprietary

- For QoS, only marking related CLIs are supported. Policing, rate limiting, shaping and other queuing features are not supported at BVI level. However, existing QoS scheduling and queuing features on other interfaces can be used in conjunction with the BVI interface.
- VRRP over the BVI interface is not supported.
- TWAMP support along with QoS shaping and Queuing for BVI is planned for future releases.
- BUM traffic is not supported.

Prerequisites

- Define Interfaces and Loopback Addresses:
  Configure Layer 2 interfaces, like port channel interfaces (e.g., po1), and assign specific IP addresses for proper identification and routing. Additionally, assign loopback IP addresses to establish essential points of connectivity. These configurations establish efficient network routing and communication.

```
interface lo
 ip address 127.0.0.1/8
 ip address 135.1.1.27/32 secondary
 ipv6 address ::1/128

interface po6
ip address 10.1.1.1/30
interface xe6
channel-group 6 mode active
```

- Configure IGP for Dynamic Routing:
  Enable ISIS to facilitate dynamic routing on all nodes within the network. Define ISIS router instances to match loopback IP addresses and add network segments to ISIS areas for proper route distribution.Set up neighbor relationships using loopback IP addresses, ensuring efficient route advertisement and convergence for optimal network performance.
  - ISIS Configuration:

```
router isis 1
 is-type level-2-only
 metric-style wide
 mpls traffic-eng router-id 10.12.183.1
 mpls traffic-eng level-2
 capability cspf
 dynamic-hostname
 fast-reroute ti-lfa level-2 proto ipv4
 net 49.0000.0000.0027.00
 passive-interface lo

interface po6
 isis network point-to-point
 ip router isis 1
```

  - OSPF Configuration:

```
router ospf 100
ospf router-id 10.12.183.1
network 10.12.183.1/32 area 0.0.0.0
network 10.1.1.0/24 area 0.0.0.0
network 10.1.1.0/24 area 0.0.0.0
```

- Configure LDP for Label Transport:
  Configure label-switching on all the nodes to help exchange the network packets at a lower lever rather than the traditional network layer and enable ldp to transport those labels.

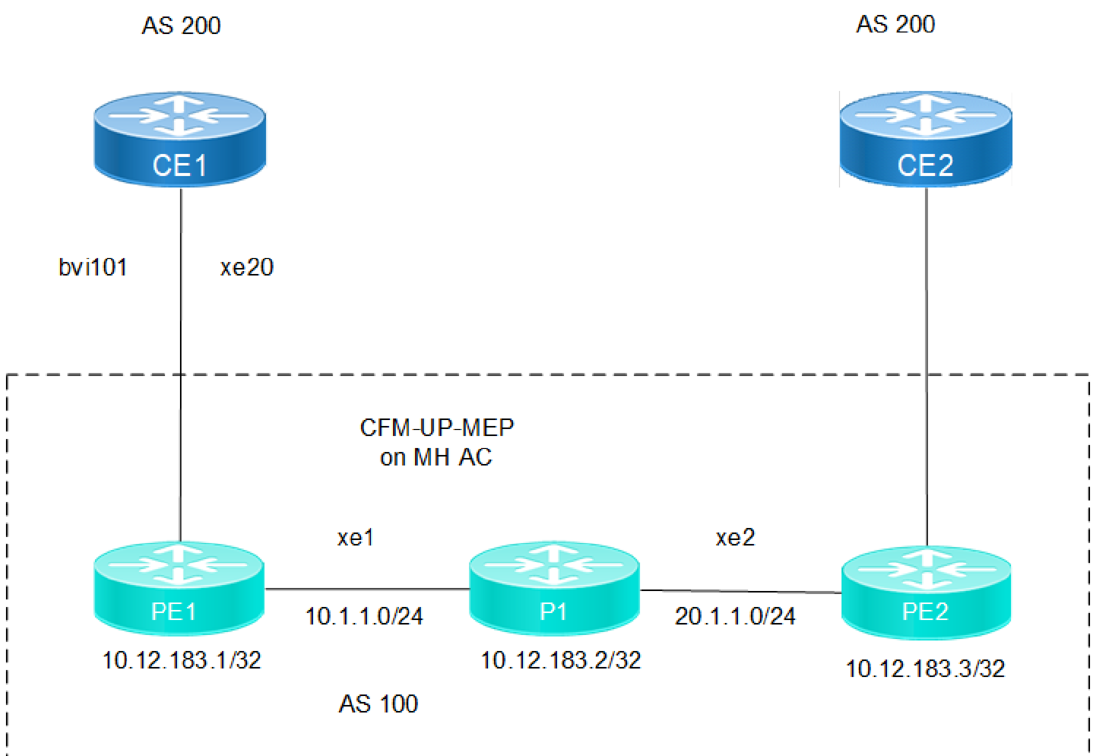
```
router ldp
targeted-peer ipv4 10.12.183.3
exit-targeted-peer
transport address ipb4 10.12.183.1

Interface po6
label-switching
enable-ldp ipv4
```

Configuration

Topology

The sample topology includes Edge nodes (PE1 and PE2), core Node (P1), and Customer Edge nodes (CE1 and CE2).



BVI Interface Topology

CE1

1. Set up the interface with VLAN encapsulation and assign an IP address.

```
CE1(config)#interface xe20.101
CE1(config-if)#encapsulation dot1q 101
CE1(config-if)#ip address 101.0.1.2/24
CE1(config-if)#exit
```

2. Configure BGP with a neighbor in the same AS (200).

```
CE1(config)# router bgp 200
CE1(config-router)# neighbor 101.0.1.1 remote-as 100
CE1(config-router)#address-family ipv4 unicast
CE1(config-router-af)#neighbor 101.0.1.1 activate
CE1(config-router-af)#exit-address-family
CE1(config-router)#exit
```

PE1

1. Create a VRF instance (VRF101) and define route targets.

```
PE1(config)# ip vrf VRF101
PE1(config-vrf)# rd 10.12.183.1:100
PE1(config-vrf)# route-target both 100:101
PE1(config-vrf)# exit
```

2. Configure the access port with VLAN encapsulation and enable rewriting.

```
PE1(config)#interface xe20.101 switchport
PE1(config-if)#encapsulation dot1q 101
PE1(config-if)#rewrite pop
PE1(config-if)# exit
```

3. Set up a BVI (Bridge Virtual Interface) for VRF forwarding.

```
PE1(config)# interface bvi101
PE1(config-if)#ip vrf forwarding VRF101
PE1(config-if)#ip address 101.0.1.1/24
PE1(config-f)# exit
```

4. Configure BGP with internal (PE) and external (CE) neighbors.

```
PE1(config)# router bgp 100
PE1(config-router)# neighbor 10.12.183.3 remote-as 100
PE1(config-router)# neighbor 10.12.183.3 update-source lo
PE1(config-router)#address-family ipv4 unicast
PE1(config-router-af)#neighbor 10.12.183.3 activate
PE1(config-router-af)#exit-address-family
PE1(config-router)#address-family vpnv4 unicast
PE1(config-router-af)#neighbor 10.12.183.3 activate
PE1(config-router-af)#exit-address-family
```

5. Enable VPNv4 and redistribute connected routes.

```
PE1(config-router)#address-family ipv4 vrf VRF101
PE1(config-router-af)#redistribute connected
PE1(config-router-af)#neighbor 101.0.1.2 remote-as 200
PE1(config-router-af)# neighbor 101.0.1.2 activate
PE1(config-router-af)#exit-address-family
PE1(config-router)#exit
```

6. Set up a bridge domain to associate the interface with BVI.

```
PE1(config)# bridge-domain 101
PE1(config)#interface xe20.101
PE1(config)#routed-interface bvi101
```

PE2

1. Create the same VRF instance (VRF101) with route targets.

```
PE2(config)# ip vrf VRF101
PE2(config-vrf)# rd 10.12.183.3:100
PE2(config-vrf)# route-target both 100:101
PE2(config-vrf)#exit
```

2. Configure the access port with VLAN encapsulation and VRF forwarding.

```
PE2(config)# interface xe30.101
PE2(config-if)#encapsulation dot1q 101
PE2(config-if)#ip vrf forwarding VRF101
```

```
PE2(config-if)#ip address 103.0.1.1/24
PE2(config-f)# exit
```

3. Assign an IP address to the interface.

```
PE2(config)# router bgp 100
PE2(config-router)# neighbor 10.12.183.1 remote-as 100
PE2(config-router)# neighbor 10.12.183.1 update-source lo
PE2(config-router)#address-family ipv4 unicast
PE2(config-router-af)#neighbor 10.12.183.1 activate
PE2(config-router-af)#exit-address-family
```

4. Configure BGP with internal (PE) and external (CE) neighbors.

```
PE2(config-router)#address-family vpnv4 unicast
PE2(config-router-af)#neighbor 10.12.183.1 activate
PE2(config-router-af)#exit-address-family
```

5. Enable VPNv4 and redistribute connected routes.

```
PE2(config-router)#address-family ipv4 vrf VRF101
PE2(config-router-af)#redistribute connected
PE2(config-router-af)#neighbor 103.0.1.2 remote-as 200
PE2(config-router-af)# neighbor 103.0.1.2 activate
PE2(config-router-af)#exit-address-family
PE2(config-router)#exit
```

CE2

1. Set up the interface with VLAN encapsulation and assign an IP address.

```
CE2#configure terminal
CE2(config)#interface xe30.101
CE2(config-if)#encapsulation dot1q 101
CE2(config-if)#ip address 103.0.1.2/24
CE2(config-if)#exit
```

2. Configure BGP with a neighbor in the same AS (200).

```
CE2(config)# router bgp 200
CE2(config-router)# neighbor 101.0.1.1 remote-as 100
CE2(config-router)#address-family ipv4 unicast
CE2(config-router-af)#neighbor 101.0.1.1 activate
CE2(config-router-af)#exit-address-family
CE2(config-router)#exit
```

Validation

PE1

To Verify the L2 interfaces and BVI interface attached on a bridge domain:

```
PE1#show running-config bridge-domain
bridge-domain 101
Interface xe20.101
routed-interface bvi101
```

To Verify the link status of L2 Interfaces attached to bridge-domain:

```
PE1#show bridge-domain

Total number of bridge-domains Configured: 1

Bridge Id  interfaces       Status
----------+----------------+-----------
 101         xe20.101         UP
```

To Verify the link status of the BVI interface:

```
PE1#show ip interface bvi101 brief

'*' - address is assigned by dhcp client

```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
BUM	Broadcast, Unknown, Multicast
BVI	Bridge Virtual Interface
L3VPN	Layer 3 Virtual Private Network
IGP	Interior Gateway Protocol
ISIS	Intermediate System to Intermediate System
OSPF	Open Shortest Path First
LDP	Label Distribution Protocol

CHAPTER 22 EVPN EPL Link-Loss Forwarding

Overview

Link Loss Forwarding (LLF) is a fault propagation feature for EVPN Ethernet Private Line (EPL) services that ensures reliable point-to-point connections on physical interfaces. It prevents traffic blackholing by detecting remote service failures and bringing the local physical link operationally down, enabling the local end to trigger a traffic failover mechanism. LLF is supported on all Broadcom chipsets and uses Ethernet Auto-Discovery (AD) per EVI (RT-1) route withdrawal for fault propagation, which is enabled by default.

The feature can be configured per service using the CLI command llf enable in interface mode. By facilitating proactive fault handling, LLF ensures minimal downtime, improves service reliability, and enhances traffic management for customers relying on point-to-point connections.

Feature Characteristics

Link Loss Forwarding (LLF) enhances the reliability of EVPN Ethernet Private Line (EPL) connections by detecting remote failures, bringing the local link down to initiate failover, and preventing traffic blackholing. It ensures prompt communication of service interruptions to minimize downtime and prevent data loss.

Benefits

LLF enhances networking environments by ensuring minimal service downtime, reliable traffic failover, and increased network stability.

- **Minimized Service Downtime**: Quick detection and propagation of faults reduce recovery time.
- **Traffic Failover Assurance**: Reliable failover mechanisms are enabled, ensuring minimal impact on customer services.
- **Improved Network Reliability**: The proactive nature of LLF enhances the robustness of EVPN EPL services.

Configuration of LLF for an EVPN Ethernet Private Line (EPL)

To configure LLF on an interface, follow the below steps to ensure that network faults are managed effectively, preventing traffic loss or blackholing by administratively adjusting the status of affected interfaces based on the fault condition.

Topology

The topology consists of two Customer Edge devices (CE1 and CE2) connected to Provider Edge devices (PE1 and PE2) through sub-interfaces. The Provider Edge devices are interconnected through MPLS. In this topology, the Link Loss Forwarding (LLF) configuration for an EVPN Ethernet Private Line (EPL) service ensures fault propagation to prevent traffic blackholing during link failures. When a link failure occurs, such as between CE-1 and PE-1 on interface xe1.1, PE-1 detects the issue and withdraws the Ethernet Auto-Discovery (AD) per EVI (RT-1) route. This withdrawal is propagated through the MPLS network to PE-2, which then takes action to bring down the corresponding physical interface (xe22.2). This mechanism ensures the fault is communicated end-to-end, allowing CE-2 to detect the failure and trigger failover mechanisms. LLF is enabled through the LLF enable command at the interface level, ensuring automated fault detection and seamless service continuity.

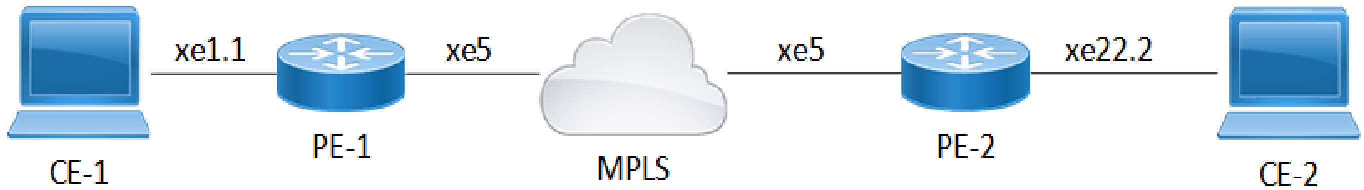

Figure 22-11: Link-loss Forwarding Topology

Configuration XE22.2

Follow these steps to configure LLF on PE2.

1. Access the interface configuration mode, configure the interface xe22.2. Set the interface as a switch port.
```
PE2(config)#configure terminal
PE2(config)#int xe22.2 sw
```
2. Specify the encapsulation type as dot1q and set the VLAN ID to 10. Enable the interface to support EVPN services.
```
PE2(config-if)#encapsulation dot1q 10
PE2(config-if)#access-if-evpn
```
3. Enable LLF on the interface to ensure link failure detection and recovery. Save the changes and exit the configuration mode.
```
PE2(config-acc-if-evpn)#llf-enable
PE2(config)#commit
PE2(config)#exit
```

Validation

To validate the proper configuration of Link Loss Forwarding (LLF), use the show running-config interface xe22.2 command to inspect the interface settings. Ensure that the interface is configured with switchport, encapsulation dot1q 10 for VLAN tagging, access-if-evpn to enable EVPN on the interface, llf-enable to activate LLF, and map vpn-id 10 to associate the service with the correct VPN ID. Verify that these attributes are present and correctly configured. If discrepancies are found, update the configuration and recheck to ensure the LLF setup is correct and operational.

```
#show running-config interface xe22.2
interface xe22.2 switchport
 encapsulation dot1q 10
 access-if-evpn
  llf-enable
  map vpn-id 10
!
Rvtep#sh evpn mpls llf-status
status : is_up\is_running
```

```

New CLI Commands

The llf introduces the following configuration commands in OcNOS.

llf-enable

Use this command to enable the link-loss forwarding on an access-interface.

Use the no parameter to disable the load interval globally.

Command Syntax

```
llf-enable
no llf-enable
```

Parameters

None

Default

Disabled

Command Mode

Access-if mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

The following example illustrates how to activate EVPN Ethernet Private Line (EPL).

```
#configure terminal
(config)#int xe22.2 sw
(config-if)#encapsulation dot1q 10
(config-if)#access-if-evpn
(config-acc-if-evpn)#llf-enable
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

© 2025 IP Infusion Inc. Proprietary

Key Terms/Acronym	Description
LLF	Link Loss Forwarding (LLF) is a feature in networking, particularly in Ethernet-based networks like Ethernet Virtual Private Network (EVPN), that is designed to prevent traffic blackholing during link failures.
EPL	Ethernet Private Line (EPL) is a high-performance, point-to-point Ethernet service used for dedicated connectivity between two locations.
MPLS	Multiprotocol Label Switching (MPLS) is a high-performance routing technique used in modern telecommunications networks to efficiently route data packets.

- show vccv statistics
- srlg-disjoint

bandwidth

Use this command to specify the maximum bandwidth to be used for a band-class. The bandwidth value is in bits.

Note: Run this command in the Bandwidth-class mode (refer to mpls bandwidth-class).

Command Syntax

```
bandwidth BANDWIDTH setup-priority <0-7> hold-priority <0-7>
```

Parameter

BANDWIDTH	<1-999>k for 1 to 999 kilo bits/s
	<1-999>m for 1 to 999 mega bits/s
	<1-100>g for 1 to 100 giga bits/s
setup-priority	Indicate the setup-priority parameter
<0-7>	The actual setup priority value
hold-priority	Indicate the hold-priority parameter
<0-7>	The actual hold priority value

Default

By default, bandwidth priority is 0

Command Mode

Bandwidth-class mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls bandwidth-class new-BC
(config-mpls-bw)#bandwidth 100m setup-priority 1 hold-priority 1
```

© 2025 IP Infusion Inc. Proprietary

control-word

Use this command to enable control word for the MPLS layer-2 virtual circuit.

Use the no parameter with this command to disable control word from the MPLS layer-2 virtual circuit.

Command Syntax:

```
control-word
no control-word
```

Parameters

NA

Default

By default, control-word is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)#control-word
```

clear mpls counters ldp

Use this command to clear traffic statistics for FTNs and ILMs configured by LDP.

Command Syntax

```
clear mpls counters ldp ((ftn (|A.B.C.D/M)) | (ilm (|A.B.C.D/M)) |)
```

Parameter

`ftn`	FEC-to-NHLFE map counters
`A.B.C.D/M`	FEC prefix
`ilm`	Incoming label map counters
`A.B.C.D/M`	FEC prefix

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear mpls counters ldp
```

clear mpls counters rsvp

Use this command to clear traffic statistics for LSPs configured by RSVP.

Command Syntax

```
clear mpls counters rsvp ((tunnel-name NAME) | (tunnel-id TUNNEL_ID) | (node-role
  (ingress | transit | egress)) |)
```

Parameter

`NAME`	RSVP tunnel name
`TUNNEL_ID`	RSVP tunnel identifier
`ingress`	LSP role is ingress
`transit`	LSP role is transit
`egress`	LSP role is egress

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear mpls counters rsvp
```

clear mpls counters static

Use this command to clear traffic statistics for statically configured FTNs and ILMs.

Command Syntax

```
clear mpls counters static ((ftn (|A.B.C.D/M)) | (ilm (|A.B.C.D/M)) |)
```

Parameter

`ftn`	FEC-to-NHLFE map counters
`A.B.C.D/M`	FEC prefix
`ilm`	Incoming label map counters
`A.B.C.D/M`	FEC prefix

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear mpls counters static
```

© 2025 IP Infusion Inc. Proprietary

clear mpls l2-circuit statistics

Use this command to clear MPLS traffic statistics for l2 circuit.

Command Syntax

```
clear mpls l2-circuit NAME statistics(access-port|network-port|)
```

Parameters

`name`	Name of L2 circuit
`access-port`	Displays the access port statistics
`network-port`	Displays the network port statistics

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear mpls l2-circuit vcl statistics
```

flow-label

Use this command to to enable flow-label transmit, receive or both for the MPLS layer-2 virtual circuit and mpls vpls on dynamic and static VPWS and VPLS.

Use `no` command to disable flow-label transmit, receive or both for the MPLS layer-2 virtual circuit and mpls vpls on dynamic and static VPWS and VPLS.

For signaling flow-label capability in an RFC-compliant (RFC6391/8077) way using "The PWid FEC Element " = 0x80 when all Interface Parameter Sub-TLV is part of PWid FEC Element to support interop with other vendors, then interface-param-tlv can be used.

Command Syntax

```
flow-label (both|receive|transmit)(static|interface-param-tlv|)
no flow-label(static|interface-param-tlv|)
```

Parameters

`both`	flow label direction both (transmit and receive)
`receive`	flow label direction receive
`transmit`	flow label direction transmit
`static`	flow-label static
`interface-param-tlv`	ldp specific interface parameter tlv

Command Mode

config-pseudowire mode and config-vpls mode

Applicability

This command was introduced in OcNOS version 6.0.0 and added parameter `interface-param-tlv` in OcNOS version 6.3.0 to support interop with other vendors.

Example

For the config-pseudowire mode:

```
# configure terminal
(config)#mpls l2-circuit vc1111 1111 7.7.7.7
(config-pseudowire)#flow-label transmit

# configure terminal
(config)#mpls l2-circuit vc1111 1111 7.7.7.7
(config-pseudowire)#no flow-label
```

For the config-vpls mode:

```
# configure terminal
(config)#mpls vpls test 100
(config-vpls)# flow-label both

# configure terminal
(config)#mpls vpls test 100
(config-vpls)# no flow-label
```

For the static configuration:

```
# configure terminal
(config)#mpls l2-circuit vc1111 1111 7.7.7.7
(config-pseudowire)#flow-label transmit static
```

For the config-vpls mode:

```
# configure terminal
(config)#mpls vpls test 100
(config-vpls)# flow-label both static

# configure terminal
(config)#mpls vpls test 100
(config-vpls)# no flow-label static
```

For the un-configuration of the static flow label:

For the config-pseudowire mode:

```
# configure terminal
(config)#mpls l2-circuit vc1111 1111 7.7.7.7
(config-pseudowire)#no flow-label static
```

© 2025 IP Infusion Inc. Proprietary

group-id

Use this command to configure a specific group identifier to existing group with a group name in the MPLS layer-2 virtual circuit.

Use the no parameter with this command to remove group identifier from the MPLS layer-2 virtual circuit

Command Syntax

```
group-id <1-4294967295>
no group-id
```

Parameters

`<1-4294967295>` Value for group identifier

Default

By default, group-id is disabled. If group-name is configured, default group-id is the first available identifier.

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)#group-name group-1
(config-pseudowire)#group-id 11
```

group-name

Use this command to map the MPLS layer-2 virtual circuit with a specific group.

Use the no parameter with this command to remove group from the MPLS layer-2 virtual circuit

Command Syntax

```
group-name NAME
no group-name
```

Parameters

NAME	String identifying group NAME

Default

By default, group-name is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 6.0.0.

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)#group-name group-1
```

label-switching

Use this command to either enable label-switching on an interface or to modify the label-space to which this interface is bound.

Use the `no` parameter and the interface is bound to the platform-wide (zero) label-space.

Note: When label-switching enabled on VLAN interface, MTU value must be manually increased by at least 20 bytes on Parent interfaces of VLAN. Example, default MTU must be set as 1520 instead of 1500 on label-switching parent interface label switched VLAN interface. (Parent Interface MTU >= label switched VLAN interface MTU + 20).

Command Syntax

```
label-switching
label-switching <0-60000>
no label-switching
```

Parameter

`<0-60000>`	Label space value in this range

Default

By default, label switching is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows the enabling of label switching on the `eth0` interface.

```
#configure terminal
(config)#interface eth0
(config-if)#label-switching 654
```

manual-pseudowire

Use this command to configure the MPLS layer-2 virtual circuit as manual. This disables the default signalling mode of the MPLS layer-2 virtual circuit.

Use the no parameter with this command to disable manual mode of the MPLS layer-2 virtual circuit & enable signalling mode of the MPLS layer-2 virtual circuit.

Command Syntax

```
manual-pseudowire
no manual-pseudowire
```

Parameters

NA

Default

By default, manual-pseudowire is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)#manual-pseudowire
```

match vlan

Use this command to configure a match VLAN action for a service template.

Use the `no` parameter to remove a match VLAN action for a service template.

Command Syntax

```
match (all | double-tag outer-vlan <2-4094> inner-vlan VLAN_RANGE | outer-vlan
  VLAN_RANGE | untagged)
```

```
no match (double-tag outer-vlan <2-4094> inner-vlan VLAN_RANGE | outer-vlan
  VLAN_RANGE | untagged)
```

Parameter

`all`	Accept all matches
`double-tag`	Double tag match
`outer-vlan`	Double tag outer VLAN
`<2-4094>`	Outer VLAN identifier
`inner-vlan`	Double tag inner VLAN
`VLAN_RANGE`	VLAN identifier <2-4094> range: 2-5,10 or 2-5,7-19
`outer-vlan`	Single tag outer-VLAN
`VLAN_RANGE`	VLAN identifier <2-4094> range: 2-5,10 or 2-5,7-19
`untagged`	Match untagged. This parameter depends on the `switchport dot1q ethertype` configuration. Packets received with a TPID other than 0x8100 (default value) and the TPID value configured by `switchport dot1q ethertype` are treated as untagged. For example, if you give the command: `switchport dot1q ethertype 0x8888` then packets received with TPID 0x8100 or 0x88a8 are treated as tagged. Packets received with other TPIDs are treated as untagged.

Command Mode

MPLS SVC mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 3.0.

The inner vlan range option added in OcNOS version 4.1.

Example

```
#configure terminal
(config)#service-template C2
(config-svc)#match double-tag outer-vlan 10 inner-vlan 20
(config-svc)#exit
(config)#service-template C2
(config-svc)#no match double-tag outer-vlan 10 inner-vlan 20
(config-svc)#exit
#configure terminal
```

```
(config)#service-template C3
(config-svc)#match double-tag outer-vlan 10 inner-vlan 200-300
(config-svc)#exit
(config)#service-template C4
(config-svc)#no match double-tag outer-vlan 10 inner-vlan 200-300
(config-svc)#exit
#configure terminal
(config)#service-template t1
(config-svc)#match untagged
(config-svc)#rewrite ingress push 100
```

mpls ac-group

Use this command to create a new access circuit group for MPLS.

Use the `no` parameter with this command to remove an access circuit group.

Command Syntax

```
mpls ac-group NAME <1-4294967295>
no mpls ac-group NAME
```

Parameter

`NAME`	The name of the access circuit group
`<1-4294967295>`	The identifier for the group; used in LDP

Default

By default, mpls ac group is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls ac-group new-ac 123

(config)#no mpls ac-group new-ac
```

admin-groups

Use this command to create a name-to-value binding for an administrative group.

Note: Only 32 administrative groups can be configured at one time.

Use the `no` parameter with this command to remove a named administrative group.

Command Syntax

```
admin-group NAME <0-31>
no admin-group NAME <0-31>
```

Parameters

`NAME`	Name of administrative group
`<0-31>`	The value of the administrative group

Default

By default, mpls admin group is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#admin-group mygroup 3
```

mpls bandwidth-class

Use this command to create a new bandwidth class name. Using this command changes the command mode to Bandwidth-class mode.

Use the `no` parameter with this command to remove a bandwidth class name.

Command Syntax

```
mpls bandwidth-class NAME
no mpls bandwidth-class NAME
```

Parameter

NAME	Name of the bandwidth class

Default

By default, mpls bandwidth-class is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls bandwidth-class new-BC
(config-mpls-bw)#

(config)#no mpls bandwidth-class new-BC
```

mpls ftn-ecmp ldp

Use this command to enable Equal-Cost Multi-Path ECMP for Label Distribution Protocol (LDP) Forwarding Table Entry (FTN). FTN contains the details of forwarding the labeled packets.

Use `no` command to disable ECMP for LDP FTN.

Command Syntax

```
mpls ftn-ecmp ldp
no mpls ftn-ecmp ldp
```

Parameter

None

Default

Disabled

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.4.1.

Examples

The below example shows how to enable and disable ECMP for LDP FTN:

```
#configure terminal
(config)#mpls ftn-ecmp ldp
(config)# commit
(config)# no mpls ftn-ecmp ldp
(config)# commit
```

© 2025 IP Infusion Inc. Proprietary

mpls ftn-entry tunnel-id

This command will be used to create a static tunnel.

In hardware, it creates a logical interface to which services can be mapped.

Note: Only global label space is supported and per interface label space is not supported. MPLS core with IPv6 is not supported.

Command Syntax

```
mpls ftn-entry tunnel-id <1-5000> (A.B.C.D/M|A.B.C.D A.B.C.D) <16-1048575> A.B.C.D
  IFNAME ((secondary|primary)|)

no mpls ftn-entry tunnel-id <1-5000> (A.B.C.D/M|A.B.C.D A.B.C.D) <16-1048575>
  A.B.C.D IFNAME ((secondary|primary)|)

mpls ftn-entry tunnel-id <1-5000> X:X::X:X/M <16-1048575> X:X::X:X IFNAME
  ((secondary|primary)|)

no mpls ftn-entry tunnel-id <1-5000> X:X::X:X/M <16-1048575> X:X::X:X IFNAME
  ((secondary|primary)|)
```

Parameters

`<1-5000>`	The tunnel ID value
`A.B.C.D/M`	Forwarding equivalence class with mask
`A.B.C.D`	Mask for forwarding equivalency class
`<16-1048575>`	Outgoing label
`A.B.C.D`	Nexthop IPv4 address
`IFNAME`	Outgoing interface name
`primary`	The primary LSP; default is primary
`secondary`	The secondary LSP Command Mode
`X:X::X:X/M`	IPv6 Forwarding Equivalence Class with Mask
`X:X::X:X`	Nexthop IPv6 address

Default

By default, mpls ftn-entry tunnel-id are disabled

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls ftn-entry tunnel-id 2 10.10.0.0/24 16 1.2.3.4 eth1 secondary
(config)#no mpls ftn-entry tunnel-id 2 10.10.0.0/24 16 1.2.3.4 eth1 secondary
```

mpls ftn-entry

Use this command to create a static LSP. In the hardware, this command creates an IP route with outgoing MPLS parameters.

Note: Only global label space is supported and per interface label space is not supported.

Command Syntax

```
mpls ftn-entry  (A.B.C.D/M|A.B.C.D A.B.C.D) <16-1048575> A.B.C.D IFNAME
no mpls ftn-entry  (A.B.C.D/M|A.B.C.D A.B.C.D) <16-1048575> A.B.C.D IFNAME
```

Parameters

A.D.C.D/M	Forwarding Equivalence Class with Mask
A.B.C.D	Mask for forwarding equivalency class
<16-1048575>	Outgoing label <16-1048575>
A.B.C.D	Nexthop IPv4 address
IFNAME	Outgoing interface name

Default

By default, mpls ftn-entry are disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)# mpls ftn-entry 2.2.2.2/32 111 20.0.0.2 eth1
(config)# no mpls ftn-entry 2.2.2.2/32 111 20.0.0.2 eth1
```

mpls ilm-ecmp ldp

Use this to enable ECMP for LDP Incoming Label Map (ILM).

Use `no` of this to disable ECMP for LDP ILM.

Note: Entropy is also required to be configured for load-balancing to work.

Note: LDP has to be configured with no-php for entropy to work (Q1 platforms).

Command Syntax

```
mpls ilm-ecmp ldp
no mpls ilm-ecmp ldp
```

Parameters

None

Default

LDP ECMP on transit nodes is disabled. If LDP load-balancing is required on transit nodes, enable this option.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
#configure terminal
(config)#mpls ilm-ecmp ldp
(config)#no mpls ilm-ecmp ldp
```

mpls ilm-entry pop

Use this command to create an ILM entry in the ILM table to which a POP incoming interface is bound. Upon receipt of a labeled packet on an MPLS-enabled router, a lookup is done based on the incoming label in the ILM table. If a match is found, the packet may either be label-switched downstream, or popped and passed over IP. In a pop operation, an outgoing label is not needed as is either accepted or forwarded over IP. The nexthop option is also not mandatory because the FEC IP address could be a local IP address.

Use the `no` option with the command to delete an ILM entry. If there is no match, an error message displays.

Note: Only global label space is supported and per interface label space is not supported.

Command Syntax

```
mpls ilm-entry <16-1048575> pop
no mpls ilm-entry <16-1048575> pop
```

Parameters

`<16-1048575>`	Incoming label value
`pop`	Pop the incoming label

Default

By default, mpls ilm-entry are disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls ilm-entry 100 pop
```

mpls ilm-entry swap

Use this command to create an ILM entry in the ILM table to which a swap incoming interface is bound. Upon receipt of a labeled packet on an MPLS-enabled router, a lookup is done based on the incoming label in the ILM table. If a match is found, the packet may either be label-switched downstream, or popped and passed over IP.

Use the `no` option with the command to delete an ILM entry. If there is no match, an error message displays.

Note: Only global label space is supported and per interface label space is not supported. MPLS core with IPv6 is not supported.

Command Syntax

```
mpls ilm-entry <16-1048575> swap <16-1048575> IFNAME A.B.C.D (A.B.C.D/M|A.B.C.D
  A.B.C.D)
no mpls ilm-entry <16-1048575> swap <16-1048575> IFNAME A.B.C.D (A.B.C.D/M|A.B.C.D
  A.B.C.D)
mpls ilm-entry <16-1048575> swap <16-1048575> IFNAME X:X::X:X X:X::X:X/M
no mpls ilm-entry <16-1048575> swap <16-1048575> IFNAME X:X::X:X X:X::X:X/M
```

Parameters

`<16-1048575>`	Incoming label value range <16-1048575>
`swap`	Specify swap for the incoming label
`<16-1048575>`	Configure an outgoing label with a value from <16-1048575>

Note: A value of 2 indicates explicit NULL and a value of 3 indicates implicit NULL.

`IFNAME`	Outgoing interface name
`A.B.C.D`	Nexthop IPv4 address
`A.B.C.D`	The FEC for which this ILM entry is created
`A.B.C.D/M`	The FEC for which this ILM entry is created, plus mask
`A.B.C.D`	A mask for forwarding equivalence class mask
`X:X::X:X/M`	IPv6 FEC for which this ILM entry is being created, plus mask
`X:X::X:X`	Nexthop IPv6 address

Default

By default, mpls ilm-entry are disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and the incoming interface name parameter `IFNAME` is removed in OcNOS version 6.4.1.

Examples

```
#configure terminal
(config)#mpls ilm-entry 16 swap 17 eth2 1.1.1.1 1.1.1.1/3
```

mpls ingress-ttl

Use this command to set a Time to Live (TTL) value for LSPs for which this LSR is the ingress.

Use the `no` parameter with this command to unset the custom TTL value being used for LSPs for which this LSR is the ingress.

Command Syntax

```
mpls ingress-ttl <0-255>
no mpls ingress-ttl
```

Parameter

`<0-255>`	Set the TTL value to use

Default

By default, mpls ingress-ttl value is 64

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls ingress-ttl 3
```

mpls l2-circuit

Use this command to create an instance of an MPLS layer 2 virtual circuit, without specifying a group to which the VC belongs. Refer to group-name for information on how to create an MPLS “with” a specific group. A Layer-2 MPLS Virtual Circuit instance may be bound to any interface on the router; however, only one interface may be bound to a Layer-2 circuit at a time.

Use the `no` parameter with this command to delete an instance of an MPLS Layer-2 Virtual Circuit.

Note: OcNOS supports configuring the same Virtual Circuit Identifier (VC-ID) with different VPWS names for different LDP neighbors.

Command Syntax

```
mpls l2-circuit NAME <1-4294967295> A.B.C.D
mpls l2-circuit NAME <1-4294967295> A.B.C.D mode raw
mpls l2-circuit NAME <1-4294967295> A.B.C.D mode tagged
no mpls l2-circuit NAME <1-4294967295> A.B.C.D
```

Parameters

`NAME`	String identifying the MPLS Layer-2 virtual circuit
`<1-4294967295>`	A 32-bit identifier to which the L2 circuit name should be mapped
`A.B.C.D`	IPv4 address for the MPLS L2 virtual circuit end-point

Default

By default, mpls l2-circuit is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
```

mpls-l2-circuit NAME

Use this command in the Interface mode to bind an interface to a MPLS Layer-2 Virtual Circuit created in the configure mode. The qos profiles cos-to-queue and queue-color-to-cos are optional parameters and are configurable dynamically on the virtual circuit by repeating mpls-l2-circuit command along with one or both profile options. In order to dynamically unbind the profile, same command pattern should be repeated by removing the profile which needs to be unbound from the command. Refer 'qos profile' commands from configuration guide for more details about qos profiles.

Use the `no` parameter with this command to delete this instance.

Note: QoS profiles are supported only on vlan based virtual circuits. For port based virtual circuits (service template with match-all option), qos profiles can be bound to interface which will take effect, otherwise default qos profile will take effect. Refer 'qos map-profile' command for binding qos profiles on interface.

Note: For untagged traffic forwarded via port based virtual circuits (service template with match-all option), queue will be 0 by default. In order to assign a non-zero queue for untagged traffic, use 'qos untagged-priority <0-7>' command on the interface.

Note: QoS profile queue-color-to-cos will take effect when MPLS model is uniform. For virtual circuit without rewrite option, 'qos remark-cos' need to be additionally configured to update cos. For virtual circuits with rewrite action pop, cos will always be updated based on qos profile irrespective of the MPLS model.

Command Syntax

```
mpls-l2-circuit NAME service-template NAME ({cos-to-queue NAME | queue-color-to-cos
  NAME}|) ((primary|secondary)|)
no  mpls-l2-circuit NAME
```

Parameters

`NAME`	A string identifying the MPLS Layer-2 Virtual Circuit
`primary`	Identify L2 circuit as the primary link
`secondary`	Identify L2 circuit as the secondary link; the secondary link is not activated unless the primary link fails
`service-template`	Customer service template
`NAME`	Name of Customer service template
`cos-to-queue`	Profile for cos to queue map
`NAME`	Profile name for cos to queue map
`queue-color-to-cos`	Profile for queue color to cos map
`NAME`	Profile name for queue color to cos map

Default

By default, mpls l2-circuit is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal

(config)#interface eth1
(config-if)#switchport
(config-if)#mpls-l2-circuit vc1 service-template C1

(config-if)#no mpls-l2-circuit vc1

(config)#interface eth2
(config-if)#switchport
(config-if)#mpls-l2-circuit vc2 service-template C2

(config-if)#no mpls-l2-circuit vc2

(config-if)#mpls-l2-circuit vc2 service-template C2
(config-if)#no mpls-l2-circuit vc2

(config)#interface eth2
(config-if)#switchport
(config-if)#mpls-l2-circuit vc2 service-template C2

(config-if)#no mpls-l2-circuit vc2

(config-if)#mpls-l2-circuit vc2 service-template C2
(config-if)#no mpls-l2-circuit vc2
```

mpls l2-circuit-fib-entry

Use this command to add a static Layer-2 MPLS Virtual Circuit FIB entry.

Use the `no` parameter with this command to delete a Layer-2 MPLS Virtual Circuit FIB entry.

Command Syntax

```
mpls l2-circuit-fib-entry <1-4294967295> <16-15999> <16-15999> (A.B.C.D|X:X::X:X)
  IFNAME NAME

no mpls l2-circuit-fib-entry <1-4294967295> (A.B.C.D|X:X::X:X)
```

Parameters

fib-entry <1-4294967295>	The Virtual Circuit ID ranges from 1 to 4294967295.
fib-entry <16-15999>	Incoming label in the range of <16-1048575>
fib-entry <16-15999>	Outgoing label in the range of <16-1048585>
fib-entry A.B.C.D	Nexthop IPv4 address
fib-entry X:X::X:X	Nexthop IPv6 address
fib-entry IFNAME	Provider-facing interface name
fib-entry NAME	Name of the access interface or the connecting VC.

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls l2-circuit-fib-entry 10 100 200 10.10.10.10 eth1 eth2

#configure terminal
(config)#no mpls l2-circuit-fib-entry 10 10.10.10.10
```

mpls label mode

Use this command to configure label allocation mode for VPNv4 and/or VPNv6 routes. Label allocation mode as per-vrf is the default mode in which single mpls-label is allocated for all VPN Routes in a VRF. Label allocation mode as per-prefix will allocate unique mpls-labels per VPN route in a VRF. If allocation model is disabled using no mpls label mode configuration, the configuration reverts back to default-mode .

Label allocation mode is the local property i.e. the VRF routes are distributed to BGP-peer as per the mode configured on local node. When per-vrf mode is configured, single label for all routes in the VRF will be distributed to peer node.

Label allocation mode can be set for all VRFs or selective VRFs by these commands:

```
mpls label mode vpnv4 all-vrfs per-vrf
```

- If the admin selects the per-vrf mode for the entire system, then all VRFs switches to per-vrf allocation mode except for the VRFs that has been explicitly configured using command mpls label mode vpnv4 vrf WORD per-prefix. Label allocation mode set using specific VRF takes precedence over all-vrf command.

```
mpls label mode vpnv6 vrf WORD per-vrf
```

- If the admin selects per-vrf mode for a particular vrf say vrf1, then only vrf1 switches to per-vrf mode and rest of the vrfs will remain in default allocation mode.

Note: The CLI requires an explicit `clear ip bgp` command to observe the impact of the mode change in the Route Reflector (RR) or ASBR context. However, in the PE node role, the change is applied automatically. For RR/ASBR node roles, a manual trigger is necessary.

Command Syntax

```
mpls label mode (vpnv4|vpnv6|all-afs) (all-vrfs|vrf WORD) (per-prefix|per-vrf)
no mpls label mode (vpnv4|vpnv6|all-afs) (all-vrfs|vrf WORD) (per-prefix)

mpls label mode 6pe per-prefix
no mpls label mode 6pe per-prefix
```

Parameters

`vrf WORD`	Enter a string to identify the VRF
`all-vrfs`	All the VRFs
`per-prefix`	Unique MPLS labels are allocated per VPN route in a VRF
`per-vrf`	Single MPLS labels are allocated for all VPN routes in a VRF
`all-afs`	All the address families

Default

By default, per-vrf is enabled.

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 3.0.

© 2025 IP Infusion Inc. Proprietary

Example

```
#configure terminal
(config)#mpls label mode all-afs all-vrfs per-vrf

(config)#no mpls label mode all-afs all-vrfs

(config)#mpls label mode 6pe per-prefix

(config)#no mpls label mode 6pe per-prefix
```

mpls local-packet-handling

Use this command to enable the labeling of locally generated TCP packets. All other locally generated packets are not looked at by the MPLS Forwarder

Use the `no` parameter with this command to disable labeling of locally generated TCP packets.

Command Syntax

```
mpls local-packet-handling
no mpls local-packet-handling
```

Default

By default, mpls local packet handling is disabled

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls local-packet-handling
```

© 2025 IP Infusion Inc. Proprietary

mpls lsp-encap-dscp-preserve

Use this command to preserve DSCP for IP packets encapsulated into MPLS headers when dscp is remarked on access interface. By default, DSCP is not preserved for IP packets encapsulated into MPLS headers.

Use the no parameter with this to unconfigure DSCP preserve.

Command Syntax

```
mpls lsp-encap-dscp-preserve
no mpls lsp-encap-dscp-preserve
```

Default

By default, mpls local packet handling is disabled

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.5.2.

Examples

```
#configure terminal
(config)#mpls lsp-encap-dscp-preserve
(config)#commit
#configure terminal
(config)#no mpls lsp-encap-dscp-preserve
(config)#commit
```

© 2025 IP Infusion Inc. Proprietary

mpls lsp-model uniform

Use this command to configure the MPLS LSP model as uniform.

Use the `no` parameter with this command to configure the MPLS LSP model as pipe or short-pipe.

Command Syntax

```
mpls lsp-model uniform
no mpls lsp-model uniform
```

Parameter

None

Default

By default, model configuration is pipe for XGS devices.

Qumran devices have the following default behavior:

- For L3VPN services, model is short-pipe by default and pipe model can be set by configuring policy-maps with match exp and set queue.
- For L2VPN services, short-pipe model is not supported and the default model is pipe.
- For L2VPN services with rewrite action pop, cos value will always be updated from qos profile irrespective of model.
- For L2VPN services without rewrite, uniform model command does not take effect until 'qos remark-cos' is configured on egress interface.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls lsp-model uniform
(config)#exit

#configure terminal
(config)#no mpls lsp-model uniform
(config)#exit
```

mpls lsp-stitching

Use this command to stitch the LSP segment for an FEC created via a different label signaling protocol.

Use the `no` form of this command to disable this configuration.

Command Syntax

```
mpls lsp-stitching
no mpls lsp-stitching
```

Parameters

None

Default

By default, MPLS LSP stitching is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 3.0.

Command Example

```
#configure terminal
(config)#mpls lsp-stitching
```

mpls map-route

Use this command to map a prefix to an FEC.

Use the `no` parameter with this command to disable this configuration.

Command Syntax

```
mpls map-route (A.B.C.D/M|A.B.C.D A.B.C.D) (A.B.C.D/M|A.B.C.D A.B.C.D)
no mpls map-route (A.B.C.D/M|A.B.C.D A.B.C.D)
```

Parameters

`A.B.C.D`	IPv4 prefix to map
`A.B.C.D/M`	IPv4 prefix to map, plus mask
`A.B.C.D`	Mask for IPv4 prefix to map
`A.B.C.D/M`	Mask for IPv4 prefix to map, plus mask.
`A.B.C.D`	IPv4 forwarding equivalence class for route to map
`A.B.C.D`	Mask for IPv4 forwarding equivalence class

Default

By default, mpls map-route is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following examples 5.6.7.8/32 is the FEC for an LSP, and 1.2.3.4 is the prefix to be mapped.

```
#configure terminal
(config)#mpls map-route 1.2.3.4/32 5.6.7.8/32

#configure terminal
(config)#mpls map-route 1.2.3.4 255.255.255.255 5.6.7.8 255.255.255.255
```

mpls min-label-value

Use this command to configure minimum and maximum label value for a label space. Use module names (rsvp | ldp | bgp) to configure minimum and maximum label value for module in a label space, minimum and maximum label space value for a module should be within the range of label space being used. After setting minimum and maximum label value for a label space, make sure to bind the label space to an interface.

Use the `no` parameter with this command to use the default minimum and maximum label value for all the label pools.

Note: The system allows label-space range (maximum and minimum label values) changes for interface-specific label spaces only. The platform-wide label-space range cannot be modified.

Note: Only label-space 0 (global) is supported. Any label-space other than 0, is not supported.

Command Syntax

```
mpls (rsvp|ldp|bgp|) min-label-value <16-1048575> max-label-value <16-1048575>
  (label-space <0-60000>|)
```

```
no mpls min-label-value max-label-value (label-space <0-60000>|)
```

```
no mpls (rsvp|ldp|bgp) (label-space <0-60000>|))
```

Parameters

`rsvp`	Label range value for RSVP
`ldp`	Label range value for LDP
`bgp`	Label range value for BGP
`min-label-value`	Specify the minimum label value
`<16-1048575>`	Minimum size to be used for label pools or protocol range
`max-label-value`	Specify the maximum label value
`<16-1048575>`	Maximum size for all label pools
`label-space`	Label space for which the minimum value needs to be modified
`<0-60000>`	Range for label space

Default

By default, mpls min-label value is 16

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls min-label-value 50000 max-label-value 80000 label-space 0
```

mpls propagate-ttl

Use this command to enable TTL propagation. Enabling TTL propagation causes the TTL value in the IP header to be copied onto the TTL field in the shim header, at the LSP ingress.

Use the `no` parameter with this command to disable TTL propagation.

Command Syntax

```
mpls propagate-ttl
no mpls propagate-ttl
```

Parameters

None

Default

By default, TTL propagation is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls propagate-ttl

#configure terminal
(config)#no mpls propagate-ttl
```

© 2025 IP Infusion Inc. Proprietary

mpls traffic-eng srlg

Use this command to create a Shared Risk Link Group (SRLG). An SRLG uses secondary backup LSPs or Fast Reroute bypass/detour LSPs that minimize the probability of "fate sharing" with the path of the primary LSP.

Use the `no` form of this command to remove an SRLG.

Note:

- An interface can be part of multiple SRLG groups upto a maximum of 255 SRLG groups.
- Any addition or deletion of SRLG value on an interface will not recalculate Primary/Backup. It is advised to configure SRLG values before bringing UP RSVP sessions or clear rsvp sessions after updating SRLG values.

Command Syntax:

```
mpls traffic-eng srlg <0-4294967295>
no mpls traffic-eng srlg <0-4294967295>
```

Parameters

`<0-4294967295>` Risk group number

Command Mode

Interface mode

Example

```
#configure terminal
(config)#int eth1
(config-if)#mpls traffic-eng srlg 1
```

© 2025 IP Infusion Inc. Proprietary

pce entity

Use this command to:

- Assign a PCE entity to a segment routing policy
- Assign a PCE entity to a RSVP tunnel

Use the `no` form of this command to:

- Remove a PCE entity from a segment routing policy
- Remove a PCE entity from a RSVP tunnel

Syntax

```
pce entity <1-255>
no pce entity
```

Parameters

`entity <1-255>`	Path computation element entity identifier.

Command Mode

RSVP trunk mode

Segment routing policy mode

Applicability

Introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)#rsvp-trunk T1 ipv4
(config-trunk)#pce entity 127

#configure terminal
(config)#segment-routing
(config-sr)#traffic-engineering
(config-sr-te)#policy P1
(config-sr-pol)#pce entity 127
```

pce lsp-delegate

Use this command to delegate all LSPs of a segment routing policy or RSVP trunk to a PCE entity.

Use `no` form of this command to revoke all LSPs of a segment routing policy or RSVP trunk from a PCE entity.

Syntax

```
pce lsp-delegate
no pce lsp-delegate
```

Parameters

None

Default

LSPs are not delegated to a segment routing policy of RSVP trunk.

Command Mode

RSVP trunk mode

Segment routing policy mode

Applicability

Introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)#segment-routing
(config-sr)#traffic-engineering
(config-sr-te)#policy P1
(config-sr-pol)#pce lsp-delegate

#configure terminal
(config)#rsvp-trunk T1 ipv4
(config-trunk)#pce lsp-delegate
```

pce state-report

Use this command to enable sending a PCEP state report.

Use the `no` form of this command to disable sending a PCEP state report.

Syntax

```
pce state-report
no pce state-report
```

Parameters

None

Default

Sending a PCEP state report is disabled.

Command Mode

RSVP trunk mode

Segment routing policy mode

Applicability

Introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)#segment-routing
(config-sr)#traffic-engineering
(config-sr-te)#policy P1
(config-sr-pol)#pce state-report

#configure terminal
(config)#rsvp-trunk T1 ipv4
(config-trunk)#pce state-report
```

ping mpls

Use this command to start sending MPLS request packets using various parameters as defined below. Ping packets can be configured for LDP, RSVP, L2 circuit, VPLS, L3 VPN, Segment Routing or generic FEC types.

Command Syntax

```
ping mpls (ldp A.B.C.D/M|rsvp (tunnel-name NAME|egress A.B.C.D)|l2-circuit <1-
  4294967295> peer A.B.C.D/M |vpls <1-10000> peer A.B.C.D/M|l3vpn VRFNAME A.B.C.D/M
  |ipv4 A.B.C.D/M) ({reply-mode (1|2)|flags|destination A.B.C.D|source A.B.C.D|ttl
  <1-255>|timeout <1-500>|repeat <5-5000>|interval <2-20000>|force-explicit-
  null|detail}|)

ping mpls (l3vpn (VRFNAME A.B.C.D/M X:X::X:X/M source A.B.C.D destination A.B.C.D))
  ({timeout <1-500>|ttl <1-255>|repeat <5-5000>|interval <2-20000>|detail}|)

ping mpls (6pe default X:X::X:X/M source A.B.C.D destination A.B.C.D)) ({timeout
  <1-500>|ttl <1-255>|repeat <5-5000>|interval <2-20000>|detail}|)

ping mpls (| protocol-origin (local | pcep) )(sr-policy SR_POLICY_NAME (|
  candidate-path CANDIDATE_PATH_ID))({flags|source A.B.C.D | ttl <1-255> | timeout
  <1-500> | repeat <5-5000>|interval <2-20000> | force-explicit-null | detail}|)

ping mpls  (ospf-sr | isis-sr)(ipv4 A.B.C.D/M )({reply-mode (1|2|3)|flags |
  destination A.B.C.D|source A.B.C.D | ttl <1-255> | timeout <1-500> | repeat <5-
  5000>|interval <2-20000> | force-explicit-null | detail}|)
```

Parameters

`ldp`	FEC type is LDP
`A.B.C.D/M`	LDP prefix address
`rsvp`	FEC type is RSVP
`tunnel-name`	RSVP tunnel name
`NAME`	Tunnel name string
`egress`	RSVP tunnel egress
`A.B.C.D`	RSVP tunnel egress address
`l2-circuit`	FEC type is L2 circuit
`<1-4294967295>`	L2 circuit ID
`peer A.B.C.D/M`	IP address of the peer
`vpls`	FEC type is MPLS VPLS (L2-VPN)
`<1-10000>`	VPLS instance ID
`peer`	VPLS peer
`A.B.C.D/M`	VPLS peer address
`l3vpn`	FEC type is MPLS VPN (L3-VPN)
`VRFNAME`	VPN instance name
`A.B.C.D./M`	VPN prefix

`X:X::X:X/M`	VPNv6 prefix
`6pe`	FEC type (6PE)
`default`	VPN Instance Name (default)
`X:X::X:X/M`	6PE Prefix
`ipv4`	FEC type is generic; use for static/SNMP label switched paths
`A.B.C.D/M`	IPv4 prefix address
`Protocol-origin`	Protocol origin for SR policy
`Local`	local originated sr policy
`Pcep`	Pcep orginated SR policy
`SR policy`	SR policy ping
`SR_POLICY_NAME`	Policy name
`Candidate-path`	Candidate path
`CANDIDATE_PATH_ID`	Candidate path id
`reply-mode`	Reply mode, one of
`1`	Do not reply
`2`	Reply via UDP/IP packet (default)
`flags`	Validate FEC stack
`destination`	Destination address
`A.B.C.D`	IPv4 address of the destination
`source`	Source address
`A.B.C.D`	IPv4 address of the source
`ttl`	Trace packet Time-to-live
`<1-255>`	Trace packet TTL value
`repeat`	Repeat sending of ping packets
`<5-5000>`	Number of pings to send
`interval`	Interval between ping packets, in milliseconds
`<2-20000>`	Interval value
`timeout`	Time to wait before rejecting the probe as a failure, in seconds
`<1-500>`	Timeout value
`force-explicit-null`	Force Explicit NULL label
`detail`	Print detailed output of the ping

Defaults

Default TTL value is 255.

Default timeout value is 60 seconds.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3. The SR ping command was introduced in OcNOS version 4.1.

Example

```
#ping mpls ipv4 10.10.0.0/24 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 ttl 226 timeout 65 repeat 6 interval 3 detail force-explicit-null

#ping mpls l2-circuit 3 peer 192.0.2.0/32 reply-mode 2 flags destination 127.1.3.4
source 10.10.0.1 ttl 226 timeout 65 repeat 6 interval 3 detail force-explicit-null

#ping mpls l3vpn vrfa 10.10.0.0/24 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 ttl 226 timeout 65 repeat 6 interval 3 detail force-explicit-null

#ping mpls ldp 10.10.0.0/24 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 ttl 226 timeout 65 repeat 6 interval 3 detail force-explicit-null

#ping mpls rsvp egress 1.2.3.5 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 ttl 226 timeout 65 repeat 6 interval 3 detail force-explicit-null

#ping mpls rsvp tunnel-name tun1 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 ttl 226 timeout 65 repeat 6 interval 3 detail force-explicit-null

#ping mpls vpls 2 peer 10.10.0.0 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 ttl 226 timeout 65 repeat 6 interval 3 detail force-explicit-null

# ping mpls sr-policy LSP3_R1_R4_R2 detail
# ping mpls ospf-sr ipv4 2.2.2.2/32 detail
# ping mpls isis-sr ipv4 2.2.2.2/32 detail

Codes:
'!' - Success, 'Q' - request not sent, '.' - timeout,
'x' - Retcode 0, 'M' - Malformed Request, 'm' - Errored TLV,
'N' - LBL Mapping Err, 'D' - DS Mismatch,
'U' - Unknown Interface, 'R' - Transit (LBL Switched),
'B' - IP Forwarded, 'F' No FEC Found, 'f' - FEC Mismatch,
'P' - Protocol Error, 'X' - Unknown code,
'Z' - Reverse FEC Validation Failed

 Type 'Ctrl+C' to abort

! seq_num = 4 200.0.0.1 2.14 ms
! seq_num = 5 200.0.0.1 1.78 ms

Success Rate is 100.00 percent (5/5)
round-trip min/avg/max = 1.78/1.96/2.14
```

rewrite ingress

Use this command to configure a match VLAN action for a service template.

Use the `no` parameter with this command to remove a match VLAN action for a service template.

Command Syntax

```
rewrite ingress (((pop |translate <2-4094>)(|outgoing-tpid (dot1.ad |dot1.q)))|
  (push <2-4094>))

no rewrite ingress (pop |push |translate)
```

Parameters

`pop`	POP the outer VLAN identifier from ACCESS->NETWORK and PUSH the match outer VID to NETWORK->ACCESS
`translate`	Translate the outer VLAN identifier to configured action VID for ACCESS->NETWORK and translate to the match outer VID for NETWORK->ACESS
`<2-4094>`	Outer VLAN identifier
`outgoing-tpid`	Outgoing TPID, set the outer-tpid for the NETWORK->ACCESS
`dot1.ad`	Set TPID value as 0x88a8 for the traffic NETWORK->ACCESS
`dot1.q`	Set TPID value as 0x8100 for the traffic NETWORK->ACCESS
`push`	PUSH the outer VLAN identifier from ACESS->NETWORK and POP the Outer VID from NETWORK->ACCESS
`<2-4094>`	Outer VLAN identifier

Command Mode

MPLS SVC mode

Applicability

This command was introduced in OcNOS version 1.3.3, and changed in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#service-template C2
(config-svc)#match double-tag outer-vlan 9 inner-vlan 8
(config-svc)#rewrite ingress translate 7 outgoing-tpid dot1.ad
(config-svc)#exit

(config)#service-template C2
(config-svc)#no rewrite ingress translate
(config-svc)#exit
```

© 2025 IP Infusion Inc. Proprietary

secondary srlg-disjoint

Use this command to set how to avoid the SRLGs (Shared Risk Link Groups) of a protected primary.

A fast-reroute/secondary path for an LSP that is disjoint from the primary ensures that a single point of failure on a particular link does not bring down both the primary and secondary paths in the LSP.

Note: The SRLG option configured in RSVP-TRUNK mode (this command) takes higher preference than the option configured in RSVP router mode (see 'srlg-disjoint').

Use the `no` form of this command to not avoid the SRLGs of a protected interface.

Command Syntax

```
secondary srlg-disjoint (forced|preferred)
no secondary srlg-disjoint
```

Parameters

`forced`	The router does not create the secondary/backup tunnel unless it avoids SRLGs of the primary-path/protected-interface.
`preferred`	With two explicit paths, the first explicit path tries to avoid the SRLGs of the primary-path/ protected interface. If that does not work, the secondary/backup tunne uses the second path (which ignores SRLGs).

Command Mode

RSVP -TRUNK mode

Example

```
#configure terminal
(config)#rsvp-trunk t1
(config-rsvp)# secondary srlg-disjoint forced
```

© 2025 IP Infusion Inc. Proprietary

secondary-priority srlg-disjoint

Use this command to set how to avoid the SRLGs (Shared Risk Link Groups) of a protected primary.

A fast-reroute/secondary path for an LSP that is disjoint from the primary ensures that a single point of failure on a particular link does not bring down both the primary and secondary paths in the LSP.

Note: The SRLG option configured in RSVP-TRUNK mode (this command) takes higher preference than the option configured in RSVP router mode (see the srlg-disjoint command).

Use the `no` form of this command to not avoid the SRLGs of a protected interface.

Command Syntax

```
secondary-priority <1-5> srlg-disjoint (forced|preferred)
no secondary-priority <1-5> srlg-disjoint
```

Parameters

`forced`	The router does not create the secondary/backup tunnel unless it avoids SRLGs of the primary-path/protected-interface.
`preferred`	With two explicit paths, the first explicit path tries to avoid the SRLGs of the primary-path/ protected interface. If that does not work, the secondary/backup tunnel uses the second path (which ignores SRLGs).

Command Mode

RSVP -TRUNK mode

Example

```
#configure terminal
(config)#rsvp-trunk t1
(config-rsvp)# secondary-piority 1 srlg-disjoint forced
```

service-tpid

Use this command to configure service tpid for the MPLS layer-2 virtual circuit.

Use the no parameter with this command to delete service tpid from the MPLS layer-2 virtual circuit.

Command Syntax

```
service-tpid (dot1.q|dot1.ad|0x9100)
no service-tpid
```

Parameters

`0x9100`	Set tpid value as 0x9100
`dot1.ad`	Set tpid value as 0x88a8
`dot1.q`	Set tpid value as 0x8100

Default

By default, service-tpid is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)#service-tpid dot1.ad
```

service-template

Use this command to configure a service template.

Use no form of this command to remove a service template.

Command Syntax

```
service-template NAME
no service-template NAME
```

Parameters

NAME	Name of the customer service template

Defaults

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 1.3.3.

Examples

```
#configure terminal
(config)#service-template C1
(config-svc)#
```

show mpls

Use this command to display MPLS data.

Command Syntax

```
show mpls
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following subsection displays a variety of `show mpls` commands.

```
#show mpls
Minimum label configured: 16
 Maximum label configured: 1048575
 Per label-space information:
   Label-space 0 is using minimum label: 16 and maximum label: 1048575
   Label-space 2342 is using minimum label: 556 and maximum label: 1048575
 Custom ingress TTL configured: none
 Custom egress TTL configured: none
 Log message detail: none
 Admin group detail: none
 Packets dropped IP:115167, dropped MPLS:0 sent to IP:490943, labeled:0,
switch
d:0

MPLS Differentiated Services Supported Classes data:
CLASS        DSCP_value
  be            000000

MPLS Differentiated Services CLASS to EXP mapping data:
CLASS     DSCP_value     EXP_value
  be       000000           0
#
```

Table 1 explains the show command output fields.

Table 1: show mpls output field

Field	Description
Packets dropped IP	Displays the number of packets dropped over the internet protocol.
Dropped MPLS	Displays the number of packets dropped over the MPLS.

Table 1: show mpls output field

Field	Description
Sent to IP	Displays the number of packets transmitted to the internet protocol.
Labeled	Number of labeled packets in the interface. The MPLS-labeled packets are switched after a label lookup/switch instead of a lookup into the IP table. Labels of pop-and-forward mpls tunnel: P—Pop labels. D—Delegation labels.
Switch	Type of switching on the links needed for the MPLS.
Class	Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode.
DSCP Value	The value of the DSCP and DSCP classifier is used for routing Layer 3 packets.
EXP value	Sets the value of the MPLS EXP field on all imposed label entries.

© 2025 IP Infusion Inc. Proprietary

show admin-groups

Use this command to display all configured administrative groups.

Command Syntax

```
show admin-groups
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following sample shows the output of the `show admin-group` command.

```
#show admin-groups
 Admin group detail:
  Value of 0 associated with admin group 'a'
  Value of 1 associated with admin group 'b'
  Value of 2 associated with admin group 'c'
  Value of 4 associated with admin group 'd'
#
```

Table 2 explains the show command output fields.

Table 2: show admin-groups output field

Field	Description
Admin group detail	Display information about configured Multi Protocol Label Switching (MPLS) administrative groups.

show mpls bandwidth-class

Use this command to view bandwidth class parameters: bandwidth class name; allocated bandwidth; setup hold priority

Command Syntax

```
show mpls bandwidth-class
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
> show mpls bandwidth-class
Bandwidth-class: BW_1
Bandwidth:   6k        Setup-priority: 1  Class-type: 1
```

Table 3 explains the show command output fields.

Table 3: show mpls bandwidth-class output field

Field	Description
Bandwidth-class	Bandwidth for each class type.
Bandwidth	Bandwidth configured for the active MPLS.
Setup-Priority	The setup priority is compared with other setup priorities for established sessions on the link to determine whether some of them should be preempted to accommodate the new session. Sessions with lower hold priorities are preempted.
Class-type	Bandwidth allocated for the specified class type.

© 2025 IP Infusion Inc. Proprietary

show mpls counters ldp

Use this command to display traffic statistics for FTNs and ILMs configured by LDP.

Command Syntax

```
show mpls counters ldp ((ftn (|A.B.C.D/M)) | (ilm (|A.B.C.D/M)) |)
```

Parameter

`ftn`	FEC-to-NHLFE map counters
`A.B.C.D/M`	FEC prefix
`ilm`	Incoming label map counters
`A.B.C.D/M`	FEC prefix

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 1.3.2.

Note: For Qumran, counters are not available for transit nodes.

Examples

```
OcNOS#show mpls counter ldp
[FTN statistics]
+------------------+-----+----------+-----------+------------+----------------+-------------------+--------------------+
|       FEC        | Pri | nhlfe_ix | out-label |  out-intf  |     nexthop    |    Tx packets     |       Tx bytes     |
+------------------+-----+----------+-----------+------------+----------------+-------------------+--------------------+
 4.4.4.4/32         1     1          3           xe3          10.10.1.2       62                   4484

[ILM statistics]
+------------------+-----------+-----------+--------------------+--------------------+--------------------+----------------+
|       FEC        | in-label  | out-label |     Rx packets     |      Rx bytes      |     Tx packets     |     Tx bytes   |
+------------------+-----------+-----------+--------------------+--------------------+--------------------+----------------+
```

Table 4 explains the show command output fields.

Table 4: show mpls counters ldp output field

Field	Description
FTN statistics	Displays the statistics details of FTN.
ILM statistics	Displays the statistics details of ILM.
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
In-label	Displays the ingress (incoming interface) label for this segment.
Out-label	Displays the egress (outgoing interface) label for this segment.
Rx packets	Number of hello packets received from the neighbor.
Rx bytes	Size of hello packets received from the neighbor.

© 2025 IP Infusion Inc. Proprietary

Table 4: show mpls counters ldp output field

Field	Description
Tx packets	Number of hello packets sent to the neighbor.
Tx bytes	Size of hello packets sent to the neighbor.

© 2025 IP Infusion Inc. Proprietary

show mpls counters rsvp

Use this command to display traffic statistics for LSPs configured by RSVP.

Command Syntax

```
show mpls counters rsvp ((tunnel-name NAME) | (tunnel-id TUNNEL_ID) | (node-role
  (ingress | transit | egress)) |)
```

Parameter

NAME	RSVP tunnel name
TUNNEL_ID	RSVP tunnel identifier
ingress	LSP role is ingress
transit	LSP role is transit
egress	LSP role is egress

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 1.3.2.

Note: For Qumran, counters are not available for transit nodes.

Examples

```
#show mpls counters rsvp
Tunnel-id 5001 Extended Tunnel-ID 9.9.9.1 Egress 9.9.9.2
 lsp-name : t1-Primary                                  [Ingress]
 lsp-ingress : 9.9.9.1         lsp-id : 101
 Rx pkts : 0                   Rx bytes : 0
 Tx pkts : 0                   Tx bytes : 0

 lsp-name : t1-Secondary                                [Ingress]
 lsp-ingress : 9.9.9.1         lsp-id : 102
 Rx pkts : 0                   Rx bytes : 0
 Tx pkts : 0                   Tx bytes : 0

Tunnel-id 5002 Extended Tunnel-ID 9.9.9.1 Egress 9.9.9.3
 lsp-name : t2-Primary                                  [Ingress]
 lsp-ingress : 9.9.9.1         lsp-id : 104
 Rx pkts : 0                   Rx bytes : 0
 Tx pkts : 0                   Tx bytes : 0

 lsp-name : t2-Detour                                   [Ingress]
 lsp-ingress : 1.1.49.1        lsp-id : 104
 Rx pkts : 0                   Rx bytes : 0
 Tx pkts : 0                   Tx bytes : 0
```

© 2025 IP Infusion Inc. Proprietary

Table 5 explains the show command output fields.

Table 5: show mpls counters rsvp output field

Field	Description
Tunnel-id	Tunnel identifier (destination port) for the RSVP session.
Extended Tunnel-ID	Extended Tunnel identifier (destination port) for the RSVP session.
Egress	Egress router is the final MPLS device that removes the last label before packets leave the MPLS network.
lsp-name	Name of the SPRING-TE LSP.
Ingress	The router at the beginning of an LSP. This router encapsulates IP packets with an MPLS Layer 2 frame and forwards it to the next router in the path.
lsp-ingress	The router at the beginning of an LSP.
lsp-id	Specify the generic LSP identifier.
Rx packets	Number of hello packets received from the neighbor.
Rx bytes	Size of hello packets received from the neighbor.
Tx packets	Number of hello packets sent to the neighbor.
Tx bytes	Size of hello packets sent to the neighbor.

show mpls counters static

Use this command to display traffic statistics for statically configured FTNs and ILMs.

Command Syntax

```
show mpls counters static ((ftn (A.B.C.D/M|)) | (ilm (A.B.C.D/M|)) |)
```

Parameter

`ftn`	FEC-to-NHLFE map counters
`A.B.C.D/M`	FEC prefix
`ilm`	Incoming label map counters
`A.B.C.D/M`	FEC prefix

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 1.3.2.

Note: For Qumran, counters are not available for transit nodes.

Examples

```
#show mpls counters static
[ FTN statistics ]
+------------------+-----------+--------------------+--------------------+
|       FEC        | out-label |     Tx packets     |      Tx bytes      |
+------------------+-----------+--------------------+--------------------+
 192.168.1.0/24     100         0                    0
 192.168.2.0/24     200         0                    0

[ ILM statistics ]
+------------------+-----------+-----------+--------------------+--------------------+--------------------+----------------+
|       FEC        | in-label  | out-label |     Rx packets     |      Rx bytes      |     Tx packets     |      Tx bytes  |
+------------------+-----------+-----------+--------------------+--------------------+--------------------+----------------+
 0.0.0.0/0          201         n/a         0                    0                    n/a                  n/a
 0.0.0.0/0          101         n/a         0                    0                    n/a                  n/a
 192.168.3.0/24     301         302         0                    0                    0                    0
 192.168.4.0/24     401         402         0                    0                    0                    0
#
```

Table 6 explains the show command output fields.

Table 6: show mpls counters static output field

Field	Description
FTN statistics	Displays the statistics details of FTN.
ILM statistics	Displays the statistics details of ILM.
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
In-label	Displays the ingress (incoming interface) label for this segment.

Table 6: show mpls counters static output field

Field	Description
Out-label	Displays the egress (outgoing interface) label for this segment.
Rx packets	Number of hello packets received from the neighbor.
Rx bytes	Size of hello packets received from the neighbor.
Tx packets	Number of hello packets sent to the neighbor.
Tx bytes	Size of hello packets sent to the neighbor.

show mpls cross-connect-table

Use this command to display detailed information for all entries created in the MPLS cross-connect table.

Command Syntax

```
show mpls cross-connect-table
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the show mpls cross-connect-table

```
#show mpls cross-connect-table
  Cross connect ix: 3, in intf: -, in label: 0, out-segment ix: 3
    Owner: RSVP, Persistent: No, Admin Status: Up, Oper Status: Up
   Out-segment with ix: 3, owner: RSVP, out intf: eth1, out label: 16
    Nexthop addr: 10.10.20.80, cross connect ix: 3, op code: Push

  Cross connect ix: 6, in intf: -, in label: 0, out-segment ix: 6
    Owner: RSVP, Persistent: No, Admin Status: Up, Oper Status: Up
   Out-segment with ix: 6, owner: RSVP, out intf: eth1, out label: 17
    Nexthop addr: 10.10.20.80, cross connect ix: 6, op code: Push
#
```

Table 7 explains the show command output fields.

Table 7: show mpls cross-connect-table output field

Field	Description
Cross connect ix	Displays the table index for the cross-connect.
In intf	Installed as a result of configuring an interface.
In label	Displays the ingress (incoming interface) label for this segment.
Out-segment ix	Displays the outbound segment index.
Owner	Displays the creator of this segment, typically a protocol such as BGP.
Persistent	Displays whether the tunnel is persistent – Yes or No.
Admin Status	Indicates whether the user can administratively disable a peer while still preserving its configuration. Up = Yes, Down = No.

Table 7: show mpls cross-connect-table output field

Field	Description
Oper Status	Displays the current status of the cross-connect segment – Up or Down
Nexthop addr	Displays the IP address of the next hop.
Op code	PUSH = Replace the top label with another and then push one or more additional labels onto the label stack SET = Set the next hop label.

show mpls cross-connect-table backup

Use this command to display detailed information for all entries created in the MPLS backup cross-connect table.

Command Syntax

```
show mpls cross-connect-table backup
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mod

Applicability

This command is newly introduced in OcNOS version 5.1.

Example

The following is a sample output of the show mpls cross-connect-table backup

```
#show mpls cross-connect-table backup

Backup Cross connect ix: 4, in intf: - in label: 0  out-segment ix: 17
Owner: LDP, Persistent: No, Admin Status: Up, Oper Status: Up
Out-segment with ix: 17, owner: LDP, Stale: NO, out intf: xe3, out label: 24324
Nexthop addr: 20.20.20.2        cross connect ix: 2, op code: Push
Primary xc-ix 2 out-segment ix 17

Backup Cross connect ix: 3, in intf: - in label: 0  out-segment ix: 12
Owner: LDP, Persistent: No, Admin Status: Down, Oper Status: Not present
Out-segment with ix: 12, owner: LDP, Stale: NO, out intf: xe21, out label: 24320
Nexthop addr: 10.10.10.2        cross connect ix: 2, op code: Push
Primary xc-ix 2 out-segment ix 17
```

show mpls forwarding-table detail

Use this command to view forwarding table entries.

Command Syntax

```
show mpls forwarding-table ((A.B.C.D/M|X:X::X:X/M|) | count | detail |)
```

Parameters

`A.B.C.D/M`	FEC IPv4
`X:X::X:X/M`	FEC IPv6
`count`	Count of IPv4 FTNs.
`detail`	show detail

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3 and the detail option is applicable form OcNOS version 4.2.

Detail applicable form is modified to display backup information if present (only for LDP FTNs).

Example

If LFA flag is not enabled

```
#show mpls forwarding-table detail

FEC prefix: 41.41.41.41/32, FTN-ID: 5
  Owner: LDP, FTN type: Regular, State: Installed
  Tunnel-Name: N/A, Tunnel-id: N/A, Color: N/A
  LSP-ID: N/A, LSP-type: Primary
  NHLFE-id: 7
  Out-Label: 3, Out-Intf: xe1, Nexthop: 50.50.50.1
  Exp-bits: 0x0, Incoming DSCP: none, QoS Resource id: 0
  ELC: No
```

If LFA is enabled and backup not present:

```
FEC prefix: 41.41.41.41/32, FTN-ID: 5
  Owner: LDP, FTN type: Regular, State: Installed
  Tunnel-Name: N/A, Tunnel-id: N/A, Color: N/A
  LSP-ID: N/A, LSP-type: Primary
  NHLFE-id: 7
  Primary : Out-Label: 3, Out-Intf: xe1, Nexthop: 50.50.50.1
  Exp-bits: 0x0, Incoming DSCP: none, QoS Resource id: 0
  ELC: No
```

If Backup is present:

© 2025 IP Infusion Inc. Proprietary

```
#show mpls forwarding-table detail
FEC prefix: 10.10.10.0/24, FTN-ID: 2
  Owner: LDP, FTN type: Regular, State: Installed
  Tunnel-Name: N/A, Tunnel-id: N/A, Color: N/A
  LSP-ID: N/A, LSP-type: Primary
  NHLFE-id: 4
  Primary : Out-Label: 3, Out-Intf: xe1, Nexthop: 50.50.50.1
  LFA Backup  : Out-Label: 3, Out-Intf: xe3, Nexthop: 20.20.20.1
  Primary : Out-Label: 3, Out-Intf: xe3, Nexthop: 20.20.20.1
  LFA Backup  : Out-Label: 3, Out-Intf: xe1, Nexthop: 50.50.50.1
  Exp-bits: 0x0, Incoming DSCP: none, QoS Resource id: 0
  ELC: No
```

show mpls forwarding-table

Use this command to view forwarding table entries.

Command Syntax

```
show mpls forwarding-table ((A.B.C.D/M|X:X::X:X/M|) | count | detail |)
```

Parameters

`A.B.C.D/M`	FEC IPv4
`X:X::X:X/M`	FEC IPv6
`count`	Count of IPv4 FTNs.
`detail`	Show detail

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3 and the `detail` parameter added in OcNOS version 4.2. The output was extended to display backup Information as well.

Example

If Backup not present:

```
#show mpls forwarding-table
Codes: > - installed FTN, * - selected FTN, p - stale FTN,

```

show mpls ftn-table

Use this command to display FTN (FEC-To-NHLF) table information.

Command Syntax

```
show mpls ftn-table
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

If LFA is not present

```
#show mpls ftn-table

Primary FTN entry with FEC: 10.10.10.0/24, id: 2, row status: Active, Tunnel-Policy: N/A
Owner: LDP, distance: 0, Action-type: Redirect to LSP, Exp-bits: 0x0, Incoming DSCP:
none
Tunnel id: 0, Protected LSP id: 0, Description: N/A, Color: 0
Cross connect ix: 3, in intf: - in label: 0 out-segment ix: 3
Owner: N/A, Persistent: No, Admin Status: Up, Oper Status: Up
Out-segment with ix: 3, owner: N/A, Stale: NO, out intf: xe1, out label: 3
Nexthop addr: 50.50.50.1        cross connect ix: 3, op code: Push
```

If Backup is present

```
#show mpls ftn-table
Primary FTN entry with FEC: 10.10.10.0/24, id: 2, row status: Active, Tunnel-Policy: N/A
Owner: LDP, distance: 0, Action-type: Redirect to LSP, Exp-bits: 0x0, Incoming DSCP:
none
Tunnel id: 0, Protected LSP id: 0, Description: N/A, Color: 0
Cross connect ix: 3, in intf: - in label: 0 out-segment ix: 3
Owner: N/A, Persistent: No, Admin Status: Up, Oper Status: Up
Out-segment with ix: 3, owner: N/A, Stale: NO, out intf: xe1, out label: 3
Nexthop addr: 50.50.50.1        cross connect ix: 3, op code: Push

Backup Cross connect ix: 4, in intf: - in label: 0  out-segment ix: 8
Owner: N/A, Persistent: No, Admin Status: Up, Oper Status: Up
Out-segment with ix: 8, owner: N/A, Stale: NO, out intf: xe3, out label: 3
Nexthop addr: 20.20.20.1        cross connect ix: 3, op code: Push
```

show mpls ilm-table

Use this command to view Incoming label mapping (ILM) table entries.

Command Syntax

```
show mpls ilm-table (count|)
```

Parameters

`count`	Count of entries in ILM table.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls ilm-table
Codes: > - installed ILM, * - selected ILM, p - stale ILM, ! - using backup
       K - CLI ILM, T - MPLS-TP, s - Stitched ILM
       S - SNMP, L - LDP, R - RSVP, C - CRLDP
       B - BGP , K - CLI , V - LDP_VC, I - IGP_SHORTCUT
       O - OSPF/OSPF6 SR, i - ISIS SR, k - SR CLI
       P - SR Policy, U - unknown
ILM-ECMP LDP: Disabled, SR: Disabled

--------------------------------------------
```

Table 8 shows the status codes displayed at the start of a route entry.

© 2025 IP Infusion Inc. Proprietary

Table 8: status code output field

Status Code	Field	Description
	Installed ILM	Number of ILM entry installed.
*	Selected ILM	ILM entry selected in the interface.
P	Stale ILM	Stale marked ILM due to on-going graceful restart of MPLS module.
K	CLI ILM	Admin configured static ILM entry.
T	MPLS-TP	ILM entry installed by MPLS-TP.

Table 9 explains the show command output fields.

Table 9: show mpls ilm-table output field

Field	Description
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
ILM-ID	ILM identifier for the session.
LSP-Type	LSP type associated with each interface being protected.
Out-Label	Label received from downstream neighbor for route.
Out-Intf	Short name of the physical interface through which traffic goes to the protected link.
In label	Displays the ingress (incoming interface) label for this segment.
In intf	Installed as a result of configuring an interface.
Nexthop	Displays the IP address of the next hop.
Num ILMs	Number of ILMs in the session.
Swap Entries	Number of packets in the entry.
Pop Entries	Number of POP entries.

show mpls in-segment-table

Use this command to display detailed information about all entries in the Incoming Label Map (also known as in-segment) table.

Command Syntax

```
show mpls in-segment-table
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls in-segment-table
  Owner: RSVP,#of pops: 1, fec: 192.168.0.5/32
    RX bytes:0, pkts:0, TX bytes:0, Swapped pkts:0, Popped pkts:0
LSP Type: ELSP_CONFIG
Class_Exp mapping:
CLASS    DSCP_value     EXP_value
  be      000000           0
     Cross connect ix: 1, in intf: eth0 in label: 52480 out-segment ix: 1
      Owner: RSVP, Persistent: No, Admin Status: Up, Oper Status: Up
       Out-segment with ix: 1, owner: RSVP, out intf: eth1, out label: 52480
        Nexthop addr: 20.30.0.3        cross connect ix: 1, op code: Swap
     Cross connect ix: 1, in intf: eth0 in label: 52480 out-segment ix: 2
      Owner: RSVP, Persistent: No, Admin Status: Up, Oper Status: Up
       Out-segment with ix: 2, owner: RSVP, out intf: eth2, out label: 52481
        Nexthop addr: 30.30.0.3        cross connect ix: 1, op code: Swap
#
```

Table 10 explains the show command output fields.

Table 10: show mpls in-segment-table output field

Field	Description
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
RX bytes	Size of hello packets received from the neighbor.
Pkts	Number packet in the interface.
TX bytes	Size of the packets that transmitted to the neighbor.
Swapped pkts	Number of swapped packets in session.

Table 10: show mpls in-segment-table output field

Field	Description
Popped pkts	Number of popped packets in the interface.
LSP-Type	LSP type associated with each interface being protected.
CLASS	Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode.
DSCP value	The value of the DSCP and DSCP classifier is used for routing Layer 3 packets.
EXP value	Sets the value of the MPLS EXP field on all imposed label entries.
Cross-connect ix	Displays the table index for the cross-connect.
Out-Label	Label received from downstream neighbor for route.
Out-Intf	Short name of the physical interface through which traffic goes to the protected link.
In label	Displays the ingress (incoming interface) label for this segment.
In intf	Installed as a result of configuring an interface.
Nexthop	Displays the IP address of the next hop.
Out-segment ix	Displays the outbound segment index.
Persistent	Displays whether the tunnel is persistent – Yes or No.
Admin Status	Indicates whether the user can administratively disable a peer while still preserving its configuration. Up = Yes, Down = No.
Oper Status	Displays the current status of the cross-connect segment – Up or Down.
Op code	PUSH = Replace the top label with another and then push one or more additional labels onto the label stack. SET = Set the next hop label.

show mpls l2-circuit

Use this command to view MPLS-TP L2 circuit parameters.

Command Syntax

```
show mpls l2-circuit (detail|)
show mpls l2-circuit NAME (detail|)
```

Parameters

`detail`	Show detailed information
`NAME`	The name of the virtual circuit

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls l2-circuit detail
MPLS Layer-2 Virtual Circuit: vc1, id: 1 PW-INDEX: 1 service-tpid: 8100

Endpoint: 1.1.1.1
Control Word: 0
MPLS Layer-2 Virtual Circuit Group: none
Bound to interface: xe41
Virtual Circuit Type: Ethernet VLAN
Virtual Circuit is configured as Primary
Virtual Circuit is configured as Active
Virtual Circuit is active
Service-template : C1
Match criteria : 10-14, 16-20
```

Table 11 explains the show command output fields.

Table 11: show mpls l2-circuit output field

Field	Description
MPLS Layer-2 Virtual Circuit	The MPLS virtual circuit on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.
Endpoint	Endpoint address.
Control Word	Number of control words.
MPLS Layer-2 Virtual Circuit Group	The MPLS virtual circuit group on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

Table 11: show mpls l2-circuit output field

Field	Description
Bound to interface	A bound service is the server in a client-server interface.
Virtual Circuit Type	Type of virtual circuit in the interface.
Service-template	Service Templates provides a powerful mechanism to configure advanced service-related options.
Match criteria	The match criteria under which redistribution is allowed for the current route-map.

show mpls l2-circuit statistics

Use this command to display MPLS traffic statistics for l2 circuit.

Command Syntax

```
show mpls l2-circuit NAME statistics (access-port|network-port|)
```

Parameters

`NAME`	Name of L2 circuit
`access-port`	Displays the access port statistics
`network-port`	Displays the network port statistics

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls l2-circuit t1 statistics
MPLS Layer-2 Virtual Circuit: t1, id 100        # Virtual circuit name and ID
Access port statistics:
   RX: Input packets : 1000
       Input bytes : 120000
   TX: Output packets : 0
       Output bytes : 0
Network port statistics:
   RX: Input packets : 0
       Input bytes : 0
   TX: Output packets : 1000
       Output bytes : 120000
```

Table 12 explains the show command output fields.

Table 12: show mpls l2-circuit statistics output field

Field	Description
MPLS Layer-2 Virtual Circuit	The MPLS virtual circuit on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.
Virtual circuit name and ID	The MPLS virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.
Access port statistics	Traffic statistics on Access port of VC/VPLS.
Network port statistics	Traffic statistics on Provider port of VC/VPLS.
RX	Number of received packets.

Table 12: show mpls l2-circuit statistics output field

Field	Description
Input packets	Number of hello packets received from the neighbor.
Input bytes	Size of hello packets received from the neighbor.
TX	Number of packets transmitted.
Output packets	Number of hello packets sent to the neighbor.
Output bytes	Size of hello packets sent to the neighbor.

show mpls mapped-routes

Use this command to view MPLS mapped routes.

Use the `no` parameter with this command to reset this configuration.

Command Syntax

```
show mpls mapped-routes
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls mapped-routes

Mapped-route          IPv4 FEC              MPLS-TP Tunnel
14.1.2.3/32           N/A                   NH4
```

Table 13 explains the show command output fields.

Table 13: show mpls mapped-routes output field

Field	Description
Mapped-route	Map the route of the interface.
IPv4	IPv4 address of the neighbor interface.
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
MPLS-TP Tunnel	MPLS-TP tunnel can be provisioned between two arbitrary nodes in an MPLS-TP enabled network.

show mpls out-segment-table

Use this command to display detailed information of out-segment entries (also known as NHLFE) table.

Command Syntax

```
show mpls out-segment-table
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls out-segment-table
       Out-segment with ix: 1, owner: RSVP, out intf: eth1, out label: 52480
        Nexthop addr: 20.30.0.3        cross connect ix: 1, op code: Swap
        TX bytes:0, pkts:0, error pkts:0, discard pkts:0

       Out-segment with ix: 2, owner: RSVP, out intf: eth2, out label: 52481
        Nexthop addr: 30.30.0.3        cross connect ix: 1, op code: Swap
        TX bytes:0, pkts:0, error pkts:0, discard pkts:0Zx
```

Table 14 explains the show command output fields.

Table 14: show mpls out-segment-table output field

Field	Description
Out-segment ix	Displays the outbound segment index.
Out-Label	Label received from downstream neighbor for route.
Out-Intf	Short name of the physical interface through which traffic goes to the protected link.
Nexthop addr	Displays the IP address of the next hop.
Cross-connect ix	Displays the table index for the cross-connect.
Op code	PUSH = Replace the top label with another and then push one or more additional labels onto the label stack. SET = Set the next hop label.
Pkts	Number packet in the interface.
TX bytes	Size of the packets that transmitted to the neighbor.

Table 14: show mpls out-segment-table output field

Field	Description
Error pkts	Number of error packets.
Discard pkts	Number of packets discarded in the interface.

show mpls owner-rib-table

This command is modified to display backup information when LDP_LFA is enabled.

Command Syntax:

```
show mpls owner-rib-table
```

Parameters

None

Example

If LFA flag is disabled.

```
#show mpls owner-rib-table count
===============================================================
RIB INFO  Type : LDP
Session IP Address: 41.41.41.41  Label Space: 0
Ftn Count 4, ILM Count 2 Dep ILM 2 VC 0
===============================================================
```

If LFA is enabled and Backup entries is not present.

```
#show mpls owner-rib-table count
===============================================================
RIB INFO  Type : LDP
Session IP Address: 41.41.41.41  Label Space: 0
Ftn Count 4, ILM Count 2 Dep ILM 2 VC 0
Backup Info
Ftn Count 0, ILM Count 0 Dep ILM 0
===============================================================
```

If Backup entries are present.

```
#show mpls owner-rib-table count
===============================================================
RIB INFO  Type : LDP
Session IP Address: 41.41.41.41  Label Space: 0
Ftn Count 4, ILM Count 2 Dep ILM 2 VC 0
Backup Info
Ftn Count 4, ILM Count 0 Dep ILM 0
===============================================================
===============================================================
RIB INFO  Type : LDP
Session IP Address: 17.17.17.17  Label Space: 0
Ftn Count 4, ILM Count 2 Dep ILM 2 VC 0
Backup Info
Ftn Count 4, ILM Count 0 Dep ILM 0
```

show mpls qos-resource

Use this command to display detailed QoS resource information.

Command Syntax

```
show mpls qos-resource IFNAME
```

Parameters

IFNAME	Display the interface name for a QoS resource

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls qos-resource eth1
<**********************************************>
              QOS RESERVED TABLE
<**********************************************>
HOLD PRIORITY : 0

HOLD PRIORITY : 1

HOLD PRIORITY : 2

HOLD PRIORITY : 3

HOLD PRIORITY : 4

HOLD PRIORITY : 5

HOLD PRIORITY : 6

HOLD PRIORITY : 7
<**********************************************>
   QOS AWAITING TABLE (static resources)
<**********************************************>
HOLD PRIORITY : 0

HOLD PRIORITY : 1

HOLD PRIORITY : 2

HOLD PRIORITY : 3

HOLD PRIORITY : 4

HOLD PRIORITY : 5

HOLD PRIORITY : 6
```

```
HOLD PRIORITY : 7
TSUP-173>
```

Table 15 explains the show command output fields.

Table 15: show mpls qos-resource output fields

Field	Description
QOS RESERVED TABLE	FTM/ILM entries for which QOS is reserved.
HOLD PRIORITY	Determines the degree to which an LSP holds onto its session reservation after the LSP has been set up successfully
QOS AWAITING TABLE (static resources)	FTN/ILM entries for which QOS reservation is pending.

© 2025 IP Infusion Inc. Proprietary

show mpls vc-table

Use this command view configured virtual circuit (VC) components

Command Syntax

```
show mpls vc-table
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show mpls vc-table

VC-ID Vlan-ID Inner-Vlan-ID Access-Intf Network-Intf Out Label  Tunnel-Label
Nexthop Status
500    N/A        N/A          eth2          eth1          544        57
N/A    Active
#
```

Table 16 explains the show command output fields.

Table 16: show mpls vc-table output fields

Field	Description
VC-ID	The virtual circuit ID for the Provider Edge (PE) MPLS.
Vlan-ID	Virtual LAN (VLAN) ID number.
Inner-Vlan-ID	Inner Virtual LAN (VLAN) ID number.
Access-Intf	The Interface Access page provides a method with which to control access to specific areas of the interface.
Network-Intf	A networking interface allows a computer or mobile device to connect to a local area network (LAN) using Ethernet as the transmission mechanism.
Out Label	Label received from downstream neighbor for route.
Tunnel-Label	Used to provide reachability between PE devices.
Nexthop Status	Displays the network status of the next hop.

show mpls vrf

Use this command to display detailed information of all the configured VRF entries. Specify the name of the VRF to display information about a specific VRF entry.

Command Syntax

```
show mpls vrf-table
show mpls vrf-table VRFNAME (count|)
```

Parameters

`VRFNAME`	Display the MPLS VRF table by its configured name
`count`	Display the MPLS VRF FTN's count

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show mpls vrf new_vrf count
----------------------------------------------
Num VRF-FTNs         : 1          [UP: 1, INSTALLED: 1]
----------------------------------------------
----------------------------------------------
Num  VRF-FTNs         : 0          [UP: 0]
----------------------------------------------
```

Table 17 explains the show command output fields.

Table 17: show vrf-table output fields

Field	Description
Num VRF-FTNs	Number of FEC-to-NHLFE map counters in VRF protocol.
Num VRF-FTNs	Number of VRF FEC-to-NHLFE map counters in protocol.

show mpls vrf-forwarding-table vrf

This CLI can be used to display a tabular output of the VRF forwarding entries received from the remote PE via MPBGP.

Command Syntax

```
show mpls vrf-forwarding-table vrf <VRFNAME>
```

Parameters

VRFNAME	Display the MPLS VRF table by its configured name

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 4.1.

Examples

```
#show mpls vrf-forwarding-table vrf BEVrf
Owner    FEC                      FTN-ID    Oper-Status    Out-Label    Tunnel-id    NHLFE-id    Out-Intf    Nexthop
BGP      10.143.73.1/32            1         Up            24320        0            19          xe25        10.143.73.1
BGP      10.143.73.10/32           6         Up            25600        0            30          xe4         10.143.73.10
BGP      10.143.169.26/31          2         Up            24320        0            19          xe25        10.143.73.1
BGP      10.143.170.26/31          3         Up            24324        0            28          xe4         10.143.73.6
```

Table 18 explains the show command output fields.

Table 18: show mpls vrf-forwarding-table vrf output fileds

Field	Description
Owner	Displays the creator of this entry, typically a protocol such as BGP.
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
FTN-ID	FEC-to-NHLFE identification.
Oper-Status	Displays the current status of the entry – Up or Down. It will be “UP” if the vrf entry is installed in the forwarder and it will be in “DOWN“ state if the vrf entry is not installed in the forwarder.
Out-Label	Displays the egress label for this FTN.
Tunnel-id	Tunnel identification to which packets of this FTN are going.
NHLFE-id	Next Hop Label Forwarding Entry identification (also known as out-segment entry identification).
Out-Intf	Name of the physical interface through which traffic goes.
Nexthop	Displays the IP address of the next hop.

show running-config interface mpls

Use this command to show the running system status and configuration for an MPLS interface.

Command Syntax

```
show running-config interface IFNAME mpls
```

Parameters

`IFNAME`	Display information for this interface name

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 mpls

#
```

show running-config mpls

Use this command to show any Multi-Protocol Label Switching (MPLS) related running configuration.

Command Syntax

```
show running-config mpls
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config mpls
!
mpls propagate-ttl
!
!
!
#
```

show running-config service-template

Use this command to show service-template related running configuration.

Command Syntax

```
show running-config service-template
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#sho running-config service-template
!
service-template s2
 match outer-vlan 200
!
service-template s1
 match outer-vlan 100
!
service-template s3
 match outer-vlan 300
!
service-template s4
 match outer-vlan 400
!
```

show running-config vc

Use this command to show any Virtual Private Wire Service (VPWS) related running configuration.

Command Syntax

```
show running-config vc
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#show running-config vc
!
mpls l2-circuit vc1 1 2.2.2.2
!
mpls l2-circuit vc2 3 2.2.2.2
 tunnel-select-policy p1
!
!
interface xe2
 mpls-l2-circuit vc1 service-template s1 primary
 mpls-l2-circuit vc2 service-template s3 primary
!
```

show running-config vpls

Use this command to show any Virtual Private LAN Service (VPLS) related running configuration.

Command Syntax

```
show running-config vpls
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#show running-config vpls
!
mpls vpls vpls1 2
 signaling ldp
  vpls-type vlan
  vpls-peer 2.2.2.2
  exit-signaling
 exit-vpls
!
mpls vpls vpls2 4
 signaling ldp
  vpls-type vlan
  vpls-peer 2.2.2.2 tunnel-select-policy p1
  exit-signaling
 exit-vpls
!
!
interface xe2
 mpls-vpls vpls1 service-template s2
 mpls-vpls vpls2 service-template s4
 split-horizon group access1
!
```

show service-template

Use this command to display information of all or particular service templates.

Command Syntax

```
show service-template (detail|)
show service-template NAME
```

Parameters

detail	Show detailed information
NAME	Name of customer service template

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 1.3.3.

Examples

```
#show service-template detail
 Service-template : C2
  Services mapped : -
  Match criteria : 9/8

 Service-template : C1
  Services mapped : -
  Match criteria : 100

 Service-template : C3
  Services mapped : -
  Match criteria : 2-5

#show service-template C1
 Service-template : C1
  Services mapped : -
  Match criteria : 100
```

Table 19 explains the show command output fields.

Table 19: show service template output fields

Field	Description
Service-template	Creates a service template and enters service template configuration mode.
Services mapped	Used to match the type of services.
Match criteria	Used to approve the identification result or dismiss it.

show vccv statistics

Use this command to display VCCV messages received prior to advertising capability.

Command Syntax

```
show vccv statistics
```

Parameters

None

Command Mode

Privileged mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following is the sample output for `show vccv statistics` command.

```
#show vccv statistics
  CC Mismatch Discards - 10
```

Table 20 explains the show command output fields.

Table 20: show vccv statistics output fields

Field	Description
CC Mismatch Discards	Number of CC mismatch packets received from neighbor discarded.

srlg-disjoint

Use this command to set how to avoid the SRLGs (Shared Risk Link Groups) of a protected primary.

A fast-reroute/secondary path for an LSP that is disjoint from the primary ensures that a single point of failure on a particular link does not bring down both the primary and secondary paths in the LSP.

Note: The SRLG option configured in RSVP-TRUNK mode (see the secondary-priority srlg-disjoint command) takes higher preference than the option configured in RSVP router mode (this command).

Use the `no` form of this command to not avoid the SRLGs of a protected interface.

Command Syntax

```
srlg-disjoint (forced|preferred)
no srlg-disjoint
```

Parameters

`forced`	The router does not create the secondary/backup tunnel unless it avoids SRLGs of the primary-path/protected-interface.
`preferred`	With two explicit paths, the first explicit path tries to avoid the SRLGs of the primary-path/protected interface. If that does not work, the secondary/backup tunnel uses the second path (which ignores SRLGs).

Command Mode

Router RSVP mode

Example

```
#configure terminal
(config)#router rsvp
(config-rsvp)# srlg-disjoint forced
```

suppress-oper-log mpls l2vpn

Use this command to suppress the operator logs for the MPLS L2VPN service.

Use the `no` parameter with this command to display the operator logs for the MPLS L2VPN service.

Command Syntax

```
suppress-oper-log mpls l2vpn
no suppress-oper-log mpls l2vpn
```

Parameters

`l2vpn`	Operator logs of L2VPN.

Default

Disabled

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

```
OcNOS#configure terminal
OcNOS(config)#suppress-oper-log mpls l2vpn
OcNOS(config)#commit
```

trace mpls

Use this command to trace the route traversed by a specified echo request packet in an MPLS protocol. Trace requests can be configured for LDP, RSVP, L2 VC, VPLS, Segment Routing and L3 VPN label switched paths.

```
trace mpls (6pe default X:X::X:X/M|ldp A.B.C.D/M|rsvp (tunnel-name NAME|egress
  A.B.C.D)|l3vpn VRFNAME A.B.C.D/M|ipv4 A.B.C.D/M) ({reply-mode
  (2)|flags|destination A.B.C.D|source A.B.C.D|timeout <1-500>|force-explicit-
  null|detail}|)
```

```
trace mpls (ospf-sr | isis-sr )(ipv4 A.B.C.D/M | sr-policy SR_POLICY_NAME
  candidate-path CANDIDATE_PATH_ID)({reply-mode (2|3)|flags | destination A.B.C.D
|source A.B.C.D | ttl <1-255> | timeout <1-500> | detail}|)
```

Parameters

6pe	FEC type is 6pe
default	VPN Instance Name (default)
X:X::X:X/M	6pe prefix address
ldp	FEC type is LDP
A.B.C.D/M	LDP prefix address
rsvp	FEC type is RSVP
tunnel-name	RSVP tunnel name
NAME	Tunnel name string
egress	RSVP tunnel egress
A.B.C.D	RSVP tunnel egress address
l3vpn	FEC type is MPLS VPN (L3-VPN)
VRFNAME	VPN instance name
A.B.C.D./M	VPN prefix
ipv4	FEC type generic; use for static/SNMP label switched paths
A.B.C.D/M	IPv4 prefix address
X:X::X:X/M	VPNv6 prefix
Ospf-sr	SR Protocol OSPF
Isis-sr	SR protocol ISIS
Ipv4	IPV4 FEC
A.B.C.D/M	Prefix with mask
Sr-policy	SR policy trace
SR_POLICY_NAME	SR policy name
Candidate-path	candidate path in sr policy
CANDIDATE_PATH_ID	candidate path id
reply-mode	Reply mode, one of
2	Reply via UDP/IP packet (default)
flags	Validate FEC stack

`destination`	Destination address
`A.B.C.D`	IPv4 address of the destination
`source`	Source address
`A.B.C.D`	IPv4 address of the source
`timeout`	Time to wait before rejecting the probe as a failure, in seconds
`<1-500>`	Timeout value
`force-explicit-null`	Force Explicit NULL label
`detail`	Print detailed output of the trace probe

Defaults

Default timeout value is 60 seconds.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3. The SR trace command was introduced in OcNOS version 4.1.

Examples

```
#trace mpls ipv4 10.10.0.0/24 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 timeout 65 detail force-explicit-null

#trace mpls l3vpn vrfa 10.10.0.0/24 reply-mode 2 flags destination 127.1.2.3
source 10.10.0.1 timeout 65 detail force-explicit-null

#trace mpls ldp 10.10.0.0/24 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 timeout 65 detail force-explicit-null

#trace mpls rsvp egress 1.2.3.5 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 timeout 65 detail force-explicit-null

#trace mpls rsvp tunnel-name tun1 reply-mode 2 flags destination 127.1.2.3 source
10.10.0.1 timeout 65 detail force-explicit-null

     # trace mpls isis-sr ipv4 2.2.2.2/32 detail
# trace mpls ospf-sr ipv4 2.2.2.2/32 detail

# trace mpls isis-sr sr-policy aaa candidate-path 1
# trace mpls ospf-sr sr-policy ABC candidate-path 1
```

tunnel-id

Use this command to configure tunnel identifier for the MPLS transport tunnel to be used for the MPLS layer-2 virtual circuit.

Use the no parameter with this command to delete tunnel identifier from the MPLS layer-2 virtual circuit.

Command Syntax:

```
tunnel-id <1-5000>
no tunnel-id
```

Parameters

`<1-5000>`	Identifying value for Tunnel-id

Default

By default, tunnel-id is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)#tunnel-id 22
```

tunnel-name

Use this command to configure tunnel name for the MPLS transport tunnel to be used for the MPLS layer-2 virtual circuit.

Use the no parameter with this command to delete tunnel name from the MPLS layer-2 virtual circuit.

Command Syntax:

```
tunnel-name NAME
no tunnel-name
```

Parameters

`NAME`	Identifying name for MPLS Tunnel

Default

By default, tunnel-name is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)#tunnel-name pe1-to-pe2
```

tunnel-select-policy

Use this command to configure tunnel selection policy name for the MPLS transport tunnel to be used for the MPLS layer-2 virtual circuit.

Use the no parameter with this command to delete tunnel selection policy name from the MPLS layer-2 virtual circuit.

Command Syntax

```
tunnel-select-policy POLICYNAME
no tunnel-select-policy
```

Parameters

POLICYNAME	Selection policy name for MPLS Tunnel

Default

By default, tunnel-select-policy is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)#tunnel-select-policy policy1
```

vccv cc-type

Use this command to configure the VCCV control channel for MPLS layer-2 virtual circuit.

Use the no parameter with this command to disable control channel from MPLS layer-2 virtual circuit.

Command Syntax

```
vccv cc-type (type-1|type-2|type-3)
no vccv cc-type (type-1|type-2|type-3)
```

Parameters

`type-1`	CC Type 1 - PWE3 Control Word with 0001b as first nibble
`type-2`	CC Type 2 - MPLS Router Alert Label
`type-3`	CC Type 3 - MPLS PW Label with TTL == 1

Default

By default, vccv is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)# vccv cc-type type-2
```

© 2025 IP Infusion Inc. Proprietary

vccv cv-type

Use this command to configure the VCCV control verification for MPLS layer-2 virtual circuit.

Use the no parameter with this command to disable control verification from MPLS layer-2 virtual circuit.

Command Syntax:

```
vccv cv-type (type-1|type-2|type-3|type-4)
no vccv cv-type (type-1|type-2|type-3|type-4)
```

Parameters

`type-1`	BFD IP/UDP-encapsulated for PW Fault Detection only
`type-2`	BFD IP/UDP-encapsulated for PW Fault Detection and AC/PW Fault Status Signalling
`type-3`	BFD PW-ACH-encapsulated for PW Fault Detection only
`type-4`	BFD PW-ACH-encapsulated for PW Fault Detection and AC/PW Fault Status Signalling

Default

By default, vccv is disabled

Command Mode

Configure Pseudowire mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls l2-circuit mycircuit 45678 1.2.3.4
(config-pseudowire)# vccv cv-type type-1
```

CHAPTER 2
Differentiated Services Commands

This chapter describes the RSVP Differentiated Services (DiffServ) commands.

- map-route A.B.C.D
- override-diffserv
- primary class-to-exp-bit
- primary elsp-signaled
- primary llsp
- secondary map class
- secondary elsp-signaled
- secondary llsp
- show rsvp diffserv-info

© 2025 IP Infusion Inc. Proprietary

map-route A.B.C.D

Use this command to map a IPv4 prefix route onto a trunk. This route is to be used for packets that are mapped to a specific RSVP trunk.

Use the `no` parameter with this command for unmapping routes from specified trunks.

Note: Do not configure the local address as a map route, as explicit validation is not done. The wrong configuration may impact traffic.

Command Syntax

```
map-route A.B.C.D A.B.C.D
map-route A.B.C.D A.B.C.D CLASS
map-route A.B.C.D/M
map-route A.B.C.D/M CLASS
no map-route A.B.C.D A.B.C.D
no map-route A.B.C.D A.B.C.D CLASS
no map-route A.B.C.D/M
no map-route A.B.C.D/M CLASS
```

Parameters

`A.B.C.D`	Specify the IPV4 address to be mapped.
`A.B.C.D`	Specify a mask to be applied to the address being mapped.
`A.B.C.D/M`	Specify the IPV4 address to be mapped, with mask.
`CLASS`	Specify the DiffServ Class Name (for example, `be`, `ef` etc.) used for selecting incoming IP packets to be mapped to a specified RSVP trunk.

Default

By default, map route A.B.C.D is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#map-route 1.1.2.2/24 be
```

© 2025 IP Infusion Inc. Proprietary

override-diffserv

Use this command to enable the Differentiated Services (Diff-Serv) override configuration.

If a Path message is received without a Diff-Serv object by a Diff-Serv enabled node, it can be interpreted either as a request for an E-LSP (EXP-Inferred-PSC LSP) or as a request for Non-Diff-Serv LSP. This command supports the override option and when configured, the LSR interprets a path message without a Diff-Serv object as a request for Non-Diff-Serv LSP.

Use the `no` parameter with this command disable this feature.

Command Syntax

```
override-diffserv

no override-diffserv
```

Parameters

None

Default

By default, override diffserv is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router rsvp
(config-router)#override-diffserv
```

primary class-to-exp-bit

Use this command to configure a primary PHB-EXP (Per-Hop Behavior-Experimental) mapping to be used by an E-LSP (EXP-Inferred-PSC LSP). This mapping is different from the node level PHB-EXP mapping.

Use the `no` parameter with this command to remove a PHB-EXP mapping configuration from current E-LSP PHB-EXP mapping.

Command Syntax

```
primary class-to-exp-bit CLASS <0-7>
no primary class-to-exp-bit CLASS <0-7>
```

Parameters

`CLASS`	Specify the DiffServ Class Name (for example, be, ef etc.) used for selecting incoming IP packets to be mapped to a specified RSVP trunk.
`<0-7>`	Exp bit which is to be mapped to this PHB.

Default

By default, primary map class is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary class-to-exp-bit af12 3

(config)#rsvp-trunk T1
(config-trunk)#no primary class-to-exp-bit af12 3
```

primary elsp-signaled

Use this command to configure a primary Diff-Serv (Differentiated Services) explicitly signaled E-LSP (EXP-Inferred-PSC LSP) interface.

The classes 1 to 7 are optional parameters that can be selected from node level PHB-EXP (Per-Hop Behavior) mapping as PHBs, which will then be used for an E-LSP. If you do not specify a class with this command, all classes will be selected for the E-LSP.

Use the no parameter with this command to remove the configuration.

Command Syntax

```
primary elsp-signaled
primary elsp-signaled CLASS1
primary elsp-signaled CLASS1 CLASS2
primary elsp-signaled CLASS1  CLASS2 CLASS3
primary elsp-signaled CLASS1  CLASS2 CLASS3 CLASS4
primary elsp-signaled CLASS1  CLASS2 CLASS3 CLASS4 CLASS5
primary elsp-signaled CLASS1  CLASS2 CLASS3 CLASS4 CLASS5 CLASS6
primary elsp-signaled CLASS1  CLASS2 CLASS3 CLASS4 CLASS5 CLASS6 CLASS7
no primary elsp-signaled
```

Parameter

`CLASS<0-7>`	Diffserv class alias. e.g.: be, ef, af11, etc.

Default

By default, primary elsp signaled is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary elsp-signaled cs2 cs5 cs6

(config)#rsvp-trunk T1
(config-trunk)#no primary elsp-signaled
```

© 2025 IP Infusion Inc. Proprietary

primary llsp

Use this command to configure a primary Differentiated Services Label-Only-Inferred-PSC (Diff-Serv L-LSP) interface, which will use Diff-Serv Class as its PHB Scheduling Class (PSC).

Use the no parameter with this command to remove the Diff-Serv L-LSP configuration.

Command Syntax

```
primary llsp CLASS
no primary llsp
```

Parameters

CLASS<0-7>	Diffserv class alias. e.g: be, ef, af11, etc.

Default

By default, primary llsp is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is not available on QUMRAN devices.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary llsp cs4

(config)#rsvp-trunk T1
(config-trunk)#no primary llsp
```

secondary map class

Use this command to configure a secondary PHB-EXP (Per-Hop Behavior-Experimental) mapping to be used by an E-LSP (EXP-Inferred-PSC LSP). This mapping is different from the node level PHB-EXP mapping.

Use the no parameter with this command to remove a PHB-EXP mapping configuration from current E-LSP PHB-EXP mapping.

Command Syntax

```
secondary map class-to-exp-bit CLASS  <0-7>
no secondary map class-to-exp-bit CLASS  <0-7>
```

Parameters

CLASS	Diff-Serv class (queue) mapped to the particular PHB.
	Diffserv class alias e.g: be, ef, af11, etc.
<0-7>	Exp bit that is to be mapped to this PHB.

Default

By default, secondary map class is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary class-to-exp-bit cs4 3

(config)#rsvp-trunk T1
(config-trunk)#no secondary class-to-exp-bit cs4 3
```

secondary elsp-signaled

Use this command to configure a secondary Diff-Serv (Differentiated Services) explicitly signaled E-LSP (EXP-Inferred-PSC LSP) interface. The classes 1 to 7 are optional parameters can be selected from the node level PHB-EXP (Per-Hop Behavior) mapping as PHBs. They will then be used for an E-LSP. If you do not specify a class with this command, all classes will be selected for the E-LSP.

Use the no parameter with this command to remove the configuration.

Command Syntax

```
secondary elsp-signaled
secondary elsp-signaled CLASS1
secondary elsp-signaled CLASS1 CLASS2
secondary elsp-signaled CLASS1 CLASS2 CLASS3
secondary elsp-signaled  CLASS1 CLASS2 CLASS3 CLASS4
secondary elsp-signaled  CLASS1 CLASS2 CLASS3 CLASS4 CLASS5
secondary elsp-signaled CLASS1 CLASS2 CLASS3 CLASS4 CLASS5 CLASS6
secondary elsp-signaled CLASS1 CLASS2 CLASS3 CLASS4 CLASS5 CLASS6 CLASS7
no secondary elsp-signaled
```

Parameters

`CLASS<0-7>`	Diffserv class alias. e.g: be, ef, af11, etc.

Default

By default, secondary elsp signaled is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary elsp-signaled class cs3 cs6 cs2 cs5

(config)#rsvp-trunk T1
(config-trunk)#no secondary elsp-signaled
```

© 2025 IP Infusion Inc. Proprietary

secondary llsp

Use this command to configure a secondary Differentiated Services Label-Only-Inferred-PSC (Diff-Serv L-LSP) interface, which will use Diff-Serv Class as its PHB Scheduling Class (PSC).

Use the no parameter with this command to remove the Diff-Serv L-LSP configuration.

Command Syntax

```
secondary llsp CLASS
no secondary llsp
```

Parameters

`CLASS<0-7>`	Diffserv class alias. e.g: be, ef, af11, etc.

Default

By default, secondary llsp is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is not available on QUMRAN devices.

Example

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary llsp class cs5

(config)#rsvp-trunk T1
(config-trunk)#no secondary llsp
```

show rsvp diffserv-info

Use this command to display node level Differentiated Services (Diff-Serv) configuration information. This information includes the node level PHB-EXP mapping configured for ELSP-signaled LSP.

Command Syntax

```
show rsvp diffserv-info
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Following is a sample output of the `show rsvp diffserv-info` command.

```
#show rsvp diffserv-info
CLASS-EXP mapping:
CLASS    DSCP_value
 c5  101000 0
 be  000000 1
 cs1 001000 2
 cs3 011000 3
 cs2 010000 4
 cs4 100000 5
 cs6 110000 6
 cs7 111000 7
```

Table 2-1 explains the show command output fields.

Table 2-1: show rsvp diffserv-info output fields

Field	Description
CLASS	MPLS class type that corresponds to the DiffServ traffic engineering class.
EXP_value	Exp value is initialized at the ingress routing device only and overrides the rewrite configuration established for that forwarding class.

CHAPTER 3 Virtual Private LAN Service Commands

This chapter describes each VPLS (Virtual Private LAN Service) command.

- ac-admin-status
- ac-description
- clear mpls vpls
- control-word
- exit-signaling
- exit-if-vpls
- learning disable (VPLS Mode)
- learning disable (Interface VPLS Mode)
- learning enable
- no learning
- mpls vpls
- mpls-vpls service-template
- show mpls vpls
- show mpls vpls mac-address
- show mpls vpls split-horizon
- show mpls vpls statistics
- signaling ldp
- signaling bgp
- split-horizon (service-template)
- static-mac
- tunnel-select-policy
- ve-id
- vpls-ac-group
- vpls-description
- vpls fib-entry
- vpls-mtu
- vpls-peer
- vpls-peer manual
- vpls-type
- vpls-vc
- vpls-route-map

ac-admin-status

Use this command to configure the admin status of an attachment circuit specific to a VPLS instance.

Command Syntax

```
ac-admin-status down
no ac-admin-status
```

Parameter

`down`	set the admin role as DOWN

Default

By default, ac admin status is up

Command Mode

Interface VPLS

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows the configuration of admin status for attachment circuit specific to VPLS instance

```
#configure terminal
(config)#interface xe1
(config-if)#mpls-vpls vpls1 service-template st1
(config-if-vpls)#no ac-admin-status
```

ac-description

Use this command to add description for an attachment circuit specific for a VPLS instance

Use the no parameter with this command to remove the description

Command Syntax

```
ac-description LINE
```

Parameter

`LINE`	Characters describing this AC

Default

By default, ac description LINE is disabled

Command Mode

Interface VPLS

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows the configuration of description for attachment circuit specific to VPLS instance

```
#configure terminal
(config)#interface xe1
(config-if)#mpls-vpls vpls1 service-template st1
(config-if-vpls)#ac-description AC1_VPLS1
```

clear mpls vpls

Use this command to clear VPLS data.

Command Syntax

```
clear mpls vpls (NAME |) mac-addresses
```

Parameters

`NAME`	Clear data for the VPLS instance with name given
`mac-addresses`	Flush all MAC addresses for a VPLS instance

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear mpls vpls VPLS_123 mac-addresses
```

control-word

Use this command to enable control-word for a VPLS instance.

Use the `no` parameter with this command to disable control-word.

Command Syntax

```
control-word
no control-word
```

Parameters

None

Default

By default, control-word is disabled.

Command Mode

VPLS mode

Applicability

This command was introduced in OcNOS version 4.1.

Example

```
#(config-vpls)#control-word

#(config-vpls)#no control-word
```

exit-signaling

Use this command to exit the VPLS signaling configuration mode, and start signaling. To configure signaling with LDP, see the signaling ldp command. Other VPLS signaling configuration commands include show mpls vpls, show mpls vpls, vpls-vc, vpls-ac-group, and vpls-peer.

Note: It is *critical* to give this command after all VPLS signaling configurations are complete, otherwise signaling does not start.

Command Syntax

```
exit-signaling
```

Parameters

None

Default

No default value is specified

Command Mode

VPLS Signaling mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
# configure terminal
(config)#mpls vpls test 100
(config-vpls)#signaling ldp
(config-vpls-sig)#exit-signaling
```

exit-if-vpls

Use this command to exit from Interface VPLS mode

Command Syntax

```
exit-if-vpls
```

Parameter

None

Default

No default value is specified

Command Mode

Interface VPLS

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows exiting from interface VPLS mode

```
#configure terminal
(config)#interface xe1
(config-if)#mpls-vpls vpls1 service-template st1
(config-if-vpls)#ac-description AC1_VPLS1
(config-if-vpls)#exit-if-vpls
(config-if-vpls)#exit
```

learning disable (VPLS Mode)

Use this command to disable learning for a VPLS instance.

Use the `no` form of this command to enable learning on a VPLS instance.

Note: This command disables learning on all the attachment circuits and pseudo-wires belonging to that VPLS instance.

Command Syntax

```
learning disable
no learning disable
```

Parameter

None

Default

By default, learning disable is disabled

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config-vpls)#mpls vpls vpls2 vlan 3
(config-vpls)#learning disable
(config-vpls)#exit

#configure terminal
(config-vpls)#mpls vpls vpls2 vlan 3
(config-vpls)#no learning disable
(config-vpls)#exit
```

learning disable (Interface VPLS Mode)

Use this command to disable learning on a particular Attachment Circuit (AC) interface.

Use the learning enable command to enable learning on a particular AC interface.

Note: This command disables MAC learning only on that interface.

Command Syntax

```
learning disable
```

Parameter

None

Default

By default, learning disable is disabled

Command Mode

Interface VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#mpls-vpls vpls1 service-template st1
(config-if-vpls)#learning disable
(config-if-vpls)#exit
```

learning enable

Use this command to enable learning on a particular attachment circuit (AC) interface.

Use the learning disable (Interface VPLS Mode) command to disable learning on a particular AC interface.

Note: This command enables MAC learning only on that AC interface.

Command Syntax

```
learning enable
```

Parameter

None

Default

By default, learning enable is enabled

Command Mode

Interface VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#mpls-vpls vpls1 service-template st1
(config-if-vpls)#learning enable
(config-if-vpls)#exit
```

no learning

Use this command to reset learning on a particular AC-interface to the global learning configuration.

Command Syntax

```
no learning
```

Parameter

None

Default

By default, no learning is disabled

Command Mode

Interface VPLS mode and VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#mpls-vpls vpls1 service-template st1
(config-if-vpls)#no learning
(config-if-vpls)#exit
(config)#

#configure terminal
(config)#mpls vpls vpls5 vlan 34
(config-vpls)#learning limit 500
(config-vpls)#exit
(config)#
```

mpls vpls

Use this command to create an instance of MPLS-based Virtual Private LAN Services (VPLS).

Use the `no` parameter with this command to delete an MPLS-based VPLS instance.

Note: OcNOS supports configuring the same Virtual Circuit Identifier (VC-ID) with different VPLS names for different LDP neighbors.

Command Syntax

```
mpls vpls NAME
mpls vpls NAME <1-4294967295>
no mpls vpls NAME
```

Parameters

NAME	VPLS instance identifier
<1-4294967295>	VPLS instance identifier

Default

By default, mpls vpls is disabled

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls vpls t1 6489
(config-vpls)#exit
```

mpls-vpls service-template

Use this command to bind a VPLS instance to a service template.

Use the no parameter with this command unbind the VPLS instance from service template.

Command Syntax

```
mpls-vpls VPLS_NAME service-template TEMPLATE_NAME
no mpls-vpls VPLS_NAME service-template TEMPLATE_NAME
```

Parameters

VPLS_NAME	VPLS instance name
TEMPLATE_NAME	Service template name

Default

N/A

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#switchport
(config-if)#mpls-vpls VPLS1 service-template C1
(config_if_vpls)#exit-if-vpls

(config-if)#no mpls-vpls VPLS1 service-template C1
(config_if)#exit-if-vpls
```

show mpls vpls

Use this command to display logging information configured for MPLS.

Command Syntax

```
show mpls vpls
show mpls vpls debug-detail
show mpls vpls detail
show mpls vpls mesh
show mpls vpls NAME
show mpls vpls NAME mesh
show mpls vpls NAME spoke
show mpls vpls spoke
show mpls vpls count
```

Parameters

`debug-detail`	Show detailed VPLS information for debugging purpose
`detail`	Display detailed VPLS information
`mesh`	Display MPLS VPLS Mesh Forwarding information. Use this parameter to display information about all core Virtual Circuit (VC) connections for all VPLS instances. Give the name of a VPLS instance to display information about that instance.
`NAME`	Display the identifying string for the VPLS domain
`spoke`	Display MPLS VPLS Spoke Forwarding information. Use this parameter to display information about all spoke VC connections for all VPLS instances. Give the name of a VPLS instance to display information about that instance.
`count`	Display the count of VPLS instances

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

Using `show mpls vpls` command without parameters displays information about all VPLS instances.

The example below displays information about the VPLS instance `v1`, returned when using the `NAME` parameter.

```
#show mpls vpls t1
Virtual Private LAN Service Instance: t1, ID: 1
 Group ID: 0, VPLS Type: Ethernet VPLS, Configured MTU: 0
 Description: none
 Configured interfaces: none
 Mesh Peers: 192.168.0.80 (Up)
             192.168.0.90 (Up)
 Spoke Peers: t100 (Up)
```

```
#
```

Table 3-2 explains the show command output fields.

Table 3-2: show mpls vpls t1 output field

Field	Description
Virtual Private LAN Service Instance	Number of VPLAN service instance.
ID	VPLAN identification detail for service instance.
Group ID	Group identification detail for VLAN.
VPLS Type	Type of VPLS in the interface.
Configured MTU	Number of configured MTU in the VPLs.
Description	Details of VPLS.
Configured interfaces	Description of the configured interfaces.
Mesh Peers	Configuring the VPLS mesh peers.
Spoke Peers	Configuring the VPLS spoke peers.

The example below displays the name of the VPLS instance, its ID, they type of instance (Ethernet), the M and S peers, and the signaling protocol. For the first entry, the signaling protocol is BGP and for the second entry it is LDP.

```
#show mpls vpls
Name   VPLS-ID      Type             MPeers     SPeers     SIG-Protocol
v1     100          Ethernet         1          0          BGP
v3     300          Ethernet         1          0          LDP
```

Table 3-3 explains the show command output fields.

Table 3-3: show mpls vpls output field

Field	Description
Name	Type of the MPLS protocol.
VPLS-ID	Identification detail of VPLS.
Type	Type of VPLS in MPLS protocol.
Mesh Peers	Configuring the VPLS mesh peers.
Spoke Peers	Configuring the VPLS spoke peers.
SIG-Protocol	Type of protocol in MPLS configuration.

The example below displays the output when using the debug-detail parameter. It displays information for VPLS instance `vpls1`, including the signaling protocol, create time, uptime, total down time, associated transport, traffic statistics if non-zero and statistics profile enabled, and so on.

```
#show mpls vpls debug-detail
Virtual Private LAN Service Instance: vpls1, ID: 300
 SIG-Protocol: LDP
 Attachment-Circuit: UP
 Learning: Enabled
 Control-Word: Disabled
 Flow Label Status: Disabled, Direction: None, Static: No
 Group ID: 0, VPLS Type: Ethernet VLAN, Configured MTU: 1500
 Description: none
 service-tpid: dot1.q
 Operating mode: Tagged
 Svlan Id: 0
 Svlan Tpid: 8100

 Configured interfaces:
  Interface: xe4
   Status: Up
   Service-template : vpls1
   Match criteria : 440

Mesh Peers:
   2.2.2.2 State: Installed
     CreateTime: 08:56:53, UpTime: 08:56:53
     TotalDownTime: N/A, FlapCount: 0, LastFlapReason: N/A
     Tunnel-Id: 11
     Transport: owner CLI, ftn_ix 9
   3.3.3.3 State: Installed
     CreateTime: 08:56:53, UpTime: 08:56:53
     TotalDownTime: N/A, FlapCount: 0, LastFlapReason: N/A
     Tunnel-Name: t1
     Transport: owner RSVP, ftn_ix 8
   4.4.4.4 State: Installed
     CreateTime: 08:56:53, UpTime: 08:49:39
     TotalDownTime: 00:01:11, FlapCount: 1, LastFlapReason: FIB delete from
protocol
     Tunnel-Policy: p1
     Transport: owner SR_POLICY, ftn_ix 13
```

The example below displays the output when using the `detail` parameter. It displays information for VPLS instance `v1`, including the signaling protocol.

```
#show mpls vpls detail

Table 3-4 explains the show command output fields.

Table 3-4: show mpls vpls details output field

Field	Description
Virtual Private LAN Service Instance	Number of VPLS service instance.
ID	VPLS identification detail for service instance.
SIG-Protocol	Type of protocol in MPLS configuration.
Attachment-Circuit	Details of the attached circuit in interface.
Learning	State of the interface.
Group ID	Group identification detail for VLAN.
VPLS Type	Type of VPLS in MPLS protocol.
Configured MTU	Number of configured MTU in the VPLs.
Description	Details of VPLS.
Service-tpid	Service TP identifier configured for the VPLS PW.
Operating mode	Type of mode in the interface.
Svlan Id	Configures a specific virtual LAN (VLAN).

Table 3-4: show mpls vpls details output field

Field	Description
Svlan Tpid	Service vlan TP identifier for the VPLS PW.
Redundancy admin role	Creating a Backup Administrator Role.
Redundancy oper role	Operational Role of the VPLS instance.
Configured interfaces	Details of the configured interfaces.
Interface	Selects an interface to configure.
Oper-state	Displays the current status of the cross-connect segment – Up or Down.
Service-template	Used to configure advanced service-related option.
Match criteria	Identifies prefix characteristics (network, BGP path attribute, nexthop, and so on) for a specific sequence.
Mesh Peers	Configuring the VPLS mesh peers.
PW Status Local	Used to perform limited local configuration changes, monitor device status and utilization, and simple local troubleshooting.
Remote	PW status of Remote end.

The example below displays the output provided when using the `mesh` parameter without a specific VPLS name.

```
VPLS-ID  Peer Addr Tunnel-Label In-Label Network-Intf Out-Label Lkps/St PW-
INDEX    SIG-Protocol
100      2.2.2.2   N/A           52503    eth2           53258      0/Dn
2        BGP
300      2.2.2.2   N/A           none      N/A            none      0/Dn
1        LDP
```

Table 3-5 explains the show command output fields.

Table 3-5: show mpls vpls output field

Field	Description
VPLS-ID	Identification details of the VPLS.
Peer Addr	IP address of the peer device.
Tunnel-Label	Tunnel label used for the next segment.
In-label	Displays the ingress (incoming interface) label for this segment.
Out-Label	Label received from downstream neighbor for route.
Network-Intf	Installed as a result of configuring an interface.
Lkps/St	Opcode and Status of the VPLS PW.

Table 3-5: show mpls vpls output field

Field	Description
PW-INDEX	Index of the VPLS entry in PW table.
SIG-Protocol	Signaling protocol used for VPLS labels advertisement.

The following is a sample output of the `show mpls vpls detail` command displaying detailed information about all configured VPLS instances.

```
#show mpls vpls detail
Virtual Private LAN Service Instance: vpls3100, ID: 3100
SIG-Protocol: BGP

Table 3-6 explains the show command output fields.

Table 3-6: show mpls vpls details output field

Field	Description
Virtual Private LAN Service Instance	Number of VPLS service instance.
ID	VPLS identification detail for service instance.
SIG-Protocol	Type of protocol in MPLS configuration.
Attachment-Circuit	Details of the attached circuit in interface.
Learning	State of the interface.
Group ID	Group identification detail for VLAN.
VPLS Type	Type of VPLS in MPLS protocol.
Configured MTU	Number of configured MTU in the VPLs.

Table 3-6: show mpls vpls details output field

Field	Description
Description	Details of VPLS.
Service-tpid	Service TP identifier configured for the VPLS PW.
Operating mode	Type of mode in the interface.
Svlan Id	Configures a specific virtual LAN (VLAN).
Svlan Tpid	Service vlan TP identifier for the VPLS PW.
Redundancy admin role	Creating a Backup Administrator Role.
Redundancy oper role	Operational Role of the VPLS instance.
Configured interfaces	Details of the configured interfaces.
Interface	Selects an interface to configure.
Oper-state	Displays the current status of the cross-connect segment – Up or Down.
Service-template	Used to configure advanced service-related option.
Match criteria	Identifies prefix characteristics (network, BGP path attribute, nexthop, and so on) for a specific sequence.
Mesh Peers	Configuring the VPLS mesh peers.
PW Status Local	Used to perform limited local configuration changes, monitor device status and utilization, and simple local troubleshooting.
Remote	PW status of Remote end.

The following is a sample output of the `show mpls vpls mesh` command displaying information about all the core VC connections for all VPLS instances.

```
#show mpls vpls mesh
VPLS-ID    Peer Addr        In-Intf    In-Label   Out-Intf   Out-Label Lkps/St
PW-INDEX SIG-Protocol Status  Ecmp-Group
1           192.168.0.80     eth0       16         eth0       640        1/Up
1          BGP Active   N/A
1           192.168.0.90     eth1       18         eth1       642        1/Up
2          BGP Active   N/A

1          BGP Active   N/A
2           192.168.0.90     eth1       17         eth1       643        1/Up
2          BGP Active   N/A
#
```

Table 3-7 explains the show command output fields.

Table 3-7: show mpls vpls mesh output field

Field	Description
VPLS-ID	Identification details of the VPLS.
Peer Addr	IP address of the peer device.
In-Intf	Installed as a result of configuring an interface.
In-label	Displays the ingress (incoming interface) label for this segment.
Out-Label	Label received from downstream neighbor for route.
Network-Intf	Installed as a result of configuring an interface.
Lkps/St	Opcode and Status of the VPLS PW.
PW-INDEX	Psuedo wire index
SIG-Protocol	Signalling protocol
Status	Status of Psuedo wire
Ecmp-Group	Equal cost multi path group

The following is a sample output of the `show mpls vpls spoke` displaying the spoke VC connection to the VPLS instance.

```
#show mpls vpls spoke
VPLS-ID    Virtual Circuit In-Intf     In-Label    Out-Intf    Out-Label Lkps/St
1          t100             eth2        20          eth2        640          1/Up
#
```

Table 3-8 explains the show command output fields.

Table 3-8: show mpls vpls spoke output field

Field	Description
VPLS-ID	Identification details of the VPLS.
Virtual Circuit	Used in transportation of data over a packet switch computer network.
In-Intf	Installed as a result of configuring an interface.
In-label	Displays the ingress (incoming interface) label for this segment.
Out-Label	Label received from downstream neighbor for route.
Network-Intf	Installed as a result of configuring an interface.
Lkps/St	Opcode and Status of the VPLS PW.

The following is a sample output of show mpls vpls count displaying information about total, active and inactive vpls instances.

```
#show mpls vpls count
-------------------------------
Total VPLS instances    : 2
Active VPLS instances   : 2
Inactive VPLS instances : 0
-------------------------------
```

Table 3-9 explains the show command output fields.

Table 3-9: show mpls vpls count output field

Field	Description
Total VPLS instances	Number of total VPLS instance.
Active VPLS instances	Number of active VPLS instance.
Inactive VPLS instances	Number of inactive VPLS instance.

show mpls vpls mac-address

Use this command to display retrieved VPLS learning mac-addresses on MPLS enabled node.

Command Syntax

```
show mpls vpls mac-address (name NAME |) (interface IFNAME |) (peer A.B.C.D |)
  (count |)
```

Parameters

NAME	Specify the name of the vpls instance
count	Counts the number of MAC address learned
IFNAME	Specify the name of interface
A.B.C.D	Specify the peer address

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show mpls vpls mac-address
VPLS-ID     MAC address        Learned from    Peer address
1           08:00:27:85:28:8a   eth1             1.1.1.1
1           08:00:27:99:91:1d   eth3             -

#show mpls vpls mac-address count
Total no of MAC addresses learnt :2

#show mpls vpls mac-address name vpls1
MAC address        Learned from    Peer address
08:00:27:85:28:8a   eth1             1.1.1.1
08:00:27:99:91:1d   eth3             -

#show mpls vpls mac-address name vpls1 count
Total no of MAC addresses learnt :2

#show mpls vpls mac-address interface eth1
VPLS-ID     MAC address        Learned from    Peer address
1           08:00:27:85:28:8a   eth1             1.1.1.1

#show mpls vpls mac-address interface eth1 count
Total no of MAC addresses learnt :1
```

```
#show mpls vpls mac-address name vpls1 interface eth1
MAC address        Learned from    Peer address
08:00:27:85:28:8a   eth1              1.1.1.1

#show mpls vpls mac-address name vpls1 interface eth1 count
Total no of MAC addresses learnt :1

#show mpls vpls mac-address peer 1.1.1.1
VPLS-ID     MAC address        Learned from    Peer address
1           08:00:27:85:28:8a   eth1              1.1.1.1

#show mpls vpls mac-address peer 1.1.1.1 count
Total no of MAC addresses learnt :1

#show mpls vpls mac-address name vpls1 peer 1.1.1.1
MAC address        Learned from    Peer address
08:00:27:85:28:8a   eth1              1.1.1.1

#show mpls vpls mac-address name vpls1 peer 1.1.1.1 count
Total no of MAC addresses learnt :1

#show mpls vpls mac-address interface eth1 peer 1.1.1.1
VPLS-ID     MAC address        Learned from    Peer address
1           08:00:27:85:28:8a   eth1              1.1.1.1

# show mpls vpls mac-address interface eth1 peer 1.1.1.1 count
Total no of MAC addresses learnt :1

#show mpls vpls mac-address name vpls1 interface eth1 peer 1.1.1.1
MAC address        Learned from    Peer address
08:00:27:85:28:8a   eth1              1.1.1.1

#show mpls vpls mac-address name vpls1 interface eth1 peer 1.1.1.1 count
Total no of MAC addresses learnt :1
```

Table 3-10 explains the show command output fields.

Table 3-10: show mpls vpls mac-address output field

Field	Description
MAC address	Used to forward the packet into a given VPLS instance.
Learned from	MAC addresses learned from a specific interface.
Peer address	IP address of the peer device.

show mpls vpls split-horizon

Use this command to display the split horizon grouping information.

Command Syntax

```
show mpls vpls split-horizon <vpls_name>
```

Parameters

<vpls_name>	(Optional). Specifies the name of the VPLS.

Default

None

Command Mode

EXEC mode

Applicability

This command was introduced before OcNOS version 6.5.2.

Example

The following example shows a summary of all VPLS instances, showing their VPLS ID, type, details (such as spokes or ACs), associated interfaces, and the split horizon group they belong to:

```
#show mpls vpls split-horizon
+------------+------------+-----------------+---------------+--------------+
|   VPLSID   |   Type     |     Details     |   Interface   |     Group    |
+------------+------------+-----------------+---------------+--------------+
800           AC          st2                xe9             access2
800           AC          -                  xe17.800        access1
800           Spoke       vc2                -               network
2000          Spoke       vc1                -               access1
```

The following example shows the split horizon details for a specific VPLS instance, showing similar information but focused on the specified VPLS ID:

```
#show mpls vpls split-horizon vpls800
+------------+------------+-----------------+---------------+--------------+
|   VPLSID   |   Type     |     Details     |   Interface   |     Group    |
+------------+------------+-----------------+---------------+--------------+
800           AC          st2                xe9             access2
800           AC          -                  xe17.800        access1
800           Spoke       vc2                -               network
```

The following example shows when there is no VPLS is configured with the specified VPLS ID:

```
#show mpls vpls split-horizon vpls200
% No VPLS with name: vpls200 configured.
```

The following example shows VPLS split horizon details for VPLS ID 2000:

```
#show mpls vpls split-horizon vpls2000
+------------+------------+-----------------+---------------+--------------+
```

```
   |   VPLSID   |   Type     |      Details      |   Interface   |     Group     |
   +------------+------------+-----------------+---------------+--------------+
   2000           Spoke       vc1                 -               access1
```

Table 3-10 explains the show command output fields.

Table 3-11: show mpls vpls split-horizon output field

Field	Description
VPLSID	The ID of the VPLS instance. It uniquely identifies each VPLS in the network.
Type	The type of connection within the VPLS instance.
Details	Additional details about the VPLS connection type, such as the virtual circuit (VC) number or other identifiers related to the connection.
Interface	The physical or logical interface on the PE router that is part of the VPLS instance.
Group	The split-horizon group associated with the VPLS instance.

show mpls vpls statistics

Use this command to display MPLS traffic statistics for VPLS network or access or all ports.

Note: Multicast traffic statistics not supported by hardware.

Command Syntax

```
show mpls vpls NAME statistics

show mpls vpls NAME statistics ((network-port ((peer A.B.C.D)|(spoke-vc VC-NAME)|))
  | (access-port (IFNAME (ethernet|(vlan <1-4094>))|)))
```

Parameters

NAME	Name of the VPLS instance
a.b.c.d	Mesh peer address of VC instance
VC-NAME	Name of the spoke VC instance
IFNAME	Name of the access-port interface
<1-4094>	VLAN ID of access-port of type VLAN

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls vpls v1 statistics
Virtual Private LAN Service Instance: v1, ID: 10

 Access port statistics:
 Interface: xe3/4 VLAN ID: 2
   RX:  Input packets  : 10
        Input bytes    : 640
   TX:  Output packets : 0
        Output bytes   : 0

 Network port statistics:
 Mesh Peer: 8.8.8.8 (Up)
   RX:  Input packets  : 0
        Input bytes    : 0
   TX:  Output packets : 10
        Output bytes   : 640
```

Table 3-10 explains the show command output fields.

Table 3-12: show mpls vpls statistics output field

Field	Description
Access port statistics	Traffic statistics on Access port of VC/VPLS.
Network port statistics	Traffic statistics on Provider port of VC/VPLS.
Interface	Type of interface in the network.
VLAN ID	Identification details of the VPLS.
Mesh Peer	Configuring the VPLS mesh peers.
RX	Number of received packets.
Input packets	Number of hello packets received from the neighbor.
Input bytes	Size of hello packets received from the neighbor.
TX	Number of packets transmitted.
Output packets	Number of hello packets sent to the neighbor.
Output bytes	Size of hello packets sent to the neighbor.

signaling ldp

Use this command to establish a pseudowire connection between Provider Edge (PE) routers. Use this command to use the Label Distribution Protocol (LDP) for signaling and to support VPLS auto-discovery between VPLS instances.Using this command triggers LDP to signal a pseudowire between the configured VPLS peers in the same VPLS instance. The `vpls-peer` command is used to identify the VPLS peers that are part of a VPLS instance

Note: Issuing this command puts the router into VPLS signaling (`config-vpls-sig`) mode.

Use the `no` parameter with this command to remove (tear down) pseudowires with other PE routers.

Command Syntax

```
signaling ldp
no signaling ldp
```

Parameters

None

Default

By default, signaling ldp is disabled

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# mpls vpls test 100
(config-vpls)#signaling ldp
(config-vpls-sig)#vpls-peer 97.97.97.97
(config-vpls-sig)#exit
```

signaling bgp

Use this command to establish a pseudowire connection between Provider Edge (PE) routers. Use this command to use the Border Gateway Protocol (BGP) for signaling and to support VPLS auto-discovery between VPLS instances.Using this command triggers BGP to auto-discover VPLS peers and signal pseudowire between the VPLS peers in the same VPLS instance.

Note: Issuing this command puts the router into VPLS signaling .

Use the `no` parameter with this command to remove (tear down) pseudowires with other PE routers.

Command Syntax

```
signaling bgp
no signaling bgp
```

Parameters

None

Default

By default, signaling bgp is disabled

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# mpls vpls test 100
(config-vpls)#signaling bgp
(config-vpls-sig)#exit
```

signaling bgp

Use this command to establish a pseudowire connection between Provider Edge (PE) routers. Use this command to use the Border Gateway Protocol (BGP) for signaling and to support VPLS auto-discovery between VPLS instances.Using this command triggers BGP to auto-discover VPLS peers and signal pseudowire between the VPLS peers in the same VPLS instance.

Note: Issuing this command puts the router into VPLS signaling .

Use the `no` parameter with this command to remove (tear down) pseudowires with other PE routers.

Command Syntax

```
signaling bgp
no signaling bgp
```

Parameters

None

Default

By default, signaling bgp is disabled

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# mpls vpls test 100
(config-vpls)#signaling bgp
(config-vpls-sig)#exit
```

split-horizon (service-template)

Use this command to configure split-horizon group for vpls attachment circuit.

Use the `no` form of this command to remove split-horizon group from vpls attachment circuit.

Command Syntax

```
split-horizon group (network | access1 | access2)
no split-horizon group
```

Parameters

`network`	Split-horizon group name network
`access1`	Split-horizon group name access1
`access2`	Split-horizon group name access2

Default

By default, split horizon is disabled.

Command Mode

Interface VPLS mode

Applicability

This command was introduced before OcNOS version 6.3.0 and applicable only on Qumran1 devices.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#mpls-vpls vpls1 service-template vc1
(config-if-vpls)#split-horizon group access1
(config-if-vpls)#no split-horizon group
```

static-mac

Use this command to add static MAC address to attachment circuit specific for a VPLS instance.

Use the `no` parameter with this command to remove static MAC address.

Note: It is not supported, if the user configures same mac address on different attachment circuits for same VPLS instance.

Command Syntax

```
static-mac XXXX.XXXX.XXXX
no static-mac XXXX.XXXX.XXXX
```

Parameter

`XXXX.XXXX.XXXX` MAC address in HHHH.HHHH.HHHH format.

Default

By default, mac is disabled

Command Mode

Interface VPLS

Applicability

This command was introduced before OcNOS version 4.2.

Examples

```
(config)#interface ce11/2
(config-if)#mpls-vpls vpls2 service-template vc1
(config-if-vpls)#static-mac 0000.0400.0602
```

tunnel-select-policy

Use this command to set tunnel-policy for a VPLS instance. This command is used for BGP signaling based VPLS instance. This will be used while selecting transport for the peer.

Use the `no` parameter with this command to un-configure tunnel selection policy.

Command Syntax

```
tunnel-select-policy TNLPOLICYNAME
no tunnel-select-policy
```

Parameters

TNLPOLICYNAME	Name of tunnel policy

Command Mode

VPLS SIG mode

Applicability

This command was introduced before OcNOS version 4.2.

Examples

```
#configure terminal
(config)#mpls vpls vpls1 10
(config-vpls)#signaling bgp
(config-vpls-sig)#tunnel-select-policy policy1
```

© 2025 IP Infusion Inc. Proprietary

ve-id

Use this command to configure a VPLS Edge (VE) device. Each Provider Edge (PE) device participating in a VPLS must have at least one VE ID. When the PE is connected to several u-PEs (Layer 2 PE devices used to provide Layer 2 aggregation), there are unique VE ID's for each u-PE. The PE may also be assigned a VE ID, if it is to act as the VE for the VPLS.

Use the `no` parameter with this command to remove a VE ID.

Command Syntax

```
ve-id <1-65535>
no ve-id <1-65535>
```

Parameters

`<1-65535>`	VE-ID's range is between 1 and 65535. This should be unique among the VPLS Peers for a VPLS instance.

Default

By default, ve id is disabled

Command Mode

BGP VPLS Signaling mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls vpls test 100
(config-vpls)#signaling bgp
(config-vpls-sig)#ve-id 2
(config-vpls-sig)#exit
```

vpls-ac-group

Use this command to assign an Attachment Circuit (AC) group to VPLS.

Use the `no` parameter with this command to remove an AC group.

Command Syntax

```
vpls-ac-group GROUPNAME
no vpls-ac-group
```

Parameter

GROUPNAME	Enter a name for the AC group

Default

By default, vpls ac group is disabled

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls vpls test 12
(config-vpls)#vpls-ac-group new-ac
(config-vpls)#no vpls-ac-group
```

vpls-description

Use this command to add a description line for a VPLS instance.

Use the `no` parameter with this command to remove a VPLS description.

Command Syntax

```
vpls-description LINE
no vpls-description (LINE|)
```

Parameter

LINE	Enter a text string for the VPLS instance

Default

By default, vpls description is disabled

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls vpls test 34
(config-vpls)#vpls-description This is for testing
(config-vpls)#exit
```

vpls fib-entry

Use this command to create a static VPLS FIB entry. When a VPLS peer is configured manually, no signaling is done. Therefore, a VPLS static entry must be created for all manually created nodes.

Use the `no` option with this command to delete a static VPLS FIB entry.

Command Syntax

```
vpls fib-entry VPLS-ID (peer A.B.C.D| spoke-vc VC-NAME) IN-LABEL OUT-INTF OUT-LABEL
no vpls fib-entry VPLS-ID ((peer A.B.C.D)| (spoke-vc VC-NAME))
no vpls fib-entry VPLS-ID ((peer A.B.C.D)| (spoke-vc VC-NAME)) IN-LABEL OUT-INTF
  OUT-LABEL
```

Parameters

`VPLS-ID`	VPLS identifier
`peer`	Mesh peer address VPLS identifier
A.`B.C.D`	Peer IPv4 Address.
`spook-vc`	Spoke VC
`VC-NAME`	Virtual Circuit name
`IN-LABEL`	Incoming label value in the range of <16-15999>
`OUT-INTF`	Provider-facing interface
`OUT-LABEL`	Outgoing label value in the range of <16-15999>

Default

By default, vpls fib entry is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The first example shows how to configure VPLS FIB entry 100 with mesh peer 97.97.97.97 for incoming label 15999, outgoing interface eth2 with outgoing label 15999:

```
#configure terminal
(config)#vpls fib-entry 100 peer 97.97.97.97 15999 eth2 15999
```

The second example shows how to configure VPLS FIB entry 100 with spoke-vc t1 for incoming label 15999, outgoing interface eth2 with outgoing label 15999:

```
#configure terminal
(config)#vpls fib-entry 100 spoke-vc t1 15999 eth2 15999
```

vpls-mtu

Use this command to set the Maximum Transmission Unit (MTU) size for a given VPLS instance. This size is signaled to peer VPLS routers.

Use the `no` parameter with this command to remove the MTU size setting.

Command Syntax

```
vpls-mtu <576-65535>
no vpls-mtu (<576-65535>|)
```

Parameter

`<576-65535>`	Range of MTU size allowed for a VPLS instance

Default

By default, vpls mtu is 1500

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls vpls test 34
(config-vpls)#vpls-mtu 6506
(config-vpls)#exit
```

© 2025 IP Infusion Inc. Proprietary

vpls-peer

Use this command to add a peer to a VPLS domain. This command triggers Label Distribution Protocol (LDP) signaling by default.

Use the `no` parameter to delete a VPLS virtual circuit for a specific peer.

Use the `no` parameter to delete a VPLS tunnel mapping for a specific peer to delete/unmap tunnel-id, tunnel-name or tunnel-select-policy for a vpls-peer.

Command Syntax

```
vpls-peer A.B.C.D ((agi NAME saii NAME taii NAME) |) ((tunnel-id <1-5000>) |
  (tunnel-name TNLNAME) |) ((tunnel-select-policy TNLPOLICYNAME)|)
```

```
no vpls-peer A.B.C.D ((tunnel-id | tunnel-name | tunnel-select-policy) |)
```

Parameters

`A.B.C.D`	The address of a VPLS peer node to which a mesh virtual circuit is to be created
`tunnel-id`	Static Tunnel Identifier
`<1-5000>`	Identifying value for Tunnel-id
`A.B.C.D`	IPv4 Address for end-point for FEC129 MPLS Layer-2 Virtual Circuit
`agi`	Specify the value used for the AGI in FEC129 MPLS Layer-2 Virtual Circuit
`NAME`	AGI value for FEC129 MPLS Layer-2 Virtual Circuit
`saii`	Specify the value used for the SAII in FEC129 MPLS Layer-2 Virtual Circuit
`NAME`	SAII value for FEC129 MPLS Layer-2 Virtual Circuit
`taii`	Specify the value used for the TAII in FEC129 MPLS Layer-2 Virtual Circuit
`NAME`	TAII value for FEC129 MPLS Layer-2 Virtual Circuit
`tunnel-name`	Tunnel name of the MPLS LSP (or Layer 2 Tunnel) to be used
`TUNNELNAME`	Identifying name for Tunnel
`tunnel-select-policy`	Tunnel selection policy
`TNLPOLICYNAME`	Name of tunnel policy

Default

By default, vpls peer is disabled

Command Mode

VPLS Signaling mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls vpls test 100
(config-vpls)#signaling ldp
(config-vpls-sig)#vpls-peer 97.97.97.97
```

```
(config-vpls-sig)#vpls-peer 97.97.97.97 tunnel-id 24
(config-vpls)#exit
(config)#exit
```

vpls-peer manual

Use this command to statically configure a VPLS peer. Because this command is not used in signaling mode, no signaling is used to set up the virtual circuit. At least one such peer configuration is required for every VPLS instance.

Use the `no` parameter with this command to remove a statically configured VPLS peer.

Use the `no` parameter to delete a VPLS tunnel mapping for a specific peer to delete/unmap tunnel-id, tunnel-name or tunnel-select-policy for a vpls-peer.

Command Syntax

```
vpls-peer A.B.C.D ((tunnel-id <1-5000>) | (tunnel-name TNLNAME) |) (manual|)
no vpls-peer A.B.C.D ((tunnel-id | tunnel-name | tunnel-select-policy) |)
```

Parameters

`A.B.C.D`	The address of a VPLS peer node to which a mesh virtual circuit is to be created
`tunnel-id`	Static Tunnel Identifier
`<1-5000>`	Identifying value for Tunnel-id
`tunnel-name`	Tunnel name of the MPLS LSP (or Layer 2 Tunnel) to be used
`TUNNELNAME`	Identifying name for Tunnel

Default

By default, vpls peer A.B.C.D manual is disabled

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls vpls test 100
(config-vpls)#vpls-peer 97.97.97.97 manual
(config-vpls)#vpls-peer 97.97.97.97 tunnel-id 24 manual
(config-vpls)#exit
(config)#exit
```

vpls-type

Use this command to assign a type (either Ethernet or VLAN) for VPLS.

Note: The default type is chosen as Ethernet.

Command Syntax

```
vpls-type (ethernet|vlan)
```

Parameter

ethernet	Designate Ethernet as the VPLS type
vlan	Designate VLAN as the VPLS type

Default

By default, vpls type is ethernet

Command Mode

signaling ldp mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mpls vpls test 100
(config-vpls)#signaling ldp
(config-vpls-sig)#vpls-type vlan
(config-vpls-sig)#vpls-peer 2.2.2.2
(config-vpls-sig)#exit
(config-vpls)#exit
```

vpls-vc

Use this command add a spoke virtual circuit to VPLS domain.

Use the `no` parameter to remove this configuration.

Command Syntax

```
vpls-vc NAME (ethernet|vlan|)
vpls-vc NAME (secondary NAME|) (ethernet|vlan|)
no vpls-vc NAME
```

Parameter

`NAME`	Enter a string that identifies the MPLS VC to add to the VPLS domain
`secondary`	Set the secondary spoke name
`NAME`	Enter a string that identifies the secondary spoke
`ethernet`	Identify the spoke type as Ethernet (default)
`vlan`	Identify the spoke type as VLAN.
`TNLNAME`	Specify the MPLS-TP tunnel-name.

Default

By default, vpls vc name is disabled

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#mpls vpls test 34
(config-vpls)#vpls-vc VC1
(config-vpls)#exit
(config)#exit
```

vpls-route-map

Use this command to configure the route-map name on an vpls instance.

Use the `no` parameter to remove the route-map configured.

Note: This command imports the extended-community color value configured on the route-map.

This command is used for BGP signaling based VPLS instance and not applicable for LDP signaling.

Command Syntax

```
vpls-route-map WORD
no vpls-route-map
```

Parameter

`WORD`	Name of the route-map.

Default

None

Command Mode

VPLS mode

Applicability

This command was introduced before OcNOS version 6.6.

Example

```
OcNOS(config)#mpls vpls a 1
OcNOS(config-vpls)#vpls-route-map map1
OcNOS(config-vpls)#exit
OcNOS(config)#

OcNOS(config)#mpls vpls a 1
OcNOS(config-vpls)#no vpls-route-map
OcNOS(config-vpls)#
```

CHAPTER 4 EVPN MPLS Commands

This chapter describes the EVPN MPLS commands:

© 2025 IP Infusion Inc. Proprietary

access-if-evpn

Use this command to create the evpn mpls access-port.

Use the no form of this command to delete the evpn mpls access-port.

Command Syntax

```
access-if-evpn
no access-if-evpn
```

Parameters

None

Command Mode

L2 Sub-interface mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-evpn
(config-access-if)#end
```

arp-cache disable

Use this command to disable the ARP cache for MAC/IP.

When the ARP cache is disabled on a access circuit, It does not reply to any ARP arriving on this port from the cache. It withdraws all MAC/IPs configured/learned on this access circuit and removes the MAC/IP entry for this AC from the local ARP cache.

It also makes sure that on withdrawing the MAC/IP route, the MAC does not become unknown. If all routes for this MAC are being withdrawn because of this command, then It advertises a MAC-only route. This is done so that the MAC does not become unknown and only the cache functionality becomes disabled.

Use the `no` form of this command to enable ARP cache for MAC/IP.

Note: On enabling the cache, an IP will be in conflict, then the cache enable will fail. The conflict has to be manually removed and then the cache enabled.

Note: When encapsulation default is configured under L2 subifp , then arp-packets will not be uplifted.

Note: Not applicable for the AC port which is mapped with ELINE/Xconnect Service.

Command Syntax

```
arp-cache disable
no arp-cache disable
```

Parameters

None

Default

By default, the arp-cache option is enabled.

Command Mode

Access if evpn mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-evpn
(config-access-if)#arp-cache disable
(config-access-if)#end
```

arp-nd cos

Use this command to explicitly set or override the COS value (0-7) in the ARP/ND reply sent (also used in ARP/ND proxy sub-feature). By default ARP/ND reply will use CoS value of received ARP/ND request.

Use the no form of this command to use the default COS value.

Command Syntax

```
arp-nd cos <0-7>
no arp-nd cos
```

Parameters

<0-7>

Default

CoS 0 or previous ARP/ND reply CoS being used.

Command Mode

Access if evpn mode

Applicability

This command was introduced in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-evpn
(config-access-if)#arp-nd cos 5
(config-access-if)#end
```

arp-nd flood-suppress

Use this command to completely restrict the flood of ARP/ND packets towards remote PEs or other Access Circuit

This command applies only when the ARP cache and ND cache are enabled. When the ARP cache is disabled, ARP flooding is not suppressed even if this command is given. When the ND cache is disabled, ND flooding is not disabled, even if this command is given.

Use the `no` form of this command to not restrict the flood of ARP/ND packets.

Note: Not applicable for the AC port which is mapped with ELINE/Xconnect Service.

Command Syntax

```
arp-nd flood-suppress
no arp-nd flood-suppress
```

Parameters

None

Default

By default, the arp-nd flood-suppress option is disabled.

Command Mode

Access if evpn mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-evpn
(config-access-if)#arp-nd flood-suppress
(config-access-if)#end
```

arp-nd refresh timer

Use this command to configure aging out the arp-cache and nd-cache entries for given time multiplied by 3 in seconds.

Use the `no` form of this command to remove the configuration.

Note: Not applicable for the AC port which is mapped with ELINE/Xconnect Service.

Note: After this timer interval, it sends out ARP to revalidate and 3 times of this would lead to removal of the dynamic entry.

Command Syntax

```
evpn mpls arp-nd refresh-timer <3-190>
no evpn mpls arp-nd refresh-timer
```

Parameters

<3-190>	Refresh timer value in seconds (age-out is refresh time * 3)

Command Mode

Config mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#config mode
(config)#evpn mpls arp-nd refresh-timer 100
(config)#no evpn mpls arp-nd refresh-timer
```

clear evpn mpls counters

Note: Use this command to clear the counters of a network port.

Command Syntax

```
clear evpn mpls counters ((network (ingress|(egress dst <A.B.C.D>)))| vpn-id <1-
  16777215> (network (ingress|(egress dst <A.B.C.D>))))
```

Parameters

`<1-16777215>`	VPN identifier
`A.B.C.D`	Ipv4 address

Command Mode

Exec Mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
DUT2#clear evpn mpls counters network egress dst 105.1.1.1
DUT2#
DUT2#clear evpn mpls counters vpn-id 10 network ingress
DUT2#
```

clear mac address-table

Use this command to clear dynamically learned MACs.

Note: To make evpn mpls disable and enable effective, system reboot is required.

Command Syntax

```
clear mac address-table dynamic evpn-mpls
clear mac address-table dynamic evpn-mpls evid <1-16777215>
clear mac address-table dynamic evpn-mpls evid <1-16777215> (address MACADDR|)
```

Parameters

`address`	Clear the specified MAC Address
`evid`	EVPN-MPLS tenant identifier
`<1-16777215>`	Range supported for EVID

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#clear mac address-table dynamic evpn-mpls
#clear mac address-table dynamic evpn-mpls evid 30
OcNOS#clear mac address-table dynamic evpn-mpls evid 30 address 0000.0022.2222
```

© 2025 IP Infusion Inc. Proprietary

dynamic-learning disable

Use this command to disable dynamic learning of MACs at the Access Circuit.

This command also disables dynamic learning of MAC/IP from ARP/ND messages received on this Access Circuit.

Use the `no` form of this command to enable dynamic learning of MACs at the Access Circuit.

Note: Not applicable for the AC port which is mapped with ELINE/Xconnect Service.

Note: IPv4 and IPv6 addresses associated with dynamic MACs also get cleaned with this command.

Command Syntax

```
dynamic-learning disable
no dynamic-learning disable
```

Parameters

None

Default

By default, the dynamic-learning option is enabled.

Command Mode

Access if evpn mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-evpn
(config-access-if)#dynamic-learning disable
(config-access-if)#end
```

© 2025 IP Infusion Inc. Proprietary

evi-name

Use this command to name the EVPN MPLS ID.

Use the `no` form of this command to remove the name of the EVPN MPLS ID.

Command Syntax

```
evi-name <WORD>
no evi-name
```

Parameters

WORD   EVI name. Maximum limit 10 characters (shall not be only numeric).

Default

None

Command Mode

EVPN MPLS mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)#evpn mpls id 3
(config-evpn-mpls)#evi-name vni_ELAN
(config-evpn-mpls)#exit
```

evpn esi hold-time

Use this command to allow some time for the evpn mpls tunnels and xconnect tunnel to come at the time of evpn mpls initialization before making the ESI up. This avoids traffic to be black-holed when a new PE is added and connected to an already running CE for multi-homing.

Use the `no` form of this command to make the esi up immediately when configuring the `access-if` cli.

Command Syntax

```
evpn esi hold-time <10-300>
no evpn esi hold-time
```

Parameters

`<10-300>`	Hold time in seconds

Default

Default value is 0.

Command Mode

Configuration Mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)# evpn esi hold-time 100
(config)# exit
```

evpn irb

Use this command to map an IRB interface to an L2 VNID. This IRB interface can have multiple IP address as explained in IRB IP address CLI and can serve all subnets attached to the L2 VNID. Currently its 1:1 mapping between IRB interface & L2VNI.

This configuration enables default gateway behavior on that VTEP for that VNID and subnet and triggers default gateway MAC-IP route generation for the corresponding IRB IP with the local or global IRB MAC (router MAC) in distributed gateway in distributed gateway

This makes the default behavior as enable for gateway functionality.

No command disables default gateway behavior of the VTEP for that VNID subnet and triggers withdrawal of the default gateway MAC/IP advertisement done for that VNID subnet.

Use the `no` form this command to disable default gateway behavior of the VTEP for that VNID subnet and triggers withdrawal of the default gateway MAC/IP advertisement done for that VNID subnet.

Command Syntax

```
evpn irb [<NAME>|irb-advertise-host-route]
no evpn irb [<NAME>|irb-advertise-host-route]
```

Parameters

`NAME`	IRB interface name
`irb-advertise-host-route`	To advertise host IP prefixes

Command Mode

EVPN_MPLS_CONFIG Mode

Applicability

This command was introduced before OcNOS version 6.0.0.

irb-advertise-host-route introduced in OcNOS version 6.2.0.

Example

```
#config mode
(config)#evpn mpls id 10
(config-evpn-mpls)#evpn irb irb100

(config)#evpn mpls id 102
(config-evpn-mpls)#evpn irb-advertise-host-route
```

evpn irb-forwarding anycast-gateway-mac

Use this command to configure common anycast mac-address for all the IRB interfaces

Use the `no` form of this command to remove the global MAC address on all the IRB interfaces.

Command Syntax

```
evpn irb-forwarding anycast-gateway-mac MAC
no evpn irb-forwarding anycast-gateway-mac
```

Parameters

MAC	`XX-XX-XX-XX-XX-XX`	Source MAC address (Option 1)
	`XX:XX:XX:XX:XX:XX`	Source MAC address (Option 2)
	`XXXX.XXXX.XXXX`	Source MAC address (Option 3)

Command Mode

Configuration Mode

Applicability

This command was introduced before OcNOS version 4.1.

Example

```
#configure terminal
(config)#evpn irb-forwarding anycast-gateway-mac 0000.0000.1313
```

Or

```
(config)#evpn irb-forwarding anycast-gateway-mac 00:00:00:00:13:13
```

Or

```
(config)#evpn irb-forwarding anycast-gateway-mac 00-00-00-00-13-13

(config)#no evpn irb-forwarding anycast-gateway-mac
```

evpn irb-if-forwarding anycast-gateway-mac

Use this command to enable a Layer 3 interface to use the global anycast IRB MAC address.

Use the `no` form of this command to unconfigure the anycast MAC at a Layer 3 interface.

Command Syntax

```
evpn irb-if-forwarding anycast-gateway-mac
no evpn irb-if-forwarding anycast-gateway-mac
```

Parameters

None

Command Mode

IRB interface mode

L3 interface mode

Applicability

This command was introduced before OcNOS version 6.0.0.

L3 interface mode support was added in OcNOS version 6.1.0.

Example

```
#configure teminal
(config)#interface irb 1
(config-irb-if)#ip vrf forwarding vrfip
(config-irb-if)#evpn irb-if-forwarding anycast-gateway-mac
(config-irb-if)#no evpn irb-if-forwarding anycast-gateway-mac
(config)#interface xe1
(config-irb-if)#ip vrf forwarding vrfip
(config-irb-if)#evpn irb-if-forwarding anycast-gateway-mac
(config-irb-if)#no evpn irb-if-forwarding anycast-gateway-mac
```

evpn mpls enable

Use this command to enable evpn mpls functionality.

Use the no version of this command to disable evpn mpls functionality.

Note: To make evpn mpls disable and enable effective, system reboot is required.

Command Syntax

```
evpn mpls enable
no evpn mpls enable
```

Parameters

None

Command Mode

Config mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
(config)#evpn mpls enable
(config)#no evpn mpls enable
```

© 2025 IP Infusion Inc. Proprietary

evpn mpls id

Use this command to set the VPN identifier to create an EVPN MPLS tunnel.

Note: To set the VPN identifier for an E-LAN, use the `evpn mpls id` command. For creating an E-LINE/XConnect, use the `evpn mpls xconnect` command with source and target identifiers.

Use the `no` parameter of this command to delete the EVPN MPLS ID for the MPLS tunnel.

Command Syntax

```
evpn mpls id <1-16777215> (| xconnect target-mpls-id <1-16777215>) (|control-word)
  (|etree-leaf)
no evpn mpls id <1-16777215>
```

Parameters

`evpn mpls id <1-16777215>`	Specifies the EVPN-MPLS tenant identifier. This is a numeric value ranging from 1 to 16777215.
`xconnect target-mpls-id <1-16777215>`	Enables E-LINE Xconnect. Specifies the target EVID for E-LINE Xconnect. This is a numeric value within the range from 1 to 16777215.
`control-word`	Enables control-word egress or ingress options for the given EVPN Instance (E-LAN or E-LINE). Requires the command hardware-profile filter evpn-mpls-cw to be enabled.
`etree-leaf`	(Optional) Configures the device as a leaf node within the E-Tree topology.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 3.0. Introduced `xconnect target-mpls-id <1-16777215>` parameter in the OcNOS version 4.0, `control-word` parameter in the OcNOS version 6.0.1, and `etree-leaf` parameter in the OcNOS version 6.5.1.

Example

```
(config)#evpn mpls id 10
(config-evpn-mpls)#exit

(config)#no evpn mpls id 10

(config)#evpn mpls id 100 xconnect target-mpls-id 200
(config-evpn-mpls)#exit

(config)#no evpn mpls id 100

(config)#evpn mpls id 300 xconnect target-mpls-id 400 control-word
(config-evpn-mpls)#exit

(config)#no evpn mpls id 300
```

Use the following command to configure the leaf node as an E-Tree leaf in a MPLS EVPN network.

```
(config)#evpn mpls id 10 etree-leaf
(config-evpn-mpls)#exit
```

evpn mpls irb

Use this command to enable EVPN-MPLS-IRB globally. Applicable to EVPN-MPLS

Use the `no` form this command to disable EVPN-MPLS.

Command Syntax

```
evpn mpls irb
no evpn mpls irb
```

Parameters

None

Command Mode

Configure Mode

Applicability

This command was introduced before OcNOS version 6.0.0.

Example

```
#config mode
(config)#evpn mpls irb
(config)#no evpn mpls irb
```

l3vni

Use this command to configure L3 Virtual Network Identifier for an ip vrf

Use the no form of this command to remove L3 Virtual Network Identifier

This identifies a tenant, with this one tenant can have L3VNI as its identifier and he can have multiple L2 networks identified with L2VNI's.

Note: L3 VNID cannot be same as L2 VNID.

Command Syntax

```
l3vni <L3 VNID>
no l3vni <L3 VNID>
```

Parameters

`<1-16777215>`	L3 VNID. Cannot be same as L2 VNID

Command Mode

Configure VRF mode

Applicability

This command was introduced in OcNOS version 4.1.

Example

```
#configure teminal
(config)#ip vrf vrfip
(config-vrf)#l3vni 10002
(config-vrf)#no l3vni 10002
```

mac

Use this command to configure a static MAC address with IPv4/IPv6 address or only MAC address under the Access-Circuit.

Use the no form of this command to unconfigure a static MAC address with IPv4/IPv6 address and only MAC address from the Access-Circuit.

Note: Not applicable for the AC port which is mapped with ELINE Service.

For static mac addresses,

1) the local static is given preference over remote learned static.

2) if same static mac is configured on more than one interface of same VPN then conflict state need to be resolved manually by removing that static-mac on all access-interfaces where it was configured.

Command Syntax

```
mac XXXX.XXXX.XXXX (| ip A.B.C.D | ipv6 X:X::X:X)
no mac XXXX.XXXX.XXXX (| ip A.B.C.D | ipv6 X:X::X:X)
```

Parameters

`XXXX.XXXX.XXXX`	Static mac address
`A.B.C.D`	Static IPv4 address
`X:X::X:X`	Static IPv6 address

Command Mode

Access if evpn mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)# interface xe1.1 switchport
(config-if)#access-if-evpn
(config-access-if)#mac 0000.0000.1001
(config-access-if)#mac 0000.0000.1002 ip 10.10.10.1
(config-access-if)#mac 0000.0000.1003 ipv6 1201::1
(config-access-if)#end
```

evpn mpls mac-ageing-time

Use this command to set the dynamically learned MAC aging time.

Use the `no` form of this command to set the age out the MACs in hardware to its default (300 seconds).

Note: This command affects the default bridge ageing time.

Command Syntax

```
evpn mpls mac-ageing-time <10-572>
no evpn mpls mac-ageing-time
```

Parameters

`<10-572>`	Ageing time in seconds.

Default

The default age out time is 300 seconds.

Command Mode

Config mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)#evpn mpls mac-ageing-time 10
```

evpn mpls multihoming enable

Use this command to enable evpn mpls multihoming

Use the `no` form of this command to disable evpn mpls multihoming.

Note: Node will have to be restarted for this to be applicable. If there are some nodes in topology which have multi-homed CEs, then the nodes which do not have multi-homed CEs should also enable multihoming, so that they can load share traffic to the multi-homed CEs.

Note: Before enabling multi-homing, configure the hardware-profiles with the hardware-profile filter evpn-mpls-mh commands.

Command Syntax

```
evpn mpls multihoming enable
no evpn mpls multihoming enable
```

Parameters

None

Default

By default evpn mpls multihoming is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
#configure terminal
#(config)# evpn mpls multihoming enable
#(config)# exit
```

© 2025 IP Infusion Inc. Proprietary

evpn mpls vtep-ip-global

Use this command to set the source IP address is used to establish BGP peering with neighbor MPLS Nodes and to establish the EVPN MPLS tunnels.

Use the no version of this command to delete the source IP address.

Command Syntax

```
evpn mpls vtep-ip-global A.B.C.D
no evpn mpls vtep-ip-global A.B.C.D
```

Parameters

A.B.C.D	IPv4 address type.

Command Mode

Config mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
(config)#evpn mpls vtep-ip-global 10.10.11.1
(config)#no evpn mpls vtep-ip-global 10.10.11.1
```

evpn multi-homed

Use this command to configure interfaces as multi-homed and configure esi-value in case of physical and static lag and system-mac in case of Dynamic lag.

The command `evpn multi-homed` allows users to configure single-active and port-active load-balancing Ethernet Segment Identifier (ESI) on a link with a multihomed Customer Edge (CE).

Use the `no` parameter of this command to unconfigure multi-homed on the interface.

Command Syntax

```
evpn multi-homed esi XX:XX:XX:XX:XX:XX:XX:XX:XX (load-balancing (single-active)|)

evpn multi-homed system-mac (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)
  (load-balancing (port-active)|)

no evpn multi-homed (esi | system-mac)
```

Parameters

`XX:XX:XX:XX:XX:XX:XX:XX:XX`	ESI value in HH:HH:HH:HH:HH:HH:HH:HH:HH - 9 octet format
`XX-XX-XX-XX-XX-XX`	Host MAC address (Option 1)
`XX:XX:XX:XX:XX:XX`	Host MAC address (Option 2)
`XXXX.XXXX.XXXX`	Host MAC address (Option 3)
`port-active`	To support ESI configuration for port-active redundancy mode.
`single-active`	To support ESI configuration for single-active redundancy mode.

Default

Default value is 0.

Command Mode

Interface Mode

Applicability

This command was introduced in OcNOS version 4.0 and underwent modifications in the OcNOS version 6.4.1 and OcNOS version 6.4.2.

Example

```
#configure terminal
(config)#interface xe1
(config)#evpn multi-homed esi 00:11:22:33:44:55:66:77:88 load-balancing single-
active
(config)#exit

configure terminal
(config)#interface po1
(config)#evpn multi-homed system-mac 0000.0000.1111 load-balancing port-active
(config)#exit
```

© 2025 IP Infusion Inc. Proprietary

hardware-profile filter evpn-mpls-cw

This hardware filter needs to be enabled, to allow configuring EVPN-MPLS with control-word functionality per EVI. Filter cannot be disabled if "EVPN-MPLS" is globally enabled.

Before enabling EVPN MPLS per-evi control-word (evpn mpls id command), give this command.

Before disabling the hardware-profile, disable EVPN MPLS globally (no evpn mpls enable).

Note: You need to save the configuration and do a reboot after giving this command.

Use the disable form of this command to disable the configured hardware-profile.

Command Syntax

```
hardware-profile filter evpn-mpls-cw enable
hardware-profile filter evpn-mpls-cw disable
```

Parameters

None

Default

By default, EVPN MPLS control-word hardware-profile is disabled.

Command Mode

Config mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Example

```
#configure terminal
(config)# hardware-profile filter evpn-mpls-cw enable
(config)# hardware-profile filter evpn-mpls-cw disable
```

© 2025 IP Infusion Inc. Proprietary

hardware-profile filter evpn-mpls-mh

Use this command to enable the hardware-profile for EVPN MPLS multihoming to successfully activate multi-homing in the hardware.

Before enabling EVPN MPLS multihoming (evpn mpls multihoming enable command), give this command.

Before disabling the hardware-profile, disable EVPN MPLS multihoming.

Note: You need to save the configuration and do a reboot after giving this command.

Use the `disable` form of this command to disable the configured hardware-profile.

Command Syntax

```
hardware-profile filter evpn-mpls-mh enable
hardware-profile filter evpn-mpls-mh disable
```

Parameters

None

Default

By default, EVPN MPLS multihoming hardware-profile is disabled.

Command Mode

Config mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)# hardware-profile filter evpn-mpls-mh enable
(config)# hardware-profile filter evpn-mpls-mh disable
```

hardware-profile statistics evpn-mpls

Use this command to enable or disable filter statistics in hardware for evpn mpls network counters.

Note: You need to save the configuration and do a reboot after giving this command.

Command Syntax

```
hardware-profile statistics evpn-mpls enable
hardware-profile statistics evpn-mpls disable
```

Parameters

None

Default

By default, evpn mpls statistics profile is disabled.

Command Mode

Config mode

Applicability

This command was introduced in OcNOS version 4.2.

Example

```
#configure terminal
(config)# hardware-profile statistics evpn-mpls enable
(config)# hardware-profile statistics evpn-mpls disable
```

© 2025 IP Infusion Inc. Proprietary

host-reachability-protocol

Use this command to set the host reachable protocol to Ethernet-VPN over BGP. This defines BGP as the mechanism for host reachability advertisement to discover EVPN peers and to learn remote host details.

Use no form of this command to remove Ethernet-VPN as the host reachable protocol.

Command Syntax

```
host-reachability-protocol evpn-bgp WORD
no host-reachability-protocol evpn-bgp
```

Parameters

`WORD`	MAC Routing/Forwarding instance name. Maximum limit 32 characters

Default

None

Command Mode

EVPN MPLS Config mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
(config)#evpn mpls id 1
(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrf1
```

evpn-route-map

Use this command to configure route-map on an evpn instance.

Use no form of this command to unconfigure route-map from an evpn instance.

Note: This command imports the extended-community color value configured on the route-map.

Command Syntax

```
evpn-route-map WORD
no evpn-route-map
```

Parameters

WORD	Name of the route-map.

Default

None

Command Mode

EVPN MPLS Config mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Examples

```
OcNOS(config)#evpn mpls id 1
OcNOS(config-evpn-mpls)#evpn-route-map map1
OcNOS(config-evpn-mpls)#

OcNOS(config)#evpn mpls id 1
OcNOS(config-evpn-mpls)#no evpn-route-map
OcNOS(config-evpn-mpls)#s
```

ip address

Use this command to set anycast flag for primary and secondary subnets under IRB interface.

With this anycast gateway can be supported for multiple subnets.

Command Syntax

```
ip address [ <A.B.C.D/M>  | anycast]
ip address [ <A.B.C.D>  | <A.B.C.D> | anycast]
ip address [ <A.B.C.D/M>  | secondary | anycast]
ip address [ <A.B.C.D>  | <A.B.C.D> | secondary | anycast]
```

Default

The default value is router mac

Parameters

`anycast`	Anycast flag
`secondary`	Used for secondary address option

Command Mode

IRB_IF Mode

Applicability

The anycast flag was introduced in OcNOS version 6.3.0.

Example

```
(config)#interface irb2
(config-irb-if)#ip address 40.1.1.1/24 anycast
(config-irb-if)#ip address 41.1.1.1/24 secondary anycast
(config-irb-if)#
(config)#interface irb1
(config-irb-if)#ip address 42.1.1.1 255.255.255.0 anycast
(config-irb-if)#ip address 43.1.1.1 255.255.255.0 secondary anycast
(config-irb-if)#
```

ipv6 address

Use this command to set anycast flag for any configured subnets under IRB interface.

With this anycast gateway can be supported for multiple subnets.

Command Syntax

```
ipv6 address [ < X:X::X:X/M > | anycast]
```

Default

The default value is router mac

Parameters

anycast	Anycast flag

Command Mode

IRB_IF Mode

Applicability

The anycast flag was introduced in OcNOS version 6.3.0.

Example

```
(config)#interface irb1
(config-irb-if)# ipv6 address 1100::1/64 anycast
```

link-loss forwarding

Use this command to configure the link-loss forwarding on an access-interface.

Use the `no` parameter to un-configure the load interval globally.

Command Syntax

```
llf-enable
no llf-enable
```

Parameters

NA.

Default

NA.

Command Mode

Access-if mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Example

```
#configure terminal
(config)#int xe22.2 sw
(config-if)#encapsulation dot1q 10
(config-if)#access-if-evpn
(config-acc-if-evpn)#llf-enable
```

mac-holdtime

Use this command to set the MAC hold time for a MAC/IP or MAC.

The feature holds the MAC in hardware until BGP has withdrawn from the neighbors. This helps to reduce the flooding to other access ports.

This setting applies when the L2 Subifp is shut down, the physical port on which the access port is down, or the access port is removed from the VNID using the no form of the map vnid command.

When the MAC hold time is configured as -1, then the MAC is not removed from the hardware and is also not withdrawn from EVPN BGP.

Use the `no` form of this command to remove the MAC hold time for the MAC/IP or MAC.

Note: When a MAC is moved to discard state, traffic to and from this MAC is discarded. This is applicable only on statically configured MAC/MAC-IPs.

Command Syntax

```
mac-holdtime <-1-300>
no mac-holdtime
```

Parameters

`<-1-300>`	MAC hold time in seconds. Specify -1 to "never expire".

Default

The default holdtime for mac is 3 seconds.

Command Mode

EVPN MPLS mode and ACC_IF mode

Note: When configured in both modes, then the ACC_IF mode value takes preference for that access port.

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#evpn mpls id 3
(config-evpn-mpls)#mac-holdtime -1
(config-evpn-mpls)#exit
```

mac-vrf

Use this command to create a MAC VRF to use in EVPN routes.

Use the `no` form of this command to delete the MAC VRF.

Command Syntax

```
mac vrf WORD
```

```
no mac vrf WORD
```

Parameters

`WORD MAC`	Routing/Forwarding instance name. Maximum limit 32 characters

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#mac vrf vrf1
(config)#no mac vrf vrf1
```

map vpn-id

Use this command to map a sub-interface to a tenant.

Use the no form of this command to remove the tenant.

Command Syntax

```
map vpn-id <1-16777215>
no map vpn-id <1-16777215>
```

Parameters

`<1-16777215>`	VNID

Command Mode

Access if evpn mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-evpn
(config-access-if)#map vpn-id 1
(config-access-if)#end
```

nd-cache disable

Use this command to disable ND cache for MAC/IPv6.

When the ND cache is disabled on an Access Circuits, It does not reply to any ND arriving on this port from the cache. It withdraws all MAC/IPs configured/learned on this Access Circuit and removes the MAC/IP entry for this AC from the local ND cache.

It also makes sure that on withdrawing the MAC/IP route, the MAC does not become unknown. If all routes for this MAC are being withdrawn because of this command, then it advertises a MAC-only route. This is done so that the MAC does not become unknown and only the cache functionality becomes disabled.

Use the `no` form of this command to enable ND cache for MAC/IPv6.

Note: On enabling the cache, an IP will be in conflict, then the cache enable will fail. The conflict has to be manually removed and then the cache enabled.

Note: Not applicable for the AC port which is mapped with ELINE/Xconnect Service.

Command Syntax

```
nd-cache disable
no nd-cache disable
```

Parameters

None

Default

By default, the nd-cache option is enabled.

Command Mode

Access if evpn mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-evpn
(config-access-if)#nd-cache disable
(config-access-if)#end
```

show bgp l2vpn evpn

Use this command to display details about Layer 2 Virtual Private Network (L2VPN) Ethernet Virtual Private Network (EVPN) routes.

Note: A BGP EVPN route update received for an unreachable IP address is also listed by this command and as a best route. This is because the next hop tracking feature is not supported for the EVPN address family. However, the tunnel to this IP address is shown in unresolved state by the show nvo vxlan tunnel output.

Note: An E-tag (Ethernet tag) can have the value of zero/VID/VNID based on the use case. An E-tag can go up to 32 bits and no restrictions are noted in the RFC. Since an E-tag can have different values, it should not be compared with the label/VNID.

Command Syntax

```
show bgp l2vpn evpn ((vrf WORD)|(rd WORD)| time|)

show bgp l2vpn evpn mac-ip ((vrf WORD)|(rd WORD)|)

show bgp l2vpn evpn mcast

show bgp l2vpn evpn multihoming es-route <(rd WORD)|(vrf WORD)>

show bgp l2vpn evpn multihoming ethernet-ad-per-evi <(rd WORD)|(vrf WORD)>

show bgp l2vpn evpn multihoming ethernet-ad-per-es <(rd WORD)|(vrf WORD)>
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
MH-PE2#sh bgp l2vpn evpn
BGP table version is 22, local router ID is 102.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i -

```

show evpn load-balance

Use this command to display ESI information in Single-Active or Port-Active mode. It assists the user in identifying whether the local device is in Active or Standby mode and understanding which election algorithm is used for ESI. In remote devices, information will only be displayed for ELINE services.

This command is used to debug and understand if the election process is occurring correctly. The commands on multi-homed devices are symmetric, and they provide insights into the election algorithm used for the DF election.

Command Syntax

```
show evpn load-balance (port-active | single-active | all)
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 6.4.1 and underwent modifications in the OcNOS version 6.4.2

Example

The following example displays ESI information using the `show evpn load-balance port-active and show evpn load-balance single-active` commands.

```
OcNOS#show evpn load-balance port-active
ESI                         AC-IF/PE     PE-IP-ADDRESS    Redundancy     Service-carving    weight   Revertive  AC-DF   Status
=======================================================================================================================
00:00:00:00:00:12:12:00:00:00  REMOTE    101.1.1.1        port-active      auto             0        NO         NA  ACTIVE
00:00:00:00:00:12:12:00:00:00  LOCAL     102.1.1.1       port-active      auto             0        NO          NA    STANDBY

#show evpn load-balance single-active
ESI                           AC-IF/PE  PE-IP-ADDRESS   Redundancy    Service-carving    weight   Revertive  AC-DF   Status
=======================================================================================================================
00:11:22:33:00:00:00:55:66:77  sa1.1     1.2.3.4       single-active   preference-based   200      NO          NO     ACTIVE
00:11:22:33:00:00:00:55:66:77  ----      3.4.5.6       single-active   preference-based   100      NO          NO     ----
```

Table 4-13 explains the output fields.

Table 4-13: show evpn load-balance port-active

Field	Description
ESI	Ethernet Segment Identifier, a unique identifier for an Ethernet Segment.
AC-IF/PE	This field indicates whether the ESI is associated with a local or remote Attachment Circuit (AC) or Provider Edge (PE).
PE-IP-ADDRESS	The IP address of the PE associated with the ESI.
Redundancy	Indicates whether the ESI is configured for port-active or single-active redundancy.
Service-carving	The service carving mode associated with the ESI.
weight	Weight assigned to the ESI.

Table 4-13: show evpn load-balance port-active

Field	Description
Revertive	Indicates whether the ESI is configured for revertive mode.
AC-DF	Attachment Circuit Designated Forwarder status.
Status	The status of the ESI, whether it's active or standby.

show evpn mpls

Use this command to display the EVPN Information.

Command Syntax

```
show evpn mpls (|id <1-16777215>)
```

Parameters

`<1-16777215>`	EVPN-MPLS tenant identifier

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
MH-PE2#sh evpn mpls

show evpn mpls counters

This command to display the ingress/egress evpn-mpls network port statistic counters for both BUM and known unicast data traffic.

Note: To see the statistics, you must enable the command `hardware-profile statistics evpn-mpls enable` and reboot the board for the command to take effect.

Command syntax

```
show evpn mpls counters ((network (ingress|(egress dst <A.B.C.D>)))| vpn-id <1-
  16777215> (network (ingress|(egress dst <A.B.C.D>))))
```

Parameters

`<1-16777215>`	VPN identifier
`A.B.C.D`	Ipv4 address

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
DUT2#show evpn mpls counters network egress
+----------+---------------+-----------+-----------+
|  VPN-ID  |  DESTINATION  |    BUM    |  Unicast  |

```

show evpn mpls xconnect tunnel

Use this command to view the active EVPN MPLS Tunnels for ELINE.

Command Syntax

```
show evpn mpls xconnect tunnel (| summary)
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
PE1#
PE1#show evpn mpls xconnect tunnel
EVPN-MPLS Network tunnel Entries
Source           Destination      Status        Up/Down       Update        local-evpn-id remote-evpn-id

PE1#
```

show evpn mpls xconnect tunnel label

Use this command to display the label details of EVPN tunnels for ELINE.

Command Syntax

```
show evpn mpls xconnect tunnel label
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 4.0 and RSVP-Multipath is introduced in OcNOS version 5.0.

Example

```
PE1#
PE1#show evpn mpls xco tunnel label
EVPN-MPLS Network tunnel labels

show running-config evpn mpls

Use this command to display the current running configuration of EVPN MPLS.

Command Syntax

```
show running-config evpn mpls
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#show running-config evpn mpls

```

tunnel-select-policy

Use this command to associate tunnel-policy to an EVPN instance and to a mac-vrf. This will be used while selecting transport for EVPN service. In particular, an EVPN instance could be either an ELINE or ELAN type and may also multi-homing also enabled.

Use the `no` parameter with this command to un-configure tunnel-policy from the EVPN instance.

Please refer MPLS Service Mapping Configuration for Tunnel-policy Name configuration.

Command Syntax

```
tunnel-select-policy NAME
no tunnel-select-policy
```

Parameters

NAME	Name of tunnel-policy

Command Mode

EVPN MPLS Config mode and MAC_VRF MODE

Note:

Applicability

This command was introduced in OcNOS version 4.1 but the support for this CLI under mac-vrf mode is introduced in OcNOS-SP version 4.2.

Examples

```
#configure terminal
(config)#mac vrf vrf1
(config-vrf)# tunnel-select-policy policy1
(config-vrf)#end
(config)# evpn mpls id 1001
(config-evpn-mpls)# tunnel-select-policy policy2
(config-evpn-mpls)# end
(config)# evpn mpls id 10 xconnect target-mpls-id 20
(config-evpn-mpls)# tunnel-select-policy policy3
(config-evpn-mpls)# end
```

CHAPTER 5 MPLS Service Mapping Commands

This chapter describes each MPLS Service Mapping command.

- color
- mode
- mpls 6pe tunnel-select-policy
- show running-config tunnel-policy
- show tunnel-policy
- tunnel-policy
- tunnel-select-policy (For L3VPN service)

color

Use this command to set color value for a tunnel policy. This value will be used while selecting transport for given service.

Use the `no` parameter with this command to un-configure color value for tunnel policy.

Command Syntax

```
color <1-4294967295>
no color <1-4294967295>
```

Parameters

`color`	Configure color code

Command Mode

Tunnel policy mode

Applicability

This command was introduced in OcNOS version 4.2.

Example

```
#configure terminal
(config)#tunnel-policy policy1
(config-tnl-policy)#color 23
```

mode

Use this command to set tunnel selection mode for a tunnel policy. This will be used while selecting transport for given service. Mode can be dedicated or best-effort.

Use the `no` parameter with this command to set mode to default mode.

Command Syntax

```
mode dedicated|best-effort
no mode
```

Parameters

`best-effort`	Best effort tunnel selection mode
`dedicated`	Dedicated tunnel selection mode (Default)

Default

Dedicated

Command Mode

Tunnel policy mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#tunnel-policy policy1
(config-tnl-policy)# mode best-effort
```

mpls 6pe tunnel-select-policy

Use this command to set tunnel-policy for a 6PE services. This will be used while selecting transport for 6PE services. Use the `no` parameter with this command to unconfigure tunnel selection policy for 6PE.

Command Syntax

```
mpls 6pe tunnel-select-policy NAME
```

Parameters

NAME	Name of tunnel-policy

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)# mpls 6pe tunnel-select-policy policy1
```

show running-config tunnel-policy

Use this command to display the current running configuration of all tunnel policies.

Command Syntax

```
show running-config tunnel-policy
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#show running-config tunnel-policy
!
tunnel-policy tp1
 color 1
!
```

show tunnel-policy

Use this command to display the tunnel policy details.

Command Syntax

```
show tunnel-policy (NAME (service (((6pe|vpls|vpws|evpn|l3vpn|) details)) |
  (count)))| service details |)
```

Parameters

`NAME`	show tunnel policy table by name
`service`	show service information
`6pe`	Display 6PE service details
`evpn`	Display EVPN service details
`l3vpn`	Display L3VPN service details
`vpls`	Display VPLS service details
`vpws`	Display VPWS service details
`count`	show counts
`details`	show details
`service`	show service information
`details`	show details

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

The following sample shows the summary of all configured tunnel policies.

```
#show tunnel-policy
tunnel-policy tp1
  color 1
  tunnel-mode dedicated
  tunnel-type any
Total Services attached:
  VRF         : 1
  VPWS    : 1
  VPLS      : 1
  EVPN     :
```

The following sample shows the summary of specific configured tunnel policy by name.

```
#show tunnel-policy tp1
tunnel-policy tp1
```

```
    color 1
    tunnel-mode dedicated
    tunnel-type any
  Total Services attached:
    VRF        : 1
    VPWS    : 1
    VPLS      : 1
    EVPN     : 0
```

The following sample shows the detailed information of all the configured tunnel policies.

```
#show tunnel-policy service details
List of services configured with tunnel-policy tp1:
  VPWS
   VPWS-Id: 100, Name: vpws1 Status: UP, Mapped Tunnel: RSVP, ftn_ix 4, color
1
  L3VPN
   VRF id 2
    FTN id: 1, Prefix: 20.10.30.0/24, Status: Up, Label: 25664, Mapped Tunnel:
RSVP, ftn_ix 4, color 1
    FTN id: 2, Prefix: 3001::/64, Status: Up, Label: 25664, Mapped Tunnel:
RSVP, ftn_ix 4, color 1
  VPLS
   VPLS-Id: 300, Name: vpls1, Status: UP, Mapped Tunnel: RSVP, ftn_ix 4, color
1
```

The following sample shows the detailed information of specific configured tunnel policy by name.

```
# show tunnel-policy tp1 service details
Total services using tunnel-policy tp1:
  VPWS
   VPWS-Id: 100, Name: vpws1 Status: UP, Mapped Tunnel: RSVP, ftn_ix 4, color
1
  L3VPN
   VRF id 2
    FTN id: 1, Prefix: 20.10.30.0/24, Status: Up, Label: 25664, Mapped Tunnel:
RSVP, ftn_ix 4, color 1
    FTN id: 2, Prefix: 3001::/64, Status: Up, Label: 25664, Mapped Tunnel:
RSVP, ftn_ix 4, color 1
  VPLS
   VPLS-Id: 300, Name: vpls1, Status: UP, Mapped Tunnel: RSVP, ftn_ix 4, color
1
```

The following sample shows the services count of specific tunnel policy by name.

```
#show tunnel-policy tp1 service count
Total services using tunnel-policy tp1:
  VPWS   : 1
  VPLS     : 0
  L3VPN  : 2
  6PE       : 0
  EVPN    : 0
```

The following sample shows the detailed VPLS service information of specific tunnel policy by name.

```
#show tunnel-policy tp1 service vpls details
Total services using tunnel-policy tp1:
  VPLS
```

```
  VPLS-Id: 300, Name: vpls1, Status: UP, Mapped Tunnel: RSVP, ftn_ix 4, color
1
```

The following sample shows the detailed VPWS service information of specific tunnel policy by name.

```
#show tunnel-policy tp1 service vpws details
Total services using tunnel-policy tp1:
  VPWS
   VPWS-Id: 100, Name: vpws1 Status: UP, Mapped Tunnel: RSVP, ftn_ix 4, color
1
```

The following sample shows the detailed L3VPN service information of specific tunnel policy by name.

```
#show tunnel-policy tp1 service l3vpn details
Total services using tunnel-policy tp1:
  L3VPN
   VRF id 2
    FTN id: 1, Prefix: 20.10.30.0/24, Status: Up, Label: 25664, Mapped Tunnel:
RSVP, ftn_ix 4, color 1
    FTN id: 2, Prefix: 3001::/64, Status: Up, Label: 25664, Mapped Tunnel:
RSVP, ftn_ix 4, color 1
```

The following sample shows the detailed 6PE service information of specific tunnel policy by name.

```
#show tunnel-policy tp1 service 6pe details
Total services using tunnel-policy tp1:
  6PE
   FTN id: 3, Prefix: 3002::/64, Status: Up, Label: 25665, Mapped Tunnel:
RSVP, ftn_ix 4, color 1
```

The following sample shows the detailed EVPN service information of specific tunnel policy by name.

```
#show tunnel-policy tp1 service evpn details
Total services using tunnel-policy tp1:
  EVPN
   EVPN-Id: 30, Tunnel count: 1
   Peer: 105.1.1.1, Mapped Tunnel: SR_POLICY, ftn_ix 3, color 202
   EVPN-Id: 1001, Tunnel count: 2
   Peer: 105.1.1.1, Mapped Tunnel: SR_POLICY, ftn_ix 3, color 202   Peer:
101.1.1.1, Mapped Tunnel: SR_POLICY, ftn_ix 4, color 204
```

tunnel-policy

Use this command to create a tunnel policy.

Use the `no` parameter with this command to un-configure the tunnel policy. Tunnel policy can be un-configured only if no service is using it.

Command Syntax

```
tunnel-policy NAME
no tunnel-policy NAME
```

Parameters

NAME	Name to be used for tunnel policy

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.2.

Example

```
#configure terminal
(config)#tunnel-policy policy1
```

tunnel-select-policy (For L3VPN service)

Use this command to set tunnel-policy for a VRF instance. This will be used while selecting transport for L3VPN service.

Use the `no` parameter with this command to un-configure tunnel-policy from VRF instance.

Command Syntax

```
tunnel-select-policy NAME
no tunnel-select-policy
```

Parameters

NAME	Name of tunnel-policy

Command Mode

IP VRF mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#tunnel-select-policy policy1
```

© 2025 IP Infusion Inc. Proprietary

CHAPTER 6 MPLS LSP BFD Commands

This chapter describes each ICCP (Inter-Chassis Communication Protocol) command.

lsp ping-interval

Use this command to configure periodic MPLS ping echo request for BFD session over MPLS LSP.

Use `no` form of the command to set default periodic MPLS ping echo request interval.

Command Syntax

```
lsp-ping-interval <0-1000>
no lsp-ping-interval
```

Parameters

`<0-1000>`	Ping interval in sec

Command Mode

MPLS BFD mode.

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#configure terminal
(config)# mpls bfd ldp all
(config-mpls-bfd)# lsp-ping-interval 10
```

min-tx

Use this command to configure BFD transmit and receive intervals, and the hello multiplier value for MPLS LSP BFD session.

Use the `no` form of the command to set the intervals and multiplier to their default values.

Command Syntax

```
min-tx <50-999> min-rx <50-999> multiplier <3-50>
no min-tx <50-999> min-rx <50-999> multiplier <3-50>
```

Parameters

`min-tx`	Set BFD Min Tx interval
`<50-999>`	Desired Tx interval in ms.
`min-rx`	Set BFD Min Rx interval
`<50-999>`	Desired Rx interval in ms.
`Multiplier`	Set BFD Detection Multiplier
`<3-50>`	Multiplier value

Defaults

The default for the transmit and receive intervals is 10 milliseconds. The default hello multiplier value is 3.

Command Mode

MPLS BFD mode.

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#configure terminal
(config)# mpls bfd ldp all
(config-mpls-bfd)# min-tx 10 min-rx 10 multiplier 3
```

mpls bfd

Use this command to configure BFD session for MPLS LSP.

Use `no` form of the command to unconfigure BFD session from MPLS LSP.

Command Syntax

```
mpls bfd ((ldp A.B.C.D/M)|(rsvp tunnel-name NAME)|(static A.B.C.D/M))
mpls bfd (ldp|rsvp|static) all
no mpls bfd ((ldp A.B.C.D/M)|(rsvp tunnel-name NAME)|(static A.B.C.D/M))
no mpls bfd (ldp|rsvp|static) all
```

Parameters

`ldp`	LDP type LSP
`A.B.C.D/M`	LDP FEC
`all`	All LSPs
`rsvp`	RSVP type LSP
`tunnel-name`	RSVP Tunnel
`all`	All LSPs
`static`	Static type LSP
`A.B.C.D/M`	Static FEC
`all`	All LSPs

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#configure terminal
(config)# mpls bfd ldp all
(config-mpls-bfd)#
```

shutdown

Use this command to configure MPLS LSP BFD session in Admin Down state or to disable BFD session.

Use `no` form of the CLI to enable BFD session.

Command Syntax

```
shutdown
no shutdown
```

Parameters

None

Command Mode

MPLS BFD mode.

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#configure terminal
(config)# mpls bfd ldp all
(config-mpls-bfd)# shutdown
```

CHAPTER 7 L2VPN over L2 Subinterface Commands

This chapter is a reference for the L2VPN commands over L2 subinterface.

VPWS:

- access-if-vpws
- mpls-l2-circuit
- vc-mode

VPLS:

- access-if-vpls
- mpls-vpls
- learning disable
- split-horizon (subinterface)
- static-mac

access-if-vpws

Use this command in L2 subinterface mode to create the vpws access-port.

Use the `no` form of this command to delete the vpws access port.

Command Syntax

```
access-if-vpws
no access-if-vpws
```

Parameters

None

Command Mode

L2 Sub-interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-vpws
(config-acc-if-vpws)#end
```

mpls-l2-circuit

Use this command to bind am mpls-l2-circuit to an L2 subinterface

Use the `no` form of this command to unbind an mpls-l2-circuit from an L2 subinterface

Command Syntax

```
mpls-l2-circuit NAME (primary | secondary)
no mpls-l2-circuit NAME
```

Parameters

`NAME`	A string identifying the MPLS Layer-2 Virtual Circuit
`primary`	Identify L2 circuit as the primary link
`secondary`	Identify L2 circuit as the secondary link; the secondary link is not activated unless the primary link fails

Command Mode

access-if-vpws mode

Applicability

This command w as introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-vpws
(config-acc-if-vpws)#mpls-l2-circuit vc1 primary
(config-acc-if-vpws)#mpls-l2-circuit vc2 secondary
(config-acc-if-vpws)#end
```

vc-mode

Use this command to configure vc-mode as revertive for an mpls l2-circuit.

Use the `no` form of this command to remove the vc-mode.

Command Syntax

```
vc-mode revertive
no vc-mode revertive
```

Parameters

None

Command Mode

access-if-vpws mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-vpws
(config-acc-if-vpws)#mpls-l2-circuit vc1 primary
(config-acc-if-vpws)#mpls-l2-circuit vc2 secondary
(config-acc-if-vpws)#vc-mode revertive
(config-acc-if-vpws)#end
```

access-if-vpls

Use this command in L2 subinterface mode to create the vpls access-port.

Use the `no` form of this command to delete the vpls access port

Command Syntax

```
access-if-vpls
no access-if-vpls
```

Parameters

None

Command Mode

L2 Sub-interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#access-if-vpls
(config-acc-if-vpls)#end
```

mpls-vpls

Use this command to bind a VPLS instance to an L2 subinterface.

Use the `no` form of this command to unbind vpls instance from a L2 subinterface.

Command Syntax

```
mpls-vpls NAME
no mpls-vpls NAME
```

Parameters

NAME	VPLS instance name

Command Mode

access-if-vpls mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface xe1.2 switchport
(config-if)#access-if-vpls
(config-acc-if-vpls)#mpls-vpls v100
(config-acc-if-vpls)#end
```

learning disable

Use this command to disable learning on a particular Attachment Circuit (AC) interface.

Use the `no` form of this command to enable learning on a particular AC interface.

Note: This command disables MAC learning only on that interface.

Command Syntax

```
learning disable
no learning disable
```

Parameters

None

Command Mode

access-if-vpls mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface xe1.2 switchport
(config-if)#access-if-vpls
(config-acc-if-vpls)#learning disable
(config-acc-if-vpls)#end
```

split-horizon (subinterface)

Use this command to configure split-horizon group for L2 sub-interface.

Use the `no` form of this command to remove split-horizon group from L2 sub-interface.

Command Syntax

```
split-horizon group (network | access1 | access2)
no split-horizon group
```

Parameters

`network`	Split-horizon group name network
`access1`	Split-horizon group name access1
`access2`	Split-horizon group name access2

Default

By default, split horizon is disabled.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.3.0 and applicable only on Qumran1 devices..

Examples

```
#configure terminal
(config)#interface xe1.1 switchport
(config-if)#split-horizon group access1
(config-if)#no split-horizon group
```

static-mac

Use this command to add a static MAC address to an attachment circuit specific for a VPLS instance.

Use the `no` parameter with this command to remove static MAC address.

Command Syntax

```
static-mac XXXX.XXXX.XXXX
no static-mac XXXX.XXXX.XXXX
```

Parameters

`XXXX.XXXX.XXXX` MAC address in HHHH.HHHH.HHHH format

Command Mode

access-if-vpls mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface xe1.2 switchport
(config-if)#access-if-vpls
(config-acc-if-vpls)#static-mac 0091.0000.1010
(config-acc-if-vpls)#end
```

Layer 2 Virtual Private network Configuration

CHAPTER 1 L2VPN FAT SUPPORT

This chapter contains configurations of L2VPN with FAT support.

This is a functional level test plan scoped for the Flow-Aware Transport (FAT) of pseudowire (PW) over an MPLS packet switched network for load-balancing traffic across LDP-based signaled pseudowire for Virtual Private LAN Services (VPLS) and Virtual Private Wire Service (VPWS).

Topology

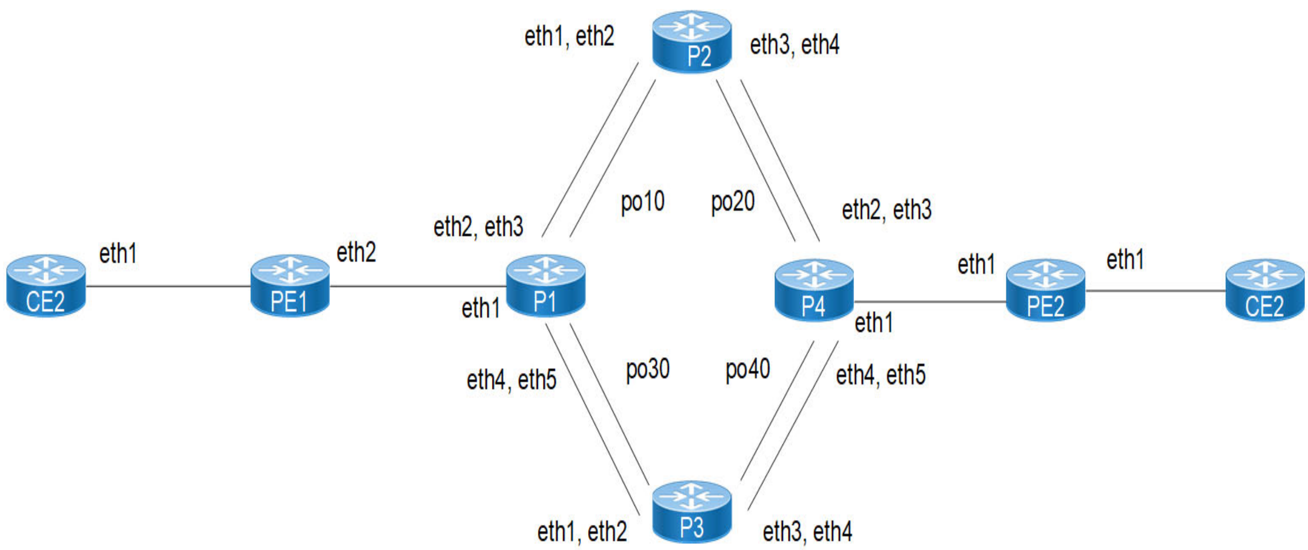

Figure 1-12: L2VPN configuration topology

Configuration for VPLS with FAT

PE-1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter interface mode
`(config -if)#ip address 1.1.1.1/32 secondary`	Configure IP address for the loopback interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#router-id 1.1.1.1`	Configure Router-id
`(config-router)#targeted-peer ipv4 6.6.6.6`	Configuring targeted LDP sessions to PE-2
`(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted-peer mode

(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
(config-router)#commit	Commit the configuration
(config-router)#exit	Exit from router mode
(config)#interface eth2	Enter interface mode
(config-if)#ip address 10.1.1.1/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ospf 100	Configure the routing process and specify the Process ID, (100). The Process ID should be a unique positive integer to identifying the routing process.
(config-router)#ospf router-id 1.1.1.1	Configure ospf Router-id
(config-router)#network 10.1.1.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 1.1.1.1/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode
(config)#mpls vpls vpls100 100	Configuring VPLS instance with name and VPLS ID
PE1(config-vpls)#flow-label both	Configure flow label based on requirement (we have three options both, transit and receive) with dynamic and static.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance
(config-vpls-sig)#vpls-peer 6.6.6.6	Configuring VPLS mesh peers
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode
(config-vpls)#exit-vpls	Exit from VPLS mode
(config-if)#interface eth2.100 switchport	Enter sub interface mode
(config-if)#encapsulation dot1q 100	Configure encapsulation under a subinterface
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-acc-if-vpls)#mpls-vpls vpls100	Associating the VPLS Instance to the attachment circuit interface.
(config-acc-if-vpls)#commit	Commit the configuration
(config-acc-if-vpls)#end	Return to privilege mode

P1

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 2.2.2.2/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 2.2.2.2	Configure Router-id

© 2025 IP Infusion Inc. Proprietary

(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.1.1.2/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#interface po10	Enter interface mode
(config-if)#ip address 10.1.2.1/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth2	Enter the Interface mode for eth2
(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10
(config-if)#interface eth3	Enter the Interface mode for eth3
(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#interface po30	Enter interface mode
(config-if)#ip address 10.1.3.1/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth4	Enter the Interface mode for eth4
(config-if)#channel-group 30 mode active	Moving interface to Dynamic LAG 30
(config-if)#interface eth5	Enter the Interface mode for eth5
(config-if)#channel-group 30 mode active	Moving interface to Dynamic LAG 30
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 3.3.3.3	Configure ospf Router-id
(config-router)#network 10.1.1.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.1.2.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.1.4.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.

(config-router)#network 2.2.2.2/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode

P2

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 3.3.3.3/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 3.3.3.3	Configure Router-id
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode
(config)#interface po10	Enter interface mode
(config-if)#ip address 10.1.2.2/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth1	Enter the Interface mode for eth1
(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10
(config-if)#interface eth2	Enter the Interface mode for eth2
(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#interface po20	Enter interface mode
(config-if)#ip address 10.1.4.2/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth3	Enter the Interface mode for eth3
(config-if)#channel-group 20 mode active	Moving interface to Dynamic LAG 20
(config-if)#interface eth4	Enter the Interface mode for eth4
(config-if)#channel-group 20 mode active	Moving interface to Dynamic LAG 20
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 3.3.3.3	Configure ospf Router-id
(config-router)#network 10.1.2.0/24 area 0	Define the interface on which OSPF runs and associate the
area ID (0) with the interface.	
(config-router)#network 10.1.4.0/24 area 0	Define the interface on which OSPF runs and associate the
area ID (0) with the interface.	
(config-router)#network 3.3.3.3/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode

P3

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 4.4.4.4/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 4.4.4.4	Configure Router-id
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode
(config)#interface po30	Enter interface mode
(config-if)#ip address 10.1.3.2/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth1	Enter the Interface mode for eth1
(config-if)#channel-group 30 mode active	Moving interface to Dynamic LAG 30
(config-if)#interface eth2	Enter the Interface mode for eth2
(config-if)#channel-group 30 mode active	Moving interface to Dynamic LAG 30
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#interface po40	Enter interface mode
(config-if)#ip address 10.1.5.2/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode

(config-if)#interface eth3	Enter the Interface mode for eth3
(config-if)#channel-group 40 mode active	Moving interface to Dynamic LAG 40
(config-if)#interface eth4	Enter the Interface mode for eth4
(config-if)#channel-group 40 mode active	Moving interface to Dynamic LAG 40
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer, identifying the routing process
(config-router)#ospf router-id 4.4.4.4	Configure ospf Router-id
(config-router)#network 10.1.3.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.1.5.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 4.4.4.4/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode

P4

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 5.5.5.5/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 5.5.5.5	Configure Router-id
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.1.6.1/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#interface po20	Enter interface mode
(config-if)#ip address 10.1.4.1/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth2	Enter the Interface mode for eth2

(config-if)#channel-group 20 mode active	Moving interface to Dynamic LAG 20
(config-if)#interface eth3	Enter the Interface mode for eth3
(config-if)#channel-group 20 mode active	Moving interface to Dynamic LAG 20
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#interface po40	Enter interface mode
(config-if)#ip address 10.1.5.1/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth4	Enter the Interface mode for eth4
(config-if)#channel-group 40 mode active	Moving interface to Dynamic LAG 40
(config-if)#interface eth5	Enter the Interface mode for eth5
(config-if)#channel-group 40 mode active	Moving interface to Dynamic LAG 40
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 5.5.5.5	Configure ospf Router-id
(config-router)#network 10.1.4.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.1.5.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.1.6.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 5.5.5.5/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode

PE-2

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 6.6.6.6/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 6.6.6.6	Configure Router-id
(config-router)#targeted-peer ipv4 1.1.1.1	Configuring targeted LDP sessions to PE-2
(config-router-targeted-peer)#exit-targeted-peer-mode	Exit from targeted-peer mode

(config-router)#transport-address ipv4 6.6.6.6	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
(config-router)#commit	Commit the configuration
(config-router)#exit	Exit from router mode
(config)#interface eth2	Enter interface mode
(config-if)#ip address 10.1.6.2/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ospf 100	Configure the routing process and specify the Process ID(100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 6.6.6.6	Configure ospf Router-id
(config-router)#network 10.1.6.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 6.6.6.6/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the configuration
(config-router)#exit	Exit from router mode
(config)#mpls vpls vpls100 100	Configuring VPLS instance with name and VPLS ID
PE1(config-vpls)#flow-label both	Configure flow label based on requirement (we have three options both, transit and receive) with dynamic and static.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance
(config-vpls-sig)#vpls-peer 1.1.1.1	Configuring VPLS mesh peers
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode
(config-vpls)#exit-vpls	Exit from VPLS mode
(config-if)#interface eth2.100 switchport	Enter sub interface mode
(config-if)#encapsulation dot1q 100	Configure encapsulation under a subinterface
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-acc-if-vpls)#mpls-vpls vpls100	Associating the VPLS Instance to the attachment circuit interface.
(config-acc-if-vpls)#commit	Commit the configuration
(config-acc-if-vpls)#end	Return to privilege mode

Configuration for BGP VPLS with FAT

PE-1

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 1.1.1.1/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP

`(config-router)#router-id 1.1.1.1`	Configure Router-id
`(config-router)#targeted-peer ipv4 6.6.6.6`	Configuring targeted LDP sessions to PE-2
`(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted-peer mode
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 10.1.1.1/24`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 1.1.1.1`	Configure ospf Router-id
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the transaction.
`(config-router)#exit`	Exit from router mode
`(config)#mpls vpls bgp_vpls200 200`	Configuring VPLS instance with name and VPLS ID
`PE1(config-vpls)#flow-label both`	Configure flow label based on requirement (we have three options both, transit and receive) with dynamic and static.
`(config-vpls)#signaling bgp`	Enabling BGP signaling for the VPLS instance
`(config-vpls-sig)#ve-id 500`	Configure VE ID, which is mandatory for BGP VPLS, otherwise, Signaling does not take place. VE ID should be unique per VPLS instance.
`(config-vpls-sig)#exit-signaling`	Exit from VPLS signaling mode
`(config-vpls)#exit-vpls`	Exit from VPLS mode
`(config-if)#interface eth2.200 switchport`	Enter sub interface mode
`(config-if)#encapsulation dot1q 200`	Configure encapsulation under a subinterface
`(config-if)#access-if-vpls`	Access VPLS under sub interface
`(config-acc-if-vpls)#mpls-vpls bgp_vpls200`	Associating the VPLS Instance to the attachment circuit interface.
`(config-acc-if-vpls)#commit`	Commit the configuration
`(config-acc-if-vpls)#end`	Return to privilege mode
`#configure terminal`	Enter configuration mode.
`(config)#router bgp 100`	Enter BGP router mode.
`(config-router)#neighbor 6.6.6.6 remote-as 100`	Configure PE2 as an iBGP peer.

(config-router)#neighbor 6.6.6.6 updatesource lo	Update the source as loopback for iBGP peering with the remote PE2 router.
(config-router)#address-family l2vpn vpls	Configure address-family l2vpn vpls.
(config-router-af)#neighbor 6.6.6.6 activate	Activate PE2 in the VPLS address family.
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#exit	Exit router mode.

P1

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 2.2.2.2/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 2.2.2.2	Configure Router-id

PE-2

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter interface mode
`(config -if)#ip address 6.6.6.6/32 secondary`	Configure IP address for the loopback interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#router-id 6.6.6.6`	Configure Router-id
`(config-router)#targeted-peer ipv4 1.1.1.1`	Configuring targeted LDP sessions to PE-2
`(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted-peer mode
`(config-router)#transport-address ipv4 6.6.6.6`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 10.1.6.2/24`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 6.6.6.6`	Configure ospf Router-id
`(config-router)#network 10.1.6.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 6.6.6.6/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#mpls vpls bgp_vpls200 200`	Configuring VPLS instance with name and VPLS ID
`PE1(config-vpls)#flow-label both`	Configure flow label based on requirement (we have three options both, transit and receive) with dynamic and static.
`(config-vpls)#signaling bgp`	Enabling BGP signaling for the VPLS instance
`(config-vpls-sig)#ve-id 600`	Configure VE ID, which is mandatory for BGP VPLS, otherwise, Signaling does not take place. VE ID should be unique per VPLS instance.
`(config-vpls-sig)#exit-signaling`	Exit from VPLS signaling mode
`(config-vpls)#exit-vpls`	Exit from VPLS mode
`(config-if)#interface eth2.200 switchport`	Enter sub interface mode
`(config-if)#encapsulation dot1q 200`	Configure encapsulation under a subinterface
`(config-if)#access-if-vpls`	Access VPLS under sub interface

(config-acc-if-vpls)#mpls-vpls bgp_vpls200	Associating the VPLS Instance to the attachment circuit interface.
(config-acc-if-vpls)#commit	Commit the configuration
(config-acc-if-vpls)#end	Return to privilege mode
(config)#router bgp 100	Enter BGP router mode.
(config-router)#neighbor 1.1.1.1 remote-as 100	Configure PE1 as an iBGP peer.
(config-router)#neighbor 1.1.1.1 updatesource lo	Update the source as loopback for iBGP peering with the remote PE1 router.
(config-router)#address-family l2vpn vpls	Configure address-family l2vpn vpls.
(config-router-af)#neighbor 1.1.1.1 activate	Activate PE1 in the VPLS address family.
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#exit	Exit router mode.

Configuration for VPWS with FAT

PE-1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter interface mode
`(config -if)#ip address 1.1.1.1/32 secondary`	Configure IP address for the loopback interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#router-id 1.1.1.1`	Configure Router-id
`(config-router)#commit`	Commit the transaction.
`(config-router)#exit`	Exit from router mode
`(config-router)#targeted-peer ipv4 6.6.6.6`	Configuring targeted LDP sessions to PE-2
`(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted-peer mode
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 10.1.1.1/24`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

© 2025 IP Infusion Inc. Proprietary

`(config-router)#ospf router-id 1.1.1.1`	Configure ospf Router-id
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#mpls l2-circuit VPWS4 400 3.3.3.3`	Configure the VC for PE-2
`PE1(config-vpls)#flow-label both`	Configure flow label based on requirement (we have three options both, transit and receive) with dynamic and static.
`(config-pseudowire)#commit`	Commit the configuration
`(config-pseudowire)#exit`	Exit from pseudowire configuration mode
`(config-if)#interface eth2.300 switchport`	Enter sub interface mode
`(config-if)#encapsulation dot1q 300`	Configure encapsulation under a subinterface
`(config-if)#access-if-vpws`	Access VPWS under sub interface
`(config-acc-if-vpws)#mpls-l2-circuit VPWS4 primary`	Associating the VPWS Instance to the attachment circuit interface.
`(config-acc-if-vpws)#commit`	Commit the configuration
`(config-acc-if-vpws)#end`	Return to privilege mode

P1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter interface mode
`(config -if)#ip address 2.2.2.2/32 secondary`	Configure IP address for the loopback interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#router-id 2.2.2.2`	Configure Router-id
`(config-router)#commit`	Commit the transaction.
`(config-router)#exit`	Exit from router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 10.1.1.2/24`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#interface po10`	Enter interface mode
`(config-if)#ip address 10.1.2.1/24`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode

(config-if)#interface eth2	Enter the Interface mode for eth2
(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10
(config-if)#interface eth3	Enter the Interface mode for eth3
(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#interface po30	Enter interface mode
(config-if)#ip address 10.1.3.1/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth4	Enter the Interface mode for eth4
(config-if)#channel-group 30 mode active	Moving interface to Dynamic LAG 30
(config-if)#interface eth5	Enter the Interface mode for eth5
(config-if)#channel-group 30 mode active	Moving interface to Dynamic LAG 30
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 3.3.3.3	Configure ospf Router-id
(config-router)#network 10.1.1.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.1.2.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.1.4.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 2.2.2.2/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode

P2

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 3.3.3.3/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 3.3.3.3	Configure Router-id
(config-router)#commit	Commit the transaction.

(config-router)#exit	Exit from router mode
(config)#interface po10	Enter interface mode
(config-if)#ip address 10.1.2.2/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth1	Enter the Interface mode for eth1
(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10
(config-if)#interface eth2	Enter the Interface mode for eth2
(config-if)#channel-group 10 mode active	Moving interface to Dynamic LAG 10
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#interface po20	Enter interface mode
(config-if)#ip address 10.1.4.2/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth3	Enter the Interface mode for eth3
(config-if)#channel-group 20 mode active	Moving interface to Dynamic LAG 20
(config-if)#interface eth4	Enter the Interface mode for eth4
(config-if)#channel-group 20 mode active	Moving interface to Dynamic LAG 20
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 3.3.3.3	Configure ospf Router-id
(config-router)#network 10.1.2.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.1.4.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 3.3.3.3/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode

P3

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 4.4.4.4/32 secondary	Configure IP address for the loopback interface

`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#router-id 4.4.4.4`	Configure Router-id
`(config-router)#commit`	Commit the transaction.
`(config-router)#exit`	Exit from router mode
`(config)#interface po30`	Enter interface mode
`(config-if)#ip address 10.1.3.2/24`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config-if)#interface eth1`	Enter the Interface mode for eth1
`(config-if)#channel-group 30 mode active`	Moving interface to Dynamic LAG 30
`(config-if)#interface eth2`	Enter the Interface mode for eth2
`(config-if)#channel-group 30 mode active`	Moving interface to Dynamic LAG 30
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the transaction.
`(config)#interface po40`	Enter interface mode
`(config-if)#ip address 10.1.5.2/24`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config-if)#interface eth3`	Enter the Interface mode for eth3
`(config-if)#channel-group 40 mode active`	Moving interface to Dynamic LAG 40
`(config-if)#interface eth4`	Enter the Interface mode for eth4
`(config-if)#channel-group 40 mode active`	Moving interface to Dynamic LAG 40
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the transaction.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 4.4.4.4`	Configure ospf Router-id
`(config-router)#network 10.1.3.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 10.1.5.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 4.4.4.4/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the transaction.
`(config-router)#exit`	Exit from router mode

(config-if)#channel-group 20 mode active	Moving interface to Dynamic LAG 20
(config-if)#interface eth3	Enter the Interface mode for eth3
(config-if)#channel-group 20 mode active	Moving interface to Dynamic LAG 20
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#interface po40	Enter interface mode
(config-if)#ip address 10.1.5.1/24	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config-if)#interface eth4	Enter the Interface mode for eth4
(config-if)#channel-group 40 mode active	Moving interface to Dynamic LAG 40
(config-if)#interface eth5	Enter the Interface mode for eth5
(config-if)#channel-group 40 mode active	Moving interface to Dynamic LAG 40
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 5.5.5.5`	Configure ospf Router-id
`(config-router)#network 10.1.4.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 10.1.5.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 10.1.6.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 5.5.5.5/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the transaction.
`(config-router)#exit`	Exit from router mode

PE-2

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter interface mode
`(config -if)#ip address 6.6.6.6/32 secondary`	Configure IP address for the loopback interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#router-id 6.6.6.6`	Configure Router-id
`(config-router)#targeted-peer ipv4 1.1.1.1`	Configuring targeted LDP sessions to PE-2
`(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted-peer mode
`(config-router)#transport-address ipv4 6.6.6.6`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 10.1.6.2/24`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 6.6.6.6`	Configure ospf Router-id
`(config-router)#network 10.1.6.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 6.6.6.6/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the configuration

`(config-router)#exit`	Exit from router mode
`(config)#mpls l2-circuit VPWS4 400 1.1.1.1`	Configure the VC for PE-2
`PE1(config-vpls)#flow-label both`	Configure flow label based on requirement (we have three options both, transit and receive) with dynamic and static.
`(config-pseudowire)#commit`	Commit the configuration
`(config-pseudowire)#exit`	Exit from pseudowire configuration mode
`(config-if)#interface eth2.300 switchport`	Enter sub interface mode
`(config-if)#encapsulation dot1q 300`	Configure encapsulation under a subinterface
`(config-if)#access-if-vpws`	Access VPWS under sub interface
`(config-acc-if-vpws)#mpls-l2-circuit VPWS4 primary`	Associating the VPWS Instance to the attachment circuit interface.
`(config-acc-if-vpws)#commit`	Commit the configuration
`(config-acc-if-vpws)#end`	Return to privilege mode

CHAPTER 2 L2VPN Sub Interface Configuration

L2VPN is a layer 2 service where different locations (customer sites) of an enterprise interconnect to form a big LAN segment. All the locations can exchange layer 2 data with each other via this Virtual LAN in a private and secured way.

The MPLS Core-based L2VPN model has two broad divisions:

- Virtual Private Wire Service (VPWS)
- Virtual Private LAN Service (VPLS)

Virtual Private Wire Service or VPWS is a Point-to-Point (P2P) service implementation of L2VPN. It provides layer 2 data flow of the same or different types (FR, ATM, etc.) of L2 services over the MPLS core attaching the two customer sites.

Virtual Private LAN Service (VPLS) is a Point-to-Multipoint (P2MP) and Multipoint-to-Multipoint (MP2MP) L2VPN service. VPLS is designed for applications that require multipoint access across geographically distributed locations. Using VPLS, several customer sites (or distributed Ethernet LANs) can be interconnected to work as a single bridged domain over the MPLS network. In simple terms, VPLS uses the Layer 2 architecture to create multipoint VPNs that connect several sites over a Wide Area Network (WAN) or Metropolitan Area Network (MAN). The different customer sites are connected via the Service Provider's MPLS core network.

Topology

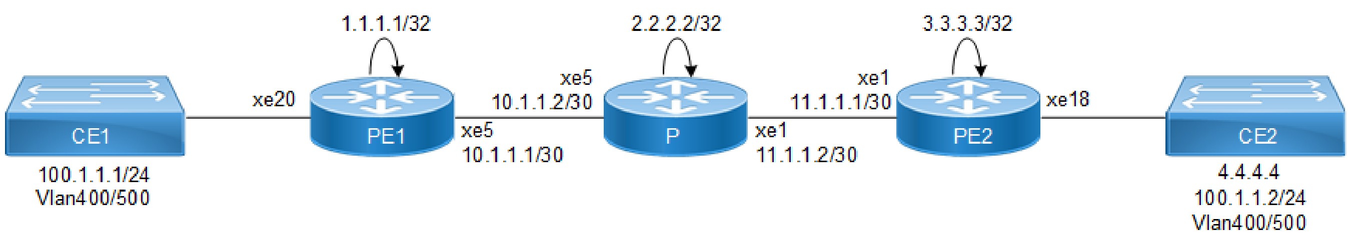

Figure 2-13: Link detection debounce timer topology

VPLS Configuration

All configuration commands in the table below should be followed for each Router.

PE1

`#configure terminal`	Enter Configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49
`(config-router)#net 49.3600.3600.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#interface lo`	Enter interface mode
`(config -if)#ip address 1.1.1.1/32 secondary`	Configure IP address for the loopback interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on an interface for area 49
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode

(config)#interface xe5	Enter interface mode
(config-if)#ip address 10.1.1.1/30	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#ip router isis 1	Enable IS-IS routing on an interface for area 49
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 1.1.1.1	Configure Router-id
(config-router)#targeted-peer ipv4 3.3.3.3	Configuring targeted LDP sessions to PE-2
(config-router-targeted-peer)#exit-targeted-peer-mode	Exit from targeted-peer mode
(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
(config-router)#commit	Commit the configuration
(config-router)#exit	Exit from router mode
(config)#mpls vpls vpls100 100	Configuring VPLS instance with name and VPLS ID
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance
(config-vpls-sig)#vpls-peer 3.3.3.3	Configuring VPLS mesh peers
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode
(config-vpls)#exit-vpls	Exit from VPLS mode
(config-if)#interface xe20.100 switchport	Enter sub interface mode
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if)#encapsulation dot1q 100	Configure encapsulation under a subinterface
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-acc-if-vpls)#mpls-vpls vpls100	Associating the VPLS Instance to the attachment circuit interface.
(config-acc-if-vpls)#commit	Commit the configuration
(config-acc-if-vpls)#end	Return to privilege mode

P

#configure terminal	Enter Configure mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49
(config-router)#net 49.3600.3600.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID
(config-router)#commit	Commit the configuration
(config-router)#exit	Exit from router mode
(config)#interface lo	Enter interface mode
(config-if)# ip address 2.2.2.2/32 secondary	Configure IP address for the loopback interface
(config-if)#ip router isis 1	Enable IS-IS routing on an interface for area 49
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode

(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 2.2.2.2	Configure Router-id
(config-router)# transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
(config-router)#commit	Commit the configuration
(config-router)#exit	Exit router mode
(config)#interface xe5	Enter interface mode
(config-if)#ip address 10.1.1.2/30	Configure IP address on interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#ip router isis 1	Enable IS-IS routing on an interface for area 49
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter interface mode
(config-if)# ip address 11.1.1.2/30	Configure IP address on interface
(config-if)# label-switching	Enable label switching capability on the interface
(config-if)# ip router isis 1	Enable IS-IS routing on an interface for area 49
(config-if)# enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode

PE2

#configure terminal	Enter Configure mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49
(config-router)#net 49.3600.3600.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID
(config-router)#commit	Commit the configuration
(config-router)#exit	Exit from router mode
(config)#interface lo	Enter interface mode
(config-if)# ip address 3.3.3.3/32 secondary	Configure IP address for the loopback interface
(config-if)#ip router isis 1	Enable IS-IS routing on an interface for area 49
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#router ldp	Enter router mode for LDP
(config-router)# router-id 3.3.3.3	Configure Router-id
(config-router)# targeted-peer ipv4 1.1.1.1	Configuring targeted LDP sessions to PE-1
(config-router-targeted-peer)#exit-targeted-peer-mode	Exit from targeted-peer mode
(config-router)# transport-address ipv4 3.3.3.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
(config-router)#commit	Commit the configuration

`(config-router)#exit`	Exit from router mode
`(config)#interface xe1`	Enter interface mode
`(config-if)#ip address 11.1.1.1/30`	Configure IP address on interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on an interface for area 49
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configurations
`(config-if)#exit`	Exit interface mode
`(config)#mpls vpls vpls100 100`	Configuring VPLS instance with name and VPLS ID
`(config-vpls)#signaling ldp`	Enabling LDP signaling for the VPLS instance
`(config-vpls-sig)#vpls-peer 1.1.1.1`	Configuring VPLS mesh peers
`(config-vpls-sig)#exit-signaling`	Exit from VPLS signaling mode
`(config-vpls)#exit-vpls`	Exit from VPLS mode
`(config)#interface xe18.100 switchport`	Enter sub interface mode
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if)#encapsulation dot1q 100`	Configure encapsulation under a subinterface
`(config-if)#access-if-vpls`	Access VPLS under sub interface
`(config-acc-if-vpls)#mpls-vpls vpls100`	Associating the VPLS Instance to the attachment circuit interface.
`(config-acc-if-vpls)#commit`	Commit the configuration
`(config-acc-if-vpls)#end`	Return to privilege mode

Validation

PE1

```

CHAPTER 3 Virtual Private LAN Service Configuration

This chapter contains configurations for Virtual Private LAN Service (VPLS).

VPLS Raw Mode

The examples show the minimum configuration required for enabling a VPLS Mesh peer between PE1, PE2, and PE3 in raw mode.

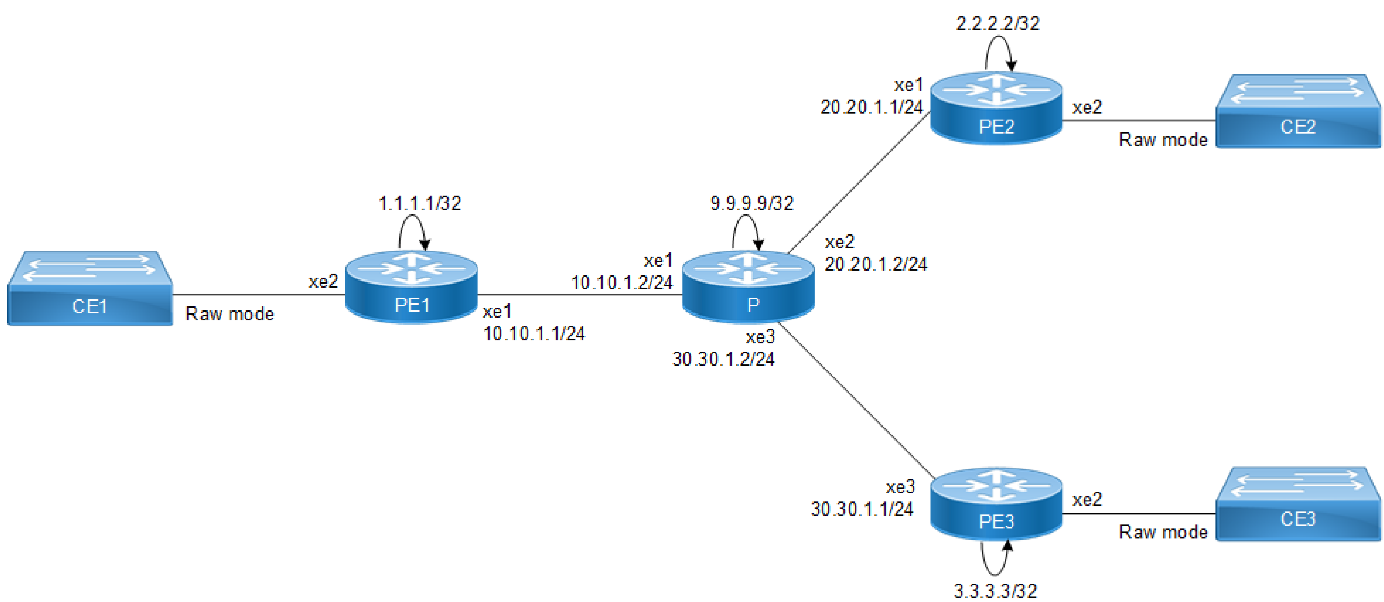

Figure 3-14: VPLS Mesh Peers Raw Mode

Configuration

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure IP address for the loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Specify the Interface (xe1) to be configured.
`(config-if)#ip address 10.10.1.1/24`	Configure IP address for the interface.
`(config-if)#no shutdown`	Administratively brining up the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the routing process ID (100).
`(config-router)#network 10.10.1.0/24 area 0` `(config-router)#network 1.1.1.1/32 area 0`	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
`(config-router)#exit`	Exit router mode.

`(config)#router ldp`	Enter router mode for LDP.
`(config-router)# router-id 1.1.1.1`	Configure the router-id
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run.
`(config-router)#targeted-peer ipv4 2.2.2.2`	Configuring targeted LDP sessions to PE2
`(config-router-targeted-peer)#exit`	Exit config-router-targeted-peer mode
`(config-router)#targeted-peer ipv4 3.3.3.3`	Enter targeted-peer-mode and PE3
`(config-router-targeted-peer)#exit`	Exit config-router-targeted-peer mode
`(config-router)#exit`	Exit router configuration mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching capability on the interface.
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#mpls vpls VPLS1 100`	Configuring VPLS instance with name and VPLS ID.
`(config-vpls)#signaling ldp`	Enabling LDP signaling for the VPLS instance.
`(config-vpls-sig)#vpls-peer 2.2.2.2` `(config-vpls-sig)#vpls-peer 3.3.3.3`	Configuring VPLS mesh peers.
`(config-vpls-sig)#exit-signaling`	Exit from VPLS signaling mode.
`(config-vpls)#exit`	Exit from VPLS Mode.
`(config)#service-template st1`	Template configuration
`(config-svc)#exit`	Exit service template mode
`(config)#interface xe2`	Specify the attachment circuit interface.
`(config-if)#switchport`	Configuring the attachment circuit interface as Layer-2.
`(config-if)mpls-vpls VPLS1 service-template st1`	Associating the VPLS Instance to the attachment circuit interface.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if-vpls)#exit`	Exit VPLS attachment-circuit mode
`(config-if)exit`	Exit interface mode.
`(config)#commit`	Commit the transaction.
`#copy running-config startup-config`	Save the configuration.

P

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 9.9.9.9/32 secondary`	Configure IP address for the loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Specify the interface to be configured.
`(config-if)#ip address 10.10.1.2/24`	Configure IP address for the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 20.20.1.2/24`	Configure IP address for the interface.

(config-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#ip address 30.30.1.2/24	Configure IP address for the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process and specify the routing process ID(100).
(config-router)#network 10.10.1.0/24 area 0 (config-router)#network 20.20.1.0/24 area 0 (config-router)#network 30.30.1.0/24 area 0 (config-router)#network 9.9.9.9/32 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the Interface address.
(config-router)#exit	Exit router mode.
(config)#router ldp	Enter router mode for LDP.
(config-router)#router-id 9.9.9.9	Confirm the router-id
(config-router)#transport-address ipv4 9.9.9.9	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run.
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#exit	Exit router mode.
(config)#interface xe1	Enter interface mode.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#enable-ldp ipv4	Enabling LDP on the interface.
(congig-if)#exit	Exit interface configuration mode.
(config)#interface xe2	Specify the interface to be configured.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#enable-ldp ipv4	Enabling LDP on the interface.
(congig-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#enable-ldp ipv4	Enabling LDP on the interface.
(congig-if)#exit	Exit interface mode.
(config)#commit	Commit the transaction.
#copy running-config startup-config	Save the configuration.

PE2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 2.2.2.2/32 secondary	Configure IP address for the loopback interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Specify the Interface (xe1) to be configured.
(config-if)#ip address 20.20.1.1/24	Configure IP address for the interface.
(config-if)#no shutdown	Administratively brining up the interface.
(config-if)#exit	Exit interface mode.

`(config)#router ospf 100`	Configure the routing process and specify the routing process ID(100).
`(config-router)#network 20.20.1.0/24 area 0` `(config-router)#network 2.2.2.2/32 area 0`	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
`(config-router)#exit`	Exit router mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 2.2.2.2`	Confirm the router-id
`(config-router)#transport-address ipv4 2.2.2.2`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run.
`(config-router)#targeted-peer ipv4 1.1.1.1`	Configuring targeted LDP sessions to PE2.
`(config-router-targeted-peer)#exit`	Exit targeted-peer-mode
`(config-router)#targeted-peer ipv4 3.3.3.3`	Configuring targeted LDP sessions to PE3
`(config-router-targeted-peer)#exit`	Exit targeted-peer-mode
`(config-router)#exit`	Exit router configuration mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching capability on the interface.
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#mpls vpls VPLS1 100`	Configuring VPLS instance with name and VPLS ID.
`(config-vpls)#signaling ldp`	Enabling LDP signaling for the VPLS instance.
`(config-vpls-sig)#vpls-peer 1.1.1.1` `(config-vpls-sig)#vpls-peer 3.3.3.3`	Configuring VPLS mesh peers.
`(config-vpls-sig)#exit-signaling`	Exit from VPLS signaling mode.
`(config-vpls)#exit`	Exit from VPLS Mode.
`(config)#service-template st1`	Template configuration.
`(config-svc)#exit`	Exit service template mode.
`(config)#interface xe2`	Specify the attachment circuit interface.
`(config-if)#switchport`	Configuring the attachment circuit interface as Layer-2.
`(config-if)mpls-vpls VPLS1 service-template st1`	Associating the VPLS Instance to the attachment circuit interface.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if-vpls)#exit`	Exit VPLS attachment-circuit mode
`(config-if)exit`	Exit interface mode.
`(config)#commit`	Commit the transaction.
`#copy running-config startup-config`	Save the configuration.

PE3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Configure IP address for the loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Specify the Interface (xe1) to be configured.

`(config-if)#ip address 30.30.1.1/24`	Configure IP address for the interface.
`(config-if)#no shutdown`	Administratively brining up the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the routing process ID(100).
`(config-router)#network 30.30.1.0/24 area 0` `(config-router)#network 3.3.3.3/32 area 0`	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
`(config-router)#exit`	Exit router mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 3.3.3.3`	Confirm the router-id
`(config-router)#transport-address ipv4 3.3.3.3`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run.
`(config-router)#targeted-peer ipv4 1.1.1.1`	Configuring targeted LDP sessions to PE2
`(config-router-targeted-peer)#exit`	Exit targeted-peer-mode
`(config-router)#targeted-peer ipv4 2.2.2.2`	Configuring targeted LDP sessions to PE3
`(config-router-targeted-peer)#exit`	Exit targeted-peer-mode
`(config-router)#exit`	Exit router configuration mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching capability on the interface.
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#mpls vpls VPLS1 100`	Configuring VPLS instance with name and VPLS ID.
`(config-vpls)#signaling ldp`	Enabling LDP signaling for the VPLS instance.
`(config-vpls-sig)#vpls-peer 1.1.1.1` `(config-vpls-sig)#vpls-peer 2.2.2.2`	Configuring VPLS mesh peers.
`(config-vpls-sig)#exit-signaling`	Exit from VPLS signaling mode.
`(config-vpls)#exit`	Exit from VPLS Mode.
`(config)#service-template st1`	Template configuration.
`(config-svc)#exit`	Exit service template mode.
`(config)#interface xe2`	Specify the attachment circuit interface.
`(config-if)#switchport`	Configuring the attachment circuit interface as Layer-2.
`(config-if)mpls-vpls VPLS1 service-template st1`	Associating the VPLS Instance to the attachment circuit interface.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if-vpls)#exit`	Exit VPLS attachment-circuit mode
`(config-if)exit`	Exit interface mode.
`(config)#commit`	Commit the transaction.
`#copy running-config startup-config`	Save the configuration.

VPLS Tagged Mode

The examples show the minimum configuration required for enabling a VPLS Mesh peer between PE1, PE2, and PE3 in Tagged Mode. In the below example PE1 and PE2 uses VLAN 10 for binding the VPLS instance to the attachment circuit and PE3 used VLAN 20 where it shows that VLAN swapping is supported.

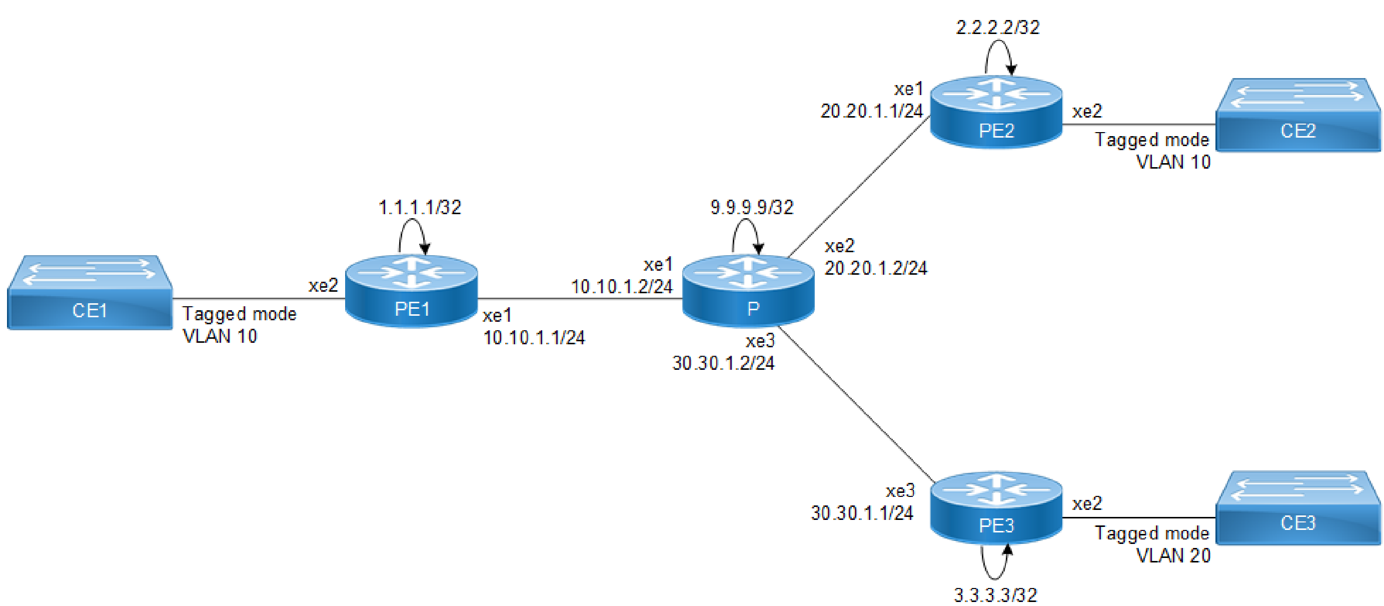

Figure 3-15: VPLS Mesh Peers Tagged Mode

Configuration

PE1

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 1.1.1.1/32 secondary	Configure IP address for the loopback interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Specify the Interface (xe1) to be configured.
(config-if)#ip address 10.10.1.1/24	Configure IP address for the interface.
(config-if)#no shutdown	Administratively brining up the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process and specify the routing process ID(100).
(config-router)#network 10.10.1.0/24 area 0 (config-router)#network 1.1.1.1/32 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
(config-router)#exit	Exit router mode.
(config)#router ldp	Enter router mode for LDP.
(config-router)#targeted-peer ipv4 2.2.2.2	Configuring targeted LDP sessions to PE2
(config-router-targeted-peer)#exit	Exit targeted peer mode
(config-router-targeted-peer)#targeted-peer ipv4 3.3.3.3	Configuring targeted LDP sessions to PE3
(config-router-targeted-peer)#exit	Exit targeted peer mode
(config-router)#exit	Exit router configuration mode
(config)#interface xe1	Enter interface mode
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#enable-ldp ipv4	Enabling LDP on the interface.
(config-if)#exit	Exit interface mode.
(config)#mpls vpls VPLS1 100	Configuring VPLS instance with name and VPLS ID.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance.
(config-vpls-sig)#vpls-type vlan	Configuring VPLS type as VLAN mode.
(config-vpls-sig)#vpls-peer 2.2.2.2 (config-vpls-sig)#vpls-peer 3.3.3.3	Configuring VPLS mesh peers.
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode.
(config-vpls)#exit	Exit from VPLS Mode.
(config)#mpls vpls v4 28	Enter VPLS config mode
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type vlan	Type VLAN configuration for VPLS
(config-vpls-sig)#vpls-peer 2.2.2.2	Configure VPLS Peers
config-vpls-sig)#vpls-peer 3.3.3.3	Configure VPLS Peers
(config-vpls-sig)#exit-signaling	Exit Signaling LDP mode

(config-vpls)#exit	Exit VPLS mode
(config)#service-template st1	Template configuration.
(config-svc)#match outer-vlan 10	Match criteria under template configuration
(config-svc)#exit	Exit service template mode.
(config)#interface xe2	Specify the attachment circuit interface.
(config-if)#switchport	Configuring the attachment circuit interface as Layer-2.
(config-if)mpls-vpls VPLS1 service-template st1	Associating the VPLS Instance to the attachment circuit interface to match service template st1.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)exit	Exit interface mode.
(config)#commit	Commit the transaction.
#copy running-config startup-config	Save the configuration.

Service template with Multiple Match Support

This is to validate the multiple match criteria support in a service template. When multiple match statements are configured only rewrite push is supported, rewrite translate and pop are not supported.

(config)#service-template template4	Template configuration
(config-svc)#match outer-vlan 700	Allow VLAN 700 traffic on this VC
(config-svc)#match double-tag outer-vlan 1200 inner-vlan 3200	Allow double tag match with s+c tags
(config-svc)#match untagged	Allow untagged traffic
(config-svc)#rewrite ingress push 300	Push Action performed for service template
(config-svc)#exit	Exit configure SVC mode
(config)#interface xe2	Specify the attachment circuit interface.
(config-if)#switchport	Configuring the attachment circuit interface as Layer-2.
(config-if)mpls-vpls v4 service-template template4	Associating the VPLS Instance to the attachment circuit interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#commit	Commit the transaction.

P

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 9.9.9.9/32 secondary	Configure IP address for the loopback interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Specify the interface to be configured.
(config-if)#ip address 10.10.1.2/24	Configure IP address for the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 20.20.1.2/24	Configure IP address for the interface.

(config-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#ip address 30.30.1.2/24	Configure IP address for the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process and specify the routing process ID(100).
(config-router)#network 10.1.1.0/24 area 0 (config-router)#network 20.20.1.0/24 area 0 (config-router)#network 30.30.1.0/24 area 0 (config-router)#network 9.9.9.9/32 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the Interface address.
(config-router)#exit	Exit router mode.
(config)#router ldp	Enter router mode for LDP.
(config-router)#exit	Exit router mode.
(config)#interface xe1	Enter interface mode.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#enable-ldp ipv4	Enabling LDP on the interface.
(congig-if)#exit	Exit interface configuration mode.
(config)#interface xe2	Specify the interface to be configured.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#enable-ldp ipv4	Enabling LDP on the interface.
(congig-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#enable-ldp ipv4	Enabling LDP on the interface.
(congig-if)#exit	Exit interface mode.
(config)#commit	Commit the transaction.
#copy running-config startup-config	Save the configuration.

PE2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 2.2.2.2/32 secondary	Configure IP address for the loopback interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Specify the Interface (xe1) to be configured.
(config-if)#ip address 20.20.1.1/24	Configure IP address for the interface.
(config-if)#no shutdown	Administratively brining up the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process and specify the routing process ID(100).
(config-router)#network 20.20.1.0/24 area 0 (config-router)#network 2.2.2.2/32 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
(config-router)#exit	Exit router mode.

(config)#router ldp	Enter router mode for LDP.

Validation for the Number of Configured VPLS Instances

This example below shows number of configured VPLS instances.

```
PE1#show mpls vpls count
--------------------------------
Total VPLS instances    : 2
Active VPLS instances   : 2
Inactive VPLS instances : 2
--------------------------------
```

The example below shows the Count of VPLS from LDP standpoint

```
PE1#show ldp vpls count
--------------------------------
Total VPLS instances    : 2
Active VPLS instances   : 2
Inactive VPLS instances : 0
--------------------------------
```

The example below shows the number of MAC addresses learned by VPLS.

```
PE1#show mpls vpls mac-address count
Total no of MAC addresses learnt :6
```

VPLS Split Horizon Group

In VPLS Hierarchy, multiple attachment circuits (AC) can be configured per few VPLS instances and AC-AC traffic blocking is not supported.Thus,when the PE router receives a broadcast, multicast, or unknown unicast packet on an AC.It sends the packet out on all other attachment circuits to all other CE devices participating in that VPLS instance.

To avoid this problem of a packet looping in the provider core, the PE devices enforce a "split-horizon" principle for the VPLS instances. That means the traffic will not flood if AC1 and AC2 are in same split horizon group.

The examples show the minimum configuration required for enabling a VPLS Mesh peer between PE-1, PE-2 with split horizon group. In the below example PE-1 and PE-2 uses split horizon groups where traffic can't be forwarded between the ACs if they are part of same access groups.But can send/receive from network ports.

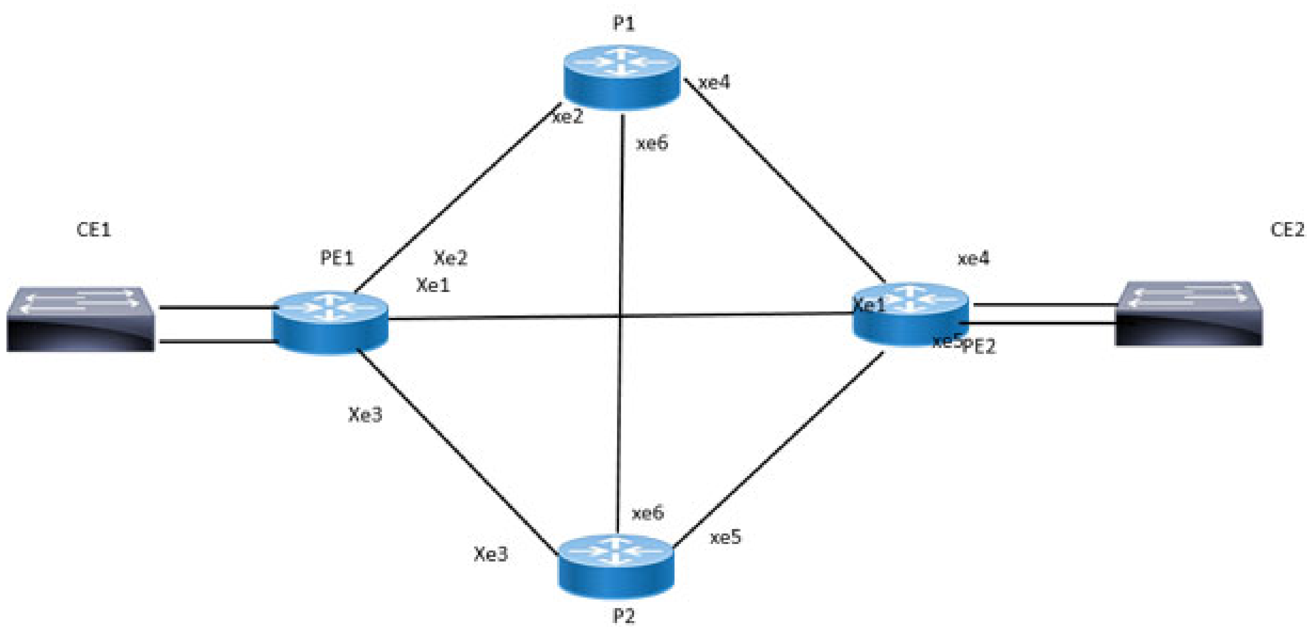

Figure 3-16: Figure 8-15: VPLS Mesh Peers split horizon

Configuration With Service Template

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 48.48.48.48/32 secondary`	Configure IP address for the loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe0`	Specify the Interface to be configured.
`(config-if)#ip address 40.40.40.1/24`	Configure IP address for the interface.
`(config-if)#no shutdown`	Administratively brining up the interface.
`(config-if)#label-switching`	Enable label switching on the interface
`(config-if)#mpls ldp-igp sync isis level-1-2`	Enable LDP IS-IS synchronization
`(config-if)#isis network point-to-point`	Configure the ISIS interface network type as point to point
`(config-if)#ip router isis ISIS-IGP`	Enable IS-IS routing on an interface

(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on interface
(config-if)#exit	Exit interface mode.
(config)#interface xe19	Specify the Interface to be configured
(config-if)#ip address 57.57.57.6/24	Configure IP address for the interface.
(config-if)#no shutdown	Administratively brining up the interface.
(config-if)#label-switching	Enable label switching on the interface
(config-if)#mpls ldp-igp sync isis level-1-2	Enable LDP IS-IS synchronization
(config-if)#isis network point-to-point	Configure the ISIS interface network type as point to point
(config-if)#ip router isis ISIS-IGP	Enable IS-IS routing on an interface
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on interface
(config-if)#exit	Exit interface mode.
(config)#interface xe20	Specify the Interface to be configured
(config-if)#ip address 52.52.52.5/24	Configure IP address for the interface.
(config-if)#no shutdown	Administratively brining up the interface.
(config-if)#label-switching	Enable label switching on the interface
(config-if)#mpls ldp-igp sync isis level-1-2	Enable LDP IS-IS synchronization
(config-if)#isis network point-to-point	Configure the ISIS interface network type as point to point
(config-if)#ip router isis ISIS-IGP	Enable IS-IS routing on an interface
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on interface
(config-if)#exit	Exit interface mode.
(config)#router isis ISIS-IGP	Create an IS-IS routing instance
(config)#is-type level-1	Configure instance as level-2-only routing.
(config)#metric-style wide	Configure the new style of metric type as wide.
(config)#mpls traffic-eng router-id 48.48.48.48	Configure MPLS-TE unique router-id TLV.
(config)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1
(config)#capability cspf	Enable CSPF feature for ISIS instance.
(config)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance
(config)#fast-reroute ti-lfa level-1 proto ipv4	Configure LFA-FRR to calculate the available backup path for all L1 IPv4 prefixes learned
(config)#fast-reroute ti-lfa level-2 proto ipv4	Configure LFA-FRR to calculate the available backup path for all L2 IPv4 prefixes learned
(config)#bfd all-interfaces	Enable BFD for all neighbors.
(config)#net 49.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config)#router ldp	Enter router mode for LDP.
(config-router)#targeted-peer ipv4 45.45.45.45	Configuring targeted LDP sessions to PE-2
(config-router-targeted-peer)#exit	Exit config-router-targeted-peer mode
(config-router)#exit	Exit router configuration mode.
(config)#router bgp 65010	Define the routing process. The number 65010 specifies the AS number

(config-router)#bgp router-id 48.48.48.48	Assign a BGP router ID.
(config-router)#neighbor 45.45.45.45 remote-as 65010	Define the eBGP neighbor
(config-router)#neighbor 45.45.45.45 fall-over bfd multihop	Enabling BFD at BGP level for particular neighbor.
(config-router)#neighbor 45.45.45.45 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#address-family ipv4 unicast	Enter into labeled-unicast address family
(config-router)#neighbor 45.45.45.45 activate	Activate the neighbor inside labeled-unicast address family
(config-router)#exit-address-family	Exit from address family IPv4 labeled unicast
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router)#neighbor 45.45.45.45 activate	Activate the neighbor inside vpnv4 address family
(config-router)#exit-address-family	Exit from address family vpnv4
(config-router)#address-family ipv6 unicast	Enter into labeled-unicast address family
(config-router)#redistribute connected	Redistribute the connected routes.
(config-router)#exit-address-family	Exit from address family IPv6 labeled unicast
(config)#mpls vpls VPLS-PE1-PE2-600 600	Configuring VPLS instance with name and VPLS ID.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance.
(config-vpls)#vpls-type vlan	Configure VPLS type as VLAN encapsulation
(config-vpls-sig)#vpls-peer 45.45.45.45	Configuring VPLS mesh peers.
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode.
(config-vpls)#exit	Exit from VPLS Mode.
(config)#mpls vpls VPLS-PE1-PE2-601 601	Configuring VPLS instance with name and VPLS ID.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance.
(config-vpls)#vpls-type vlan	Configure VPLS type as VLAN encapsulation
(config-vpls-sig)#vpls-peer 45.45.45.45	Configuring VPLS mesh peers.
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode.
(config-vpls)#exit	Exit from VPLS Mode.
(config)#mpls vpls VPLS-PE1-PE2-602 602	Configuring VPLS instance with name and VPLS ID.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance.
(config-vpls)#vpls-type vlan	Configure VPLS type as VLAN encapsulation
(config-vpls-sig)#vpls-peer 45.45.45.45	Configuring VPLS mesh peers.
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode.
(config-vpls)#exit	Exit from VPLS Mode.
(config)#service-template ST-VPLS-PE1-PE2-600	Template configuration
(config-svc)#exit	Exit service template mode
(config)#service-template ST-VPLS-PE1-PE2-601	Template configuration
(config-svc)#exit	Exit service template mode
(config)#service-template ST-VPLS-PE1-PE2-602	Template configuration
(config-svc)#exit	Exit service template mode
(config)#interface xe2	Specify the attachment circuit interface.
(config-if)#switchport	Configuring the attachment circuit interface as Layer-2.

(config-if)#mpls-vpls VPLS-PE1-PE2-600 service-template ST-VPLS-PE1-PE2-600	Associating the VPLS Instance to the attachment circuit interface.
(config-if)#split-horizon group access1	Configuring split horizon group.
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls VPLS-PE1-PE2-601 service-template ST-VPLS-PE1-PE2-601	Associating the VPLS Instance to the attachment circuit interface.
(config-if)#split-horizon group access1	Configuring split horizon group
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls VPLS-PE1-PE2-602 service-template ST-VPLS-PE1-PE2-602	Associating the VPLS Instance to the attachment circuit interface.

(config)#mpls traffic-eng router-id 48.48.48.48	Configure MPLS-TE unique router-id TLV.
(config)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1
(config)#capability cspf	Enable CSPF feature for ISIS instance.

(config)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance
(config)#fast-reroute ti-lfa level-1 proto ipv4	Configure LFA-FRR to calculate the available backup path for all L1 IPv4 prefixes learned
(config)#fast-reroute ti-lfa level-2 proto ipv4	Configure LFA-FRR to calculate the available backup path for all L2 IPv4 prefixes learned
(config)#bfd all-interfaces	Enable BFD for all neighbors.
(config)#net 49.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config)#router ldp	Enter router mode for LDP.
(config-router)#targeted-peer ipv4 48.48.48.48	Configuring targeted LDP sessions to PE-2
(config-router-targeted-peer)#exit	Exit config-router-targeted-peer mode
(config-router)#exit	Exit router configuration mode.
(config)#router bgp 65010	Define the routing process. The number 65010 specifies the AS number
(config-router)#bgp router-id 45.45.45.45	Assign a BGP router ID.
(config-router)#neighbor 48.48.48.48 remote-as 65010	Define the eBGP neighbor
(config-router)#neighbor 48.48.48.48 fall-over bfd multihop	Enabling BFD at BGP level for particular neighbor.
(config-router)#neighbor 48.48.48.48 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#address-family ipv4 unicast	Enter into labeled-unicast address family
(config-router)#neighbor 48.48.48.48 activate	Activate the neighbor inside labeled-unicast address family
(config-router)#exit-address-family	Exit from address family IPv4 labeled unicast
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router)#neighbor 48.48.48.48 activate	Activate the neighbor inside vpnv4 address family
(config-router)#exit-address-family	Exit from address family vpnv4
(config-router)#address-family ipv6 unicast	Enter into labeled-unicast address family
(config-router)#redistribute connected	Redistribute the connected routes.
(config-router)#exit-address-family	Exit from address family IPv6 labeled unicast
(config)#mpls vpls VPLS-PE1-PE2-600 600	Configuring VPLS instance with name and VPLS ID.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance.
(config-vpls)#vpls-type vlan	Configure VPLS type as VLAN encapsulation
(config-vpls-sig)#vpls-peer 48.48.48.48	Configuring VPLS mesh peers.
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode.
(config-vpls)#exit	Exit from VPLS Mode.
(config)#mpls vpls VPLS-PE1-PE2-601 601	Configuring VPLS instance with name and VPLS ID.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance.
(config-vpls)#vpls-type vlan	Configure VPLS type as VLAN encapsulation
(config-vpls-sig)#vpls-peer 48.48.48.48	Configuring VPLS mesh peers.
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode.
(config-vpls)#exit	Exit from VPLS Mode.

(config)#mpls vpls VPLS-PE1-PE2-602 602	Configuring VPLS instance with name and VPLS ID.
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance.
(config-vpls)#vpls-type vlan	Configure VPLS type as VLAN encapsulation
(config-vpls-sig)#vpls-peer 48.48.48.48	Configuring VPLS mesh peers.
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode.
(config-vpls)#exit	Exit from VPLS Mode.
(config)#interface xe2.600 switchport	Creates a L2 sub-interface as xe2.600.
(config-if)#encapsulation dot1q 600	Configuring the attachment circuit interface as Layer-2.
(config-if)#rewrite push 0x8100 4050	Configure rewrite push.
(config-if)#split-horizon group access1	Configuring split horizon group.
(config-if-vpls)#load-interval 30	Configure load period in multiple of 30 seconds
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-if-vpls)#mpls-vpls VPLS-PE1-PE2-600	Associating the VPLS Instance to the attachment circuit interface.
(config)#interface xe2.601 switchport	Creates a L2 sub-interface as xe2.600.
(config-if)#encapsulation dot1q 601	Configuring the attachment circuit interface as Layer-2.
(config-if)#rewrite push 0x8100 4050	Configure rewrite push.
(config-if)#split-horizon group access1	Configuring split horizon group.
(config-if-vpls)#load-interval 30	Configure load period in multiple of 30 seconds
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-if-vpls)#mpls-vpls VPLS-PE1-PE2-601	Associating the VPLS Instance to the attachment circuit interface.
(config)#interface xe2.602 switchport	Creates a L2 sub-interface as xe2.600.
(config-if)#encapsulation dot1q 602	Configuring the attachment circuit interface as Layer-2.
(config-if)#rewrite push 0x8100 4050	Configure rewrite push.
(config-if)#split-horizon group access1	Configuring split horizon group.
(config-if-vpls)#load-interval 30	Configure load period in multiple of 30 seconds
(config-if)#access-if-vpls	Access VPLS under sub interface
config-if-vpls)#mpls-vpls VPLS-PE1-PE2-602	Associating the VPLS Instance to the attachment circuit interface.
(config)#interface xe23.600 switchport	Creates a L2 sub-interface as xe2.600.
(config-if)#encapsulation dot1q 600	Configuring the attachment circuit interface as Layer-2.
(config-if)#rewrite push 0x8100 4050	Configure rewrite push.
(config-if)#split-horizon group access1	Configuring split horizon group.
(config-if-vpls)#load-interval 30	Configure load period in multiple of 30 seconds
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-if-vpls)#mpls-vpls VPLS-PE1-PE2-600	Associating the VPLS Instance to the attachment circuit interface.
(config)#interface xe23.601 switchport	Creates a L2 sub-interface as xe2.600.
(config-if)#encapsulation dot1q 601	Configuring the attachment circuit interface as Layer-2.
(config-if)#rewrite push 0x8100 4050	Configure rewrite push.
(config-if)#split-horizon group access1	Configuring split horizon group.

(config-if-vpls)#load-interval 30	Configure load period in multiple of 30 seconds
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-if-vpls)#mpls-vpls VPLS-PE1-PE2-601	Associating the VPLS Instance to the attachment circuit interface.
(config)#interface xe23.602 switchport	Creates a L2 sub-interface as xe2.600.
(config-if)#encapsulation dot1q 602	Configuring the attachment circuit interface as Layer-2.
(config-if)#rewrite push 0x8100 4050	Configure rewrite push.
(config-if)#split-horizon group access1	Configuring split horizon group.
(config-if-vpls)#load-interval 30	Configure load period in multiple of 30 seconds
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-if-vpls)#mpls-vpls VPLS-PE1-PE2-602	Associating the VPLS Instance to the attachment circuit interface.
(config-if)#commit	Commit the candidate configuration to the running configuration.
(config-if)#exit	Exit interface mode
#copy running-config startup-config	Save the configuration.

P2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 46.46.46.46/32 secondary	Configure IP address for the loopback interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Specify the interface to be configured.
(config-if)#ip address 80.80.80.2/24	Configure IP address for the interface.
(config-if)#label-switching	Enable label switching on the interface
(config-if)#mpls ldp-igp sync isis level-1-2	Enable LDP IS-IS synchronization
(config-if)#isis network point-to-point	Configure the ISIS interface network type as point to point
