VPLS - Per-Peer VPLS-type Signaling

Overview

Virtual Private LAN Service (VPLS) LDP signaling is a mechanism used to establish and manage pseudowires (PWs) in a VPLS network. VPLS allows geographically dispersed sites to share a common Ethernet broadcast domain, enabling any-to-any communication between the sites as if they were all connected to the same local area network (LAN).

VPLS LDP signaling occurs when each PE has discovered the endpoints of the VPLS instance. PWs are established over MPLS tunnels between VPN sites to transparently transmit Layer 2 packets. With the ability to configure the VPLS type per peer, and with the VPLS type configured being forwarded to LDP only when there is a change in the VPLS type at the VPLS instance or per peer level, signaling behavior is more efficient. Previously, the VPLS type at the VPLS instance was significant across all PEs involved in the VPLS instance.

If there is a change in the VPLS type at the VPLS instance or per peer level, NSM will update LDP, triggering LDP signaling. If there is no change, there is no need for re-signaling, and the VPLS session remains in the same state. The VPLS type configured on PEs at both ends of a pseudowire must match; otherwise, negotiation is required, and the VPLS session will be inactive until resolved.

Feature Characteristics

Provide the ability to configure the VPLS type on a per-peer basis, in addition to the VPLS type set across all PEs in the VPLS instance. The VPLS type configured on PEs at both ends of a pseudowire must match; otherwise, negotiation should occur. The per-peer VPLS type should take priority when both the VPLS instance type and the per-peer type are configured.

The examples show the minimum configuration required for enabling a VPLS Mesh peer between PE1, PE2, and PE3 in per peer VPLS-type Signaling.

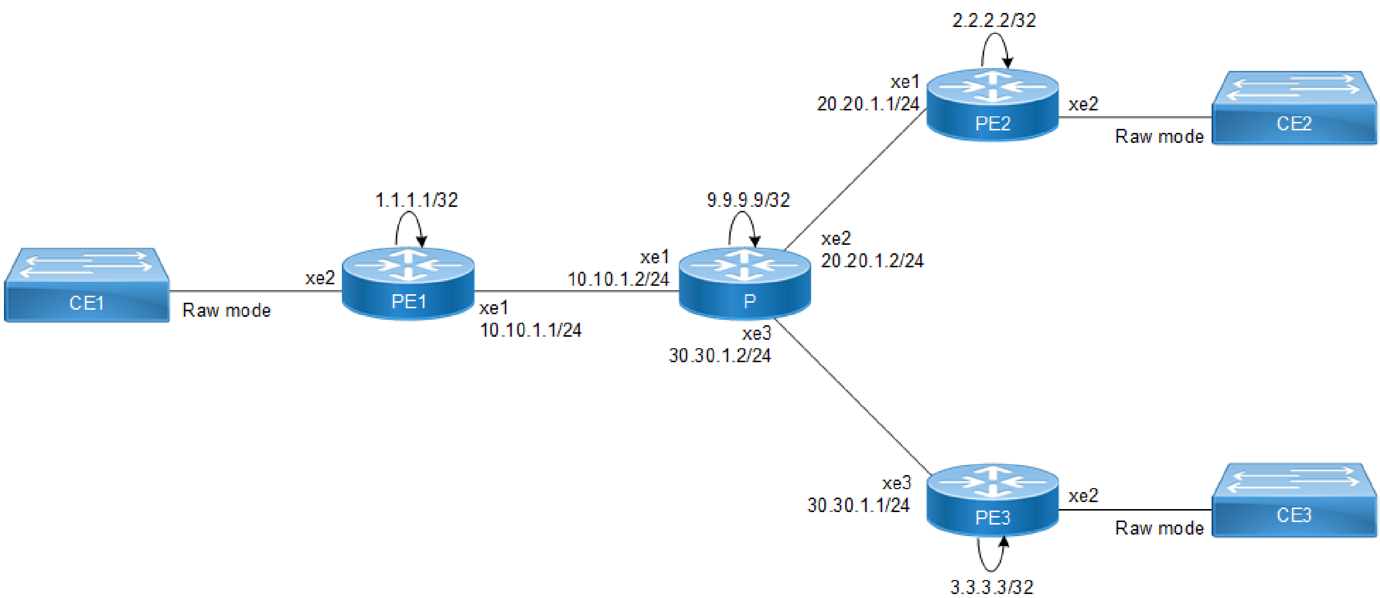

Figure 3-17: VPLS Per Peer VPLS Type Signaling

Configuration

The VPLS BGPSignaling feature enables you to use BGP as the control plane protocol for both auto discovery and signaling in accordance with RFC 4761

PE1 Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
PE1(config)#configure terminal
PE1(config)#interface lo
PE1(config-if)#ip address 1.1.1.1/32 secondary
PE1(config-if)#exit
PE1(config)#interface xe1
PE1(config-if)#ip address 10.10.1.1/24
PE1(config-if)#no shutdown
PE1(config-if)#exit
PE1(config)#router ospf 100
PE1(config-router)#network 10.10.1.0/24 area 0
PE1(config-router)#network 1.1.1.1/32 area 0
PE1(config-router)#exit
PE1(config)#router ldp
PE1(config-router)# router-id 1.1.1.1
```

```
PE1(config-router)#transport-address ipv4 1.1.1.1
PE1(config-router)#targeted-peer ipv4 2.2.2.2
PE1(config-router-targeted-peer)#exit
PE1(config-router)#targeted-peer ipv4 3.3.3.3
PE1(config-router-targeted-peer)#exit
PE1(config-router)#exit
PE1(config)#interface xe1
PE1(config-if)#label-switching
PE1(config-if)#enable-ldp ipv4
PE1(config-if)#exit
PE1(config)#mpls vpls VPLS1 100
PE1(config-vpls)#signaling ldp
PE1(config-vpls-sig)#vpls-peer 2.2.2.2 vpls-type vlan
PE1(config-vpls-sig)#vpls-peer 3.3.3.3 vpls-type ethernet
PE1(config-vpls-sig)#exit-signaling
PE1(config-vpls)#exit
PE1(config)#service-template st1
PE1(config-svc)#exit
PE1(config)#interface xe2
PE1(config-if)#switchport
PE1(config-if)mpls-vpls VPLS1 service-template st1
PE1(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE1(config-if-vpls)#exit
PE1(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE1(config)#commit
PE1(config)#copy running-config startup-config
```

P Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
P(config)#configure terminal
P(config)#interface lo
P(config-if)#ip address 9.9.9.9/32 secondary
P(config-if)#exit
P(config)#interface xe1
P(config-if)#ip address 10.10.1.2/24
P(config-if)#exit
P(config)#interface xe2
P(config-if)#ip address 20.20.1.2/24
P(config-if)#exit
P(config)#interface xe3
P(config-if)#ip address 30.30.1.2/24
P(config-if)#exit
P(config)#router ospf 100
P(config-router)#network 10.10.1.0/24 area 0
P(config-router)#network 20.20.1.0/24 area 0
P(config-router)#network 30.30.1.0/24 area 0
P(config-router)#network 9.9.9.9/32 area 0
```

```
P(config-router)#exit
P(config)#router ldp
P(config-router)#router-id 9.9.9.9
P(config-router)#transport-address ipv4 9.9.9.9
P(config-router-targeted-peer)#exit
P(config-router)#exit
P(config)#interface xe1
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
P(congig-if)#exit
P(config)#interface xe2
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
P(congig-if)#exit
P(config)#interface xe3
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
```

2. To exit the configuration, execute the following command.

```
P(config-if)exit
```

3. To save the configuration, execute the following command.

```
P(config)#commit
P(config)#copy running-config startup-config
```

PE2 Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
PE2(config)#configure terminal
PE2(config)#interface lo
PE2(config-if)#ip address 2.2.2.2/32 secondary
PE2(config-if)#exit
PE2(config)#interface xe1
PE2(config-if)#ip address 20.20.1.1/24
PE2(config-if)#no shutdown
PE2(config-if)#exit
PE2(config)#router ospf 100
PE2(config-router)#network 20.20.1.0/24 area 0
PE2(config-router)#network 2.2.2.2/32 area 0
PE2(config-router)#exit
PE2(config)#router ldp
PE2(config-router)#router-id 2.2.2.2
PE2(config-router)#transport-address ipv4 2.2.2.2
PE2(config-router)#targeted-peer ipv4 1.1.1.1
PE2(config-router-targeted-peer)#exit
PE2(config-router)#targeted-peer ipv4 3.3.3.3
PE2(config-router-targeted-peer)#exit
PE2(config-router)#exit
PE2(config)#interface xe1
PE2(config-if)#label-switching
PE2(config-if)#enable-ldp ipv4
PE2(config-if)#exit
```

```
PE2(config)#mpls vpls VPLS1 100
PE2(config-vpls)#signaling ldp
PE2(config-vpls-sig)#vpls-peer 2.2.2.2 vpls-type vlan
PE2(config-vpls-sig)#vpls-peer 3.3.3.3 vpls-type ethernet
PE2(config-vpls-sig)#exit-signaling
PE2(config-vpls)#exit
PE2(config)#service-template st1
PE2(config-svc)#exit
PE2(config)#interface xe2
PE2(config-if)#switchport
PE2(config-if)mpls-vpls VPLS1 service-template st1
PE2(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE2(config-if-vpls)#exit
PE2(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE2(config)#commit
PE2(config)#copy running-config startup-config
```

PE3 Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
PE3(config)#configure terminal
PE3(config)#interface lo
PE3(config-if)#ip address 3.3.3.3/32 secondary
PE3(config-if)#exit
PE3(config)#interface xe1
PE3(config-if)#ip address 30.30.1.1/24
PE3(config-if)#no shutdown
PE3(config-if)#exit
PE3(config)#router ospf 100
PE3(config-router)#network 30.30.1.0/24 area 0
PE3(config-router)#network 3.3.3.3/32 area 0
PE3(config-router)#exit
PE3(config)#router ldp
PE3(config-router)#router-id 3.3.3.3
PE3(config-router)#transport-address ipv4 3.3.3.3
PE3(config-router)#targeted-peer ipv4 1.1.1.1
PE3(config-router-targeted-peer)#exit
PE3(config-router)#targeted-peer ipv4 2.2.2.2
PE3(config-router-targeted-peer)#exit
PE3(config-router)#exit
PE3(config)#interface xe1
PE3(config-if)#label-switching
PE3(config-if)#enable-ldp ipv4
PE3(config-if)#exit
PE3(config)#mpls vpls VPLS1 100
PE3(config-vpls)#signaling ldp
PE3(config-vpls-sig)#vpls-peer 2.2.2.2 vpls-type vlan
PE3(config-vpls-sig)#vpls-peer 3.3.3.3 vpls-type ethernet
```

```
PE3(config-vpls-sig)#exit-signaling
PE3(config-vpls)#exit
PE3(config)#service-template st1
PE3(config-svc)#exit
PE3(config)#interface xe2
PE3(config-if)#switchport
PE3(config-if)mpls-vpls VPLS1 service-template st1
PE3(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE3(config-if-vpls)#exit
PE3(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE3(config)#commit
PE3(config)#copy running-config startup-config
```

Validation

Use this command to validate the Per peer VPLS-type signaling.

VPLS - Tunnel-ID

Overview

Virtual Private LAN Service (VPLS) is a Layer 2 VPN technology that allows geographically dispersed sites to share an Ethernet broadcast domain by connecting them through a service provider's MPLS network. This effectively creates a single, bridged Ethernet LAN across multiple sites.

VPLS with Tunnel-IDs provides a robust solution for extending Ethernet LAN services over a wide area network. The use of Tunnel-IDs ensures efficient and reliable delivery of Ethernet frames across the MPLS core, enabling service providers to offer high-quality, scalable, and flexible VPN services to their customers.

Feature Characteristics

Tunnel-IDs in VPLS are essential for efficient and reliable operation due to their unique identification, support for scalability, dynamic allocation by protocols like LDP or BGP, and compatibility with various signaling methods. They enable precise traffic engineering and load balancing, enhance resilience through fast reroute mechanisms and redundancy, and improve security with traffic isolation and access control. Additionally, Tunnel-IDs facilitate network management and monitoring by providing visibility into network paths and performance metrics, and they ensure compatibility with existing infrastructure for seamless integration of new services.

The examples show the minimum configuration required for enabling a VPLS Tunnel-ID between PE1, PE2, and PE3.

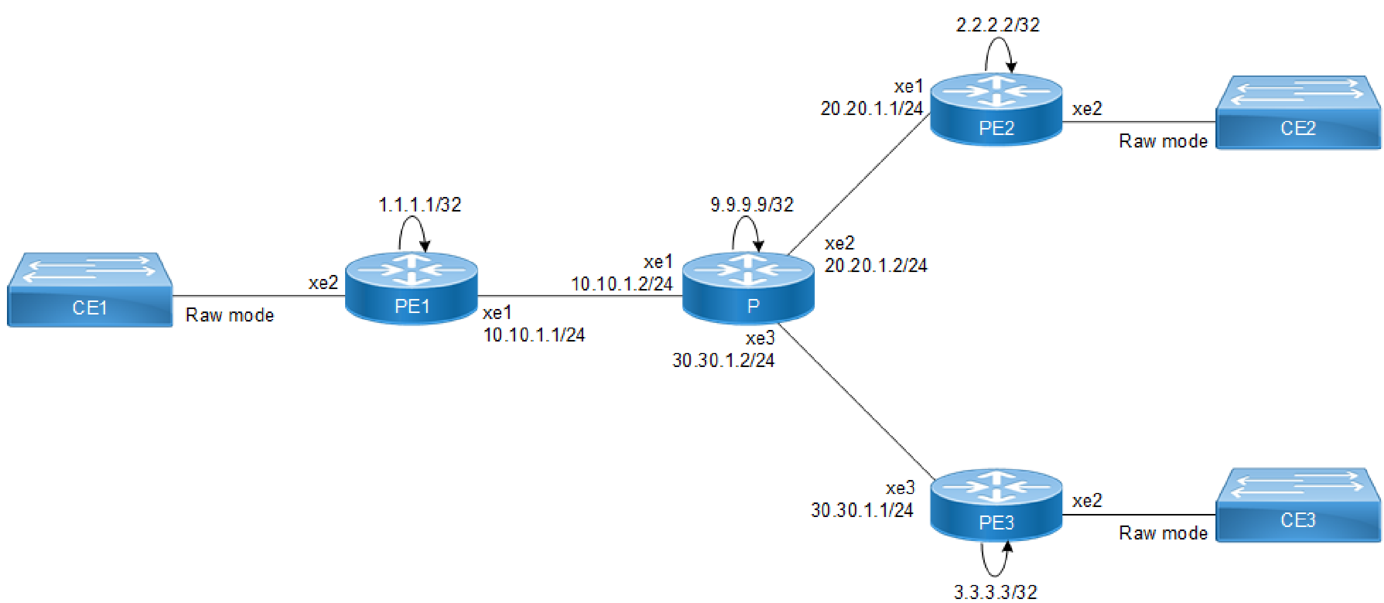

Figure 3-18: VPLS Tunnel-ID

Configuration

The VPLS Tunnel-ID feature enables you to use BGP as the control plane protocol for both auto discovery and signaling in accordance with RFC 4761

PE1 Configuration

1. To enable the VPLS-Tunnel-ID, execute the following command in the config mode

```
PE1(config)#configure terminal
```

```
PE1(config)#interface lo
PE1(config-if)#ip address 1.1.1.1/32 secondary
PE1(config-if)#exit
PE1(config)#interface xe1
PE1(config-if)#ip address 10.10.1.1/24
PE1(config-if)#no shutdown
PE1(config-if)#exit
PE1(config)#router ospf 100
PE1(config-router)#network 10.10.1.0/24 area 0
PE1(config-router)#network 1.1.1.1/32 area 0
PE1(config-router)#exit
PE1(config)#router ldp
PE1(config-router)# router-id 1.1.1.1
PE1(config-router)#transport-address ipv4 1.1.1.1
PE1(config-router)#targeted-peer ipv4 2.2.2.2
PE1(config-router-targeted-peer)#exit
PE1(config-router)#targeted-peer ipv4 3.3.3.3
PE1(config-router-targeted-peer)#exit
PE1(config-router)#exit
PE1(config)#interface xe1
PE1(config-if)#label-switching
PE1(config-if)#enable-ldp ipv4
PE1(config-if)#exit
PE1(config)#mpls vpls VPLS1 100
PE1(config-vpls)#signaling ldp
PE1(config-vpls-sig) #mpls ftn-entry tunnel-id 100 2.2.2.2/32 200 10.10.1.2 xe1 
primary
PE1(config-vpls-sig) #mpls ftn-entry tunnel-id 300 3.3.3.3/32 400 10.10.1.2 xe1 
primary
PE1(config-vpls-sig)#exit-signaling
PE1(config-vpls)#exit
PE1(config)#service-template st1
PE1(config-svc)#exit
PE1(config)#interface xe2
PE1(config-if)#switchport
PE1(config-if)mpls-vpls VPLS1 service-template st1
PE1(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE1(config-if-vpls)#exit
PE1(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE1(config)#commit
PE1(config)#copy running-config startup-config
```

P Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
P(config)#configure terminal
P(config)#interface lo
P(config-if)#ip address 9.9.9.9/32 secondary
```

```
P(config-if)#exit
P(config)#interface xe1
P(config-if)#ip address 10.10.1.2/24
P(config-if)#exit
P(config)#interface xe2
P(config-if)#ip address 20.20.1.2/24
P(config-if)#exit
P(config)#interface xe3
P(config-if)#ip address 30.30.1.2/24
P(config-if)#exit
P(config)#router ospf 100
P(config-router)#network 10.10.1.0/24 area 0
P(config-router)#network 20.20.1.0/24 area 0
P(config-router)#network 30.30.1.0/24 area 0
P(config-router)#network 9.9.9.9/32 area 0
P(config-router)#exit
P(config)#router ldp
P(config-router)#router-id 9.9.9.9
P(config-router)#transport-address ipv4 9.9.9.9
P(config-router-targeted-peer)#exit
P(config-router)#exit
P(config)#interface xe1
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
P(congig-if)#exit
P(config)#interface xe2
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
P(congig-if)#exit
P(config)#interface xe3
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
```

2. To exit the configuration, execute the following command.

```
P(config-if)exit
```

3. To save the configuration, execute the following command.

```
P(config)#commit
P(config)#copy running-config startup-config
```

PE2 Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
PE2(config)#configure terminal
PE2(config)#interface lo
PE2(config-if)#ip address 2.2.2.2/32 secondary
PE2(config-if)#exit
PE2(config)#interface xe1
PE2(config-if)#ip address 20.20.1.1/24
PE2(config-if)#no shutdown
PE2(config-if)#exit
PE2(config)#router ospf 100
```

```
PE2(config-router)#network 20.20.1.0/24 area 0
PE2(config-router)#network 2.2.2.2/32 area 0
PE2(config-router)#exit
PE2(config)#router ldp
PE2(config-router)#router-id 2.2.2.2
PE2(config-router)#transport-address ipv4 2.2.2.2
PE2(config-router)#targeted-peer ipv4 1.1.1.1
PE2(config-router-targeted-peer)#exit
PE2(config-router)#targeted-peer ipv4 3.3.3.3
PE2(config-router-targeted-peer)#exit
PE2(config-router)#exit
PE2(config)#interface xe1
PE2(config-if)#label-switching
PE2(config-if)#enable-ldp ipv4
PE2(config-if)#exit
PE2(config)#mpls vpls VPLS1 100
PE2(config-vpls)#signaling ldp
PE2(config-vpls-sig) #mpls ftn-entry tunnel-id 200 1.1.1.1/32 100 20.20.1.2 xe16 primary
PE2(config-vpls-sig)#exit-signaling
PE2(config-vpls)#exit
PE2(config)#service-template st1
PE2(config-svc)#exit
PE2(config)#interface xe2
PE2(config-if)#switchport
PE2(config-if)mpls-vpls VPLS1 service-template st1
PE2(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE2(config-if-vpls)#exit
PE2(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE2(config)#commit
PE2(config)#copy running-config startup-config
```

PE3 Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
PE3(config)#configure terminal
PE3(config)#interface lo
PE3(config-if)#ip address 3.3.3.3/32 secondary
PE3(config-if)#exit
PE3(config)#interface xe1
PE3(config-if)#ip address 30.30.1.1/24
PE3(config-if)#no shutdown
PE3(config-if)#exit
PE3(config)#router ospf 100
PE3(config-router)#network 30.30.1.0/24 area 0
PE3(config-router)#network 3.3.3.3/32 area 0
PE3(config-router)#exit
PE3(config)#router ldp
```

```
PE3(config-router)#router-id 3.3.3.3
PE3(config-router)#transport-address ipv4 3.3.3.3
PE3(config-router)#targeted-peer ipv4 1.1.1.1
PE3(config-router-targeted-peer)#exit
PE3(config-router)#targeted-peer ipv4 2.2.2.2
PE3(config-router-targeted-peer)#exit
PE3(config-router)#exit
PE3(config)#interface xe1
PE3(config-if)#label-switching
PE3(config-if)#enable-ldp ipv4
PE3(config-if)#exit
PE3(config)#mpls vpls VPLS1 100
PE3(config-vpls)#signaling ldp
PE3(config-vpls-sig) #mpls ftn-entry tunnel-id 400 1.1.1.1/32 300 30.30.1.2 xe21 
primary
PE3(config-vpls-sig)#exit-signaling
PE3(config-vpls)#exit
PE3(config)#service-template st1
PE3(config-svc)#exit
PE3(config)#interface xe2
PE3(config-if)#switchport
PE3(config-if)mpls-vpls VPLS1 service-template st1
PE3(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE3(config-if-vpls)#exit
PE3(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE3(config)#commit
PE3(config)#copy running-config startup-config
```

Validation

Use this command to validate the Per peer VPLS-type signaling.

VPLS - Tunnel-Name

Overview

Virtual Private LAN Service (VPLS) is a Layer 2 VPN technology that allows geographically dispersed sites to share a common Ethernet broadcast domain, functioning as if they were all connected to the same LAN. This setup enables any-to-any communication between sites, providing the appearance of a single, cohesive LAN across multiple locations.

VPLS - Tunnel-Name is a configuration element within a VPLS network that is used to identify and manage MPLS tunnels. When configuring a VPLS instance on a network device, the Tunnel-Name is assigned to each MPLS tunnel. This can typically be done in the device’s CLI under the VPLS configuration mode.

The "VPLS - Tunnel-Name" is a vital element in the configuration and management of VPLS networks. By providing unique identifiers for MPLS tunnels, it enhances the organization, management, and troubleshooting of VPLS instances, ultimately leading to more efficient and reliable network operations.

Feature Characteristics

The VPLS - Tunnel-Name feature in a VPLS network enhances functionality, manageability, and efficiency by providing unique identification for MPLS tunnels, simplifying network management, and improving troubleshooting. It allows granular control over configurations and policies, supports scalability and future network expansions, enhances security through controlled access and traffic isolation, and ensures redundancy and reliability by managing backup tunnels effectively. Additionally, it streamlines operations and reduces configuration errors, making it an essential tool for maintaining robust and reliable VPLS networks.

The examples show the minimum configuration required for enabling a VPLS Tunnel-Name between PE1, PE2, and PE3.

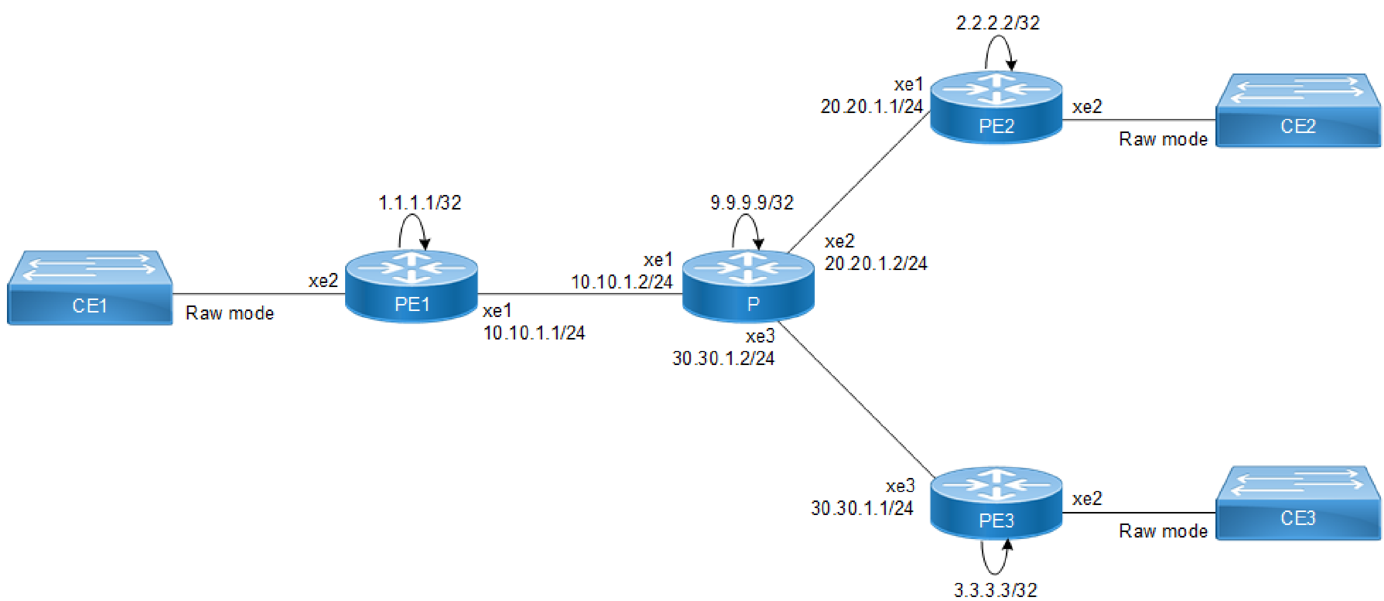

Figure 3-19: VPLS Tunnel-Name

Configuration

The VPLS Tunnel-Name feature enables you to use BGP as the control plane protocol for both auto discovery and signaling in accordance with RFC 4761

PE1 Configuration

1. To enable the per peer VPLS-Tunnel-Name, execute the following command in the config mode

```
PE1(config)#configure terminal
PE1(config)#interface lo
PE1(config-if)#ip address 1.1.1.1/32 secondary
PE1(config-if)#exit
PE1(config)#interface xe1
PE1(config-if)#ip address 10.10.1.1/24
PE1(config-if)#no shutdown
PE1(config-if)#exit
PE1(config)#router ospf 100
PE1(config-router)#network 10.10.1.0/24 area 0
PE1(config-router)#network 1.1.1.1/32 area 0
PE1(config-router)#exit
```

```
PE1(config)#router ldp
PE1(config-router)# router-id 1.1.1.1
PE1(config-router)#transport-address ipv4 1.1.1.1
PE1(config-router)#targeted-peer ipv4 2.2.2.2
PE1(config-router-targeted-peer)#exit
PE1(config-router)#targeted-peer ipv4 3.3.3.3
PE1(config-router-targeted-peer)#exit
PE1(config-router)#exit
PE1(config)#interface xe1
PE1(config-if)#label-switching
PE1(config-if)#enable-ldp ipv4
PE1(config-if)#exit
PE1(config)#mpls vpls VPLS1 100
PE1(config-vpls)#signaling ldp
PE1(config-vpls-sig)#vpls-peer 2.2.2.2 vpls-type vlan
PE1(config-vpls-sig)#vpls-peer 3.3.3.3 vpls-type ethernet
PE1(config-vpls-sig)#exit-signaling
PE1(config-vpls)#exit
PE1(config)#service-template st1
PE1(config-svc)#exit
PE1(config)#interface xe2
PE1(config-if)#switchport
PE1(config-if)mpls-vpls VPLS1 service-template st1
PE1(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE1(config-if-vpls)#exit
PE1(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE1(config)#commit
PE1(config)#copy running-config startup-config
```

P Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
P(config)#configure terminal
P(config)#interface lo
P(config-if)#ip address 9.9.9.9/32 secondary
P(config-if)#exit
P(config)#interface xe1
P(config-if)#ip address 10.10.1.2/24
P(config-if)#exit
P(config)#interface xe2
P(config-if)#ip address 20.20.1.2/24
P(config-if)#exit
P(config)#interface xe3
P(config-if)#ip address 30.30.1.2/24
P(config-if)#exit
P(config)#router ospf 100
P(config-router)#network 10.10.1.0/24 area 0
P(config-router)#network 20.20.1.0/24 area 0
```

```
P(config-router)#network 30.30.1.0/24 area 0
P(config-router)#network 9.9.9.9/32 area 0
P(config-router)#exit
P(config)#router ldp
P(config-router)#router-id 9.9.9.9
P(config-router)#transport-address ipv4 9.9.9.9
P(config-router-targeted-peer)#exit
P(config-router)#exit
P(config)#interface xe1
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
P(congig-if)#exit
P(config)#interface xe2
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
P(congig-if)#exit
P(config)#interface xe3
P(config-if)#label-switching
P(config-if)#enable-ldp ipv4
```

2. To exit the configuration, execute the following command.

```
P(config-if)exit
```

3. To save the configuration, execute the following command.

```
P(config)#commit
P(config)#copy running-config startup-config
```

PE2 Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
PE2(config)#configure terminal
PE2(config)#interface lo
PE2(config-if)#ip address 2.2.2.2/32 secondary
PE2(config-if)#exit
PE2(config)#interface xe1
PE2(config-if)#ip address 20.20.1.1/24
PE2(config-if)#no shutdown
PE2(config-if)#exit
PE2(config)#router ospf 100
PE2(config-router)#network 20.20.1.0/24 area 0
PE2(config-router)#network 2.2.2.2/32 area 0
PE2(config-router)#exit
PE2(config)#router ldp
PE2(config-router)#router-id 2.2.2.2
PE2(config-router)#transport-address ipv4 2.2.2.2
PE2(config-router)#targeted-peer ipv4 1.1.1.1
PE2(config-router-targeted-peer)#exit
PE2(config-router)#targeted-peer ipv4 3.3.3.3
PE2(config-router-targeted-peer)#exit
PE2(config-router)#exit
PE2(config)#interface xe1
PE2(config-if)#label-switching
```

```
PE2(config-if)#enable-ldp ipv4
PE2(config-if)#exit
PE2(config)#mpls vpls VPLS1 100
PE2(config-vpls)#signaling ldp
PE2(config-vpls-sig)#vpls-peer 2.2.2.2 vpls-type vlan
PE2(config-vpls-sig)#vpls-peer 3.3.3.3 vpls-type ethernet
PE2(config-vpls-sig)#exit-signaling
PE2(config-vpls)#exit
PE2(config)#service-template st1
PE2(config-svc)#exit
PE2(config)#interface xe2
PE2(config-if)#switchport
PE2(config-if)mpls-vpls VPLS1 service-template st1
PE2(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE2(config-if-vpls)#exit
PE2(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE2(config)#commit
PE2(config)#copy running-config startup-config
```

PE3 Configuration

1. To enable the per peer VPLS-type signaling, execute the following command in the config mode

```
PE3(config)#configure terminal
PE3(config)#interface lo
PE3(config-if)#ip address 3.3.3.3/32 secondary
PE3(config-if)#exit
PE3(config)#interface xe1
PE3(config-if)#ip address 30.30.1.1/24
PE3(config-if)#no shutdown
PE3(config-if)#exit
PE3(config)#router ospf 100
PE3(config-router)#network 30.30.1.0/24 area 0
PE3(config-router)#network 3.3.3.3/32 area 0
PE3(config-router)#exit
PE3(config)#router ldp
PE3(config-router)#router-id 3.3.3.3
PE3(config-router)#transport-address ipv4 3.3.3.3
PE3(config-router)#targeted-peer ipv4 1.1.1.1
PE3(config-router-targeted-peer)#exit
PE3(config-router)#targeted-peer ipv4 2.2.2.2
PE3(config-router-targeted-peer)#exit
PE3(config-router)#exit
PE3(config)#interface xe1
PE3(config-if)#label-switching
PE3(config-if)#enable-ldp ipv4
PE3(config-if)#exit
PE3(config)#mpls vpls VPLS1 100
PE3(config-vpls)#signaling ldp
```

```
PE3(config-vpls-sig)#vpls-peer 2.2.2.2 vpls-type vlan
PE3(config-vpls-sig)#vpls-peer 3.3.3.3 vpls-type ethernet
PE3(config-vpls-sig)#exit-signaling
PE3(config-vpls)#exit
PE3(config)#service-template st1
PE3(config-svc)#exit
PE3(config)#interface xe2
PE3(config-if)#switchport
PE3(config-if)mpls-vpls VPLS1 service-template st1
PE3(config-if-vpls)#split-horizon group access1
```

2. To exit the configuration, execute the following command.

```
PE3(config-if-vpls)#exit
PE3(config-if)exit
```

3. To save the configuration, execute the following command.

```
PE3(config)#commit
PE3(config)#copy running-config startup-config
```

Validation

Use this command to validate the Per peer VPLS-type signaling.

CHAPTER 4 Static VPLS Configuration

This chapter includes step-by-step configurations for Static VPLS. It also contains an overview of the concepts of Static VPLS.

Overview

Virtual Private LAN Service (VPLS) is a way to provide Ethernet-based multipoint-to-multipoint communication over IP-MPLS networks. It allows geographically-dispersed sites to share an Ethernet broadcast domain by connecting sites through pseudowires. A set of Martini circuits is grouped by a common VPLS identifier to achieve this service objective.

A pseudowire (PW) consists of a pair of point-to-point, single-hop unidirectional LSPs in opposite directions, each identified by a PW label, also called a Virtual Connection (VC) label.

The Label Distribution Protocol (LDP) is used to signal constituent VCs, and the service provider may use either LDP or RSVP-TE or add static provisioning to set up LSP tunnels to transport data through virtual circuits.

The VPLS identifier is exchanged with the labels, so that both PWs can be linked and be associated with a particular VPLS instance.

Configure Static VPLS

In the following examples, VPLS (v1) is configured on PE-2 with Static VPLS-Peers PE-1 and PE-3 using static LSPs.

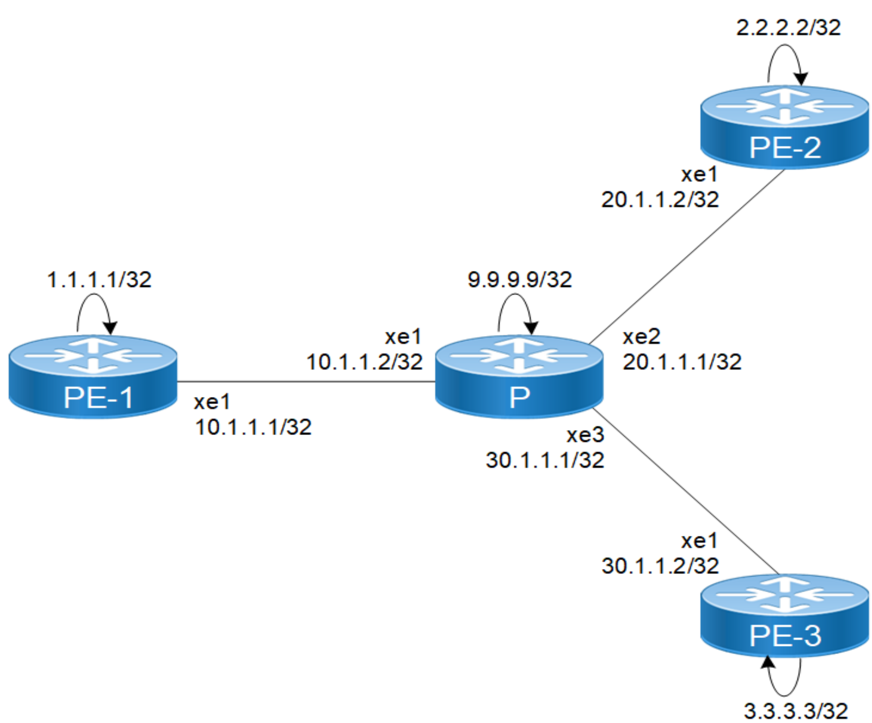

Figure 4-20: Static Virtual Private LAN Service Topology

PE-1

`#configure terminal`	Enter configure mode.
`(config)#mpls ftn-entry tunnel-id 11 2.2.2.2/32 102 10.10.1.2 xe1 primary`	Configure MPLS FTN entry for the creation of a static LSP to PE-2.
`(config)#mpls ftn-entry tunnel-id 22 3.3.3.3/32 103 10.10.1.2 xe1 primary`	Configure MPLS FTN entry for the creation of a static LSP to PE-3.
`(config)#mpls ilm-entry 201 pop`	Configure MPLS ILM entry for the creation of a static LSP to PE-2.
`(config)#mpls ilm-entry 301 pop`	Configure MPLS ILM entry for the creation of a static LSP to PE-3.
`(config)#mpls vpls v1 100`	Configure VPLS `v1` with ID `100` on PE-1.
`(config-vpls)#vpls-peer 2.2.2.2 tunnel-id 11 manual`	Configure PE-2 as a manual VPLS peer using the static LSP tunnel ID `11`
`(config-vpls)#vpls-peer 3.3.3.3 tunnel-id 22 manual`	Configure PE-3 as a manual VPLS peer using the static LSP tunnel ID `22`.
`(config-vpls)#exit`	Exit Configure VPLS mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.1.1/24`	Configure IP address for the interface.
`(config-if)#label-switching`	Enable label switching capability on the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure IP address for the loopback interface.
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 100`	Configure the routing process and specify the routing `process ID(100)`.
`(config-router)#ospf router-id 1.1.1.1`	Configure OSPF router id same as loopback IP address
`(config-router)#transport-address ipv4 1.1.1.1`	Configure transport address as loopback address.
`(config-router)#targeted-peer ipv4 3.3.3.3`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#network 10.10.1.0/24 area 0`	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
`(config-router)#exit`	Exit router mode
`(config)#service-template st1`	Template configuration
`(config-svc)#exit`	Exit service template mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#switchport`	Switch to Layer-2 mode.
`(config-if)#mpls-vpls v1 service-template st1`	Bind the VPLS to the Access Interface.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if-vpls)#exit`	Exit VPLS attachment-circuit mode
`(config-if)#exit`	Exit interface mode.

(config)#vpls fib-entry 100 peer 2.2.2.2 1000 xe1 2000	Configure VPLS FIB entry for VPLS peer PE-2.
(config)#vpls fib-entry 100 peer 3.3.3.3 3000 xe1 4000	Configure VPLS FIB entry for VPLS peer PE-3.
(config)#commit	Commit the transaction.

P

#configure terminal	Enter configure mode
(config)#interface lo	Enter interface mode
(config-if)#ip address 9.9.9.9/32 secondary	Configure IP address for the loopback interface.
(config-if)#exit	Exit interface mode
(config)#interface xe1	Specify the interface to be configured.
(config-if)#ip address 10.10.1.2/24	Configure IP address for the interface.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe2	Enter interface mode
(config-if)#ip address 20.20.1.2/24	Configure IP address for the interface.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe3	Enter interface mode
(config-if)#ip address 30.30.1.2/24	Configure IP address for the interface.
(config-if)#label-switching	Enable label switching capability on the interface.
(config-if)#exit	Exit interface mode
(config)#router ospf 100	Configure the routing process and specify the routing process ID(100).
(config-router)#ospf router-id 9.9.9.9	Configure OSPF router id same as loopback IP address
(config-router)#transport-address ipv4 9.9.9.9	Configure transport address as loopback address.
(config-router)#network 10.1.1.0/24 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the Interface address.
(config-router)#network 20.20.1.0/24 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the Interface address.
(config-router)#network 30.30.1.0/24 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the Interface address.
(config-router)#network 9.9.9.9/32 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the Interface address.
(config)#commit	Commit the transaction.

PE-2

#configure terminal	Enter Configure mode
(config)#mpls ftn-entry tunnel-id 11 1.1.1.1/32 201 20.20.1.2 xe1 primary	Configure MPLS FTN entry for the creation of a static LSP to PE-1, and designate xe1 as primary.

`(config)#mpls ftn-entry tunnel-id 33 3.3.3.3/32 301 20.20.1.2 xe1 primary`	Configure MPLS FTN entry for the creation of a static LSP to PE-3, and designate xe1 as primary.
`(config)#mpls ilm-entry 102 pop`	Configure MPLS ILM entry for the creation of a static LSP to PE-1.
`(config)#mpls ilm-entry 302 pop`	Configure MPLS ILM entry for the creation of a static LSP to PE-3
`(config)#mpls vpls v1 100`	Configure VPLS v1 with ID 100 on PE-2.
`(config-vpls)#vpls-peer 1.1.1.1 tunnel-id 11 manual`	Configure PE-1 as a manual VPLS peer using static LSP tunnel ID
`(config-vpls)#vpls-peer 3.3.3.3 tunnel-id 33 manual`	Configure PE-3 as a manual VPLS peer using static LSP tunnel ID
`(config-vpls)#exit`	Exit Configure VPLS mode
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 2.2.2.2/32 secondary`	Configure IP address for the loopback interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe1`	Enter interface mode
`(config-if)#ip address 20.20.1.1/24`	Configure IP address for the interface
`(config-if)#label-switching`	Configure label switching
`(config-if)#exit`	Exit interface mode
`(config)#service-template st1`	Template configuration
`(config-svc)#exit`	Exit service template mode
`(config)#interface xe2`	Enter interface mode
`(config-if)#switchport`	Make port Layer-2
`(config-if)#mpls-vpls v1 service-template st1`	Bind the VPLS to the Access Interface
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if-vpls)#exit`	Exit VPLS attachment-circuit mode
`(config-if)#exit`	Exit interface mode
`(config)#vpls fib-entry 100 peer 1.1.1.1 2500 xe1 1500`	Configure VPLS FIB entry for VPLS peer PE-1.
`(config)#vpls fib-entry 100 peer 3.3.3.3 3500 xe1 4500`	Configure VPLS FIB entry for VPLS peer PE-3.
`(config)#router ospf 100`	Configure the routing process and specify the routing process ID(100).
`(config-router)#ospf router-id 2.2.2.2`	Configure OSPF router id same as loopback IP address
`(config-router)#transport-address ipv4 2.2.2.2`	Configure transport address as loopback address.
`(config-router)#targeted-peer ipv4 1.1.1.1`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#network 20.20.1.0/24 area 0`	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
`(config-router)#network 2.2.2.2/32 area 0`	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
`(config-router)#exit`	Exit router mode
`(config)#commit`	Commit the transaction.

PE-3

`#configure terminal`	Enter Configure mode
`(config)#mpls ftn-entry tunnel-id 11 1.1.1.1/32 301 30.30.1.2 xe1 primary`	Configure MPLS FTN entry for the creation of a static LSP to PE-1.
`(config)#mpls ftn-entry tunnel-id 22 2.2.2.2/32 302 30.30.1.2 xe1 primary`	Configure MPLS FTN entry for the creation of a static LSP to PE-2.
`(config)#mpls ilm-entry 103 pop`	Configure MPLS ILM entry for the creation of a static LSP to PE-1.
`(config)#mpls ilm-entry 203 pop`	Configure MPLS ILM entry for the creation of a static LSP to PE-2.
`(config)#mpls vpls v1 100`	Configure VPLS v1 with ID 100 on PE-3.
`(config-vpls)#vpls-peer 1.1.1.1 tunnel-id 11 manual`	Configure PE-1 as a manual VPLS peer using static LSP tunnel ID 11.
`(config-vpls)#vpls-peer 2.2.2.2 tunnel-id 22 manual`	Configure PE-2 as a manual VPLS peer using static LSP tunnel ID 22.
`(config-vpls)#exit`	Exit Configure VPLS mode
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 3.3.3.3/32 secondary`	Configure IP address for the loopback interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe1`	Enter interface mode
`(config-if)#ip address 30.30.1.1/24`	Configure IP address for the interface
`(config-if)#label-switching`	Configure label switching
`(config-if)#exit`	Exit interface mode
`(config)#service-template st1`	Template configuration
`(config-svc)#exit`	Exit service template mode
`(config)#interface xe2`	Enter interface mode
`(config-if)#switchport`	Switch to Layer-2 mode
`(config-if)#mpls-vpls v1 service-template st1`	Bind the VPLS to the Access Interface.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if-vpls)#exit`	Exit VPLS attachment-circuit mode
`(config-if)#exit`	Exit interface mode.
`(config)#vpls fib-entry 100 peer 1.1.1.1 4000 xe1 3000`	Configure VPLS FIB entry for VPLS peer PE-1.
`(config)#vpls fib-entry 100 peer 2.2.2.2 4500 xe1 3500`	Configure VPLS FIB entry for VPLS peer PE-2.
`(config)#router ospf 100`	Configure the routing process and specify the routing process ID(100).
`(config-router)#ospf router-id 3.3.3.3`	Configure OSPF router id same as loopback IP address
`(config-router)#transport-address ipv4 3.3.3.3`	Configure transport address as loopback address.
`(config-router)#targeted-peer ipv4 1.1.1.1`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode

(config-router)#network 30.30.1.0/24 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
(config-router)#network 3.3.3.3/32 area 0	Define the interface address on which the OSPF runs and associate an area ID(0) with the interface address.
(config)#commit	Commit the transaction.

Validation

Enter the commands listed in the sections below to confirm the configurations.

Verify VPLS Session on PE-1

```
#show mpls vpls detail

   Tunnel-Id: 11
   3.3.3.3 (Up)
   Tunnel-Id: 22
PE1#
```

Verify VPLS Peer

```
#show mpls vpls mesh
VPLS-ID    Peer Addr         Tunnel-Label  In-Label    Network-Intf   Out-Label  Lkps/St    PW-INDEX SIG-Protocol  Status
100        2.2.2.2           102           1000          xe1           2000       2/Up       1          STATIC        Active
100        3.3.3.3           103           3000          xe1           4000       2/Up       2          STATIC        Active
PE1#
```

Remove Configurations

Follow these steps to remove VPLS peer and VPLS spoke FIB entries from router PE-2.

#configure terminal	Enter configure mode
(config)#no vpls fib-entry 100 peer 1.1.1.1	Remove VPLS FIB for VPLS peer PE-1.

`(config)#no vpls fib-entry 100 peer 3.3.3.3`	Remove VPLS FIB for VPLS peer PE-3.
`(config)#exit`	Exit Configure mode

CHAPTER 5 BGP-VPLS Configuration

This chapter contains configurations for VPLS with Border Gateway Protocol Signaling.

Overview

Virtual Private LAN Service (VPLS) is a way to provide Ethernet-based multipoint-to-multipoint communication over IP/MPLS networks. It allows geographically-dispersed sites to share an Ethernet broadcast domain by connecting sites through pseudowires. A set of Kompella circuits is grouped by a common VPLS identifier to achieve this service objective.

A Pseudowire (PW) consists of a pair of point-to-point, single-hop unidirectional LSPs in opposite directions, each identified by a PW label, also called a Virtual Connection (VC) label.

The Border Gateway Protocol (BGP) is used to signaling VCs and for auto-discovery of neighbors. A service provider may use either LDP or RSVP-TE or add static provisioning to set up LSP tunnels to transport data through virtual circuits.

The VPLS identifier is exchanged with the labels, so that both PWs can be linked and associated with a particular VPLS instance.

Note: In Inter-AS, OcNOS accepts information from any other AS but the same VPN-ID/VPLS-ID (*: VPLS-ID). OcNOS does not have explicit RD/RT (import/export) support for BGP VPLS. RD/RT are automatically generated based on the configured BGP AS number and VPN-ID/VPLS-ID as (AS-number: VPN-ID).

Topology

The diagram depicts the topology for the configuration examples that follow.

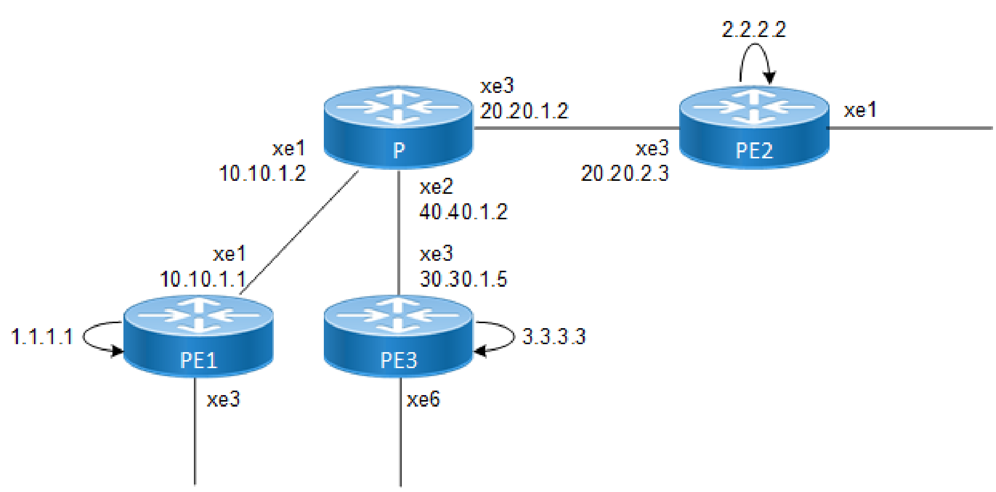

Figure 5-21: Sample Topology for VPLS with BGP Signaling

BGP-VPLS Configuration

PE-1

#configure terminal	Enter configuration mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#ip address 10.10.1.1/24	Set the IP address of the interface to 10.10.1.1/24.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback address.
(config-if)#ip address 1.1.1.1/32 secondary	Set the IP address of the loopback interface to 1.1.1.1/32.
(config-if)#exit	Exit interface mode
(config)#mpls vpls v1 25	Create an instance of VPLS, and switch to the VPLS command mode, by specifying the VPLS name (v1) and VPLS ID (25).
(config-vpls)#vpls-mtu 1400	Configure the MTU for the VPLS. (Default is 1500; range is <576 - 65535>.
(config-vpls)#signaling bgp	Enter the Signaling bgp mode for BGP VPLS.
(config-vpls-sig)#ve-id 1	Configure VE ID, which is mandatory for BGP VPLS, otherwise, Signaling does not take place. VE ID should be unique per VPLS instance.
(config-vpls-sig)#exit	Exit is a mandatory command for signaling BGP configuration to take affect. If exit is not given BGP signaling does not take place.
(config-vpls)#exit	Exit VPLS mode.
(config)#service-template v1	Configure service template
(config-svc)#match all	Configure the match condition
(config-svc)#exit	Exit interface mode
(config)#interface xe3	Specify the interface (xe3) to be configured.
(config-if)#switchport	Switch to Layer-2 mode. (VPLS can be bound only on the Layer-2 port.)
(config-if)#mpls-vpls v1 service-template v1	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#commit	Commit the transaction.

Note: VE IDs range is from 1 to 64. Administrator should configure the VE ID’s accordingly in their Network.

PE1 - LDP

#configure terminal	Enter configuration mode
(config)#router ldp	Enter Router LDP mode.

(config-router)#router-id 1.1.1.1	Configure the router ID.
(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address for a label space by binding the address to a loopback address.
(config-router)#exit	Exit Router mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe1.
(config-if)#commit	Commit the transaction.

PE1 - OSPF

#configure terminal	Enter configure mode
(config)#router ospf 1	Configure the OSPF routing process, and specify the process ID.
(config-router)#network 10.10.1.0/24 area 0	Define the interfaces on which OSPF runs, and specify the backbone area 0.
(config-router)#network 1.1.1.1/32 area 0	
(config-router)#commit	Commit the transaction.

PE1 - BGP

#configure terminal	Enter configuration mode.
(config)#router bgp 100	Enter BGP Configure mode.
(config-router)#neighbor 2.2.2.2 remote-as 100	Configure PE2 as an iBGP peer.
(config-router)#neighbor 2.2.2.2 update-source lo	Update the source as loopback for iBGP peering with the remote PE2 router.
(config-router)#neighbor 3.3.3.3 remote-as 100	Configure PE3 as an iBGP peer.
(config-router)#neighbor 3.3.3.3 update-source lo	Update the source as loopback for iBGP peering with the remote PE3 router
(config-router)#address-family l2vpn vpls	Configure address-family L2VPN VPLS.
(config-router-af)#neighbor 2.2.2.2 activate	Activate PE2 in the VPLS address family.
(config-router-af)#neighbor 3.3.3.3 activate	Activate PE3 in the VPLS address family.
(config-router-af)#commit	Commit the transaction.

PE2

#configure terminal	Enter configuration mode.
(config)#interface xe3	Specify the interface (xe3 to be configured.
(config-if)#ip address 20.20.1.3/24	Set the IP address of the interface to 20.20.1.3/24.
(config-if)#label-switching	Enable label switching on interface xe3.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback address.

`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to `2.2.2.2/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#mpls vpls v1 25`	Create an instance of VPLS, and switch to the VPLS command mode, by specifying the VPLS name (v1) and VPLS ID (`25`).
`(config-vpls)#vpls-mtu 1400`	Configure the MTU for the VPLS. (Default is 1500; range is <576 - 65535>.)
`(config-vpls)#signaling bgp`	Enter the Signaling BGP mode for BGP VPLS.
`(config-vpls-sig)#ve-id 2`	Configure ve-id, which is mandatory for BGP VPLS. Without a ve-id Signaling does not take place. VE ID should be unique per VPLS instance.
`(config-vpls-sig)#exit`	Exit is a mandatory command for signaling BGP configuration to take affect. If exit is done, BGP signaling does not take place.
`(config-vpls)#exit`	Exit VPLS mode.
`(config)#service-template v1`	Configure service template
`(config-svc)#match all`	Configure the match condition
`(config-svc)#exit`	Exit interface mode
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#switchport`	Switch to Layer-2 mode. (VPLS can only be bound on the Layer-2 port.)
`(config-if)#mpls-vpls v1 service-template v1`	Bind the VPLS to the Access Interface.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if-vpls)#exit`	Exit VPLS attachment-circuit mode
`(config-if)#commit`	Commit the transaction.

Note: VE ID’s range is from 1 to 64. Administrator should configure the VE ID’s accordingly in their Network.

PE2 - LDP

`#configure terminal`	Enter configuration mode
`(config)#router ldp`	Enter Router LDP mode.
`(config-router)#router-id 2.2.2.2`	Configure the router ID.
`(config-router)#transport-address ipv4 2.2.2.2`	Configure the transport address for a label space by binding the address to a loopback address.
`(config-router)#exit`	Exit Router mode.
`(config)#interface xe3`	Specify the interface `(xe3)` to be configured.
`(config-if)#enable-ldp ipv4`	Enable LDP on the specified interface (`xe3`).
`(config-if)#commit`	Commit the transaction.

PE2 - OSPF

`#configure terminal`	Enter configuration mode.
`(config)#router ospf 1`	Configure the OSPF routing process, and specify the process ID.
`(config-router)#network 20.20.1.0/24 area 0`	Define the interfaces on which OSPF runs, and specify the backbone area 0.
`(config-router)#network 2.2.2.2/32 area 0`	
`(config-router)#commit`	Commit the transaction.

PE2 - BGP

`#configure terminal`	Enter configuration mode.
`(config)#router bgp 100`	Enter BGP router mode.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Configure PE1 as an iBGP peer.
`(config-router)#neighbor 1.1.1.1 update-source lo`	Update the source as loopback for iBGP peering with the remote PE1 router.
`(config-router)#neighbor 3.3.3.3 remote-as 100`	Configure PE3 as an iBGP peer.
`(config-router)#neighbor 3.3.3.3 update-source lo`	Update the source as loopback for iBGP peering with the remote PE3 router.
`(config-router)#address-family l2vpn vpls`	Configure address-family L2VPN VPLS.
`(config-router-af)#neighbor 1.1.1.1 activate`	Activate PE1 in the VPLS address family.
`(config-router-af)#neighbor 3.3.3.3 activate`	Activate PE3 in the VPLS address family.
`(config-router-af)#commit`	Commit the transaction.

PE3

`#configure terminal`	Enter configuration mode.
`(config)#interface xe3`	Specify the interface `(xe3)` to be configured.
`(config-if)#ip address 40.40.1.5/24`	Set the IP address of the interface to `40.40.1.5/24`.
`(config-if)#label-switching`	Enable label switching on interface `xe3`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Specify the loopback address.
`(config-if)#ip address 3.3.3.3/32 secondary`	Set the IP address of the loopback interface to `3.3.3.3/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#mpls vpls v1 25`	Create an instance of VPLS, and switch to the VPLS command mode, by indicating the VPLS name (v1) and VPLS ID (`25`).
`(config-vpls)#vpls-mtu 1400`	Configure the MTU for the VPLS. Default is 1500; range is <576 - 65535>.
`(config-vpls)#signaling bgp`	Enter the Signaling BGP mode, for BGP VPLS.

`(config-vpls-sig)#ve-id 3`	Configure ve-id, which is mandatory for BGP VPLS. Without a ve-id Signaling does not take place. VE ID should be unique per VPLS instance
`(config-vpls-sig)#exit`	Exit is a mandatory command for signaling BGP configuration to take affect. If exit is not done, BGP signaling does not take place.
`(config-vpls)#exit`	Exit VPLS mode.
`(config)#service-template v1`	Configure service template
`(config-svc)#match all`	Configure the match condition
`(config-svc)#exit`	Exit interface mode
`(config)#interface xe6`	Specify the interface `(xe6)` to be configured.
`(config-if)#switchport`	Switch to Layer-2 mode. (VPLS can be bound only on the Layer-2 port.)
`(config-if)#mpls-vpls v1 service-template v1`	Bind the VPLS to the Access Interface.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config-if-vpls)#exit`	Exit VPLS attachment-circuit mode
`(config-if)#commit`	Commit the transaction.

Note: VE ID’s range is from 1 to 64. Administrator should configure the VE ID’s accordingly in their Network.

PE3 - LDP

`#configure terminal`	Enter configuration mode.
`(config)#router ldp`	Enter Router LDP mode.
`(config-router)#router-id 3.3.3.3`	Configure the router ID.
`(config-router)#transport-address ipv4 3.3.3.3`	Configure the transport address for a label space by binding the address to a loopback address.
`(config-router)#exit`	Exit Router mode.
`(config)#interface xe3`	Specify the interface `(xe3)` to be configured.
`(config-if)#enable-ldp ipv4`	Enable LDP on the interface.
`(config-if)#commit`	Commit the transaction.

PE3 - OSPF

`#configure terminal`	Enter configuration mode.
`(config)#router ospf 1`	Configure the OSPF routing process, and specify the process ID.
`(config-router)#network 40.40.1.0/24 area 0`	Define the interfaces on which OSPF runs, and specify the backbone area 0.
`(config-router)#network 3.3.3.3/32 area 0`	
`(config-router)#commit`	Commit the transaction.

PE3 - BGP

`#configure terminal`	Enter configuration mode.
`(config)#router bgp 100`	Enter BGP Router mode.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Configure PE1 as an iBGP peer.
`(config-router)#neighbor 1.1.1.1 update-source lo`	Update the source as loopback for iBGP peering with the remote PE1 router.
`(config-router)#neighbor 2.2.2.2 remote-as 100`	Configure PE2 as an iBGP peer.
`(config-router)#neighbor 2.2.2.2 update-source lo`	Update the source as loopback for iBGP peering with the remote PE2 router.
`(config-router)#address-family l2vpn vpls`	Configure address-family L2VPN VPLS.
`(config-router-af)#neighbor 1.1.1.1 activate`	Activate PE1 in the VPLS address family.
`(config-router-af)#neighbor 2.2.2.2 activate`	Activate PE2 in the VPLS address family.
`(config-router-af)#commit`	Commit the transaction.

P

`#configure terminal`	Enter configuration mode.
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#ip address 10.10.1.2/24`	Set the IP address of the interface to `10.10.1.2/24`.
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Specify the interface `(xe2)` to be configured.
`(config-if)#ip address 40.40.1.2/24`	Set the IP address of the interface to `40.40.1.2/24`.
`(config-if)#label-switching`	Enable label switching on interface `xe2`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe3`	Specify the interface `(xe3)` to be configured.
`(config-if)#ip address 20.20.1.2/24`	Set the IP address of the loopback interface to `20.20.1.2/24`.
`(config-if)#label-switching`	Enable label switching on interface `xe3`.
`(config-if)#commit`	Commit the transaction.

P - LDP

`#configure terminal`	Enter configuration mode.
`(config)#router ldp`	Enter Router LDP mode.
`(config-router)#exit`	Exit Router mode.
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#enable-ldp ipv4`	Enable LDP on the interface.

(config-if)#exit	Exit interface mode.
(config)#interface xe2	Specify the interface (xe2) to be configured.
(config-if)#enable-ldp ipv4	Enable LDP on the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe3	Specify the interface (xe3) to be configured.
(config-if)#enable-ldp ipv4	Enable LDP on the interface.
(config-if)#commit	Commit the transaction.

P - OSPF

#configure terminal	Enter configuration mode.
(config)#router ospf 1	Configure the OSPF routing process, and specify the process ID.
(config-router)#network 10.10.1.0/24 area 0	Define the interfaces on which OSPF runs, and specify the backbone area 0.
(config-router)#network 20.20.1.0/24 area 0	
(config-router)#network 40.40.1.0/24 area 0	
(config-router)#commit	Commit the transaction.

Note: BGP L2VPN VPLS Route Reflector is not supported.

CHAPTER 6 Static VPLS Service Mapping Configuration

Overview

This chapter includes step-by-step configurations for static VPLS. It also contains an overview of the concepts of Static VPLS. Virtual Private LAN Service (VPLS) is a way to provide Ethernet-based multipoint-to-multipoint communication over IP- MPLS networks. It allows geographically-dispersed sites to share an Ethernet broadcast domain by connecting sites through pseudowires.

Topology

The diagram depicts the topology for the configuration examples that follow.

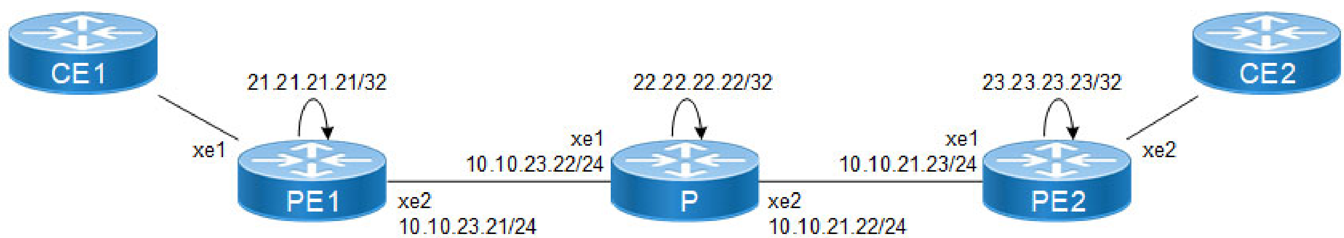

Figure 6-22: Static VPLS service mapping

Configuration

PE1: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter interface mode for the loopback interface.
`(config-if)#ip address 21.21.21.21/32 secondary`	Configure IP address on loopback interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 21.21.21.21`	Set the router ID to IP address 21.21.21.21
`(config-router)#transport-address ipv4 21.21.21.21`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 23.23.23.23`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode

PE1: Interface Configuration

`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#ip address 10.10.23.21/24`	Configure IP address on the interface.
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on xe2
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

PE1: Static VPLS Configuration

`(config)#mpls vpls v1 25`	Enter VPLS configuration mode
`(config-vpls)#vpls-peer 23.23.23.23 tunnel-id 1 manual`	Configure VPLS peer
`(config-vpls)#exit`	Exit from VPLS configuration mode
`(config)#mpls vpls v2 26`	Enter VPLS configuration mode
`(config-vpls)#vpls-peer 23.23.23.23 tunnel-id 1 manual`	Configure VPLS peer
`(config-vpls)#exit`	Exit from VPLS configuration mode
`(config)#mpls vpls v3 27`	Enter VPLS configuration mode
`(config-vpls)#vpls-peer 23.23.23.23 tunnel-id 1 manual`	Configure VPLS peer
`(config-vpls)#exit`	Exit from VPLS configuration and configuration mode
`(config)#mpls vpls v4 28`	Enter VPLS configuration mode
`(config-vpls)#vpls-peer 23.23.23.23 tunnel-id 1 manual`	Configure VPLS peer
`(config-vpls)#commit`	Commit the candidate configuration to the running configuration.
`(config-vpls)#end`	Exit from VPLS configuration and configuration mode

PE1: FIB Entry Configuration

`#configure terminal`	Enter configuration mode.
`(config)#mpls ftn-entry tunnel-id 1 23.23.23.23/32 100 10.10.23.22 xe2 primary`	Configure Static LSP FTN entry
`(config)#mpls ilm-entry 250 pop`	Configure ILM entry
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#exit`	Exit

P: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter interface mode for the loopback interface.

`(config-if)#ip address 22.22.22.22/32 secondary`	Configure IP address on loopback interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 22.22.22.22`	Set the router ID to IP address 22.22.22.22
`(config-router)#transport-address ipv4 22.22.22.22`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit router mode

P: Interface Configuration

`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 10.10.23.22/24`	Configure IP address on the interface.
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#ip address 10.10.21.22/24`	Configure IP address on the interface.
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

P: FIB Entry Configuration

`#configure terminal`	Enter configure mode.
`(config)#mpls ilm-entry 100 swap 200 xe2 10.10.21.23 23.23.23.23/32`	Configure Static LSP ILM entry
`(config)#mpls ilm-entry 150 swap 250 xe1 10.10.23.21 21.21.21.21/32`	Configure ILM entry
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#exit`	Exit

PE2: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter interface mode for the loopback interface.
`(config-if)#ip address 23.23.23.23/32 secondary`	Configure IP address on loopback interface.

`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 23.23.23.23`	Set the router ID to IP address 23.23.23.23
`(config-router)#transport-address ipv4 23.23.23.23`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 21.21.21.21`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode

PE2: Interface Configuration

`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 10.10.21.23/24`	Configure IP address on the interface.
`(config-if)#label-switching`	Enable label switching on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

PE2: Static VPLS Configuration

`(config)#mpls vpls v1 25`	Enter VPLS configuration mode
`(config-vpls)#vpls-peer 21.21.21.21 tunnel-id 1 manual`	Configure VPLS peer
`(config-vpls)#exit`	Exit from VPLS configuration mode
`(config)#mpls vpls v2 26`	Enter VPLS configuration mode
`(config-vpls)#vpls-peer 21.21.21.21 tunnel-id 1 manual`	Configure VPLS peer
`(config-vpls)#exit`	Exit from VPLS configuration mode
`(config)#mpls vpls v3 27`	Enter VPLS configuration mode
`(config-vpls)#vpls-peer 21.21.21.21 tunnel-id 1 manual`	Configure VPLS peer
`(config-vpls)#exit`	Exit from VPLS configuration and configuration mode
`(config)#mpls vpls v4 28`	Enter VPLS configuration mode
`(config-vpls)#vpls-peer 21.21.21.21 tunnel-id 1 manual`	Configure VPLS peer
`(config-vpls)#commit`	Commit the candidate configuration to the running configuration.
`(config-vpls)#exit`	Exit from VPLS configuration and configuration mode

PE2: FIB Entry Configuration

(config)#mpls ftn-entry tunnel-id 1 21.21.21.21/32 150 10.10.21.22 xe1	Configure Static LSP FTN entry
(config)#mpls ilm-entry 200 pop	Configure ILM entry
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#exit	Exit

Static VPLS Service Mapping Configuration

PE1: POP

#configure terminal	Enter configuration mode.
(config)#service-template template1	Template configuration
(config-svc)#match double-tag outer-vlan 2024 inner-vlan 2023	Match criteria under template configuration
(config-svc)#rewrite ingress pop outgoing-tpid dot1.q	Action to be performed for the match.
(config-svc)#commit	Commit the candidate configuration to the running configuration.
(config-svc)#exit	Exit template configuration mode

PE1: XLATE

(config)#service-template template2	Template configuration
(config-svc)#match double-tag outer-vlan 2030 inner-vlan 2024	Match criteria under template configuration
(config-svc)#rewrite ingress translate 2026 outgoing-tpid dot1.q	Action to be performed for the match
(config-svc)#commit	Commit the candidate configuration to the running configuration.
(config-svc)#exit	Exit template configuration mode

PE1: PUSH

(config)#service-template template3	Template configuration
(config-svc)#match outer-vlan 500	Match criteria under template configuration
(config-svc)#rewrite ingress push 300	Action to be performed for the default match .
(config-svc)#commit	Commit the candidate configuration to the running configuration.
(config-svc)#exit	Exit template configuration mode

PE1: PUSH-service-template with multiple match support

This is to validate the multiple match criteria support in a service template. When multiple match statements are configured only rewrite push is supported, rewrite translate and pop are not supported.

`(config)#service-template template4`	Template configuration
`(config-svc)# match outer-vlan 700`	Allow VLAN 700 traffic on this VC
`(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200`	Allow double tag match with s+c tags
`(config-svc)# match untagged`	Allow untagged traffic
`(config-svc)# rewrite ingress push 300`	Push Action performed for service template
`(config-svc)#commit`	Commit the candidate configuration to the running configuration.
`(config-svc)#exit`	Exit configure SVC mode

PE1: Access port Configuration

`(config)#interface xe1`	Enter the Interface mode for ethernet1.
`(config-if)#switchport`	Configure interface as L2 interface
`(config-if)#mpls-vpls v1 service-template template1`	Configure template configuration.
`(config_if_vpls)#exit`	Exit Interface VPLS mode and return to Interface mode.
`(config-if)#mpls-vpls v2 service-template template2`	Configure template configuration.
`(config_if_vpls)#exit`	Exit Interface VPLS mode and return to Interface mode.
`(config-if)#mpls-vpls v3 service-template template3`	Configure template configuration.
`(config_if_vpls)#exit`	Exit Interface VPLS mode and return to Interface mode.
`(config-if)#mpls-vpls v4 service-template template4`	Configure template configuration.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config_if_vpls)#exit`	Exit Interface mode and return to Configure mode.
`(config_if)#exit`	Exit interface mode.
`(config)#vpls fib-entry 25 peer 23.23.23.23 1001 xe2 2001`	Configure access port
`(config)#vpls fib-entry 26 peer 23.23.23.23 1002 xe2 2002`	Configure access port
`(config)#vpls fib-entry 27 peer 23.23.23.23 1003 xe2 2003`	Configure access port
`(config)#vpls fib-entry 28 peer 23.23.23.23 1004 xe2 2004`	Configure access port
`(config)#commit`	Commit the candidate configuration to the running configuration.

PE2: POP

`#configure terminal`	Configure mode
`(config)#service-template template1`	Template configuration
`(config-svc)#match double-tag outer-vlan 2024 inner-vlan 2023`	Match criteria under template configuration
`(config-svc)#rewrite ingress pop outgoing-tpid dot1.q`	Action to be performed for the match.
`(config-svc)#commit`	Commit the candidate configuration to the running configuration.
`(config-svc)#exit`	Exit template configuration mode

PE2: XLATE

`(config)#service-template template2`	Template configuration
`(config-svc)#match double-tag outer-vlan 2030 inner-vlan 2024`	Match criteria under template configuration
`(config-svc)#rewrite ingress translate 2026 outgoing-tpid dot1.q`	Action to be performed for the match
`(config-svc)#commit`	Commit the candidate configuration to the running configuration.
`(config-svc)#exit`	Exit template configuration mode

PE2: PUSH

`(config)#service-template template3`	Template configuration
`(config-svc)#match outer-vlan 500`	Match criteria under template configuration
`(config-svc)#rewrite ingress push 300`	Action to be performed for the default match.
`(config-svc)#commit`	Commit the candidate configuration to the running configuration.
`(config-svc)#exit`	Exit template configuration mode

PE2: PUSH-service-template with multiple match

This is to validate the multiple match criteria support in a service template. When multiple match statements are configured only rewrite push is supported, rewrite translate and pop are not supported.

`(config)#service-template template4`	Template configuration
`(config-svc)# match outer-vlan 700`	Allow VLAN 700 traffic on this VC
`(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200`	Allow double tag match with s+c tags
`(config-svc)# match untagged`	Allow untagged traffic
`(config-svc)# rewrite ingress push 300`	Push Action performed for service template
`(config-svc)#commit`	Commit the candidate configuration to the running configuration.
`(config-svc)#exit`	Exit configure SVC mode

PE2: Access port Configuration

`(config)#interface xe2`	Enter the Interface mode for ethernet2.
`(config-if)#switchport`	Configure interface as L2 interface
`(config-if)#mpls-vpls v1 service-template template1`	Configure template configuration.
`(config_if_vpls)#exit`	Exit Interface VPLS mode and return to Interface mode.
`(config-if)#mpls-vpls v2 service-template template2`	Configure template configuration.
`(config_if_vpls)#exit`	Exit Interface VPLS mode and return to Interface mode.
`(config-if)#mpls-vpls v3 service-template template3`	Configure template configuration.
`(config_if_vpls)#exit`	Exit Interface VPLS mode and return to Interface mode.
`(config-if)#mpls-vpls v4 service-template template4`	Configure template configuration.
`(config-if-vpls)#split-horizon group access1`	Configure split-horizon group on VPLS
`(config_if_vpls)#exit`	Exit Interface VPLS mode and return to Interface mode.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#vpls fib-entry 25 peer 21.21.21.21 2001 xe1 1001`	Configure access port
`(config)#vpls fib-entry 26 peer 21.21.21.21 2002 xe1 1002`	Configure access port
`(config)#vpls fib-entry 27 peer 21.21.21.21 2003 xe1 1003`	Configure access port
`(config)#vpls fib-entry 28 peer 21.21.21.21 2004 xe1 1004`	Configure access port
`(config)#commit`	Commit the candidate configuration to the running configuration.

CHAPTER 7 LDP-VPLS Service Mapping Configuration

Overview

This chapter includes step-by-step configurations for LDP VPLS. It also contains an overview of the concepts of LDP VPLS. Virtual Private LAN Service (VPLS) is a way to provide Ethernet-based multipoint-to-multipoint communication over IP- MPLS networks. It allows geographically-dispersed sites to share an Ethernet broadcast domain by connecting sites through pseudowires.

Topology

The diagram depicts the topology for the configuration examples that follow.

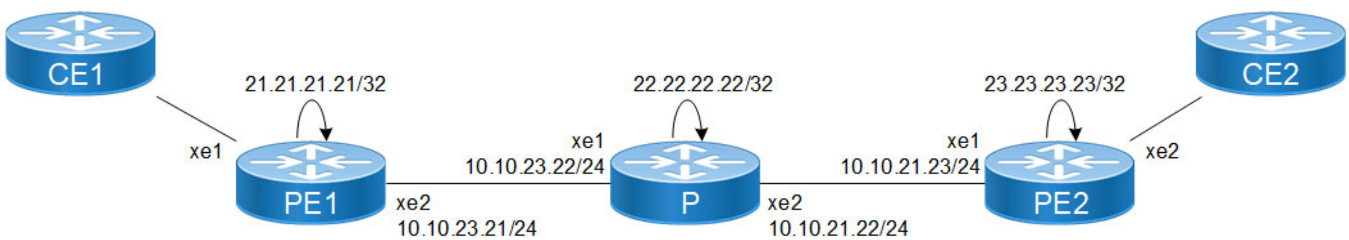

Figure 7-23: LDP-VPLS service mapping

Configuration

PE1: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 21.21.21.21/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

PE1: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 21.21.21.21`	Set the router ID to IP address 21.21.21.21
`(config-router)#transport-address ipv4 21.21.21.21`	Configure transport address
`(config-router)#targeted-peer ipv4 23.23.23.23`	Configure targeted peer
`(config-router)#targeted-peer #commit`	Commit candidate configuration to the running configuration
`(config-router-targeted-peer)#end`	Exit from router target peer and LDP mode

PE1: Interface Configuration

`#configure terminal`	Enter configuration mode
`(config)#interface xe2`	Enter the Interface mode for xe2.
`(config-if)# ip address 10.10.23.21/24`	Configure IP address on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)# label-switching`	Enable label switching on the interface.
`(config-if)#exit`	Exit interface mode

PE1: OSPF Configuration

`(config)#router ospf 100`	Enter the Router OSPF mode.
`(config-router)#ospf router-id 21.21.21.21`	Router-id configurations
`(config-router)#network 21.21.21.21/32 area 0`	Advertise loopback address in OSPF.
`(config-router)#network 10.10.23.0/24 area 0`	Advertise network address in OSPF.
`(config-router)#exit`	Exit Router OSPF mode and return to Configure mode.

PE1: LDP VPLS Configuration

`(config)#mpls vpls v1 25`	Enter VPLS config mode
`(config-vpls)#service-tpid dot1.ad`	Service tp-id configuration.
`(config-vpls)#signaling ldp`	Define Signaling as LDP
`(config-vpls-sig)#vpls-type vlan`	Type VLAN configuration for VPLS
`(config-vpls-sig)#vpls-peer 23.23.23.23`	Configure VPLS Peer
`(config-vpls-sig)#exit-signaling`	Exit Signaling LDP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#mpls vpls v2 26`	Enter VPLS config mode
`(config-vpls)#service-tpid dot1.ad`	Service tp-id configuration.
`(config-vpls)#signaling ldp`	Define Signaling as LDP
`(config-vpls-sig)#vpls-type vlan`	Type VLAN configuration for VPLS
`(config-vpls-sig)#vpls-peer 23.23.23.23`	Configure VPLS Peer
`(config-vpls-sig)#exit-signaling`	Exit Signaling LDP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#mpls vpls v3 27`	Enter VPLS config mode
`(config-vpls)#signaling ldp`	Define Signaling as LDP
`(config-vpls-sig)#vpls-type vlan`	Type VLAN configuration for VPLS
`(config-vpls-sig)#vpls-peer 23.23.23.23`	Configure VPLS Peer
`(config-vpls-sig)# exit-signaling`	Exit Signaling LDP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#mpls vpls v4 28`	Enter VPLS config mode
`(config-vpls)#signaling ldp`	Define Signaling as LDP
`(config-vpls-sig)#vpls-type vlan`	Type VLAN configuration for VPLS

(config-vpls-sig)#vpls-peer 23.23.23.23	Configure VPLS Peer
(config-vpls-sig)# exit-signaling	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#commit	Commit candidate configuration to the running configuration

P: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 22.22.22.22/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

P: Global LDP

(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 22.22.22.22	Set the router ID to IP address 22.22.22.22
(config-router)#transport-address ipv4 22.22.22.22	Configure transport address
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router-targeted-peer)#end	Exit from router target peer and LDP mode

P: Interface Configuration

#configure terminal	Enter configuration mode
(config)#interface xe1	Enter the Interface mode for xe1.
(config-if)# ip address 10.10.23.22/24	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)# label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe2	Enter the Interface mode for xe2.
(config-if)# ip address 10.10.21.22/24	Configure IP address on the interface.
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)# label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode

P: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#network 22.22.22.22/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 10.10.23.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 10.10.21.0/24 area 0	Advertise network address in OSPF.

`(config-router)#exit`	Exit Router OSPF mode and return to Configure mode.
`(config)#commit`	Commit candidate configuration to the running configuration

PE2: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 23.23.23.23/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

PE2: Global LDP

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 23.23.23.23`	Set the router ID to IP address 23.23.23.23
`(config-router)#transport-address ipv4 23.23.23.23`	Configure transport address
`(config-router)#targeted-peer ipv4 21.21.21.21`	Configure targeted peer
`(config-router-targeted-peer)#commit`	Commit candidate configuration to the running configuration
`(config-router-targeted-peer)#end`	Exit from router target peer and LDP mode

PE2: Interface Configuration

`#configure terminal`	Enter configuration mode.
`(config)#interface xe1`	Enter the Interface mode for xe1.
`(config-if)# ip address 10.10.21.23/24`	Configure IP address on the interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)# label-switching`	Enable label switching on the interface.
`(config-if)#exit`	Exit interface mode

PE2: OSPF Configuration

`(config)#router ospf 100`	Enter the Router OSPF mode.
`(config-router)#network 23.23.23.23/32 area 0`	Advertise loopback address in OSPF.
`(config-router)#network 10.10.21.0/24 area 0`	Advertise network address in OSPF.
`(config-router)#exit`	Exit Router OSPF mode and return to Configure mode.

PE2: LDP VPLS Configuration

`(config)#mpls vpls v1 25`	Enter VPLS config mode
`(config-vpls)#service-tpid dot1.ad`	Service tp-id configuration.
`(config-vpls)#signaling ldp`	Define Signaling as LDP

(config-vpls-sig)#vpls-type vlan	Type VLAN configuration for VPLS
(config-vpls-sig)#vpls-peer 21.21.21.21	Configure VPLS Peer
(config-vpls-sig)# exit-signaling	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#mpls vpls v2 26	Enter VPLS config mode
(config-vpls)#service-tpid dot1.ad	Service tp-id configuration.
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type vlan	Type VLAN configuration for VPLS
(config-vpls-sig)#vpls-peer 21.21.21.21	Configure VPLS Peer
(config-vpls-sig)# exit-signaling	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#mpls vpls v3 27	Enter VPLS config mode
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type vlan	Type VLAN configuration for VPLS
(config-vpls-sig)#vpls-peer 21.21.21.21	Configure VPLS Peer
(config-vpls-sig)# exit-signaling	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#mpls vpls v4 28	Enter VPLS config mode
(config-vpls)#signaling ldp	Define Signaling as LDP
(config-vpls-sig)#vpls-type vlan	Type VLAN configuration for VPLS
(config-vpls-sig)#vpls-peer 21.21.21.21	Configure VPLS Peer
(config-vpls-sig)# exit-signaling	Exit Signaling LDP mode
(config-vpls)#exit	Exit VPLS mode
(config)#commit	Commit candidate configuration to the running configuration

LDP VPLS Service Mapping Configuration

PE1: POP

#configure terminal	Configure mode
(config)#service-template template1	Template configuration
(config-svc)# match double-tag outer-vlan 2024 inner-vlan 2023	Match criteria under template configuration
(config-svc)# rewrite ingress pop outgoing-tpid dot1.q	Action to be performed for the match.
(config-svc)#exit	Exit template configuration mode

PE1: XLATE

(config)#service-template template2	Template configuration
(config-svc)# match double-tag outer-vlan 2030 inner-vlan 2024	Match criteria under template configuration
(config-svc)# rewrite ingress translate 2026 outgoing-tpid dot1.q	Action to be performed for the match
(config-svc)#exit	Exit template configuration mode

PE1: PUSH

(config)#service-template template3	Template configuration
(config-svc)# match outer-vlan 500	Match criteria under template configuration
(config-svc)# rewrite ingress push 300	Action to be performed for the default match.
(config-svc)#exit	Exit template configuration mode

PE1: PUSH-service-template with multiple match support

This is to validate the multiple match criteria support in a service template. When multiple match statements are configured only rewrite push is supported, rewrite translate and pop are not supported.

(config)#service-template template4	Template configuration
(config-svc)# match outer-vlan 700	Allow VLAN 700 traffic on this VC
(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200	Allow double tag match with s+c tags
(config-svc)# match untagged	Allow untagged traffic
(config-svc)# rewrite ingress push 300	Push Action performed for service template
(config-svc)#exit	Exit configure SVC mode

PE1: Access port Configuration

(config)#interface xe1	Enter the Interface mode for xe1.
(config-if)#switchport	Configure interface as a layer 2 port.
(config-if)#mpls-vpls v1 service-template template1	Bind the VPLS to the Access Interface.
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v2 service-template template2	Bind the VPLS to the Access Interface.
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v3 service-template template3	Bind the VPLS to the Access Interface.
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v4 service-template template4	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode

`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#commit`	Commit candidate configuration to the running configuration

PE2: POP

`#configure terminal`	Configure mode
`(config)#service-template template1`	Template configuration
`(config-svc)# match double-tag outer-vlan 2024 inner-vlan 2023`	Match criteria under template configuration
`(config-svc)# rewrite ingress pop outgoing-tpid dot1.q`	Action to be performed for the match.
`(config-svc)#exit`	Exit template configuration mode

PE2: XLATE

`(config)#service-template template2`	Template configuration
`(config-svc)# match double-tag outer-vlan 2030 inner-vlan 2024`	Match criteria under template configuration
`(config-svc)# rewrite ingress translate 2026 outgoing-tpid dot1.q`	Action to be performed for the match
`(config-svc)#exit`	Exit template configuration mode

PE2: PUSH

`(config)#service-template template3`	Template configuration
`(config-svc)# match outer-vlan 500`	Match criteria under template configuration
`(config-svc)# rewrite ingress push 300`	Action to be performed for the default match.
`(config-svc)#exit`	Exit template configuration mode

PE2: PUSH-service-template with multiple match

This is to validate the multiple match criteria support in a service template. When multiple match statements are configured only rewrite push is supported, rewrite translate and pop are not supported.

`(config)#service-template template4`	Template configuration
`(config-svc)# match outer-vlan 700`	Allow VLAN 700 traffic on this VC
`(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200`	Allow double tag match with s+c tags
`(config-svc)# match untagged`	Allow untagged traffic
`(config-svc)# rewrite ingress push 300`	Push Action performed for service template
`(config-svc)#exit`	Exit configure SVC mode

PE2: Access port Configuration

(config)#interface xe2	Enter the Interface mode for xe2.
(config-if)#switchport	Configure interface as a layer 2 port.
(config-if)#mpls-vpls v1 service-template template1	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v2 service-template template2	Bind the VPLS to the Access Interface.
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v3 service-template template3	Bind the VPLS to the Access Interface.
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v4 service-template template4	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#commit	Commit candidate configuration to the running configuration

CHAPTER 8 BGP-VPLS Service Mapping Configuration

Overview

This chapter includes step-by-step configurations for BGP VPLS. It also contains an overview of the concepts of BGP VPLS. Virtual Private LAN Service (VPLS) is a way to provide Ethernet-based multipoint-to-multipoint communication over IP- MPLS networks. It allows geographically-dispersed sites to share an Ethernet broadcast domain by connecting sites through pseudowires

Topology

The diagram depicts the topology for the configuration examples that follow.

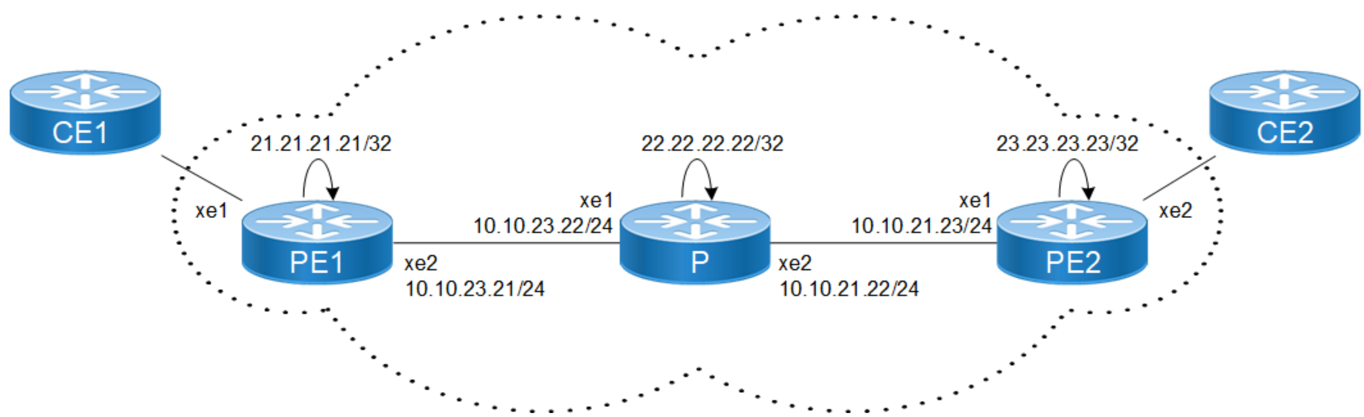

Figure 8-24: BGP-VPLS service mapping

Configuration

PE1: Loopback Interface

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 21.21.21.21/32 secondary`	Configure IP address on loopback interface.
`(config-if)#exit`	Exit interface mode

PE1: Interface Configuration

`(config)#interface xe2`	Enter the Interface mode for xe2.
`(config-if)# ip address 10.10.23.21/24`	Configure IP address on the interface.
`(config-if)#enable-rsvp`	Enable RSVP on the physical interface

© 2025 IP Infusion Inc. Proprietary

(config-if)# label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode

PE1: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#ospf router-id 21.21.21.21	Router-id configurations
(config-router)#network 21.21.21.21/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 10.10.23.0/24 area 0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.

PE1: Global RSVP

(config)#router rsvp	Enter the Router OSPF mode.
(config-router)#exit	Exit Router RSVP mode and return to Configure mode.

PE1: RSVP-Trunk Configuration

(config)#rsvp-trunk 1	Enter the Trunk configuration mode
(config-trunk)#to 23.23.23.23	Configure the destination of the Trunk
(config-trunk)#exit	Exit.Trunk configuration mode

PE1: BGP Configuration

(config)# router bgp 100	Enter the BGP configuration mode.
(config-router)#neighbor 23.23.23.23 remote-as 100	Configure neighbor
(config-router)#neighbor 23.23.23.23 update-source 21.21.21.21	Update loopback address as source
(config-router)#address-family l2vpn vpls	Enter address family mode.
(config-router-af)#neighbor 23.23.23.23 activate	Activate the neighbor.
(config-router-af)#exit	Exit address family mode.
(config-router)#exit	Exit Router BGP mode

PE1: BGP VPLS Configuration

(config)#mpls vpls v1 25	Enter VPLS config mode
(config)#service-tpid dot1.ad	Service tp-id configuration.
(config-vpls)#signaling bgp	Define Signaling as BGP
(config-vpls-sig)#ve-id 1	Configure VE-ID
(config-vpls-sig)#exit	Exit Signaling BGP mode
(config-vpls)#exit	Exit VPLS mode
(config)#mpls vpls v2 26	Enter VPLS config mode

(config)#service-tpid dot1.ad	Service tp-id configuration.
(config-vpls)#signaling bgp	Define Signaling as BGP
(config-vpls-sig)#ve-id 1	Configure VE-ID
(config-vpls-sig)#exit	Exit Signaling BGP mode
(config-vpls)#exit	Exit VPLS mode
(config)#mpls vpls v3 27	Enter VPLS config mode
(config-vpls)#signaling bgp	Define Signaling as BGP
(config-vpls-sig)#ve-id 1	Configure VE-ID
(config-vpls-sig)#exit	Exit Signaling BGP mode
(config-vpls)#exit	Exit VPLS mode
(config)#mpls vpls v4 28	Enter VPLS config mode
(config-vpls)#signaling bgp	Define Signaling as BGP
(config-vpls-sig)#ve-id 1	Configure VE-ID
(config-vpls-sig)#exit	Exit Signaling BGP mode
(config-vpls)#exit	Exit VPLS mode
(config)#commit	Commit candidate configuration to running configuration

P1: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 22.22.22.22/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

P1: Interface Configuration

(config)#interface xe1	Enter the Interface mode for xe1
(config-if)#ip address 10.10.23.22/24	Configure IP address on the interface.
(config-if)#enable-rsvp	Enable RSVP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode
(config)#interface xe2	Enter the Interface mode for xe2
(config-if)#ip address 10.10.21.22/24	Configure IP address on the interface.
(config-if)#enable-rsvp	Enable RSVP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode

P1: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#network 22.22.22.22/32 area 0	Advertise loopback address in OSPF.

(config-router)#network 10.10.23.0/24 area 0	Advertise network address in OSPF.
(config-router)#network 10.10.21.0/24 area 0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.

P1: Global RSVP

(config)#router rsvp	Enter the Router OSPF mode.
(config-router)#exit	Exit Router RSVP mode and return to Configure mode.
(config)#commit	Commit candidate configuration to running configuration

PE2: Loopback Interface

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)#ip address 23.23.23.23/32 secondary	Configure IP address on loopback interface.
(config-if)#exit	Exit interface mode

PE2: Interface Configuration

(config)#interface xe1	Enter the Interface mode for xe1
(config-if)#ip address 10.10.21.23/24	Configure IP address on the interface.
(config-if)#enable-rsvp	Enable RSVP on the physical interface
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#exit	Exit interface mode

PE2: OSPF Configuration

(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#network 23.23.23.23/32 area 0	Advertise loopback address in OSPF.
(config-router)#network 10.10.21.0/24 area 0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.

PE2: Global RSVP

(config)#router rsvp	Enter the Router OSPF mode.
(config-router)#exit	Exit Router RSVP mode and return to Configure mode.

PE2: RSVP-Trunk Configuration

(config)#rsvp-trunk 1	Enter the Trunk configuration mode
(config-trunk)#to 21.21.21.21	Configure the destination of the Trunk
(config-trunk)#exit	Exit.Trunk configuration mode

PE2: BGP Configuration

`(config)# router bgp 100`	Enter the BGP configuration mode.
`(config-router)#neighbor 21.21.21.21 remote-as 100`	Configure neighbor
`(config-router)#neighbor 21.21.21.21 update-source 23.23.23.23`	Update loopback address as source
`(config-router)#address-family l2vpn vpls`	Enter address family mode.
`(config-router-af)#neighbor 21.21.21.21 activate`	Activate the neighbor.
`(config-router-af)#exit`	Exit address family mode.
`(config-router)#exit`	Exit Router BGP mode

PE2: BGP VPLS Configuration

`(config)#mpls vpls v1 25`	Enter VPLS config mode
`(config)#service-tpid dot1.ad`	Service tp-id configuration.
`(config-vpls)#signaling bgp`	Define Signaling as BGP
`(config-vpls-sig)#ve-id 2`	Configure VE-ID
`(config-vpls-sig)#exit`	Exit Signaling BGP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#mpls vpls v2 26`	Enter VPLS config mode
`(config)#service-tpid dot1.ad`	Service tp-id configuration.
`(config-vpls)#signaling bgp`	Define Signaling as BGP
`(config-vpls-sig)#ve-id 2`	Configure VE-ID
`(config-vpls-sig)#exit`	Exit Signaling BGP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#mpls vpls v3 27`	Enter VPLS config mode
`(config-vpls)#signaling bgp`	Define Signaling as BGP
`(config-vpls-sig)#ve-id 2`	Configure VE-ID
`(config-vpls-sig)#exit`	Exit Signaling BGP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#mpls vpls v4 28`	Enter VPLS config mode
`(config-vpls)#signaling bgp`	Define Signaling as BGP
`(config-vpls-sig)#ve-id 2`	Configure VE-ID
`(config-vpls-sig)#exit`	Exit Signaling BGP mode
`(config-vpls)#exit`	Exit VPLS mode
`(config)#commit`	Commit candidate configuration to running configuration

BGP VPLS Service Mapping Configuration

PE1: POP

(config)#configure terminal	Configure mode
(config)#service-template template1	Template configuration
(config-svc)# match double-tag outer-vlan 2024 inner-vlan 2023	Match criteria under template configuration
(config-svc)# rewrite ingress pop outgoing-tpid dot1.q	Action to be performed for the match.
(config-svc)#exit	Exit template configuration mode

PE1: XLATE

(config)#service-template template2	Template configuration
(config-svc)# match double-tag outer-vlan 2030 inner-vlan 2024	Match criteria under template configuration
(config-svc)# rewrite ingress translate 2026 outgoing-tpid dot1.q	Action to be performed for the match
(config-svc)#exit	Exit template configuration mode

PE1: PUSH

(config)#service-template template3	Template configuration
(config-svc)# match outer-vlan 500	Match criteria under template configuration
(config-svc)# rewrite ingress push 300	Action to be performed for the default match.
(config-svc)#exit	Exit template configuration mode

PE1: PUSH-service-template with multiple match

This is to validate the multiple match criteria support in a service template. When multiple match statements are configured only rewrite push is supported, rewrite translate and pop are not supported.

(config)#service-template template4	Template configuration
(config-svc)# match outer-vlan 700	Allow VLAN 700 traffic on this VC
(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200	Allow double tag match with s+c tags
(config-svc)# match untagged	Allow untagged traffic
(config-svc)# rewrite ingress push 300	Push Action performed for service template
(config-svc)#exit	Exit configure SVC mode

PE1: Access port Configuration

(config)#interface xe1	Enter the Interface mode for xe1.
(config-if)switchport	Configure interface as L2 interface

(config-if)#mpls-vpls v1 service-template template1	Bind the VPLS to the Access Interface.
(config-if-vpls)no ac-admin-status	Making Ac-admin-status Up
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v2 service-template template2	Bind the VPLS to the Access Interface.
(config-if-vpls)no ac-admin-status	Making Ac-admin-status Up
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v3 service-template template3	Bind the VPLS to the Access Interface.
(config-if-vpls)#no ac-admin-statusv	Making Ac-admin-status Up
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v4 service-template template4	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#no ac-admin-status	Making Ac-admin-status Up
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#commit	Commit candidate configuration to running configuration

PE2: POP

(config)#configure terminal	Configure mode
(config)#service-template template1	Template configuration
(config-svc)# match double-tag outer-vlan 2024 inner-vlan 2023	Match criteria under template configuration
(config-svc)# rewrite ingress pop outgoing-tpid dot1.ad	Action to be performed for the match.
(config-svc)#exit	Exit template configuration mode

PE2: XLATE

(config)#service-template template2	Template configuration
(config-svc)# match double-tag outer-vlan 2030 inner-vlan 2024	Match criteria under template configuration
(config-svc)# rewrite ingress translate 2026 outgoing-tpid dot1.q	Action to be performed for the match
(config-svc)#exit	Exit template configuration mode

PE2: PUSH

(config)#service-template template3	Template configuration
(config-svc)# match outer-vlan 500	Match criteria under template configuration
(config-svc)# rewrite ingress push 300	Action to be performed for the default match.
(config-svc)#exit	Exit template configuration mode

PE2: PUSH-service-template with multiple match

This is to validate the multiple match criteria support in a service template. When multiple match statements are configured only rewrite push is supported, rewrite translate and pop are not supported.

(config)#service-template template4	Template configuration
(config-svc)# match outer-vlan 700	Allow VLAN 700 traffic on this VC
(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200	Allow double tag match with s+c tags
(config-svc)# match untagged	Allow untagged traffic
(config-svc)# rewrite ingress push 300	Push Action performed for service template
(config-svc)#exit	Exit configure SVC mode

PE2: Access port Configuration

(config)#interface eth2	Enter the Interface mode for ethernet1.
(config-if)switchport	Configure interface as L2 interface
(config-if)#mpls-vpls v1 service-template template1	Bind the VPLS to the Access Interface.
(config-if-vpls)#no ac-admin-status	Making admin status up
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v2 service-template template2	Bind the VPLS to the Access Interface.
(config-if-vpls)#no ac-admin-status	Making admin status up
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v3 service-template template3	Bind the VPLS to the Access Interface.
(config-if-vpls)#no ac-admin-status	Making admin status up
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#mpls-vpls v4 service-template template4	Bind the VPLS to the Access Interface.
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#no ac-admin-status	Making Ac-admin-status Up
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#commit	Commit candidate configuration to running configuration

CHAPTER 9 Hierarchical VPLS

Overview

A Virtual Private LAN Service (VPLS) enables multipoint to multipoint communication, creating LAN-like connectivity between customers' sites. However, the typical full mesh topology required for LAN emulation can be impractical in large networks. To address this, Hierarchical VPLS (H-VPLS) introduces a hierarchical approach using a spoke-PW (pseudowire) type. Unlike the standard mesh-PW, the spoke-PW facilitates traffic between hierarchical levels, offering a more scalable solution for VPLS networks.

H-VPLS Redundancy Characteristics

In a Virtual Private LAN Service (VPLS) network, when a node connects through a spoke-PW, a single point of failure arises. In the event of a connection failure to the VPLS mesh or a failure within the PE-rs node, the spoke device experiences a complete loss of connectivity. To address this, PW redundancy is implemented, configuring a secondary path that activates if the primary path fails. The MTU-s is configured with a primary spoke-PW connected to PE1-rs and a secondary spoke-PW connected to PE2-rs. During normal operation, the primary spoke-PW is active, but in case of failure, the MTU-s can switch to the standby spoke-PW for continued connectivity, aiming for sub-second convergence times with potential MAC flush-related traffic loss.

Benefits

Hierarchical VPLS (H-VPLS) is introduced to address scalability challenges associated with the traditional VPLS (Virtual Private LAN Service) architecture. It introduces a hierarchical approach that enhances scalability, reduces configuration complexity, optimizes traffic flow, and improves overall network efficiency and fault tolerance.

Limitations

- Automatic revertive cases from secondary to primary will not be supported.
- MAC Address Withdrawal feature will not be supported in release 6.5.2.
- Convergence on redundancy may require bidirectional traffic or MAC aging.

Prerequisites

- The `block-mesh-spoke-on-all-ac-down` and `ignore-ac-spoke-state` commands are optional and mutually exclusive, meaning only one can be applied at a time, or neither. By default, neither command is applied. If one of commands is applied, applying the other will make it the active one. To remove a command, use the `no` prefix.

```
signaling ldp
   (block-mesh-spoke-on-all-ac-down | ignore-ac-spoke-state)
   (no block-mesh-spoke-on-all-ac-down | no ignore-ac-spoke-state)
```

- **Define Interfaces and Loopback Addresses:**
  Configure Layer 2 interfaces, like port channel interfaces (e.g., po1), and assign specific IP addresses for proper identification and routing. Additionally, assign loopback IP addresses to establish essential points of connec-tivity. These configurations establish the efficient network routing and communication.

```
!
interface lo
```

```
 ip address 127.0.0.1/8
 ip address 2.2.2.2/32 secondary
 ipv6 address ::1/128

interface xe14
 ip address 30.1.1.2/24
```

- **Configure IGP for Dynamic Routing:** Enable ISIS to facilitate dynamic routing on all nodes within the net-work. Define ISIS router instances to match loopback IP addresses and add network segments to ISIS areas for proper route distribution.Set up neighbor relationships using loopback IP addresses, ensuring efficient route advertisement and convergence for optimal network performance.

ISIS Configuration:

```
router isis 1
 is-type level-2-only
 metric-style wide
 microloop-avoidance level-2
 mpls traffic-eng router-id 2.2.2.2
 mpls traffic-eng level-2
 capability cspf
 dynamic-hostname
 bfd all-interfaces
 net 49.0000.0000.0002.00
 passive-interface lo
!
interface xe14
 mpls ldp-igp sync isis level-2
 isis network point-to-point
 ip router isis 1
```

OSPF Configuration:

```
router ospf 1
ospf router-id 2.2.2.2
network 2.2.2.2/32 area 0.0.0.0
 network 30.1.1.0/24 area 0.0.0.0!
!
interface xe14
ip ospf network point-to-point
```

Configuration for H-VPLS with Redundancy

Configure various nodes within the topology to set up a H-VPLS session.

Topology

This sample topology provides basic connectivity and routing between the devices.

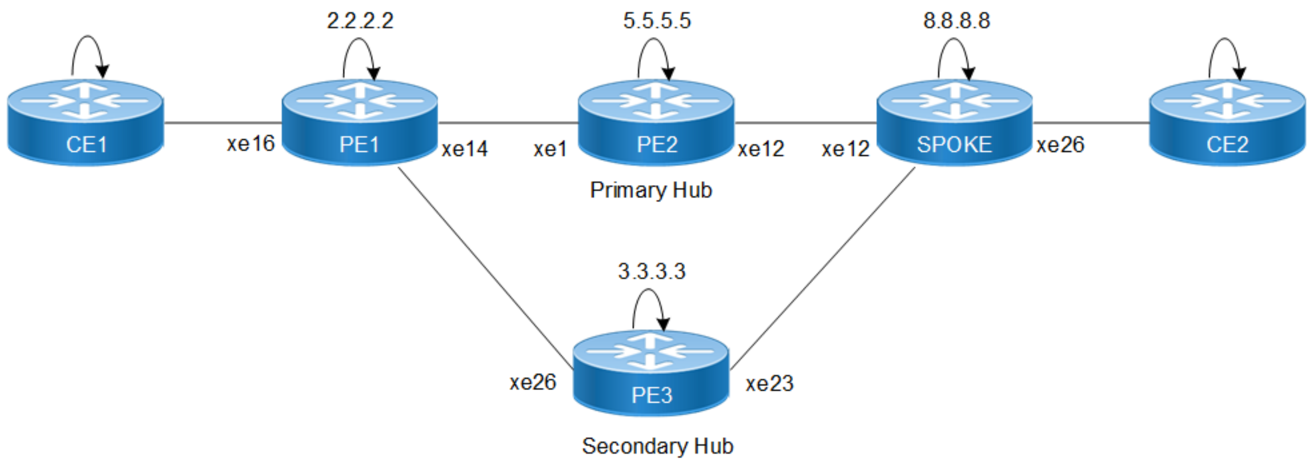

Figure 9-25: H-VPLS Configuration with Redundancy

Configure H-VPLS on PE1 Router

Follow the steps to configure the H-VPLS on PE1 router:

1. Configure router LDP.

```
PE1(config)#router ldp
PE1(config-router)# router-id 2.2.2.2
PE1(config-router)# transport-address ipv4 2.2.2.2
```

2. Configure targeted-peer under router LDP.

```
PE1(config-router)# targeted-peer ipv4 5.5.5.5
PE1(config-router-targeted-peer)#  exit-targeted-peer-mode
PE1(config-router)# targeted-peer ipv4 3.3.3.3
PE1(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
PE1(config)#interface xe14
PE1(config-if)# enable-ldp ipv4
PE1(config-if)#label-switching

PE1(config)#interface xe26
PE1(config-if)# enable-ldp ipv4
PE1(config-if)#label-switching
```

4. Configure VPLS instance.

```
PE1(config)#mpls vpls vpls2000 2000
PE1(config-vpls)# signaling ldp
PE1(config-vpls-sig)#  vpls-peer 3.3.3.3
PE1(config-vpls-sig)#  vpls-peer 5.5.5.5
PE1(config-vpls-sig)#  exit-signaling
PE1(config-vpls)# exit-vpls
PE1(config)#
```

5. Configure sub-interface and attach vpls-instance to sub-interface.

```
PE1(config)#
PE1(config)#interface xe16.2000 switchport
PE1(config-if)# encapsulation dot1q 2000
PE1(config-if)# access-if-vpls
```

```
PE1(config-acc-if-vpls)#  mpls-vpls vpls2000
PE1(config-acc-if-vpls)#
```

Configure H-VPLS on PE2 (Primary Hub)

Follow the steps to configure the H-VPLS on PE2 (Primary Hub):

1. Configure router LDP.
```
PE2(config)#router ldp
PE2(config-router)# router-id 5.5.5.5
PE2(config-router)# transport-address ipv4 5.5.5.5
```
2. Configure targeted-peer under router LDP.
```
PE2(config)#router ldp
PE2(config-router)# targeted-peer ipv4 2.2.2.2
PE2(config-router-targeted-peer)#  exit-targeted-peer-mode
PE2(config-router)# targeted-peer ipv4 3.3.3.3
PE2(config-router-targeted-peer)#  exit-targeted-peer-mode
PE2(config-router)#
```
3. Enable LDP and label-switching for core interface.
```
PE2(config)#interface xe1
PE2(config-if)# enable-ldp ipv4
PE2(config-if)#label-switching

PE2(config)#interface xe12
PE2(config-if)# enable-ldp ipv4
PE2(config-if)#label-switching
```
4. Configure VPLS instance.
```
PE2(config)#mpls vpls vpls2000 2000
PE2(config-vpls)# signaling ldp
PE2(config-vpls-sig)#  vpls-peer 2.2.2.2
PE2(config-vpls-sig)#  vpls-peer 3.3.3.3
PE2(config-vpls-sig)#  exit-signaling
PE2(config-vpls)# exit-vpls
PE2(config)#
```
5. Configure L2-ckt.
```
PE2(config)#mpls l2-circuit vc2000 2222 8.8.8.8 mode raw
PE2(config-pseudowire)#
```
6. Attach L2-ckt under vpls instance.
```
PE2(config)#mpls vpls vpls2000 2000
PE2(config-vpls)#vpls-vc vc2000
PE2(config-vpls-spoke)#
```

Configure H-VPLS on PE3 (Secondary Hub)

Follow the steps to configure the H-VPLS on PE3 (Secondary Hub):

1. Configure router LDP.
```
PE3(config)#router ldp
PE3(config-router)# router-id 3.3.3.3
PE3(config-router)# transport-address ipv4 3.3.3.3
```
2. Configure targeted-peer under router LDP.

```
PE3(config)#router ldp
PE3(config-router)# targeted-peer ipv4 2.2.2.2
PE3(config-router-targeted-peer)#  exit-targeted-peer-mode
PE3(config-router)# targeted-peer ipv4 5.5.5.5
PE3(config-router-targeted-peer)#  exit-targeted-peer-mode
PE3(config-router)#
```

3. Enable LDP and label-switching for core interface.

```
PE3(config)#interface xe23
PE3(config-if)# enable-ldp ipv4
PE3(config-if)#label-switching

PE3(config)#interface xe26
PE3(config-if)# enable-ldp ipv4
PE3(config-if)#label-switching
```

4. Configure VPLS instance.

```
PE3(config)#mpls vpls vpls2000 2000
PE3(config-vpls)# signaling ldp
PE3(config-vpls-sig)#  vpls-peer 2.2.2.2
PE3(config-vpls-sig)#  vpls-peer 5.5.5.5
PE3(config-vpls-sig)#  exit-signaling
PE3(config-vpls)# exit-vpls
PE3(config)#
```

5. Configure L2-ckt.

```
PE3(config)#mpls l2-circuit vc2001 2223 8.8.8.8 mode raw
PE3(config-pseudowire)#
```

6. 6.Attach L2-ckt under vpls instance.

```
PE3 (config)#mpls vpls vpls2000 2000
PE3(config-vpls)#vpls-vc vc2001
PE3(config-vpls-spoke)#
```

Configure H-VPLS on Spoke Router

Follow the steps to configure the H-VPLS on Spoke router:

1. Configure router LDP.

```
Spoke(config)#router ldp
Spoke(config-router)# router-id 8.8.8.8
Spoke(config-router)# transport-address ipv4 8.8.8.8
```

2. Configure targeted-peer under router LDP.

```
Spoke(config-router)# targeted-peer ipv4 5.5.5.5
Spoke(config-router-targeted-peer)#  exit-targeted-peer-mode
Spoke(config-router)# targeted-peer ipv4 3.3.3.3
Spoke(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
Spoke(config)#interface xe12
Spoke(config-if)# enable-ldp ipv4
Spoke(config-if)#label-switching

Spoke(config)#interface xe25
Spoke(config-if)# enable-ldp ipv4
Spoke(config-if)#label-switching
```

4. Configure VPLS instance.

```
Spoke (config)#mpls vpls vpls2000 2000
Spoke (config-vpls)#
```

5. 5.Configure L2-ckt.

```
Spoke(config)#mpls l2-circuit vc2000 2222 5.5.5.5 mode raw
Spoke(config-pseudowire)#!
Spoke(config-pseudowire)#mpls l2-circuit vc2001 2223 3.3.3.3 mode raw
Spoke(config-pseudowire)#
```

6. 6.Configure Primary and secondary spoke under vpls instance.

```
Spoke(config)#mpls vpls vpls2000 2000
Spoke(config-vpls)#vpls-vc vc2000
Spoke(config-vpls-spoke)#  secondary vc2001
Spoke(config-vpls-spoke)#  exit-spoke
Spoke(config-vpls)# exit-vpls
Spoke(config)#
```

7. Configure sub-interface and attach vpls-instance to sub-interface.

```
Spoke(config)#
Spoke(config)#interface xe26.2000 switchport
Spoke(config-if)# encapsulation dot1q 2000
Spoke(config-if)# access-if-vpls
Spoke(config-acc-if-vpls)#  mpls-vpls vpls2000
Spoke(config-acc-if-vpls)#
```

Running Configuration on PE1 Router

```

Configuration for H-VPLS without Redundancy

Configure various nodes within the topology to set up a H-VPLS session.

Topology

This sample topology provides basic connectivity and routing between the devices.

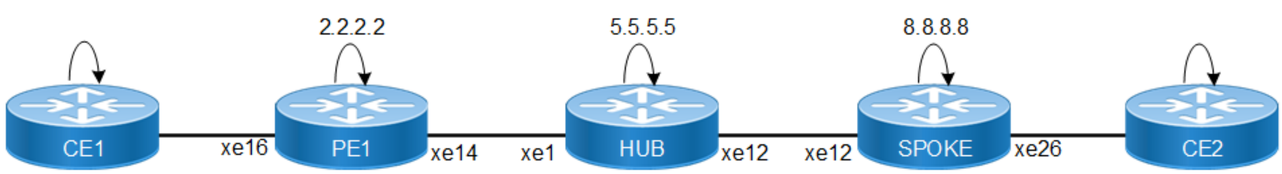

Figure 9-26: H-VPLS Configuration without Redundancy

Configure H-VPLS on PE1 Router

Follow the steps to configure the H-VPLS on PE1 router:

1. Configure router LDP.

```
PE1(config)#router ldp
PE1(config-router)# router-id 2.2.2.2
PE1(config-router)# transport-address ipv4 2.2.2.2
```

2. Configure targeted-peer under router LDP.

```
PE1(config-router)# targeted-peer ipv4 5.5.5.5
PE1(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
PE1(config)#interface xe14
PE1(config-if)# enable-ldp ipv4
PE1(config-if)#label-switching
```

4. Configure VPLS instance.

```
PE1(config)#mpls vpls vpls2000 2000
PE1(config-vpls)# signaling ldp
PE1(config-vpls-sig)#  vpls-peer 5.5.5.5
PE1(config-vpls-sig)#  exit-signaling
PE1(config-vpls)# exit-vpls
PE1(config)#
```

5. Configure sub-interface and attach vpls-instance to sub-interface

```
PE1(config)#
PE1(config)#interface xe16.2000 switchport
PE1(config-if)# encapsulation dot1q 2000
PE1(config-if)# access-if-vpls
PE1(config-acc-if-vpls)#  mpls-vpls vpls2000
PE1(config-acc-if-vpls)#
```

Configure H-VPLS on Hub Router

Follow the steps to configure the H-VPLS on Hub router:

1. Configure router LDP.

```
Hub(config)#router ldp
Hub(config-router)# router-id 5.5.5.5
Hub(config-router)# transport-address ipv4 5.5.5.5
```

2. Configure targeted-peer under router LDP.

```
Hub(config-router)# targeted-peer ipv4 2.2.2.2
Hub(config-router-targeted-peer)#  exit-targeted-peer-mode
R5-P5(config-router)# targeted-peer ipv4 8.8.8.8
R5-P5(config-router-targeted-peer)#
```

3. Enable LDP and label-switching for core interface.

```
Hub(config)#interface xe1
Hub(config-if)# enable-ldp ipv4
Hub(config-if)#label-switching

Hub(config)#interface xe12
Hub(config-if)# enable-ldp ipv4
Hub(config-if)#label-switching
```

4. Configure VPLS instance.

```
Hub(config)#mpls vpls vpls2000 2000
Hub(config-vpls)# signaling ldp
Hub(config-vpls-sig)# vpls-peer 2.2.2.2
Hub(config-vpls-sig)# exit-signaling
Hub(config-vpls)# exit-vpls
Hub(config)#
```

5. Configure L2-ckt.

```
Hub (config)#mpls l2-circuit vc2000 2222 8.8.8.8 mode raw
Hub (config-pseudowire)#
```

6. Attach L2-ckt under vpls instance.

```
Hub (config)#mpls vpls vpls2000 2000
Hub (config-vpls)#vpls-vc vc2000
Hub(config-vpls-spoke)#
```

Configure H-VPLS on Spoke Router

Follow the steps to configure the H-VPLS on Spoke router:

1. Configure router LDP.

```
Spoke(config)#router ldp
Spoke(config-router)# router-id 8.8.8.8
Spoke(config-router)# transport-address ipv4 8.8.8.8
```

2. Configure targeted-peer under router LDP.

```
Spoke(config-router)# targeted-peer ipv4 5.5.5.5
Spoke(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
Spoke(config)#interface xe12
Spoke(config-if)# enable-ldp ipv4
Spoke(config-if)#label-switching
```

4. Configure VPLS instance.

```
Spoke(config)#mpls vpls vpls2000 2000
     Spoke(config-vpls)#
```

5. Configure L2-ckt.

```
Spoke(config)#mpls l2-circuit vc2000 2222 5.5.5.5 mode raw
Spoke(config-pseudowire)#
```

6. Attach L2-ckt under vpls instance.

```
Spoke (config)#mpls vpls vpls2000 2000
Spoke(config-vpls)#vpls-vc vc2000
Spoke(config-vpls-spoke)#
```

7. Configure sub-interface and attach vpls-instance to sub-interface.

```
Spoke(config)#
Spoke(config)#interface xe26.2000 switchport
Spoke(config-if)# encapsulation dot1q 2000
Spoke(config-if)# access-if-vpls
Spoke(config-acc-if-vpls)#  mpls-vpls vpls2000
Spoke(config-acc-if-vpls)#
```

Running Configuration on PE1 Router

```
router ldp
 router-id 2.2.2.2
 targeted-peer ipv4 5.5.5.5
  exit-targeted-peer-mode
 transport-address ipv4 2.2.2.2
!
interface xe14
     enable-ldp ipv4
!
mpls vpls vpls2000 2000
 signaling ldp
  vpls-peer 5.5.5.5
  exit-signaling
 exit-vpls
!
interface xe16.2000 switchport
```

```
 access-if-vpls
    mpls-vpls vpls2000
```

Running Configuration on Hub Router

```
router ldp
targeted-peer ipv4 2.2.2.2
exit-targeted-peer-mode
 targeted-peer ipv4 8.8.8.8
  exit-targeted-peer-mode
!
!

```

Commands for H-VPLS Configuration

The H-VPLS uses the following configuration commands.

vpls-vc

Use this command to add a spoke virtual circuit to VPLS domain hierarchically.

Use `no` parameter of this command to remove this configuration.

Command Syntax

```
vpls-vc NAME
 (secondary NAME|)
 (ethernet|vlan|)
```

Parameters

`NAME`	Specifies the name of the VPLS. It is a string that identifies the MPLS VC to add to the VPLS domain.
`secondary`	Specifies the name of the secondary spoke.
`NAME`	Specifies the name for the secondary spoke.
`ethernet`	Specifies the spoke type. Defaults to `ethernet`.
`vlan`	Specifies the spoke type.

Default

Disabled

Command Mode

VPLS mode

Applicability

Introduced before OcNOS version 1.3.

Modified the command prompt into a hierarchical structure from single line in the OcNOS version 6.5.1.

Example

Example for adding a spoke virtual circuit with VPLS name vc1 and secondary spoke vc2:

```
#configure terminal
(config)#mpls vpls vpls1 3000
(config-vpls)#vpls-vc vc1
(config-vpls-spoke)#secondary vc2
(config-vpls-spoke)#type ethernet
(config-vpls-spoke)#exit-spoke
(config-vpls)#exit
```

Example to remove the configuration of the spoke virtual circuit with VPLS name vc1:

```
#configure terminal
(config)#mpls vpls vpls1 3000
(config-vpls)#no vpls-vc vc1
(config-vpls)#exit
```

signaling

Use this command to set all mesh and spoke pseudowires to down when all access interfaces are down.

Use `ignore-ac-spoke-state` parameter of this command to remove this configuration.

Command Syntax

```
signaling ldp block-mesh-spoke-on-all-ac-down
```

```
signaling ignore-ac-spoke-state
```

Parameters

`block-mesh-spoke-on-all-ac-down`	(Optional) Controls the behavior of pseudowires (PWs) in a VPLS instance when all access interfaces associated with the VPLS instance are down.
`ignore-ac-spoke-state`	Ignores access interfaces and spoke pseudowires state and keep mesh pseudowires up.

Default

disabled

Command Mode

VPLS mode

Applicability

Introduced before OcNOS version 1.3.

Modified the command prompt into a hierarchical structure from single line in the OcNOS version 6.5.1.

Example

Example for setting up all mesh and spoke pseudowires to down when all access interfaces are down:

```
#configure terminal
(config)# mpls vpls test 100
(config-vpls)#signaling ldp
(config-vpls-sig)#block-mesh-spoke-on-all-ac-down
(config-vpls-sig)#exit
```

Example for setting up all mesh and spoke pseudowires to up:

```
#configure terminal
(config)# mpls vpls test 100
(config-vpls)#signaling ldp
(config-vpls-sig)#ignore-ac-spoke-state
(config-vpls-sig)#exit
```

CHAPTER 10 MAC Withdrawal - VPLS/H-VPLS

Overview

The MAC withdrawal mechanism allows for faster convergence by immediately clearing dynamically learned MAC addresses upon detecting a switchover event, rather than waiting for the usual aging process. This process is triggered by specific network events or state changes, such as:

- Spoke-PW switchover: A path between two VPLS network elements, typically between MTU-s (Multi-Tenant Units) and Provider Edge (PE) routers, transitions from standby to active or vice versa.
- MLAG switchover: When a link failure or node failure occurs in a MLAG setup, leading to the activation of a previously standby link.

The main goal is to ensure that MAC addresses learned from any given path (spoke or mesh) are promptly removed when a switchover occurs, preventing stale entries from affecting the network.

The MAC withdrawal message, defined as the LDP Positive MAC Flush message, is used to remove MAC address tables. This message can be triggered either by MTU-s or PE-rs depending on the network topology and the specific trigger event (such as a switchover or link failure).

Characteristics of MAC Withdrawal - VPLS/H-VPLS

- MAC Withdrawal is used to speed up network convergence during topology changes.
- It ensures that dynamically learned MAC addresses are flushed proactively instead of aging out, reducing traffic disruption.
- Triggers for MAC Withdrawal:
  - **Spoke PW Switchover:** When a Spoke Pseudowire (PW) transitions between active and standby.
  - **MLAG Switchover:** When a multi-chassis link aggregation (MLAG) event causes a switchover between active and standby devices.
  - **Node Failure:** When a PE-rs (Provider Edge router) or MTU-s (Multi-Tenant Unit switch) fails or reboots.
  - **PW Status TLV:** The Preferential Forwarding Status bit in an LDP PW Status TLV can signal a switchover.
  - **Manual Intervention:** Administrators can trigger MAC withdrawal manually for network maintenance.

Benefits

- Proactively removes outdated MAC entries, reducing the time taken for the network to stabilize.
- Ensures quick adaptation to topology changes without requiring manual intervention.
- Reduces packet flooding by clearing invalid MAC table entries.
- Prevents stale forwarding information, ensuring accurate traffic routing.
- Ensures seamless transition when a standby link becomes active.
- Enables compatibility with industry-standard VPLS/H-VPLS deployments.
- Prevents unnecessary flushing across Mesh PWs, maintaining stability.

Prerequisites

- Define Interfaces and Loopback Addresses:

  Configure Layer 2 interfaces, like port channel interfaces (e.g., po1), and assign specific IP addresses for proper identification and routing. Additionally, assign loopback IP addresses to establish essential points of connec-tivity. These configurations establish the efficient network routing and communication.

```
!
interface lo
 ip address 127.0.0.1/8
 ip address 2.2.2.2/32 secondary
 ipv6 address ::1/128

interface xe14
 ip address 30.1.1.2/24
```

- **Configure IGP for Dynamic Routing:**

  Enable ISIS to facilitate dynamic routing on all nodes within the net-work. Define ISIS router instances to match loopback IP addresses and add network segments to ISIS areas for proper route distribution.Set up neighbor relationships using loopback IP addresses, ensuring efficient route advertisement and convergence for optimal network performance.

  - ISIS Configuration:

```
router isis 1
 is-type level-2-only
 metric-style wide
 microloop-avoidance level-2
 mpls traffic-eng router-id 2.2.2.2
 mpls traffic-eng level-2
 capability cspf
 dynamic-hostname
 bfd all-interfaces
 net 49.0000.0000.0002.00
 passive-interface lo
!
interface xe14
 mpls ldp-igp sync isis level-2
 isis network point-to-point
 ip router isis 1
```

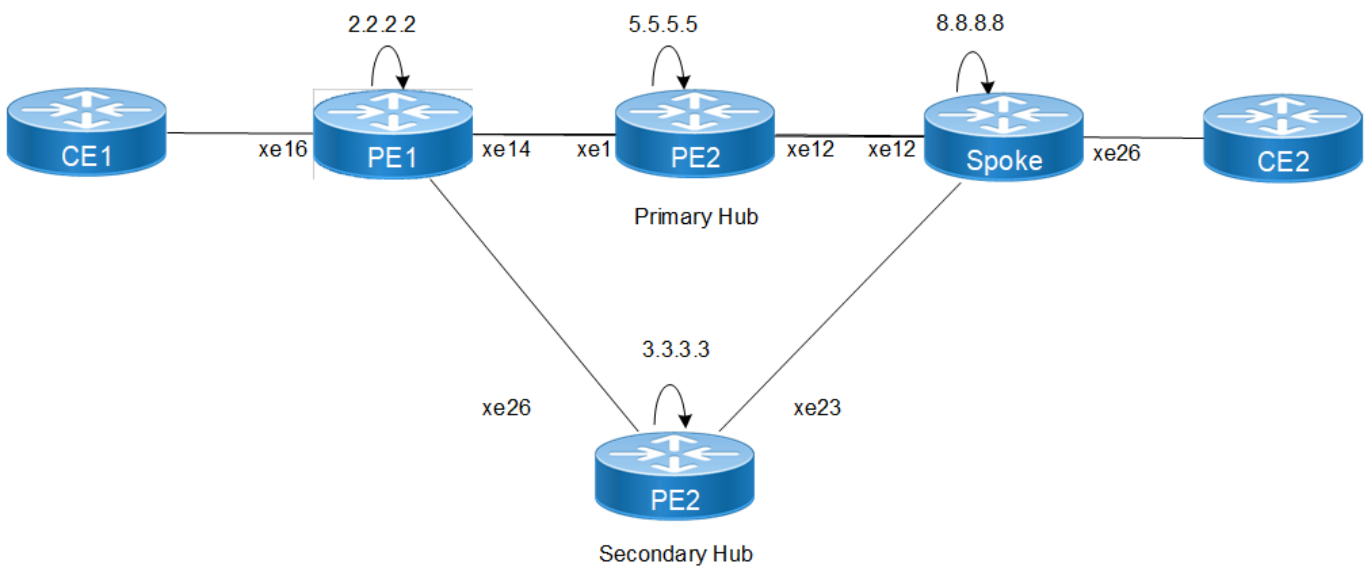
  - OSPF Configuration:

```
router ospf 1
ospf router-id 2.2.2.2
network 2.2.2.2/32 area 0.0.0.0
 network 30.1.1.0/24 area 0.0.0.0!
!
interface xe14
ip ospf network point-to-point
```

Configuration

Topology

This topology represents MAC withdrawal for VPLS/H-VPLS with Primary and Secondary Hub architecture.



MAC Withdrawal for VPLS/H-VPLS Topology

Configuring H-VPLS

Configure PE1 router as follows:

1. Configure router LDP.

```
PE1(config)#router ldp
PE1(config-router)# router-id 2.2.2.2
PE1(config-router)# transport-address ipv4 2.2.2.2
```

2. Configure targeted-peer under router LDP.

```
PE1(config-router)# targeted-peer ipv4 5.5.5.5
PE1(config-router-targeted-peer)#  exit-targeted-peer-mode
PE1(config-router)# targeted-peer ipv4 3.3.3.3
PE1(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
PE1(config)#interface xe14
PE1(config-if)# enable-ldp ipv4
PE1(config-if)#label-switching

PE1(config)#interface xe26
PE1(config-if)# enable-ldp ipv4
PE1(config-if)#label-switching
```

4. Configure VPLS instance.

```
PE1(config)#mpls vpls vpls2000 2000
PE1(config-vpls)# signaling ldp
PE1(config-vpls-sig)#  vpls-peer 3.3.3.3
PE1(config-vpls-sig)#  vpls-peer 5.5.5.5
PE1(config-vpls-sig)#  exit-signaling
PE1(config-vpls)# exit-vpls
PE1(config)#
```

5. Configure sub-interface and attach vpls-instance to sub-interface.

```
PE1(config)#
PE1(config)#interface xe16.2000 switchport
PE1(config-if)# encapsulation dot1q 2000
PE1(config-if)# access-if-vpls
PE1(config-acc-if-vpls)#  mpls-vpls vpls2000
PE1(config-acc-if-vpls)#
```

Configuring the H-VPLS MAC-Withdrawal on PE2 (Primary Hub):

1. Configure router LDP.

```
PE2(config)#router ldp
PE2(config-router)# router-id 5.5.5.5
PE2(config-router)# transport-address ipv4 5.5.5.5
```

2. Configure targeted-peer under router LDP.

```
PE2(config)#router ldp
PE2(config-router)# targeted-peer ipv4 2.2.2.2
PE2(config-router-targeted-peer)#  exit-targeted-peer-mode
PE2(config-router)# targeted-peer ipv4 3.3.3.3
PE2(config-router-targeted-peer)#  exit-targeted-peer-mode
PE2(config-router)#
```

3. Enable LDP and label-switching for core interface

```
PE2(config)#interface xe1
PE2(config-if)# enable-ldp ipv4
PE2(config-if)#label-switching

PE2(config)#interface xe12
PE2(config-if)# enable-ldp ipv4
PE2(config-if)#label-switching
```

4. Configure VPLS instance.

```
PE2(config)#mpls vpls vpls2000 2000
PE2(config-vpls)# signaling ldp
PE2(config-vpls-sig)#  vpls-peer 2.2.2.2
PE2(config-vpls-sig)#  vpls-peer 3.3.3.3
PE2(config-vpls-sig)#  exit-signaling
PE2(config-vpls)# exit-vpls
PE2(config)#
```

5. Configure L2-ckt.

```
PE2 (config)#mpls l2-circuit vc2000 2222 8.8.8.8 mode raw
PE2(config-pseudowire)#
```

6. Attach L2-ckt under vpls instance.

```
PE2 (config)#mpls vpls vpls2000 2000
PE2(config-vpls)#vpls-vc vc2000
PE2(config-vpls-spoke)#
```

7. Configure mac-withdrawal under VPLS instance.

```
PE2(config-vpls-spoke)#mpls vpls vpls2000 2000
PE2(config-vpls)# vpls-vc vc2000
PE2(config-vpls-spoke)#  exit-spoke
PE2(config-vpls)# mac-withdrawal flush-propagate-spoke-to-mesh
PE2(config-vpls)#exit
PE2(config)#
```

Configuring the H-VPLS on PE3 (Secondary Hub):

1. Configure router LDP.

```
PE3(config)#router ldp
PE3(config-router)# router-id 3.3.3.3
PE3(config-router)# transport-address ipv4 3.3.3.3
```

2. Configure targeted-peer under router LDP.

```
PE3(config)#router ldp
PE3(config-router)# targeted-peer ipv4 2.2.2.2
PE3(config-router-targeted-peer)#  exit-targeted-peer-mode
PE3(config-router)# targeted-peer ipv4 5.5.5.5
PE3(config-router-targeted-peer)#  exit-targeted-peer-mode
PE3(config-router)#
```

3. Enable LDP and label-switching for core interface.

```
PE3(config)#interface xe23
PE3(config-if)# enable-ldp ipv4
PE3(config-if)#label-switching

PE3(config)#interface xe26
PE3(config-if)# enable-ldp ipv4
PE3(config-if)#label-switching
```

4. Configure VPLS instance.

```
PE3(config)#mpls vpls vpls2000 2000
PE3(config-vpls)# signaling ldp
PE3(config-vpls-sig)#  vpls-peer 2.2.2.2
PE3(config-vpls-sig)#  vpls-peer 5.5.5.5
PE3(config-vpls-sig)#  exit-signaling
PE3(config-vpls)# exit-vpls
PE3(config)#
```

5. 5.Configure L2-ckt.

```
PE3(config)#mpls l2-circuit vc2001 2223 8.8.8.8 mode raw
PE3(config-pseudowire)#
```

6. Attach L2-ckt under VPLS instance.

```
PE3 (config)#mpls vpls vpls2000 2000
PE3(config-vpls)#vpls-vc vc2001
PE3(config-vpls-spoke)#
```

7. Configure mac-withdrawal under VPLS instance.

```
PE3(config)#mpls vpls vpls2000 2000
PE3(config-vpls)# vpls-vc vc2001
PE3(config-vpls-spoke)#  exit-spoke
PE3(config-vpls)# mac-withdrawal flush-propagate-spoke-to-mesh
PE3(config-vpls)#exit
PE3(config)#
```

Configuring the H-VPLS on Spoke Router:

1. Configure router LDP.

```
Spoke(config)#router ldp
Spoke(config-router)# router-id 8.8.8.8
Spoke(config-router)# transport-address ipv4 8.8.8.8
```

2. Configure targeted-peer under router LDP.

```
Spoke(config-router)# targeted-peer ipv4 5.5.5.5
Spoke(config-router-targeted-peer)#  exit-targeted-peer-mode
Spoke(config-router)# targeted-peer ipv4 3.3.3.3
Spoke(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
Spoke(config)#interface xe12
Spoke(config-if)# enable-ldp ipv4
Spoke(config-if)#label-switching

Spoke(config)#interface xe25
Spoke(config-if)# enable-ldp ipv4
Spoke(config-if)#label-switching
```

4. Configure VPLS instance.

```
Spoke (config)#mpls vpls vpls2000 2000
Spoke (config-vpls)#
```

5. Configure L2-ckt.

```
Spoke(config)#mpls l2-circuit vc2000 2222 5.5.5.5 mode raw
Spoke(config-pseudowire)#!
Spoke(config-pseudowire)#mpls l2-circuit vc2001 2223 3.3.3.3 mode raw
Spoke(config-pseudowire)#
```

6. Configure Primary and Secondary spoke under VPLS instance.

```
Spoke(config)#mpls vpls vpls2000 2000
Spoke(config-vpls)#vpls-vc vc2000
Spoke(config-vpls-spoke)#  secondary vc2001
Spoke(config-vpls-spoke)#  exit-spoke
Spoke(config-vpls)# exit-vpls
Spoke(config)#
```

7. Configure sub-interface and attach vpls-instance to sub-interface.

```
Spoke(config)#
Spoke(config)#interface xe26.2000 switchport
Spoke(config-if)# encapsulation dot1q 2000
Spoke(config-if)# access-if-vpls
Spoke(config-acc-if-vpls)#  mpls-vpls vpls2000
Spoke(config-acc-if-vpls)#
```

8. Configure mac-withdrawal under VPLS instance.

```
Spoke(config)#mpls  vpls vpls2000 2000
Spoke(config-vpls)#mac-withdrawal flush-on-spoke-vc-standby-activation
Spoke(config-vpls)#commit
Spoke(config-vpls)#
```

Running Configuration on PE1 Router:

```
router ldp

CLI Commands

The MAC Withdrawal for VPLS/H-VPLS introduces the following configuration commands.

mac-withdrawal flush-on-spoke-vc-standby-activation

Use this command to send MAC withdraw when the secondary spoke becomes the primary.

Use `no` parameter of this command to remove MAC withdraw when the secondary spoke becomes the primary.

Command Syntax

```
mac-withdrawal flush-on-spoke-vc-standby-activation
no mac-withdrawal flush-on-spoke-vc-standby-activation
```

Parameters

None

Default

None

Command Mode

VPLS Mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

Explain or describe the example.

```
#configure terminal
(config)#mpls vpls vpls12 12
(config-vpls)#mac-withdrawal flush-on-spoke-vc-standby-activation
```

mac-withdrawal flush-propagate-spoke-to-mesh

Use this command to allow propagation of MAC withdraw from spoke to mesh.

Use `no` parameter of this command to remove propagation of MAC withdraw from spoke to mesh.

Command Syntax

```
mac-withdrawal flush-propagate-spoke-to-mesh
```

Parameters

None

Default

None

Command Mode

VPLS Mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

Explain or describe the example.

```
#configure terminal
(config)#mpls vpls vpls12 12
(config-vpls)#mac-withdrawal flush-propagate-spoke-to-mesh
```

Glossary

Key Terms/Acronym	Description
H-VPLS	Hierarchical Virtual Private LAN Service
VPLS	Virtual Private LAN Service

CHAPTER 11 MAC Move Protection - VPLS/H-VPLS

Overview

MAC Move Protection is a Layer 2 feature for detecting and managing the movement of MAC addresses across various interfaces in Virtual Private LAN Service (VPLS) or Hierarchical VPLS (H-VPLS) networks.

In VPLS environments, MAC address moves can occur across Attachment Circuits (AC), Spoke-PWs, and Mesh-PWs. MAC Move Protection is particularly useful in detecting and responding to these movements within these different components.

Characteristics of MAC Move Protection - VPLS/H-VPLS

- Monitors MAC address movements across Attachment Circuits (AC), Spoke-PWs, and Mesh-PWs, detecting any moves between these components in a VPLS/H-VPLS topology.
- Enables detection settings across multiple VPLS instances, ensuring uniformity and reducing redundant configurations.
- Allows more granular control, enabling overrides for detection timers and error-disable actions on specific instances.
- Administrators can configure detection interval and move count threshold.
- When a MAC move is detected, this feature:
    - Applies error-disable actions to ACs to prevent disruption.
    - Brings down Spoke-PWs or Mesh-PWs, reducing impact on the network.
    - Automatically restores components after the error-disable or operational down actions are triggered.

Benefits

- By detecting and managing unexpected MAC address moves, the feature helps prevent network loops, service disruptions, and performance degradation, ensuring stable VPLS connectivity.
- The action mechanism minimizes disruptions by intelligently deciding which components to block (AC, Spoke-PW, or Mesh-PW) based on priority, reducing the impact of MAC move events on the overall network.
- With syslog reporting and detailed CLI commands, network administrators can quickly identify and address MAC move issues.
- The ability to configure detection settings both globally and at the instance level provides flexibility in managing large-scale VPLS networks.

Prerequisites

- **Define Interfaces and Loopback Addresses:**

  Configure Layer 2 interfaces, like port channel interfaces (e.g., po1), and assign specific IP addresses for proper identification and routing. Additionally, assign loopback IP addresses to establish essential points of connec-tivity. These configurations establish the efficient network routing and communication.

```
!
interface lo
```

```
 ip address 127.0.0.1/8
 ip address 2.2.2.2/32 secondary
 ipv6 address ::1/128

interface xe14
 ip address 30.1.1.2/24
```

- **Configure IGP for Dynamic Routing:**
  Enable ISIS to facilitate dynamic routing on all nodes within the net-work. Define ISIS router instances to match loopback IP addresses and add network segments to ISIS areas for proper route distribution.Set up neighbor relationships using loopback IP addresses, ensuring efficient route advertisement and convergence for optimal network performance.
  - **ISIS Configuration:**

```
router isis 1
 is-type level-2-only
 metric-style wide
 microloop-avoidance level-2
 mpls traffic-eng router-id 2.2.2.2
 mpls traffic-eng level-2
 capability cspf
 dynamic-hostname
      bfd all-interfaces
 net 49.0000.0000.0002.00
 passive-interface lo
!
interface xe14
 mpls ldp-igp sync isis level-2
 isis network point-to-point
 ip router isis 1
```

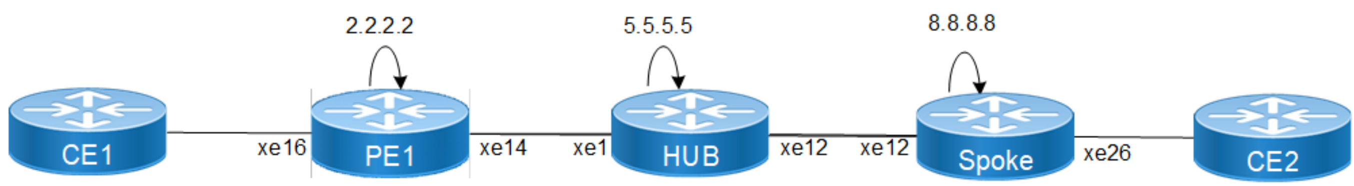
  - **OSPF Configuration:**

```
router ospf 1
ospf router-id 2.2.2.2
network 2.2.2.2/32 area 0.0.0.0
 network 30.1.1.0/24 area 0.0.0.0!
!
interface xe14
ip ospf network point-to-point
```

Configuration

Topology

The sample topology for MAC Move Protection with CE-PE-Hub-Spoke architecture.



MAC Move Protection Topology Diagram

Configuring MAC Move Protection

Configure PE1 router as follows:

1. Configure router LDP.

```
PE1(config)#router ldp
PE1(config-router)# router-id 2.2.2.2
PE1(config-router)# transport-address ipv4 2.2.2.2
```

2. Configure targeted-peer under router LDP.

```
PE1(config-router)# targeted-peer ipv4 5.5.5.5
PE1(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
PE1(config)#interface xe14
PE1(config-if)# enable-ldp ipv4
PE1(config-if)#label-switching
```

4. Configure VPLS instance.

```
PE1(config)#mpls vpls vpls2000 2000
PE1(config-vpls)# signaling ldp
PE1(config-vpls-sig)#  vpls-peer 5.5.5.5
PE1(config-vpls-sig)#  exit-signaling
PE1(config-vpls)# exit-vpls
PE1(config)#
```

5. Configure sub-interface and attach vpls-instance to sub-interface.

```
PE1(config)#
PE1(config)#interface xe16.2000 switchport
PE1(config-if)# encapsulation dot1q 2000
PE1(config-if)# access-if-vpls
PE1(config-acc-if-vpls)#  mpls-vpls vpls2000
PE1(config-acc-if-vpls)#
```

6. MAC-MOVE global configuration.

```
PE1(config)#vpls mac-move enable detect 10 10
PE1(config)#commit
PE1(config)#
```

7. Configure MAC-MOVE under VPLS instance.

```
PE1(config)#mpls vpls vpls2000 2000
PE1(config-vpls)# mac-move
PE1(config-vpls-mac-move)#  detect 10 10
PE1(config-vpls-mac-move)#  errdisable timeout-interval 120
PE1(config-vpls-mac-move)#commit
PE1(config-vpls-mac-move)#
PE1(config-vpls-mac-move)#exit
PE1(config)#
```

Configure the Hub Router:

1. Configure router LDP.

```
Hub(config)#router ldp
Hub(config-router)# router-id 5.5.5.5
Hub(config-router)# transport-address ipv4 5.5.5.5
```

2. Configure targeted-peer under router LDP.

```
Hub(config-router)# targeted-peer ipv4 2.2.2.2
Hub(config-router-targeted-peer)#  exit-targeted-peer-mode
R5-P5(config-router)# targeted-peer ipv4 8.8.8.8
R5-P5(config-router-targeted-peer)#
```

3. Enable LDP and label-switching for core interface.

```
Hub(config)#interface xe1
Hub(config-if)# enable-ldp ipv4
Hub(config-if)#label-switching
Hub(config)#interface xe12
Hub(config-if)# enable-ldp ipv4
Hub(config-if)#label-switching
```

4. Configure VPLS instance.

```
Hub(config)#mpls vpls vpls2000 2000
Hub(config-vpls)# signaling ldp
Hub(config-vpls-sig)#  vpls-peer 2.2.2.2
Hub(config-vpls-sig)#  exit-signaling
Hub(config-vpls)# exit-vpls
Hub(config)#
```

5. Configure L2-ckt.

```
Hub (config)#mpls l2-circuit vc2000 2222 8.8.8.8 mode raw
Hub (config-pseudowire)#
```

6. Attach L2-ckt under VPLS instance.

```
Hub (config)#mpls vpls vpls2000 2000
Hub (config-vpls)#vpls-vc vc2000
Hub(config-vpls-spoke)#
```

7. MAC Move Protection global configuration.

```
Hub(config)#vpls mac-move enable detect 10 10
Hub(config)#commit
Hub(config)#
```

8. Configure MAC-MOVE under VPLS instance.

```
Hub(config)#mpls vpls vpls2000 2000
Hub(config-vpls)# mac-move
Hub(config-vpls-mac-move)#  detect 10 10
Hub(config-vpls-mac-move)#  errdisable timeout-interval 120
```

```
Hub(config-vpls-mac-move)#  errdisable allow-mesh-pw-blocking
Hub(config-vpls-mac-move)#exit
Hub(config)#PE1(config)#
```

Configure Spoke Router as follows:

1. Configure router LDP.
```
Spoke(config)#router ldp
Spoke(config-router)# router-id 8.8.8.8
Spoke(config-router)# transport-address ipv4 8.8.8.8
```
2. Configure targeted-peer under router LDP.
```
Spoke(config-router)# targeted-peer ipv4 5.5.5.5
Spoke(config-router-targeted-peer)#  exit-targeted-peer-mode
```
3. Enable LDP and label-switching for core interface.
```
Spoke(config)#interface xe12
Spoke(config-if)# enable-ldp ipv4
Spoke(config-if)#label-switching
```
4. Configure VPLS instance.
```
Spoke(config)#mpls vpls vpls2000 2000
Spoke(config-vpls)#
```
5. Configure L2-ckt.
```
Spoke(config)#mpls l2-circuit vc2000 2222 5.5.5.5 mode raw
Spoke(config-pseudowire)#
```
6. Attach L2-ckt under VPLS instance.
```
Spoke (config)#mpls vpls vpls2000 2000
Spoke(config-vpls)#vpls-vc vc2000
Spoke(config-vpls-spoke)#
```
7. MAC Move Protection global configuration
```
Spoke(config)#vpls mac-move enable detect 10 10
Spoke(config)#commit
Spoke(config)#
```
8. Configure MAC-MOVE under VPLS instance.
```
Spoke(config)#mpls vpls vpls2000 2000
Spoke(config-vpls)# mac-move
Spoke(config-vpls-mac-move)#  detect 10 10
Spoke(config-vpls-mac-move)#  errdisable timeout-interval 120
Spoke(config-vpls-mac-move)#  errdisable allow-mesh-pw-blocking
Spoke(config-vpls-mac-move)#exit
Spoke(config)#PE1(config)#
```

Running Configuration on PE1 Router:

```
router ldp
 router-id 2.2.2.2
 targeted-peer ipv4 5.5.5.5
  exit-targeted-peer-mode
 transport-address ipv4 2.2.2.2

CLI Commands

The MAC Move Protection introduces the following configuration commands.

vpls mac-move enable detect

Use this command to enable MAC address move detection within a VPLS environment with global configuration.

Use `no` parameter of this command to disable MAC address move detection

Command Syntax

```
vpls mac-move enable detect <1-1000> <5-300>
no vpls mac-move enable detect
```

Parameters

`<1-1000>`	Specifies the number of detected MAC address moves required to trigger an action. The default value is 5.
`<5-300>`	Specifies the time period (in seconds) within which the specified number of MAC address moves must occur for the move to be considered valid. The default value is 15 seconds.

Default

Disabled

Command Mode

CONFIG mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

The following example is for configuration of MAC move protection using global configuration:

```
#configure terminal
(config)#vpls mac-move enable detect 10 40
(config)#commit
```

mac-move

Use this command to enable MAC address move detection within a VPLS environment with VPLS MAC MOVE mode.

Use `no` parameter of this command to disable MAC address move detection

Command Syntax

```
mac-move detect (<1-1000> | <5-300>) | errdisable (allow-mesh-pw-blocking |
  timeout-interval <0-86400>)
```

```
no mac-move
```

Parameters

`<1-1000>`	Specifies the number of detected MAC address moves required to trigger an action. The default value is 5.
`<5-300>`	Specifies the time period (in seconds) within which the specified number of MAC address moves must occur for the move to be considered valid. The default value is 15 seconds.
`allow-mesh-pw-blocking`	Allows blocking the Mesh Pseudowire (PW) instead of only disabling the MAC in case of an error.
`<0-86400>`	(Optional) Specifies the MAC move errdisable timeout interval, determining how long the affected MAC remains disabled before being re-enabled. The default value is 0 second.

Default

Disabled

Command Mode

VPLS MAC MOVE mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

The following example is for configuration of MAC move protection for VPLS instance:

```
#configure terminal
(config)# mpls vpls vpls_test1 100
(config-vpls)#mac-move
(config-vpls-mac-move)# detect 10  60
(config-vpls-mac-move)# errdisable timeout interval 120
(config-vpls-mac-move)# errdisable allow-mesh-pw-blocking
(config-vpls-mac-move)# exit-mac-move
(config-vpls)# exit-vpls
```

show mpls vpls mac-move name

Use this command to display the MAC address move configuration and status for the VPLS instance.

Command Syntax

```
show mpls vpls mac-move name
```

Parameters

`name`	Specifies the name of VPLS instance.

Applicability

Introduced in OcNOS version 6.6.0.

Example

The following example is for configuration of MAC move protection:

```
#show mpls vpls mac-move name vpls26
Virtual Private LAN Service Instance: vpls26, ID:26
Mac Address          Move Count    Elapsed time

90:67:17:e2:46:74    29            00:17:35
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description

ISIS	Intermediate System to Intermediate System
OSPF	Open Shortest Path First
BFD	Bidirectional Forwarding Detection
VPLS	Virtual Private LAN Service

CHAPTER 12 MAC Limit for VPLS and H-VPLS

Overview

The MAC limit controls how many MAC addresses a system can learn, which is especially beneficial in Virtual Private LAN Service (VPLS) deployments. This control allows you to limit MAC addresses at more granular levels, such as the Access Circuit (AC) or Spoke-PW level, while maintaining the current VPLS instance-level limits.

Characteristics of MAC Move Protection - VPLS/H-VPLS

- Threshold-based control for the number of MAC addresses.
- Granular configuration options, including interface/subinterface/AC/Spoke-PW levels.
- Monitoring and enforcement with actions like logging or error-disable.
- Security benefits by preventing MAC flooding and limiting device access.
- Non-disruptive operation with logging, and optional error-disable with recovery options.

Benefits

- Prevents MAC flooding attacks, controls access to network segments.
- Improves network efficiency by managing memory and CPU usage.
- Granular configuration at interface, subinterface, AC, and Spoke-PW levels.
- Prevents MAC table overflows, ensuring stable traffic forwarding.
- Syslog alerts and watermark thresholds for proactive management.
- Logging doesn't affect traffic, and error-disable includes recovery options.
- Helps networks grow efficiently without overloading devices.

Prerequisites

- **Define Interfaces and Loopback Addresses:**

  Configure Layer 2 interfaces, like port channel interfaces (e.g., po1), and assign specific IP addresses for proper identification and routing. Additionally, assign loopback IP addresses to establish essential points of connec-tivity. These configurations establish the efficient network routing and communication.

```
!
interface lo
 ip address 127.0.0.1/8
 ip address 2.2.2.2/32 secondary
 ipv6 address ::1/128

interface xe14
 ip address 30.1.1.2/24
```

- **Configure IGP for Dynamic Routing:** Enable ISIS to facilitate dynamic routing on all nodes within the net-work. Define ISIS router instances to match loopback IP addresses and add network segments to ISIS areas for proper route distribution.Set up neighbor relationships using loopback IP addresses, ensuring efficient route advertisement and convergence for optimal network performance.

- **ISIS Configuration:**

```
router isis 1
 is-type level-2-only
 metric-style wide
 microloop-avoidance level-2
 mpls traffic-eng router-id 2.2.2.2
 mpls traffic-eng level-2
 capability cspf
 dynamic-hostname
      bfd all-interfaces
 net 49.0000.0000.0002.00
 passive-interface lo
!
interface xe14
 mpls ldp-igp sync isis level-2
 isis network point-to-point
 ip router isis 1
```

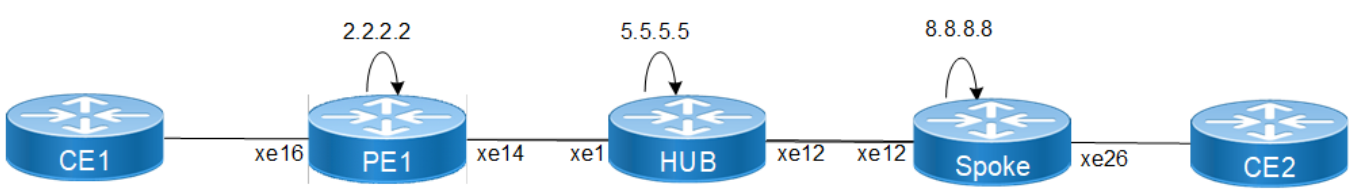
- **OSPF Configuration:**

```
router ospf 1
ospf router-id 2.2.2.2
network 2.2.2.2/32 area 0.0.0.0
 network 30.1.1.0/24 area 0.0.0.0!
!
interface xe14
ip ospf network point-to-point
```

Configuration

Topology

The sample topology for MAC Limit with CE-PE-Hub-Spoke architecture.



MAC Limit for H-VPLS Topology Diagram

Configuring MAC-Limit

Configure PE1 router as follows:

1. Configure router LDP.

```
PE1(config)#router ldp
PE1(config-router)# router-id 2.2.2.2
PE1(config-router)# transport-address ipv4 2.2.2.2
```

2. Configure targeted-peer under router LDP.

```
PE1(config-router)# targeted-peer ipv4 5.5.5.5
PE1(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
PE1(config)#interface xe14
PE1(config-if)# enable-ldp ipv4
PE1(config-if)#label-switching
```

4. Configure VPLS instance.

```
PE1(config)#mpls vpls vpls2000 2000
PE1(config-vpls)# signaling ldp
PE1(config-vpls-sig)#  vpls-peer 5.5.5.5
PE1(config-vpls-sig)#  exit-signaling
PE1(config-vpls)# exit-vpls
PE1(config)#
```

5. Configure sub-interface and attach vpls-instance to sub-interface.

```
PE1(config)#
PE1(config)#interface xe16.2000 switchport
PE1(config-if)# encapsulation dot1q 2000
PE1(config-if)# access-if-vpls
PE1(config-acc-if-vpls)#  mpls-vpls vpls2000
PE1(config-acc-if-vpls)#
```

6. Configure mac-limit profile configuration.

```
PE1(config)#
PE1(config)#vpls mac-limit-profile prof1
PE1(config-vpls-mac-lim-profile)#  learning-limit 5
PE1(config-vpls-mac-lim-profile)#  action log-errdisable
PE1(config-vpls-mac-lim-profile)#  errdisable-timeout 120
```

7. Configure mac-limit profile under AC sub-interface.

```
PE1(config)#
PE1(config)#interface xe16.2001 switchport
PE1(config-if)# access-if-vpls
PE1(config-acc-if-vpls)#learning limit prof1
PE1(config-acc-if-vpls)#exit
```

Configure the MAC-LIMIT on Hub Router:

1. Configure router LDP.

```
Hub(config)#router ldp
Hub(config-router)# router-id 5.5.5.5
Hub(config-router)# transport-address ipv4 5.5.5.5
```

2. Configure targeted-peer under router LDP.

```
Hub(config-router)# targeted-peer ipv4 2.2.2.2
Hub(config-router-targeted-peer)#  exit-targeted-peer-mode
R5-P5(config-router)# targeted-peer ipv4 8.8.8.8
R5-P5(config-router-targeted-peer)#
```

3. Enable LDP and label-switching for core interface.

```
Hub(config)#interface xe1
```

```
Hub(config-if)# enable-ldp ipv4
Hub(config-if)#label-switching
Hub(config)#interface xe12
Hub(config-if)# enable-ldp ipv4
Hub(config-if)#label-switching
```

4. Configure VPLS instance.

```
Hub(config)#mpls vpls vpls2000 2000
Hub(config-vpls)# signaling ldp
Hub(config-vpls-sig)#  vpls-peer 2.2.2.2
Hub(config-vpls-sig)#  exit-signaling
Hub(config-vpls)# exit-vpls
Hub(config)#
```

5. Configure L2-ckt.

```
Hub (config)#mpls l2-circuit vc2000 2222 8.8.8.8 mode raw
Hub (config-pseudowire)#
```

6. Attach L2-ckt under vpls instance.

```
Hub (config)#mpls vpls vpls2000 2000
Hub (config-vpls)#vpls-vc vc2000
Hub(config-vpls-spoke)#
```

7. Configure mac-limit profile configuration.

```
HUB(config)#vpls mac-limit-profile prof1
HUB(config-vpls-mac-lim-profile)#  learning-limit 5
HUB(config-vpls-mac-lim-profile)#  action log-errdisable
HUB(config-vpls-mac-lim-profile)#  errdisable-timeout 120
HUB(config-vpls-mac-lim-profile)#
```

8. Configure mac-limit profile under vpls instance.

```
HUB(config)#mpls vpls vpls2001 2001
HUB(config-vpls)#vpls-vc vc2000
HUB(config-vpls-spoke)#  learning limit prof1
HUB(config-vpls-spoke)#
```

Configure the MAC-LIMIT on Spoke Router:

1. Configure router LDP.

```
Spoke(config)#router ldp
Spoke(config-router)# router-id 8.8.8.8
Spoke(config-router)# transport-address ipv4 8.8.8.8
```

2. Configure targeted-peer under router LDP.

```
Spoke(config-router)# targeted-peer ipv4 5.5.5.5
Spoke(config-router-targeted-peer)#  exit-targeted-peer-mode
```

3. Enable LDP and label-switching for core interface.

```
Spoke(config)#interface xe12
Spoke(config-if)# enable-ldp ipv4
Spoke(config-if)#label-switching
```

4. Configure VPLS instance.

```
Spoke(config)#mpls vpls vpls2000 2000
Spoke(config-vpls)#
```

5. Configure L2-ckt.

```
Spoke(config)#mpls l2-circuit vc2000 2222 5.5.5.5 mode raw
```

```
Spoke(config-pseudowire)#
```

6. Attach L2-ckt under VPLS instance.

```
Spoke (config)#mpls vpls vpls2000 2000
Spoke(config-vpls)#vpls-vc vc2000
Spoke(config-vpls-spoke)#
```

7. Configure sub-interface and attach vpls-instance to sub-interface.

```
Spoke(config)#
Spoke(config)#interface xe26.2000 switchport
Spoke(config-if)# encapsulation dot1q 2000
Spoke(config-if)# access-if-vpls
Spoke(config-acc-if-vpls)#  mpls-vpls vpls2000
Spoke(config-acc-if-vpls)#
```

8. Configure mac-limit profile configuration.

```
Spoke(config)#vpls mac-limit-profile R8
Spoke(config-vpls-mac-lim-profile)#  learning-limit 10
Spoke(config-vpls-mac-lim-profile)#  action log-errdisable
Spoke(config-vpls-mac-lim-profile)#  errdisable-timeout 60
Spoke(config-vpls-mac-lim-profile)#
Spoke(config-vpls-mac-lim-profile)#
```

9. Configure mac-limit profile under vpls instance.

```
Spoke(config)#mpls vpls vpls2000 2000
Spoke(config-vpls)#vpls-vc vc2000
Spoke(config-vpls-spoke)#learning limit R8
Spoke(config-vpls-spoke)#
```

Running Configuration on PE1 Router:

```
vpls mac-limit-profile prof1
  learning-limit 5
  action log-errdisable
  errdisable-timeout 120
!

Group ID: 0, VPLS Type: Ethernet, Configured MTU: 1500
Description: none
service-tpid: dot1.q
Operating mode: Raw
Ignoring AC interface and spoke-VC state

Configured interfaces:
  None

Mesh Peers:
  2.2.2.2 (Peer VPLS Type: Ethernet) (Up) (UpTime: 2d10h47m)
  3.3.3.3 (Peer VPLS Type: Ethernet) (Up) (UpTime: 2d10h56m)
Spoke Peers:
  vc2000 (Up) (UpTime 00:05:48)
```

CLI Commands

The MAC Limit introduces the following configuration commands.

vpls mac-limit-profile

Use this command to set the MAC address learning limits which will be used to associate the AC or Spoke PW for a specific VPLS MAC limit profile.

Use `no` parameter of this command to delete the VPLS MAC limit profile.

Command Syntax

```
vpls mac-limit-profile <PROFILE_NAME> learning-limit <1-32767> | high-watermark <1-
  100> | low-watermark <1-100> | action (log-errdisable <0-86400> | log-only) |
  errdisable-timeout <0-86400>
no vpls mac-limit-profile
```

Parameters

`<PROFILE_NAME>`	Specifies the name of the MAC limit profile.
`learning-limit <1-32767>`	Specifies the maximum number of MAC addresses allowed to be learned on the interface. The default value is 32767.
`high-watermark <1-100>`	Specifies the high watermark (maximum number of MAC addresses) for logging purposes. The threshold is a numeric value and a percentage of the learning limit. The default value is 90%.
`low-watermark <1-100>`	Specifies the low watermark (minimum number of MAC addresses) for logging purposes. The threshold is a numeric value and a percentage of the learning limit. The default value is 70%.

action log-errdisable <0-86400>	Logs an event when the MAC limit is exceeded and disables MAC learning for the timeout period.The default value is 0.
action log-only	Logs when the MAC limit is exceeded without disabling MAC learning.
errdisable-timeout <0-86400>	Specifies the duration (in seconds) before MAC learning is re-enabled after being errdisabled. The default value is 0, meaning no automatic recovery.

Default

None

Command Mode

VPLS MAC Limit Profile Mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

The following example is for creating a VPLS MAC limit profile and configuring with specific parameters to manage MAC address learning limits:

```
#configure terminal
(config)#vpls mac-limit-profile prof1
(config-vpls-mac-lim-profile)#learning-limit 50
(config-vpls-mac-lim-profile)#action log-errdisable
(config-vpls-mac-lim-profile)#high-watermark 60
(config-vpls-mac-lim-profile)#low-watermark 30
(config-vpls-mac-lim-profile)#errdisable-timeout 30
(config-vpls-mac-lim-profile)#commit
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

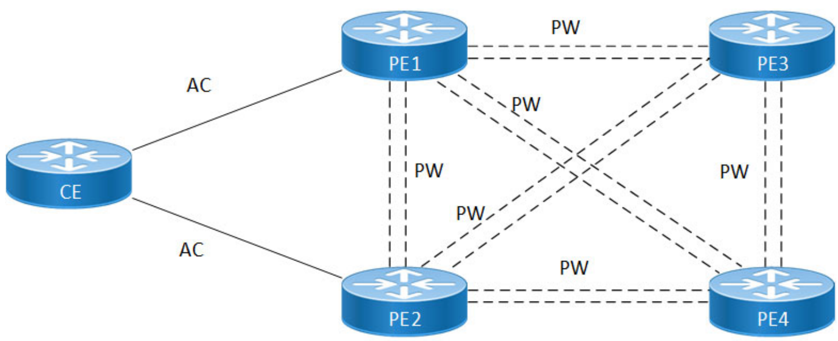
Key Terms/Acronym	Description
CLI	Command Line Interface
H-VPLS	Hierarchical Virtual Private LAN Service
IGP	Interior Gateway Protocol
ISIS	Intermediate System to Intermediate System
OSPF	Open Shortest Path First
BFD	Bidirectional Forwarding Detection
VPLS	Virtual Private LAN Service

CHAPTER 13 MLAG Active-Standby for VPLS

Overview

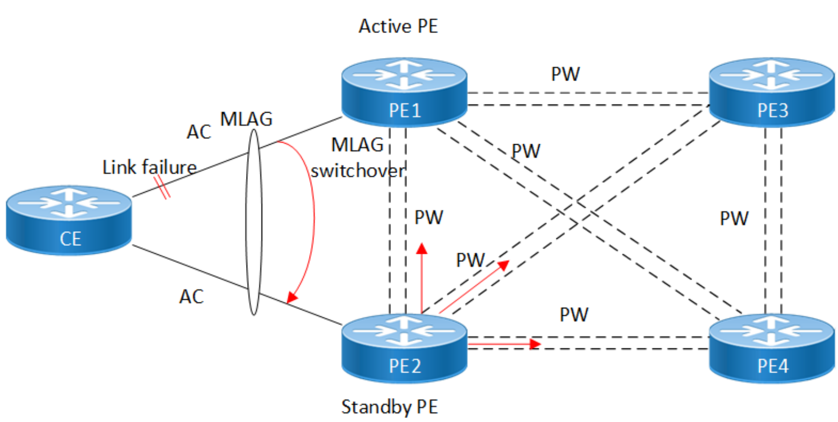
The Virtual Private LAN Service (VPLS) architecture provides a multipoint ethernet connection using the Multi-Protocol Label Switching (MPLS) transport. This helps connect multiple devices from different geographical locations to the same virtual network. The Multi-Chassis Link Aggregation (MLAG) provides the redundancy technique in the VPLS architecture, making it failsafe multipoint VPLS connectivity. The redundancy in the network traffic is achieved by dual-homing a Customer Edge (CE) device to two Provider Edge (PE) devices.

A single CE is dual-homed to two PEs for redundancy is shown in the following figure:



Feature Characteristics

The Multi-Chassis Link Aggregation (MLAG) Active-Standby for VPLS feature facilitates implementation of the MLAG Active-Standby between the VPLS PE devices. This facilitates Attachment Circuit (AC) redundancy for the dual-homed Customer Edge (CE) device. This means there is one Active link and another Standby link between a CE device and the PE devices. When an Active link fails, the Standby link becomes Active with the MLAG switch, resulting in a change in topology. The change in topology requires a mac-flush in the peer devices for faster convergence. The feature also facilitates forwarding the automatic mac-flush message to all the peer nodes, reducing the convergence time when a link fails.



The above figure shows a VPLS mesh linked to a dual-homed CE connected to PE1 and PE2. The traffic flows from CE to PE3 through the active MLAG PE1, while PE2 remains a standby MLAG. When PE1 experiences a link failure, the standby MLAG becomes active, and traffic flows through the PE2 device to reach the destination PE3. Configuring the `mac flush send on mlag switchover` command enables MAC flush PDU tx, and PE2 automatically sends the MAC flush message to all the peer nodes PE1, PE3, and PE4 as depicted by the red arrows, which reduces the convergence time.

Consider the following point while configuring this feature:

- Only Active-Standby MLAG is supported.
- Only flush-all-but-mine MAC-flush approach is supported.
- If multiple Attachment Circuits (ACs) are mapped to the same MLAG interface, the MLAG switch is not triggered when only one or a few AC go down.
- MAC flush on a remote VPLS peer is supported only when LDP signaling (not BGP signaling) is used. A MAC flush message (flush-all-but-mine) will have an empty MAC address list. An empty MAC address list will flush all the MAC addresses and cannot flush any selected MAC addresses.

Benefit

This feature enhances the reliability of VPLS by providing redundancy using MLAG.

Prerequisites

Refer to the MLAG Configuration section in the *OcNOS Layer 2 Guide*.

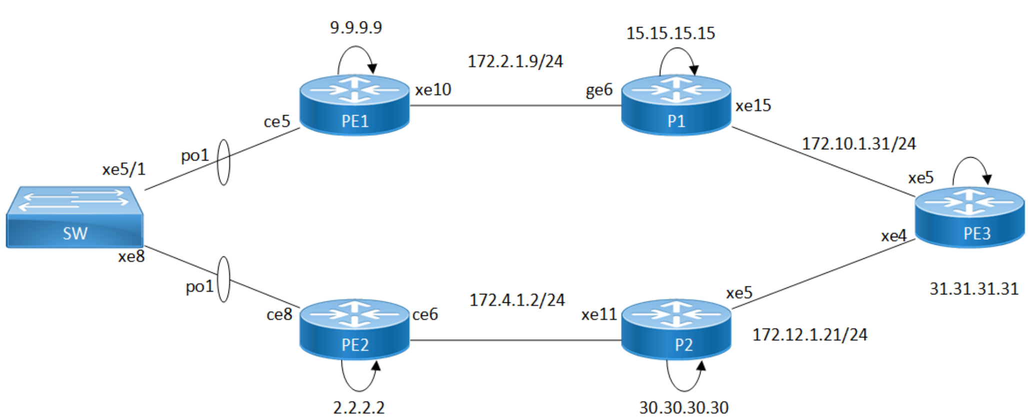
Configuration

This section shows the configuration of the MLAG VPLS.

Topology

The following topology shows a VPLS mesh. The traffic is flowing from SW to PE3. PE1 has an MLAG configured as Active and PE2 as Standby. When a link failure occurs between SW and PE1 (the Active MLAG node), the link between SW and PE2 becomes Active.

Figure 13-27: MLAG VPLS configuration topology



MLAG VPLS Configuration

The following steps show the configuration of the MLAG VPLS with automatic MAC flush capability during the MLAG switchover.

Configuring MLAG on PE1 (Active) and PE2 (Standby)

1. Type `bridge 1 protocol rstp vlan-bridge` to create a bridge and attach it to the RSTP. Type the command `vlan database` to enter the VLAN configuration mode, and then `vlan 100-300 bridge 1 state enable` to enable the VLAN 100 to 300 on the bridge 1.

```
(config)#bridge 1 protocol rstp vlan-bridge
(config)#vlan database
(config-vlan)#vlan 100-300 bridge 1 state enable
```

2. Type `mcec domain configuration` to enter the MCEC domain configuration mode and then configure the `domain-address` to identify the MCEC domain. Type the command `domain-system-number 1` to configure the domain system number that uniquely identifies the domain system in MCEC domain and then type the command `intra-domain-peer 2.2.2.2 source-address 9.9.9.9` to map an interface as intra domain peer that connects the domain system with its neighbor in a MCEC domain.

```
(config)#mcec domain configuration
(config-mcec-domain)#domain-address 1111.2222.3333
(config-mcec-domain)#domain-system-number 1
(config-mcec-domain)#intra-domain-peer 2.2.2.2 source-address 9.9.9.9
```

3. Type the command `interface mlag1` and then `switchport` to configure the interface. Type `bridge-group 1` to bind an interface with the bridge group. Type `switchport mode trunk` to set the interface to the trunk port that allows multiple VLAN configurations in the interface, and then type `switchport trunk allowed vlan add 100-150` to configure the required VLAN identifier. Type the command `switchover type revertive 2` to return back to initial MLAG after 2 seconds after fail recovery.

```
(config)#interface mlag1
(config-if)#switchport
(config-if)#bridge-group 1
(config-if)#switchport mode trunk
(config-if)#switchport trunk allowed vlan add 100-150
(config-if)#switchover type revertive 2
```

4. Type `interface po1` to enter the specified port channel, type `switchport` to configure the interface as Layer 2, and the type `mlag 1` to enable the specific MLAG.

```
(config)#interface po1
(config-if)#switchport
(config-if)#mlag 1
```

5. Type `interface ce5` to configure the interface and then type `channel-group 1 mode active` to add the interface to the channel group.

```
(config)#interface ce5
(config-if)#channel-group 1 mode active
```

Configuring VPLS Session on PE1 (Active MLAG Peer), PE2 (Standby MLAG Peer), and PE3

1. Type `mpls vpls vpls1 200` to create an VPLS instance. Type `mac-flush-send-on-mlag-switchover` to enable the MAC flush PDU tx during the MLAG switchover, type `signaling ldp` to enter the VPLS signaling mode as only LDP signaling is supported for the MAC flush, and then type `vpls-peer 2.2.2.2` and `vpls-peer 31.31.31.31` to add a peer to a VPLS domain.

```
(config)#mpls vpls vpls1 200
(config-vpls)#mac-flush-send-on-mlag-switchover
(config-vpls)#signaling ldp
```

```
(config-vpls-sig)#vpls-peer 2.2.2.2
(config-vpls-sig)#vpls-peer 31.31.31.31
(config-vpls-sig)#exit-signaling
(config-vpls)#exit-vpls
```

2. Type `interface po1.200 switchport` to create a sub-interface. In the sub-interface, type `encapsulation dot1q 200` to select the type of encapsulation as dot1q with the VLAN ID 200. Type `access-if-vpls` to create a VPLS access port and then `mpls-vpls vpls1` to bind the VPLS instance to the subinterface.

```
(config)#interface po1.200 switchport
(config-if)#encapsulation dot1q 200
(config-if)#access-if-vpls
(config-acc-if-vpls)#mpls-vpls vpls1
```

Running configurations

PE1:

```
bridge 1 protocol rstp vlan-bridge
vlan database
 vlan 100-300 bridge 1 state enable

mcec domain configuration
 domain-address 1111.2222.3333
 domain-system-number 1
 intra-domain-peer 2.2.2.2 source-address 9.9.9.9

interface mlag1
 switchport
 bridge-group 1
 switchport mode trunk
 switchport trunk allowed vlan add 100-150
 switchover type revertive 2

interface po1
 switchport
  mlag 1

mpls vpls vpls1 200
 mac-flush-send-on-mlag-switchover
 signaling ldp
  vpls-peer 2.2.2.2
  vpls-peer 31.31.31.31
  exit-signaling
 exit-vpls

interface po1.200 switchport

Validation

Use the following show commands to verify the configuration.

Verify MLAG Domain summary on PE1 and PE2 to verify the Current MLAG status and MLAG Synchronization

```
PE1# #show mlag domain summary

MLAG Active-Standby for VPLS commands

The MLAG Active-Standby for VPLS introduces the following configuration command.

mac flush send on mlag switchover

Use this command to enable the MAC flush PDU tx during the MLAG switchover.

Use the `no` command to disable the MAC PDU tx flush during the MLAG switchover.

Command Syntax

```
mac-flush-send-on-mlag-switchover
no mac-flush-send-on-mlag-switchover
```

Parameters

None

Default

Disabled

Command Mode

VPLS mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

This example shows how to configure mac flush automatically on the peer nodes:

```
OcNOS#configure terminal
OcNOS(config)#mpls vpls VPLS-102 102
OcNOS(config-vpls)#mac-flush-send-on-mlag-switchover
OcNOS(config-vpls)#commit
OcNOS(config-vpls)#end
```

Revised CLI Commands

The following command is revised:

switchover type

The revertive time range is revised from `<1-255>` to `<1-3600>`. For more details, refer to switchover type command in the Multi-chassis Link Aggregation Commands chapter in the *Layer 2 Guide*.

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
VPLS	Virtual Private Local Area Network Service is a technology that uses a shared Layer 2 Virtual Private Network (L2VPN) to establish communication between different geographical sites as if they are in the same Local Area Network (LAN).
MPLS	Multi-Protocol Label Switching is a high-performance routing protocol that attaches labels to data packets to efficiently forward and route data in a network.
CE	Customer Edge is a device that resides at the customer premises and bridges the customer's internal network to the service provider network.
PE	Provider Edge is a device that resides at the provider's edge, manages traffic from the customer edge, and forwards it to the provider's backbone.
MLAG	Multi-Chassis Link Aggregation is a network architecture that uses multiple switches or routers to work as a single logical device to increase redundancy and bandwidth.
AC	Attachment circuit is an interface or link that connects a CE device to the PE device.
MAC	Media Access Control is a unique identifier of a device's network interface card (NIC) to communicate in a local area network (LAN).

CHAPTER 14 Virtual Private Wire Service Configuration

This chapter shows configurations for Virtual Private Wire Service (VPWS), where a point-to-point Layer 2 VPN service interconnects multiple Ethernet LANs across an MPLS backbone.

Overview

An MPLS Layer 2 Virtual Circuit (VC) is a point-to-point Layer 2 connection transported via MPLS on the service provider's network. The Layer 2 circuit is transported over a single Label Switched Path (LSP) tunnel between two Provider Edge (PE) routers.

The following diagram illustrates the configuration steps in this section. In this sample, the VC host devices, Host1 and Host2, are connected to the Provider Edge (PE) router PE-1; and Host3 and Host4 are connected to PE-2. The VC is established between PE-1 and PE-2. Interface xe2, on PE-1 and PE-2, is connected to the customer network; xe1, on PE-1 and PE-2, is connected to the MPLS cloud.

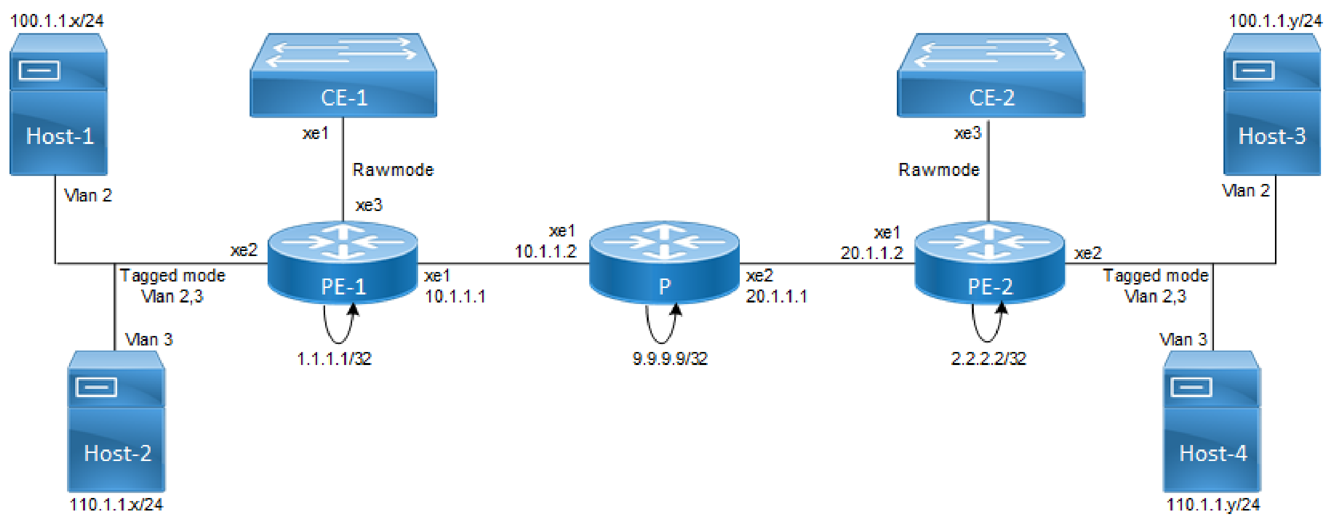

Figure 14-28: MPLS Layer 2 Virtual Circuit

The VC configuration process can be divided into the following steps:

Note: Loopback addresses being used should be advertised through OSPF, or should be statically routed.

1. Configure the IP address and OSPF for the PE-1, P (Provider), and PE-2 routers.
2. Configure MPLS and LDP on PE-1, P, and PE-2, and LDP targeted peer for the PE-1 and PE-2 routers. (If RSVP is used for configuring trunks, LDP must be configured on PE-1 and PE-2, and RSVP must be configured on PE-1, P, and PE-2.)
3. Configure the VC.
4. Bind the customer interface to the VC.

Configure IP Address and OSPF on Routers

Configure the IP addresses and OSPF on the PE-1, P, and PE-2 routers.

PE-1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface `(lo0)` to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to `1.1.1.1/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#ip address 10.1.1.1/24`	Set the IP address of the interface to `10.1.1.1/24`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.1.1.0/24 area 0` `(config-router)#network 1.1.1.1/32 area 0`	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface.
`(config-router)#commit`	Commit the transaction.

P

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface `(lo0)` to be configured.
`(config-if)#ip address 9.9.9.9/32 secondary`	Set the IP address of the loopback interface to `9.9.9.9/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#ip address 10.1.1.2/24`	Set the IP address of the interface to `10.1.1.2/24`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Specify the interface `(xe2)` to be configured.
`(config-if)#ip address 20.1.1.1/24`	Set the IP address of the interface to `20.1.1.1/24`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 10.1.1.0/24 area 0`
`(config-router)#network 20.1.1.0/24 area 0`
`(config-router)#network 9.9.9.9/32 area 0`
	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface.

`(config-router)#commit`	Commit the transaction.

PE-2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface `(lo0)` to be configured.
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to `2.2.2.2/32`.
`(config-if)#exit`	Exit interface mode.

(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#ip address 20.1.1.2/24	Set the IP address of the interface to 20.1.1.2/24.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 20.1.1.0/24 area 0 (config-router)#network 2.2.2.2/32 area 0	Define the interface on which OSPF runs, and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

Configure MPLS, LDP, and LDP Targeted Peer on Routers

Configure MPLS and LDP on PE-1, P, and PE-2, and LDP targeted peers on PE-1 and PE-2.

Note: If RSVP is used for configuring trunks, LDP must be configured on PE-1 and PE-2, and RSVP must be configured on PE-1, P, and PE-2,

PE-1

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the Router mode.
(config)#router-id 1.1.1.1	Set the router ID to IP address 1.1.1.1
(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#targeted-peer ipv4 2.2.2.2	Specify the targeted LDP peer on PE-1.
(config-router-targeted-peer)# exit	Exit the Router targeted peer mode.
(config-router)#exit	Exit the Router mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe1..
(config-if)#commit	Commit the transaction.

P

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the Router mode.
(config)#router-id 9.9.9.9	Set the router ID to IP address 9.9.9.9
(config-router)#transport-address ipv4 9.9.9.9	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#exit	Exit the Router mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe2.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Specify the interface (xe2) to be configured.

(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe2.
(config-if)#commit	Commit the transaction.

PE-2

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the Router mode.
(config)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2
(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
(config-router)#targeted-peer ipv4 1.1.1.1	Specify the targeted LDP peer on PE-2.
(config-router-targeted-peer)# exit	Exit the Router targeted peer mode.
(config-router)#exit	Exit the Router mode.
(config)#interface xe1	Specify the interface(xe1) to be configured.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe1.
(config-if)#commit	Commit the transaction.

Configure VC

Configure the VC. Each VC ID uniquely identifies the Layer-2 circuit among all the Layer-2 circuits.

Note: Both PE routers (endpoints) must be configured with the same VC-ID (100 in this example).

PE-1

#configure terminal	Enter configure mode.
(config)#mpls l2-circuit t1 100 2.2.2.2	Configure the VC for PE-2. In this example, t1 is the VC name, 100 is the VC ID, and 2.2.2.2 is the VC endpoint IP address.
(config)#commit	Save transaction into the database

PE-2

#configure terminal	Enter configure mode.
(config)#mpls l2-circuit t1 100 1.1.1.1	Configure the VC for PE-1. In this example, t1 is the VC name, 100 is the VC ID, and 1.1.1.1 is the VC endpoint IP address.
(config)#commit	Commit the transaction.

Bind Customer Interface to VC

Bind the customer interface to the VC using one of the two procedures described below: Layer-2 untagged traffic or Layer-2 tagged traffic.

Note: Layer 2 VCs can only be bound to Layer 2 interfaces. The VC encapsulation method should be Ethernet (default), VLAN.

Layer 2 Untagged Traffic

Use Access mode for Layer 2 untagged traffic.

PE-1

`#configure terminal`	Enter configure mode.
`(config)#service-template SUT1`	Create a service template SUT1
`(config-svc)#match untagged`	Allow untagged traffic.
`(config-svc)#exit`	Exit the service template mode
`(config)#interface xe3`	Specify the interface (xe3) to be configured.
`(config-if)#switchport`	Switch to Layer-2 mode.
`(config-if)#mpls-l2-circuit t1 service-template SUT1`	Bind the interface to the VC with service template.
`(config-if)#commit`	Commit the transaction.

PE-2

`#configure terminal`	Enter configure mode.
`(config)#service-template SUT1`	Create a service template SUT1
`(config-svc)#match untagged`	Allow untagged traffic.
`(config-svc)#exit`	Exit the service template mode
`(config)#interface xe3`	Specify the interface (xe3) to be configured.
`(config-if)#switchport`	Switch to Layer-2 mode.
`(config-if)#mpls-l2-circuit t1 service-template SUT1`	Bind the interface to the VC with service template.
`(config-if)#commit`	Commit the transaction.

Layer 2 Tagged Traffic

Use Trunk mode for Layer-2 tagged traffic. The following configuration allows only VLAN 2 and 3 traffic.

PE-1

`#configure terminal`	Enter configure mode.
`(config)#mpls l2-circuit t2 200 2.2.2.2`	Configure the VC for PE-2. In this example, t2 is the VC name, 200 is the VC ID, and 2.2.2.2 is the VC endpoint IP address.
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)#service-template ST1`	Create a service template ST1
`(config-svc)#match outer-vlan 2`	Allow VLAN 2 traffic on this VC.
`(config-svc)#match outer-vlan 3`	Allow VLAN 3 traffic on this VC.

(config-svc)#exit	Exit the service template mode
(config)#interface xe2	Specify the interface (xe2) to be configured.
(config-if)#switchport	Switch to Layer-2 mode.
(config-if)#mpls-l2-circuit t2 service-template ST1	Bind the interface to the VC with service template.
(config-if)#commit	Commit the transaction.

PE-2

#configure terminal	Enter configure mode.
(config)#mpls l2-circuit t2 200 1.1.1.1	Configure the VC for PE-2. In this example, t2 is the VC name, 200 is the VC ID, and 1.1.1.1 is the VC endpoint IP address.
(config-pseudowire)#exit	Exit pseudowire config mode.
(config)#service-template ST1	Create a service template ST1
(config-svc)#match outer-vlan 2	Allow VLAN 2 traffic on this VC.
(config-svc)#match outer-vlan 3	Allow VLAN 3 traffic on this VC.
(config-svc)#exit	Exit the service template mode
(config)#interface xe2	Specify the interface (xe2) to be configured.
(config-if)#switchport	Switch to Layer-2 mode.
(config-if)#mpls-l2-circuit t2 service-template ST1	Bind the interface to the VC with service template.
(config-if)#commit	Commit the transaction.

Validation

Use the show ldp mpls-l2-circuit (Control Plane) command, and the show mpls vc-table (Forwarding Plane) command, to display complete information about the Layer 2 VC.

If the VC State is UP in the output from the show ldp mpls-l2 circuit command, and the Status is Active in the output of the show mpls vc-table command, a ping from CE1 to CE2 should be successful.

```
#show ldp mpls-l2-circuit
Transport    Client      VC       Trans    Local        Remote        Destination
VC ID        Binding     State    Type     VC Label     VC Label      Address
100          xe3         UP       Ethernet VLAN 26240   26240         2.2.2.2
200          xe2         UP       Ethernet VLAN 26241   26241         2.2.2.2

#show mpls vc-table

Configure a Static Layer-2 VC

For a static MPLS Layer 2 VC configuration:

1. Configure the VC with the manual option
2. Configure the VC FIB entry
3. Bind the VC; all steps are in the configurations that follow.

PE-1

`#configure terminal`	Enter configure mode.
`PE1(config)#mpls l2-circuit t3 300 2.2.2.2`	Configure the VC ID for PE1
`PE1(config-pseuodwire)#manual-pseudowire`	Configure pseudowire manual (no signaling)
`PE1(config-pseudowire)#exit`	Exit pseudowire config mode.
`PE1(config)#service-template ST3`	Create a service template ST3
`PE1(config-svc)#exit`	Exit the service template mode
`PE1(config)#interface xe2`	Add an FTN entry; where 1000 is the incoming label, 2000 is the outgoing label, 2.2.2.2 is the endpoint, xe1 is the incoming interface name, and xe2 is outgoing interface name.

`PE1(config)#switchport`	config interface as switch port.
`PE1(config-if)#mpls-l2-circuit t3 service-template ST3`	Bind the interface to the VC with service template.
`PE1(config-if)#exit`	Exit interface mode
`PE1(config)#mpls l2-circuit-fib-entry 300 1000 2000 2.2.2.2 xe1 xe2`	Configure the VC ID with the manual option (no signaling used).
`PE1(config)#commit`	Commit the transaction.

PE-2

`#configure terminal`	Enter configure mode.
`PE2(config)#mpls l2-circuit t3 300 1.1.1.1`	Configure the VC ID for PE2
`PE2(config-pseuodwire)#manual-pseudowire`	Configure pseudowire manual (no signaling)
`PE2(config-pseudowire)#exit`	Exit pseudowire config mode.
`PE2(config)#service-template ST3`	Create a service template ST3
`(config-svc)#exit`	Exit the service template mode
`PE2(config)#interface xe2`	Add an FTN entry; where 2000 is the incoming label, 1000 is the outgoing label, 1.1.1.1 is the endpoint, xe1 is the incoming interface name, and xe 2 is outgoing interface name.
`PE1(config)#switchport`	config interface as switch port.
`PE2(config-if)#mpls-l2-circuit t3 service-template ST3`	Bind the interface to the VC with service template.
`PE2(config-if)#exit`	Exit interface mode.
`PE2(config)#mpls l2-circuit-fib-entry 300 2000 1000 1.1.1.1 xe1 xe2`	Configure the VC ID with the manual option (no signaling used).
`PE2(config)#end`	Exit configure mode.
`PE2(config)#commit`	Commit the transaction.

Validation

This example shows number of configured VCs and its status.

```
#show mpls vc-table count
 -------------------------------
  Num PWs       : 3
  Active PWs    : 3
  OAM-only PWs : 0
  Inactive PWs : 0
 -------------------------------

 #show ldp mpls-l2-circuit count
 ----------------------------------------------
 Num Signaled PWs: 3        [UP: 3]
 ----------------------------------------------
```

Service Template Configuration

PE-1

`#configure terminal`	Enter configure mode.
`(config)#mpls l2-circuit vc1 10 2.2.2.2`	Configure the VC
`(config-pseudowire)# service-tpid dot1.ad`	Configure Service-TPID as dot1.ad (0x88a8)
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)# service-template template1`	Configure the service template.
`(config-svc)# match double-tag outer-vlan 204 inner-vlan 203`	Matching criteria for service template.
`(config-svc)#rewrite ingress pop outgoing-tpid dot1.ad`	Action performed for service template.
`(config-svc)#exit`	Exit configure SVC mode
`(config)#interface xe2`	Specify the interface `(xe2)` to be configured.
`(config-if)#switchport`	Switch to Layer-2 mode.
`(config-if)#dot1ad ethertype 0x88a8`	Configure interface ethertype as dot1.ad (0x88a8)
`(config-if)#mpls-l2-circuit vc1 service-template template1`	Bind the interface to the VC with service template.
`(config-if)#commit`	Commit the transaction.
`(config-if)#end`	End of Interface and configurations mode.

PE-2

`#configure terminal`	Enter configure mode.
`(config)#mpls l2-circuit vc1 10 1.1.1.1`	Configure the VC.
`(config-pseudowire)#service-tpid dot1.ad`	Configure Service-TPID as dot1.ad (0x88a8)
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)# service-template template1`	Configure the service template.
`(config-svc)# match double-tag outer-vlan 204 inner-vlan 203`	Matching criteria for service template.
`(config-svc)# rewrite ingress pop outgoing-tpid dot1.ad`	Action performed for service template.
`(config-svc)#exit`	Exit configure SVC mode
`(config)#interface xe2`	Specify the interface `(xe2)` to be configured.
`(config-if)#switchport`	Switch to Layer-2 mode.
`(config-if)#dot1ad ethertype 0x88a8`	Configure interface ethertype as dot1.ad (0x88a8)
`(config-if)#mpls-l2-circuit vc1 service-template template1`	Bind the interface to the VC with service template.
`(config-if)#commit`	Commit the transaction.
`(config-if)#end`	End of interface and configurations mode.

Service Template with Multiple Match

This is to validate the multiple match criteria support in a service template. When multiple match statements are configured only rewrite push is supported, rewrite translate and pop are not supported.

PE-1

`#configure terminal`	Enter configure mode.
`(config)#mpls l2-circuit t4 400 2.2.2.2`	Configure the VC for PE-1. In this example, t4 is the VC name, 400 is the VC ID, and 2.2.2.2 is the VC endpoint IP address.
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)#service-template template4`	Template configuration
`(config-svc)# match outer-vlan 700`	Allow VLAN 700 traffic on this VC
`(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200`	Allow double tag match with s+c tags
`(config-svc)# match untagged`	Allow untagged traffic
`(config-svc)# rewrite ingress push 300`	Push Action performed for service template
`(config)#interface xe2`	Specify the interface (xe2) to be configured.
`(config-if)#switchport`	Switch to Layer-2 mode.
`(config-if)#mpls-l2-circuit t4 service-template template4`	Bind the interface to the VC with service template.
`(config-if)#commit`	Commit the transaction.

PE-2

`#configure terminal`	Enter configure mode.
`(config)#mpls l2-circuit t4 400 1.1.1.1`	Configure the VC for PE-2. In this example, t4 is the VC name, 400 is the VC ID, and 1.1.1.1 is the VC endpoint IP address.
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)#service-template template4`	Template configuration
`(config-svc)# match outer-vlan 700`	Allow VLAN 700 traffic on this VC
`(config-svc)# match double-tag outer-vlan 1200 inner-vlan 3200`	Allow double tag match with s+c tags
`(config-svc)# match untagged`	Allow untagged traffic
`(config-svc)# rewrite ingress push 300`	Push Action performed for service template
`(config)#interface xe2`	Specify the interface (xe2) to be configured.
`(config-if)#switchport`	Switch to Layer-2 mode.
`(config-if)#mpls-l2-circuit t4 service-template template4`	Bind the interface to the VC with service template.
`(config-if)#commit`	Commit the transaction.

VPWS-CFM

The below examples contains of Ethernet Operations and Management (OAM) configurations using the Connectivity Fault Management (CFM) protocol.

Connectivity Fault Management detects, verifies, isolates and notifies connectivity failures on a Virtual Bridged LAN (B-VLAN) based on the protocol standard specified in IEEE 802.1ag 2007. It provides discovery and verification of paths through 802.1 bridges and LANs and is part of the Operation, Administration and Management (OAM) module. CFM is transparent to customer data being transported by a network and is capable of providing maximum fault management.

Prerequisite

Configure basic VPWS configuration as in above section.

1. Configure the IP address and OSPF for the PE-1, P (Provider), and PE-2 routers.
2. Configure MPLS and LDP on PE-1, P, and PE-2, and LDP targeted peer for the PE-1 and PE-2 routers. (If RSVP is used for configuring trunks, LDP must be configured on PE-1 and PE-2, and RSVP must be configured on PE-1, P, and PE-2.)

PE1

`PE1#configure terminal`	Enter configure mode.
`PE1(config)#ethernet cfm domain-type character-string domain-name MD-05 level 0 mip-creation none`	Create cfm domain with type as character string and set mip creation criteria to default.

`PE1(config-ether-cfm)#service ma-type string ma-name CFM-2`	Create ma type as string and configure the ma
`PE1(config-ether-cfm-ma)# vpws vc1`	Configure vpws to associate to the MA
`PE1(config-ether-cfm-ma)# ethernet cfm mep up mpid 115 active true vpws vc1`	Create mep up on vpws.
`PE1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast.
`PE1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit CFM MEP configuration mode.
`PE1(config-ether-cfm-ma)#mep crosscheck mpid 1115`	Configure crosscheck to remote MEP.
`PE1(config-ether-cfm-ma)#cc interval 10ms`	Enable cc interval for 10 millisecond.
`PE1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit CFM MA configuration mode.
`PE1(config-ether-cfm)#exit`	Exit ethernet CFM mode.
`PE1(config)#commit`	Commit the configuration
`PE1(config)#exit`	Exit the configure terminal mode

PE2

`PE2#configure terminal`	Enter configure mode.
`PE2(config)#ethernet cfm domain-type character-string domain-name MD-05 level 0 mip-creation none`	Create cfm domain with type as character string and set mip creation criteria to default.
`PE2(config-ether-cfm)#service ma-type string ma-name CFM-2`	Create ma type as string and set mip creation criteria to default.
`PE2(config-ether-cfm-ma)#vpws vc1`	Configure vpws to associate to the MA
`PE2(config-ether-cfm-ma)#ethernet cfm mep down mpid 1115 active true vpws vc1`	Create mep up on vpws.
`PE2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast.
`PE2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit CFM MEP configuration mode
`PE2(config-ether-cfm-ma)#mep crosscheck mpid 115`	Configure crosscheck to remote MEP in VLAN 512.
`PE2(config-ether-cfm-ma)#cc interval 10ms`	Enable cc interval for 10 millisecond.
`PE2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit CFM MA configuration mode.
`PE2(config-ether-cfm)#exit`	Exit ethernet CFM mode.
`PE2(config)#commit`	Commit the configuration
`PE2(config)#exit`	Exit the configure terminal mode

Layer 3 Virtual Private network Configuration

CHAPTER 1 L3VPN over EVPN MPLS Configuration

This chapter includes step-by-step configurations for L3VPN over EVPN MPLS.

Overview

L3vpn EVPN MPLS ensures that we are able to do the Ip-vrf to Ip-vrf routing with MPLS as overlay. We can ensure that with this model we can do the Anycast gateway using EVPN concepts. L3VPN EVPN MPLS is a way of integrating the interface-less model. In this model we will use non-irb interface i.e. L3 interface for the Ip-Vrf routing.

Using Anycast gateway idea is to have the Multi-Homed PE nodes to work in active-standby mode. From remote perspective at one time only one Peer PE will be active. If that PE goes down, then a new tunnel to the peer PE will be established for the traffic. From the access-side Traffic can reach to either of the peer PE and sent across the remote PE nodes. This way we can achieve redundancy using the anycast mac-address.

Topology

Below Topology depicts the topology for the L3VPN over EVPN MPLS configuration examples for both single homing and multi-homing with SR/LDP. MLAG configured between PE1 and PE2 to achieve multi-homing Active-Standby connected to CE1.

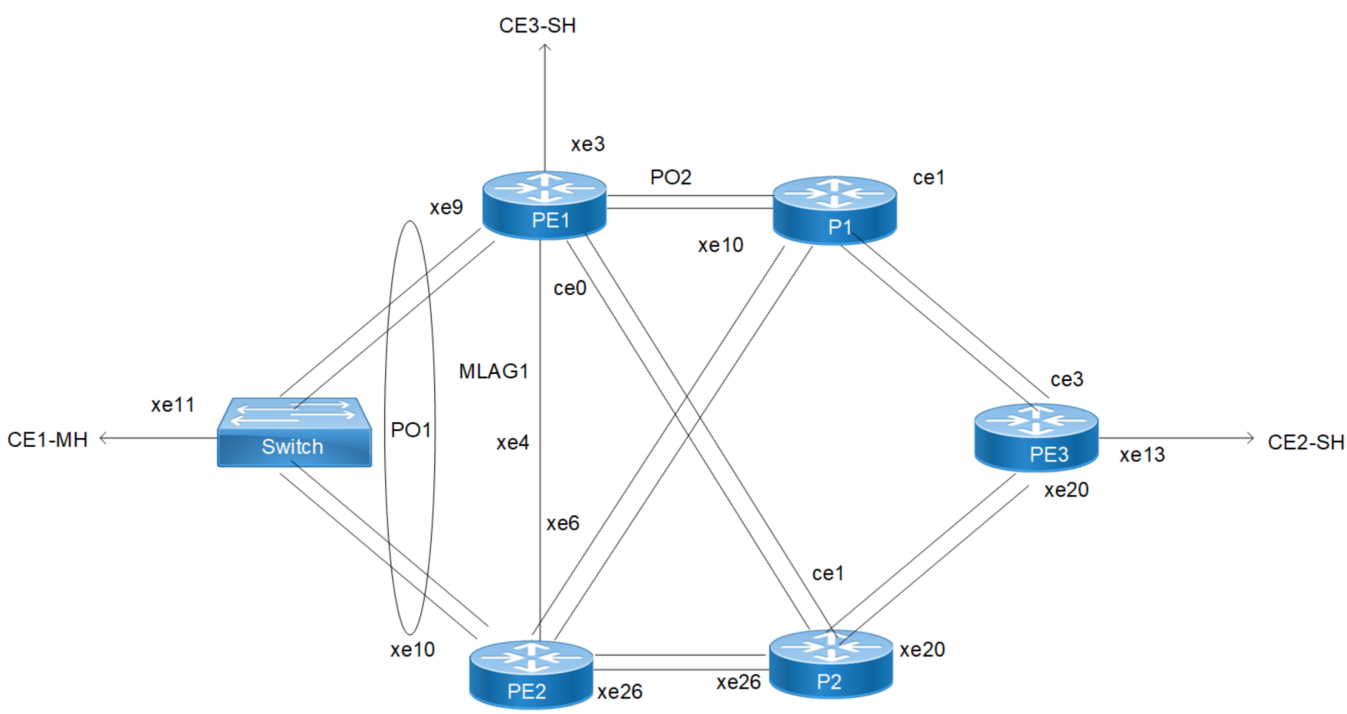

Figure 1-29: Topology diagram for L3VPN over EVPN MPLS

Configuration

PE1

Loopback Interface:

#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 1.1.1.1/32 secondary	Configure IP address on loopback interface.
(config-if)# prefix-sid index 1	Configuring prefix sid for segment id
(config-if)#commit	Commit the transaction.
(config-if)#exit	Exit interface mode

Global EVPN MPLS Command:

#configure terminal	Enter configuration mode.
(config)#load-balance enable	Enable Load balance
(config)#hardware-profile filter evpn-mpls-mh enable	Enable hardware profile for evpn mpls multihoming
(config)#evpn mpls enable	Enable EVPN MPLS
(config)#evpn mpls irb	Enable EVPN MPLS IRB
(config)#evpn mpls multihoming enable	Enable EVPN MPLS multihoming
(config)#evpn mpls vtep-ip-global 1.1.1.1	Configuring VTEP global IP to loopback IP
(config)#evpn irb-forwarding anycast-gateway-mac 0011.2233.4466	Confiiguring anycast gateway mac for MH. Note: Anycast gateway is mandatory for MH nodes.
(config)#commit	Commit candidate configuration to be running configuration Note: Reload is required after Enabling/Disabling EVPN MPLS Feature.

Configure SR:

(config)#segment-routing	Configure segment routing
(config-sr)# mpls sr-prefer	Set mpls prefer segment routing over other protocols
(config-sr)#exit	Exit from router sr mode
(config)#commit	Commit the transaction.

Configure LDP:

(config)#router ldp	Enter the Router LDP mode.
(config-router)# transport-address ipv4 1.1.1.1	Configuring transport address
(config-router)#exit	Exit from router target peer and LDP mode
(config)#commit	Commit the transaction.

MLAG Configuration:

(config)#interface mlag1	Create mlag interface
(config-if)# switchport	Configuring as L2 port
(config-if)# load-interval 30	Configure load interval
(config-if)# exit	Exit from interface mode
(config)#interface po1	Configure dynamic lag
(config-if)# switchport	Configuring as L2 port
(config-if)# mtu 1500	Set mtu value
(config-if)# mlag 1	Attach mlag to po1. Note: While creating po1 subifp, this needs to be un-configured and configured back
(config-if)#interface xe10	Enter interface mode for xe10
(config-if)# channel-group 1 mode active	Attach lag interface po1
(config-if)#exit	Exit interface mode
(config)#mcec domain configuration	Create mcec domain
(config-mcec-domain)# domain-address 1111.2222.3333	Configure mcec domain address
(config-mcec-domain)# domain-system-number 1	Configure system number. Active node should have lower value.
(config-mcec-domain)# intra-domain-link xe4	Configure ideal interface between mlag devices
(config-mcec-domain)# domain-hello-timeout long	Configure domain hello timeout

Interface Configuration Network Side:

(config-if)#interface ce0	Configure network interface ce0
(config-if)# ip address 20.1.1.1/24	Configure IP address on the interface.
(config-if)# mtu 1522	Configure mtu
(config-if)# label-switching	Enable label switching on the interface.
(config-if)# mpls ldp-igp sync ospf	Configure mpls igp sync
(config-if)# ip ospf network point-to-point	Configure ospf as p2p
(config-if)# enable-ldp ipv4	Enable LDP on the physical interface
(config)#interface po2	Create channel group po2
(config-if)# ip address 10.1.1.1/24	Configure IP address on the interface.
(config-if)# mtu 2000	Configure mtu
(config-if)# label-switching	Enable label switching on the interface.
(config-if)# mpls ldp-igp sync ospf	Configure mpls igp sync
(config-if)# ip ospf network point-to-point	Configure ospf as p2p
(config-if)# enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#interface xe18	Enter interface mode for xe18
(config-if)# channel-group 2 mode active	Attach lag interface po2
(config-if)#interface xe19	Enter interface mode for xe19

(config-if)# channel-group 2 mode active	Attach lag interface po2
(config)#commit	Commit the transaction.

OSPF Configuration:

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# network 1.1.1.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 10.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# network 20.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# ospf segment-routing global block 16000 23000	Configure SR global block for ospf
(config-router)# segment-routing mpls	Enable ospf SR
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the transaction.

BGP Configuration:

(config)#router bgp 100	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 5.5.5.5 remote-as 100	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 5.5.5.5 fall-over bfd multihop	Configure BFD
(config-router)# neighbor 5.5.5.5 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Enter in to address family ipv4 unicast mode
(config-router-af)# neighbor 5.5.5.5 activate	Activate PE3 neighbor
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family l2vpn evpn	Enter in to address family l2vpn vpn
(config-router-af)# neighbor 5.5.5.5 activate	Activate PE3 neighbor
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 unicast	Enter in to address family ipv6 unicast mode
(config-router-af)# neighbor 5.5.5.5 activate	Activate PE3 neighbor
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv4 vrf vrf102	Enter in to address family ipv4 vrf vrf102
(config-router-af)# redistribute connected	Redistribute connected networks in to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv4 vrf vrf101	Enter in to address family ipv4 vrf vrf102
(config-router-af)# redistribute connected	Redistribute connected networks in to bgp

(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 vrf vrf101	Enter in to address family ipv6 vrf vrf101
(config-router-af)# redistribute connected	Redistribute connected networks in to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 vrf vrf102	Enter in to address family ipv6 vrf vrf102
(config-router-af)# redistribute connected	Redistribute connected networks in to bgp
(config-router-af)# exit-address-family	Exit address family

IP VRF Configuration:

(config-vrf)#ip vrf vrf102	Enter VRF mode
(config-vrf)# rd 10001:102	Configuring Route-Distinguisher value
(config-vrf)# route-target both 1.1.1.1:102	Configure RT value
(config-vrf)# l3vni 102	Configure L3VNID to populate route through evpn
(config-vrf)#ip vrf vrf101	Enter VRF mode
(config-vrf)# rd 10001:1	Configuring Route-Distinguisher value
(config-vrf)# route-target both 1.1.1.1:1	Configure RT value
(config-vrf)# l3vni 101	Configure L3VNID to populate route through evpn

L3 VRF Port Configuration:

(config-if)#interface xe3	Enter the Interface mode for xe3. This is for untagged traffic
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 100.1.1.1/24	Assign ipv4 address
(config-if)# ipv6 address 1000::1/64	Assign ipv6 address
(config-if)#interface xe3.1	Create xe3.1 subifp
(config-if)# encapsulation dot1q 10	Configure encapsulation as single tagged
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 110.1.1.1/24	Assign ipv4 address
(config-if)# ipv6 address 1100::1/64	Assign ipv6 address
(config-if)#interface xe3.2	Create xe3.2 subifp
(config-if)# encapsulation dot1q 11 inner-dot1q 11	Configure encapsulation as double tagged
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 120.1.1.1/24	Assign ipv4 address
(config-if)# ipv6 address 1200::1/64	Assign ipv6 address
(config-if)#interface xe3.11	Create xe3.11 subifp
(config-if)# encapsulation dot1q 11	Configure encapsulation as single tagged
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 111.1.1.1/24	Assign ipv4 address
(config-if)# ipv6 address 1110::1/64	Assign ipv6 address

(config-if)#interface po1.11	Create po1 subinterface. We need to unconfigure mlag under po1 before creating subinterface.
(config-if)# encapsulation dot1q 11	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac
(config-if)# ip address 150.11.1.1/24	Assign ipv4 address
(config-if)#interface po1.12	Create po1 subinterface.
(config-if)# encapsulation dot1q 12	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac
(config-if)# ip address 150.12.1.1/24	Assign ipv4 address
(config-if)#interface po1.13	Create po1 subinterface.
(config-if)# encapsulation dot1q 13	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac
(config-if)# ip address 150.13.1.1/24	Assign ipv4 address
(config-if)#interface po1.14	Create po1 subinterface.
(config-if)# encapsulation dot1q 14	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac
(config-if)# ip address 150.14.1.1/24	Assign ipv4 address
(config-if)#interface po1.15	Create po1 subinterface.
(config-if)# encapsulation dot1q 15	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac
(config-if)# ip address 150.15.1.1/24	Assign ipv4 address
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
PE2 Configuration:	
Loopback Interface:	
#configure terminal	Enter configuration mode.
(config)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 2.2.2.2/32 secondary	Configure IP address on loopback interface.
(config-if)# prefix-sid index 2	Configuring prefix sid for segment id
(config-if)#commit	Commit the transaction.
(config-if)#exit	Exit interface mode

Global EVPN MPLS Command:

`#configure terminal`	Enter configuration mode.
`(config)#load-balance enable`	Enable Load balance
`(config)#hardware-profile filter evpn-mpls-mh enable`	Enable hardware profile for evpn mpls multihoming
`(config)#evpn mpls enable`	Enable EVPN MPLS
`(config)#evpn mpls irb`	Enable EVPN MPLS IRB
`(config)#evpn mpls multihoming enable`	Enable EVPN MPLS multihoming
`(config)#evpn mpls vtep-ip-global 2.2.2.2`	Configuring VTEP global IP to loopback IP
`(config)#evpn irb-forwarding anycast-gateway-mac 0011.2233.4466`	Configure Anycast gateway mac for MH. This command is mandatory for MH nodes.
`(config)#commit`	Commit candidate configuration to be running configuration Note: Reload is required after Enabling/Disabling EVPN MPLS Feature.

Configure SR:

`(config)#segment-routing`	Configure segment routing
`(config-sr)# mpls sr-prefer`	Set mpls prefer segment routing over other protocols
`(config-sr)#exit`	Exit from router sr mode
`(config)#commit`	Commit the transaction.

Configure LDP:

`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)# transport-address ipv4 2.2.2.2`	Configuring transport address
`(config-router)#exit`	Exit from router target peer and LDP mode
`(config)#commit`	Commit the transaction.

MLAG Configuration:

`(config)#interface mlag1`	Create mlag interface
`(config-if)# switchport`	Configuring as L2 port
`(config-if)# load-interval 30`	Configure load interval
`(config-if)# exit`	Exit from interface mode
`(config)#interface po1`	Configure dynamic lag
`(config-if)# switchport`	Configuring as L2 port
`(config-if)# mtu 1500`	Set mtu value
`(config-if)# mlag 1`	Attach mlag
`(config-if)#interface xe9`	Enter interface mode
`(config-if)# speed 10g`	Set speed as 10g
`(config-if)# channel-group 1 mode active`	Attach the channel group po1

(config-if)# exit	Exit from interface mode
(config)#mcec domain configuration	Create mcec domain
(config-mcec-domain)# domain-address 1111.2222.3333	Configure mcec domain address
(config-mcec-domain)# domain-system-number 2	Configure system number
(config-mcec-domain)# intra-domain-link xe4	Configure ideal interface between mlag devices
(config-mcec-domain)# domain-hello-timeout long	Configure domain hello timeout
(config)#commit	Commit the transaction.

Interface Configuration Network Side:

(config-if)#interface xe6	Enter the Interface mode for xe6.
(config-if)# ip address 30.1.1.1/24	Configure ipv4 address
(config-if)# mtu 1522	Configure mtu
(config-if)# label-switching	Enable label switching on the interface.
(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync
(config-if)# ip ospf network point-to-point	Configure ospf as p2p
(config-if)# enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#interface xe26	Enter the Interface mode for xe26.
(config-if)# ip address 40.1.1.1/24	Configure ipv4 address
(config-if)# mtu 2000	Configure mtu
(config-if)# label-switching	Enable label switching on the interface.
(config-if)# mpls ldp-igp sync ospf	Configure ldp sync with ospf
(config-if)# ip ospf network point-to-point	Configure ospf as p2p
(config-if)# enable-ldp ipv4	Enable LDP on the physical interface
(config-router)#exit	Exit interface mode
(config)#commit	Commit the transaction.

OSPF Configuration:

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# network 1.1.1.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 10.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# network 20.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# ospf segment-routing global block 16000 23000	Configure SR global block for ospf
(config-router)# segment-routing mpls	Enable ospf SR
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the transaction.

BGP Configuration:

(config)#router bgp 100	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 5.5.5.5 remote-as 100	Configuring PE3 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 5.5.5.5 fall-over bfd multihop	Configure BFD
(config-router)# neighbor 5.5.5.5 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Enter in to address family ipv4 unicast mode
(config-router-af)# neighbor 5.5.5.5 activate	Activate PE3 neighbor
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family l2vpn evpn	Enter in to address family l2vpn vpn
(config-router-af)# neighbor 5.5.5.5 activate	Activate PE3 neighbor
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 unicast	Enter in to address family ipv6 unicast mode
(config-router-af)# neighbor 5.5.5.5 activate	Activate PE3 neighbor
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv4 vrf vrf102	Enter in to address family ipv4 vrf vrf102
(config-router-af)# redistribute connected	Redistribute connected networks in to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv4 vrf vrf101	Enter in to address family ipv4 vrf vrf102
(config-router-af)# redistribute connected	Redistribute connected networks in to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 vrf vrf101	Enter in to address family ipv6 vrf vrf101
(config-router-af)# redistribute connected	Redistribute connected networks in to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 vrf vrf102	Enter in to address family ipv6 vrf vrf102
(config-router-af)# redistribute connected	Redistribute connected networks in to bgp
(config-router-af)# exit-address-family	Exit address family
(config)#commit	Commit the transaction.

IP VRF Configuration:

(config-vrf)#ip vrf vrf102	Enter VRF mode
(config-vrf)# rd 10001:102	Configuring Route-Distinguisher value
(config-vrf)# route-target both 1.1.1.1:102	Configure RT
(config-vrf)# l3vni 102	Configure L3VNI to send ipv4 route through evpn

(config-vrf)#ip vrf vrf101	Create ip vrf vrf101
(config-vrf)# rd 10001:1	Configuring Route-Distinguisher value
(config-vrf)# route-target both 1.1.1.1:1	Configure RT
(config-vrf)# l3vni 101	Configure L3VNI to send ipv4 route through evpn
(config)#commit	Commit the transaction.

L3 VRF Port Configuration:

(config-if)#interface po1.11	Create po1 subinterface. We need to unconfigure mlag under po1 before creating subinterface.
(config-if)# encapsulation dot1q 11	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac for multi-homing
(config-if)# ip address 150.11.1.1/24	Assign ipv4 address
(config-if)#interface po1.12	Create po1 subinterface.
(config-if)# encapsulation dot1q 12	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac for multi-homing
(config-if)# ip address 150.12.1.1/24	Assign ipv4 address
(config-if)#interface po1.13	Create po1 subinterface.
(config-if)# encapsulation dot1q 13	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac for multi-homing
(config-if)# ip address 150.13.1.1/24	Assign ipv4 address
(config-if)#interface po1.14	Create po1 subinterface.
(config-if)# encapsulation dot1q 14	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 150.14.1.1/24	Assign ipv4 address
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac for multi-homing
(config-if)#interface po1.15	Create po1 subinterface.
(config-if)# encapsulation dot1q 15	Configure encapsulation type and value
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 150.15.1.1/24	Assign ipv4 address
(config-if)# evpn irb-if-forwarding anycast-gateway-mac	Configure anycast gateway mac for multi-homing
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.

P1:

(config)#segment-routing	Configure SR.
(config-sr)# mpls sr-prefer	Prefer SR over other protocol.
(config-sr)#exit	Exit sr mode.
(config)#router ldp	Configure router ldp
(config-router)# transport-address ipv4 3.3.3.3	Configure transport address.
(config-router)#exit	Exit
(config)#interface po2	Configure dynamic LAG po2
(config-if)# ip address 10.1.1.2/24	Configure ipv4 address
(config-if)# mtu 2000	Configure MTU
(config-if)# label-switching	Configure label switching
(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync
(config-if)# ip ospf network point-to-point	Configure ospf p2p
(config-if)# enable-ldp ipv4	Enable ldp
(config-if)#interface ce1	Configure network interface ce1
(config-if)# ip address 60.1.1.1/24	Configure ipv4 address
(config-if)# mtu 1522	Configure MTU
(config-if)# label-switching	Configure label switching
(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync
(config-if)# ip ospf network point-to-point	Configure ospf p2p
(config-if)# enable-ldp ipv4	Enable ldp
(config-if)#interface lo	Configure loopback interface
(config-if)# ip address 3.3.3.3/32 secondary	Configure secondary ip
(config-if)# prefix-sid absolute 16003	Configure SR segment id
(config-if)#interface xe10	Configure network interface xe10
(config-if)# speed 10g	Set speed 10g
(config-if)# ip address 30.1.1.2/24	Configure ipv4 address
(config-if)# mtu 1522	Configure MTU
(config-if)# label-switching	Configure label switching
(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync
(config-if)# ip ospf network point-to-point	Configure ospf p2p
(config-if)# enable-ldp ipv4	Enable ldp
(config-if)#interface xe14	Configure network interface xe14
(config-if)# ip address 50.1.1.1/24	Configure ipv4 address
(config-if)# mtu 1522	Configure MTU
(config-if)# label-switching	Configure label switching
(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync
(config-if)# ip ospf network point-to-point	Configure ospf p2p
(config-if)# enable-ldp ipv4	Enable ldp

(config-if)#interface xe16	Enter interface mode
(config-if)# channel-group 2 mode active	Map dynamic lag po2
(config-if)#interface xe17	Enter interface mode
(config-if)# channel-group 2 mode active	Map dynamic lag po2
(config-if)# exit	Exit
(config)#router ospf 1	Configure router ospf 1
(config-router)# network 3.3.3.3/32 area 0.0.0.0	Add loopback ip to ospf
(config-router)# network 10.1.1.0/24 area 0.0.0.0	Add network address
(config-router)# network 30.1.1.0/24 area 0.0.0.0	Add network address
(config-router)# network 50.1.1.0/24 area 0.0.0.0	Add network address
(config-router)# network 60.1.1.0/24 area 0.0.0.0	Add network address
(config-router)# segment-routing mpls	Enable SR ospf

P2:

(config)#segment-routing	Configure SR.
(config-sr)# mpls sr-prefer	Prefer SR over other protocol.
(config)#exit	Exit sr mode.
(config-sr)#router ldp	Configure router ldp
(config-router)# transport-address ipv4 4.4.4.4	Configure transport address.
(config-router)#exit	Exit
(config)#interface ce1	Configure network interface ce1
(config-if)# ip address 20.1.1.2/24	Configure ipv4 address
(config-if)# mtu 1522	Configure MTU
(config-if)# label-switching	Configure label switching
(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync
(config-if)# ip ospf network point-to-point	Configure ospf p2p
(config-if)# enable-ldp ipv4	Enable ldp
(config-if)#interface lo	Configure loopback interface
(config-if)# ip address 4.4.4.4/32 secondary	Configure secondary ip
(config-if)# prefix-sid absolute 16004	Configure SR segment id
(config-if)#interface xe14	Configure network interface xe14
(config-if)# ip address 50.1.1.2/24	Configure ipv4 address
(config-if)# mtu 1522	Configure MTU
(config-if)# label-switching	Configure label switching
(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync

(config-if)# ip ospf network point-to-point	Configure ospf p2p
(config-if)# enable-ldp ipv4	Enable ldp

(config-router)# network 50.1.1.0/24 area 0.0.0.0	Add network address
(config-router)# network 70.1.1.0/24 area 0.0.0.0	Add network address
(config-router)# segment-routing mpls	Enable SR ospf

PE3

Loopback Interface:	
#configure terminal	Enter configuration mode.
(config-if)#interface lo	Enter the Interface mode for the loopback interface.
(config-if)# ip address 5.5.5.5/32 secondary	Configure IP address on loopback interface.
(config-if)# prefix-sid absolute 16005	Configure SR segment id
(config)#commit	Commit the transaction.

Global EVPN MPLS Command:

(config)#evpn mpls enable	Enable EVPN MPLS
(config)#evpn mpls irb	Enable EVPN MPLS IRB

(config)#commit	Commit candidate configuration to be running configuration Note: Reload is required after Enabling/Disabling EVPN MPLS Feature
(config)#evpn mpls vtep-ip-global 5.5.5.5	Configuring VTEP global IP to loopback IP
(config-evpn-mpls)#commit	Commit the transaction.

IP VRF Configuration:

(config-vrf)#ip vrf vrf102	Enter VRF mode
(config-vrf)# rd 10001:102	Configuring Route-Distinguisher value
(config-vrf)# route-target both 1.1.1.1:102	Configure RT value
(config-vrf)# l3vni 102	Configure L3VNI to send ipv4 route through evpn
(config-vrf)#ip vrf vrf101	Create ip vrf vrf101
(config-vrf)# rd 10002:1	Configuring Route-Distinguisher value
(config-vrf)# route-target both 1.1.1.1:1	Configure RT value
(config-vrf)# l3vni 101	Configure L3VNI to send ipv4 route through evpn
(config)#commit	Commit the transaction.

Cofigure SR:

(config)#segment-routing	Configure SR
(config-sr)# mpls sr-prefer	Prefer SR over other protocols for mpls
(config)#commit	Commit the transaction.
Global LDP:	
(config)#router ldp	Enter the Router LDP mode.
(config-router)# transport-address ipv4 5.5.5.5	Configure transport address
(config-router)#exit	Exit
(config)#commit	Commit the transaction.

Interface Configuration Network Side:

(config-if)#interface ce3	Configure network interface ce3
(config-if)# ip address 60.1.1.2/24	Configure ipv4 address
(config-if)# mtu 1522	Configure MTU
(config-if)# label-switching	Configure label switching
(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync
(config-if)# ip ospf network point-to-point	Configure ospf p2p
(config-if)# enable-ldp ipv4	Enable ldp
(config-if)#interface xe20	Enter the Interface mode for xe20.
(config-if)# ip address 70.1.1.2/24	Configure ipv4 address
(config-if)# mtu 1522	Configure MTU
(config-if)# label-switching	Configure label switching

(config-if)# mpls ldp-igp sync ospf	Configure ldp ospf sync
(config-if)# ip ospf network point-to-point	Configure ospf p2p
(config-if)# enable-ldp ipv4	Enable ldp
(config)#commit	Commit the transaction.

OSPF Configuration:

(config)#router ospf 1	Enter the Router OSPF mode.
(config-router)# network 5.5.5.5/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)# network 60.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# network 70.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)# segment-routing mpls	Enable SR ospf
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#commit	Commit the transaction.

BGP Configuration:

(config-router)#router bgp 100	Enter the Router BGP mode, ASN: 100
(config-router)# neighbor 1.1.1.1 remote-as 100	Configuring PE1 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 1.1.1.1 fall-over bfd multihop	Configure BFD
(config-router)# neighbor 2.2.2.2 remote-as 100	Configuring PE2 as iBGP neighbor using it's loopback IP
(config-router)# neighbor 2.2.2.2 fall-over bfd multihop	Configure BFD
(config-router)# neighbor 1.1.1.1 update-source lo	Source of routing updates as loopback
(config-router)# neighbor 2.2.2.2 update-source lo	Source of routing updates as loopback
(config-router)# address-family ipv4 unicast	Enter ipv4 unicast address family
(config-router-af)# neighbor 1.1.1.1 activate	Activate neighbor PE1
(config-router-af)# neighbor 2.2.2.2 activate	Activate neighbor PE2
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family l2vpn evpn	Enter evpn address family
(config-router-af)# neighbor 1.1.1.1 activate	Activate neighbor PE1
(config-router-af)# neighbor 2.2.2.2 activate	Activate neighbor PE2
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 unicast	Enter ipv6 unicast address family
(config-router-af)# neighbor 1.1.1.1 activate	Activate neighbor PE1

(config-router-af)# neighbor 2.2.2.2 activate	Activate neighbor PE2
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv4 vrf vrf102	Enter vrf vrf102 address family
(config-router-af)# redistribute connected	Redisdribute vrf connected routes to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 vrf vrf102	Enter ipv6 vrf vrf102 address family
(config-router-af)# redistribute connected	Redisdribute vrf connected routes to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv4 vrf vrf101	Enter vrf vrf102 address family
(config-router-af)# redistribute connected	Redisdribute vrf connected routes to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)# address-family ipv6 vrf vrf101	Enter ipv6 vrf vrf101 address family
(config-router-af)# redistribute connected	Redisdribute vrf connected routes to bgp
(config-router-af)# exit-address-family	Exit address family
(config-router)#exit	Exit bgp mode
(config)#commit	Commit the transaction.

L3 VRF Port Configuration:

(config-if)#interface xe13	Enter the Interface mode for xe3. This is for untagged traffic
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 201.1.1.1/24	Assign ipv4 address
(config-if)# ipv6 address 2001::1/64	Assign ipv6 address
(config-if)#interface xe13.1	Create subinterface xe13.1
(config-if)# encapsulation dot1q 10	Configure encapsulation single tagged
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 210.1.1.1/24	Assign ipv4 address
(config-if)# ipv6 address 2100::1/64	Assign ipv6 address
(config-if)#interface xe13.2	Create subinterface xe13.2
(config-if)# encapsulation dot1q 11 inner-dot1q 11	Configure encapsulation double tagged
(config-if)# ip vrf forwarding vrf101	Map the vrf vrf101
(config-if)# ip address 220.1.1.1/24	Assign ipv4 address
(config-if)# ipv6 address 2200::1/64	Assign ipv6 address
(config)#commit	Commit the transaction.

CHAPTER 2 L3VPN GR Configuration

Using BGP graceful restart, the data-forwarding plane of a router can continue to process and forward packets even if the control plane - which is responsible for determining best paths - fails. Graceful restart also reduces routing flaps, stabilizing the network and reducing control-plane resource consumption.

By exchanging a new BGP capability (BGP capability code 64) in the initial BGP open messages that establish the session, the restarting router and its peers show that they are aware of the BGP graceful restart mechanism when the initial BGP connection is established. In addition, the restarting router provides its peers with a list of supported address-families (VPNv4, IPv4, and IPV6) for which it can maintain a forwarding state across a BGP restart.

The peer router's TCP connection might be cleared, when the router's BGP process is restarted. Under normal circumstances, this would cause the peer router to clear all routes associated with the restarting router. But with a BGP graceful restart, this doesn't happen. Instead, in expectation of the restarting router shortly re-establishing the BGP session, the peer router marks all routes as “stale” yet continues to use them to forward packets. Likewise, the restarting router also continues forwarding packets in the interim.

When the restarting router opens the new BGP session, it will again send BGP capability 64 to its peers. But this time, flags will be set in the graceful restart capabilities exchange to let the peer router know that the BGP process has restarted.

The goal of the BGP graceful restart was to minimize the duration and reach of an outage associated with a failed BGP process. To do this, the software extensions must be deployed on both the router restarting the BGP process and the BGP peers of that router. The peers help the BGP process regain lost forwarding information and also help isolate failures from the rest of the network.

While forwarding packets, the peer router will refresh the restarting router with any relevant BGP routing information base (RIB) updates. The peer signals that it has finished sending the updates with an "End-of-RIB" (EOR) marker - an “empty” BGP update message. EOR markers help speed convergence because once the restarting router has received them from all peers, it can begin best-path selection again using the new routing information. Similarly, the restarting router then sends any updates to its peer routers and uses the EOR marker to indicate the completion of the process.

As part of this feature, we will be extending the feature for VPNv4 AF.

Topology

In the below example shows to configure BGP VPNv4 neighborship between PE1 and PE2.

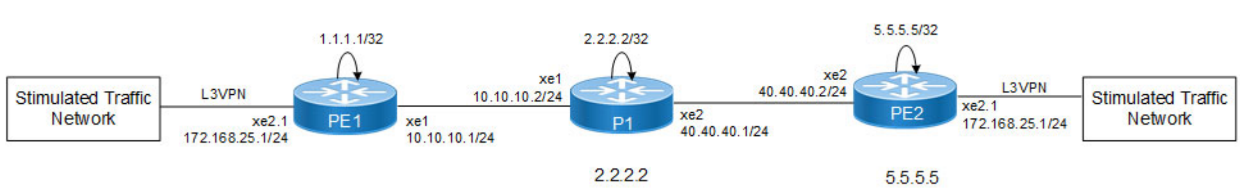

Figure 2-30: L3VPN GR Topology

L3VPN GR Configuration

Configuration

Below are the configurations and validations of L3VPN GR with OSPF as IGP. We can also configure ISIS as IGP and LDP/RSVP as transport.

PE1

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to 1.1.1.1/32
`(config-if)#exit`	Exit interface mode.
`(config)#ip-vrf l3vpn`	Configure IP VRF L3VPN.
`(config-vrf)#rd 1:300`	Enter RD value.
`(config-vrf)#route-target both 300:400`	Enter RT value.
`(config-vrf)#exit`	Exiting from VRF mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1.
`(config-router)#targeted-peer ipv4 2.2.2.2`	Configure targeted peer.
`(config-router-targeted-peer)#exit-targeted- peer-mode`	Exit-targeted-peer-mode
`(config-router)#targeted-peer ipv4 5.5.5.5`	Configure targeted peer.
`(config-router-targeted-peer)#exit-targeted- peer-mode`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure IPv4 address for xe1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2.1`	Configure access-port .
`(config-if)#description MPLS-L3VPN`	Giving Interface Description
`(config-if)#encapsulation dot1q 4`	Setting Encapsulation to dot1q with VLAN ID 4
`(config-if)#load-interval 30`	Load interval setting
`(config-if)#ip vrf forwarding l3vpn`	Bind the interface connected to the CE router with VRF l3vpn
`(config-if)#ip address 172.168.25.2/24`	Assign the IPv4 address.
`(config)#router ospf 1`	Configure the routing process and specify the Process ID 100. The Process ID should be a unique positive integer identifying the routing process.
`(config)#ospf router-id 1.1.1.1`	Configure OSPF router-ID same as loopback interface IP address

(config-router) #network 1.1.1.1/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router) #network 10.10.10.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter router BGP mode
(config-router)#bgp router-id 1.1.1.1	Configuring the BGP router id 1.1.1.1.
(config-router)#bgp graceful-restart restart-time 100	Enable BGP GR with restart timer 100.
(config-router)#neighbor 5.5.5.5 remote-as 100	Configure neighbor 5.5.5.5.
(config-router)#neighbor 5.5.5.5 update-source lo	Update source lo for neighbor 5.5.5.5.
(config-router)#address-family ipv4 unicast	Enter address-family IPv4 unicast.
(config-router-af)#redistribute connected	Redistribute connected.
(config-router)#neighbor 5.5.5.5 activate	Activate neighbor.
(config-router)#address-family vpnv4 unicast	Entering Address family VPNv4 unicast.
(config-router-af)#neighbor 5.5.5.5 activate	Activate the neighbor 5.5.5.5.
(config-router-af)#neighbor 5.5.5.5 capability graceful-restart	Activate capability graceful restart for neighbor 5.5.5.5.
(config-router-af)#exit-address-family	Exit address family.
(config-router)#address-family ipv4 vrf l3vpn	Entering address family.
(config-router-af)#redistribute connected	Redistribute connected.
(config-router)#neighbor 172.168.25.1 remote-as 600	Configure neighbor 172.168.25.1.
(config-router)#neighbor 172.168.25.1 activate	Activate neighbor.
(config-router-af)#commit	Commit all the transactions.

P1

#configure terminal	Enter configuration mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 2.2.2.2/32 secondary	Set the IP address of the loopback interface to 2.2.2.2/32.
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter router mode for LDP.
(config-router)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2.
(config-router)#transport-address ipv4 2.2.2.2 0	Configure the transport address for IPV4 (for IPV6, use ipv6) to be used for a TCP session over which LDP will run.
Note:	It is preferable to use the loopback address as the transport address.
(config-router)#targeted-peer ipv4 1.1.1.1	Configure targeted peer.
(config-router-targeted-peer)#exit-targeted- peer-mode	Exit-targeted-peer-mode.
(config-router)#targeted-peer ipv4 5.5.5.5	Configure targeted peer.

`(config-router-targeted-peer)#exit-targeted- peer-mode`	Exit-targeted-peer-mode.
`(config-router)#exit`	Exit-targeted-peer-mode.
`(config-if)#exit`	Exit router mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.2/24`	Configure IPv4 address for xe1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 40.40.40.1/24`	Configure IPv4 address for xe2.
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process and specify the Process ID. The Process ID should be a unique positive integer identifying the routing process.
`(config)#ospf router-id 2.2.2.2`	Configure OSPF router-ID same as loopback interface IP address.
`(config-router) #network 2.2.2.2/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router) #network 10.10.10.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 40.40.40.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#bfd all-interfaces`	Enable the OSPF enabled interfaces with BFD.
`(config-if)#exit`	Exit interface mode.

PE-2

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 5.5.5.5/32 secondary`	Set the IP address of the loopback interface to 5.5.5.5/32.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 5.5.5.5`	Set the router ID to IP address 5.5.5.5.
`(config-router)#targeted-peer ipv4 1.1.1.1`	Configure targeted peer.
`(config-router-targeted-peer)#exit-targeted- peer-mode`	Exit-targeted-peer-mode.
`(config-router)#targeted-peer ipv4 2.2.2.2`	Configure targeted peer.
`(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit-targeted-peer-mode.
`(config-router)#exit`	Exit router mode.
`(config)#interface xe1`	Enter interface mode.

`(config-if)#ip address 40.40.40.2/24`	Configure IPv4 address for xe1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#exit`	Exit interface mode.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2.1`	Enter interface mode.
`(config-if)#description MPLS-L3VPN`	Giving Interface Description.
`(config-if)#encapsulation dot1q 4`	Setting Encapsulation to dot1q with VLAN ID 4.
`(config-if)#load-interval 30`	Load interval setting.
`(config-if)#ip vrf forwarding l3vpn`	Bind the interface connected to the CE router with VRF L3VPN.
`(config-if)#ip address 172.168.25.2/24`	Assign the IPv4 address.
`(config)#router ospf 1`	The Process ID should be a unique positive integer identifying the routing process.
`(config)#ospf router-id 5.5.5.5`	Configure OSPF router-ID same as loopback interface IP address.
`(config-router) #network 5.5.5.5/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router) #network 40.40.40.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter router BGP mode
`(config-router)#bgp router-id 5.5.5.5`	Configuring the bgp router id 1.1.1.1.
`(config-router)#bgp graceful-restart restart-time 100`	Enable BGP GR with restart timer 100.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Configure neighbor 1.1.1.1.
`(config-router)#neighbor 1.1.1.1 update-source lo`	Update source lo for neighbor 1.1.1.1.
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast.
`(config-router-af)#redistribute connected`	Redistribute connected.
`(config-router)#neighbor 1.1.1.1 activate`	Activate neighbor.
`(config-router)#address-family vpnv4 unicast`	Entering Address family VPNv4 unicast.
`(config-router-af)#neighbor 1.1.1.1 activate`	Activate the neighbor 1.1.1.1.
`(config-router-af)#neighbor 1.1.1.1 capability graceful-restart`	Activate capability graceful restart for neighbor 1.1.1.1.
`(config-router-af)#exit-address-family`	Exit address family.
`(config-router)#address-family ipv4 vrf l3vpn`	Entering address family.
`(config-router-af)#redistribute connected`	Redistribute connected.
`(config-router)#neighbor 172.168.26.1 remote-as 700`	Configure neighbor 172.168.26.1.
`(config-router)#neighbor 172.168.26.1 activate`	Activate neighbor.
`(config-router-af)#commit`	Commit all the transactions.

CHAPTER 3 TWAMP over L3VPN Configuration

This chapter contains a complete sample TWAMP over L3VPN configuration.

Two-way Active Measurement Protocol (TWAMP) is an open protocol for measuring network performance between any two devices. The TWAMP MPLS transport is implemented as part of supporting TWAMP on routers which acts as MPLS routers both in the roles of LERs as well as intermediate routers. OcNOS version 6.0.0 also supports the end to end statistics calculation when multiple paths are available between sender and reflector with multihop support.

The user can use the link delay metrics such as average, minimum, and maximum delay, and delay variance to determine the network latency. Using link delay metrics will enable troubleshooting latency issues or apply Traffic Engineering (TE) solutions to meet Service Level Agreements (SLAs).

The TWAMP protocol is designed to do such measurements, and a basic implementation of this protocol has already been implemented in OcNOS. This feature here is a TWAMP protocol in OcNOS where the focus will be on accuracy and configurable advertisement of the measured data.

L3VPN (based on MPLS) Supported scenarios:

In general, TWAMP over L3VPN works on:

CE-CE Overlay Only

CE-PE Overlay Only

PE-PE Both Under lay and over lay

Topology

Figure 3-31 displays a sample TWAMP over L3VPN topology.

- CE1 and CE2 are customer edge routers
- PE1 and PE2 are IPv4 Provider Edge routers
- P1 is the router at the core of the IPv4 MPLS provider network

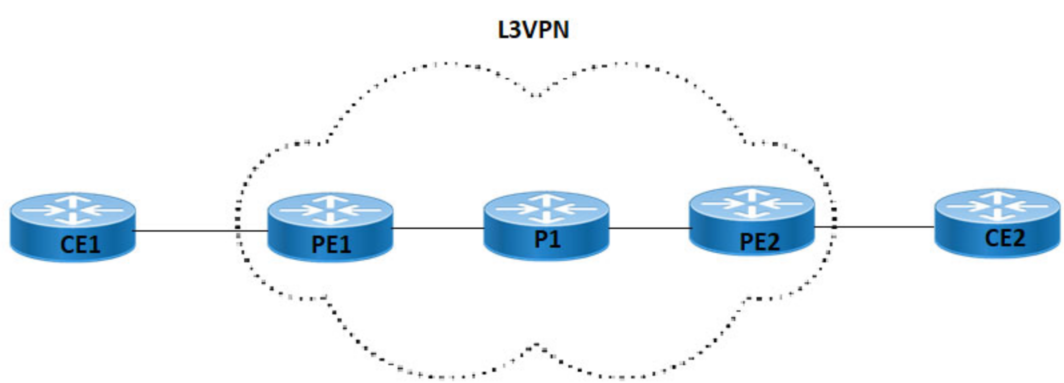

Figure 3-31: TWAMP over L3VPN Topology

Configure TWAMP over L3VPN for LDP

PE1

`#configure terminal`	Enter Configure mode.
`(config)# ip vrf vrf100`	Create a new VRF named vrf100
`(config-vrf)#rd 100:1`	Assign the route distinguisher (RD) value as 100:1
`(config-vrf)#route-target both 100:1`	Import routes between route target (RT) ext-communities 100 and 1
`(config-vrf)#exit`	Exit VRF mode
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 18.18.18.18/32 sec-ondary`	Assign IP address to Loopback interface
`(config-if)#exit`	Exit Interface mode
`(config)#interface xe8`	Enter Interface mode
`(config-if)# ip address 10.1.1.18/24`	Assign IP address to interface
`(config-if)#enable-ldp ipv4`	Enable LDP on the physical interface
`(config-if)#label-switching`	Enable label switching on the interface
`(config-if)#exit`	Exit Interface mode
`(config)#interface xe11`	Enter Interface mode
`(config-if)# ip vrf forwarding vrf100`	Bind the interface connected to the CE1 router with VRF 100
`(config-if)# ip address 100.1.1.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter the Router LDP mode
`(config-router)#router-id 18.18.18.18`	Configure router id as loopback address
`(config-router)#transport-address ipv4 18.18.18.18`	Configure ldp transport addess as loopback address
`(config-router)#exit`	Exit from the router ldp mode
`(config)# router ospf 1`	Enter Router OSPF mode
`(config-router)# ospf router-id 18.18.18.18`	Configure OSPF router-id
`(config-router)# network 10.1.1.0/24 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`(config-router)# network 18.18.18.18/32 area 0.0.0.0`	Define the network on which OSPF runs and associate area id.
`(config-router)# commit`	Commit the configurations
`(config-router)# exit`	Exit from router OSPF mode
`(config)# router bgp 100`	Enter BGP router mode
`(config-router)# bgp router-id 18.18.18.18`	Configure BGP router-id
`(config-router)# neighbor 8.8.8.8 remote-as 100`	Configure PE2 as an iBGP4+ neighbor
`(config-router)# neighbor 8.8.8.8 up-date-source lo`	Update the source as loopback for iBGP peering with the remote PE2 router

© 2025 IP Infusion Inc. Proprietary

(config-router)# address-family vpnv4 unicast	Enter address-family vpnv4 mode
(config-router-af)# neighbor 8.8.8.8 activate	Activate the PE2 neighbor in the vpnv4 address family
(config-router-af)# neighbor 8.8.8.8 next-hop-self	Activate the neighbor as next hop self
(config-router-af)#exit	Exit form address family
(config-router)# address-family ipv4 vrf vrf100	Enter the IPv4 address family for VRF 100
(config-router-af)# redistribute connected	Redistribute connected routes
(config-router-af)# neighbor 100.1.1.2 remote-as 200	Configure CE1 neighbor in the vrf address family
(config-router-af)# neighbor 100.1.1.2 activate	Activate the CE1 neighbor
(config-router-af)#exit	Exit form address family
(config-router)# commit	Commit the configurations

P1

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter loopback interface mode
(config-if)#ip address 3.3.3.3/32 secondary	Assign IP address to Loopback interface
(config-if)#exit	Exit Interface mode
(config)#router ldp	Enter the Router LDP mode
(config-router)#router-id 3.3.3.3	Configure router id as loopback address
(config-router)#transport-address ipv4 3.3.3.3	Configure ldp transport addess as loopback address
(config-router)#exit	Exit from the router ldp mode
(config)#interface xe14	Enter Interface mode
(config-if)# ip address 10.1.1.3/24	Assign IP address to interface
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode
(config)#interface xe15	Enter Interface mode
(config-if)# ip address 11.1.1.3/24	Assign IP address to interface
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit interface mode
(config)# router ospf 1	Enter Router OSPF mode
(config-router)# ospf router-id 18.18.18.18	Configure OSPF router-id
(config-router)# network 10.1.1.0/24 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)# network 3.3.3.3/32 area 0.0.0.0	Define the network on which OSPF runs and associate area id.

(config-router)# network 11.1.1.0/24 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)# commit	Commit the configurations
(config-router)# exit	Exit from router OSPF mode

PE2

#configure terminal	Enter Configure mode.
(config)#ip vrf vrf100	Create a new VRF named vrf100
(config-vrf)#rd 101:1	Assign the route distinguisher (RD) value as 101:1
(config-vrf)#route-target both 100:1	Import routes between route target (RT) ext-communities 100 and 1
(config-vrf)#exit	Exit VRF mode
(config)#router ldp	Enter the Router LDP mode
(config-router)#router-id 8.8.8.8	Configure router id as loopback address
(config-router)#transport-address ipv4 8.8.8.8	Configure ldp transport addess as loopback address
(config-router)#exit	Exit from the router ldp mode
(config)#interface lo	Enter loopback interface mode
(config-if)#ip address 8.8.8.8/32 secondary	Assign IP address to Loopback interface
(config-if)#exit	Exit Interface mode
(config)#interface xe24	Enter Interface mode
(config-if)# ip address 11.1.1.8/24	Assign IP address to interface
(config-if)#enable-ldp ipv4	Enable LDP on the physical interface
(config-if)#label-switching	Enable label switching on the interface
(config-if)#exit	Exit Interface mode
(config)#interface xe25	Enter Interface mode
(config-if)# ip vrf forwarding vrf100	Bind the interface connected to the CE1 router with VRF 100
(config-if)# ip address 101.1.1.1/24	Assign IP address to interface
(config-if)#exit	Exit interface mode
(config)# router ospf 1	Enter Router OSPF mode
(config-router)# ospf router-id 8.8.8.8	Configure OSPF router-id
(config-router)# network 11.1.1.0/24 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)# network 8.8.8.8/32 area 0.0.0.0	Define the network on which OSPF runs and associate area id.
(config-router)#exit	Exit from router OSPF mode
(config)# router bgp 100	Enter BGP router mode
(config-router)# bgp router-id 8.8.8.8	Configure BGP router-id
(config-router)# neighbor 18.18.18.18 remote-as 100	Configure PE1 as an iBGP4+ neighbor
(config-router)# neighbor 18.18.18.18 update-source lo	Update the source as loopback for iBGP peering with the remote PE1 router

(config-router)# address-family vpnv4 unicast	Enter address-family vpnv4 mode
(config-router-af)# neighbor 18.18.18.18 activate	Activate the PE1 neighbor in the vpnv4 address family
(config-router-af)# neighbor 18.18.18.18 next-hop-self	Activate the neighbor as next hop self
(config-router-af)#exit	Exit form address family
(config-router)# address-family ipv4 vrf vrf100	Enter the IPv4 address family for VRF 100
(config-router-af)# redistribute connected	Redistribute connected routes
(config-router-af)# neighbor 101.1.1.2 remote-as 200	Configure CE2 neighbor in the vrf address family
(config-router-af)# neighbor 101.1.1.2 activate	Activate the CE2 neighbor
(config-router-af)#exit	Exit form address family
(config-router)# commit	Commit the configurations

CE1

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter loopback interface mode
(config-if)#ip address 37.37.37.37/32 secondary	Assign IP address to Loopback interface
(config-if)#exit	Exit Interface mode
(config)#interface xe24	Enter Interface mode
(config-if)# ip address 100.1.1.2/24	Assign IP address to interface
(config-if)#exit	Exit Interface mode
(config)#interface xe26	Enter Interface mode
(config-if)# ip address 200.1.1.1/24	Assign IP address to interface
(config-if)#exit	Exit interface mode
(config)# router bgp 200	Enter BGP router mode
(config-router)# bgp router-id 37.37.37.37	Configure BGP router-id
(config-router)#neighbor 100.1.1.1 remote-as 100	Configure PE1 as an eBGP4+ neighbor
(config-router)# address-family ipv4 unicast	Enter address-family IPv4 unicast mode
(config-router-af)# redistribute connected	Redistribute the connected route under address family IPv4 unicast
(config-router-af)# neighbor 100.1.1.1 activate	Activate the neighbor in the IPv4 address family
(config-router-af)#exit	Exit form address family
(config-router)# commit	Commit the configurations

CE2

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 2.2.2.2/32 secondary`	Assign IP address to Loopback interface
`(config-if)#exit`	Exit Interface mode
`(config)#interface xe14`	Enter Interface mode
`(config-if)# ip address 101.1.1.2/24`	Assign IP address to interface
`(config-if)#exit`	Exit Interface mode
`(config)#interface xe15`	Enter Interface mode
`(config-if)# ip address 201.1.1.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)# router bgp 300`	Enter BGP router mode
`(config-router)# bgp router-id 2.2.2.2`	Configure BGP router-id
`(config-router)#neighbor 101.1.1.1 remote-as 100`	Configure PE2 as an eBGP4+ neighbor
`(config-router)# address-family ipv4 unicast`	Enter address-family IPv4 unicast mode
`(config-router-af)# redistribute connected`	Redistribute the connected route under address family IPv4 unicast
`(config-router-af)# neighbor 101.1.1.1 activate`	Activate the neighbor in the IPv4 address family
`(config-router-af)#exit`	Exit form address family
`(config-router)# commit`	Commit the configurations

TWAMP Configuration on Sender (PE1)

TWAMP sender is configured to measure the delay on interface Loopback on PE1

`#configure terminal`	Enter Configure mode.
`(config)# hardware-profile filter twamp-ipv4 enable`	Enable hardware filter for ipv4 to configure TWAMP measurement configs
`(config)#commit`	Commit the configuration
`(config)# twamp-light control`	Enable TWAMP light controller on PE1
`(config-twamp-light-con)# control-admin-state enable`	Enable TWAMP Controller admin state
`(config)#interface lo`	Enter Interface Loopback mode
`(config-if)# delay-measurement dynamic twamp reflector-ip 11.1.1.8`	Configure delay measurement on interface Loopback to reflector PE2
`(config-if)#commit`	Commit the configurations
`(config-if)#end`	Return to privilege mode

TWAMP Configuration on Reflector (PE2)

Configure TWAMP Reflector as interface xe24 on PE2 (Towards core)

`#configure terminal`	Enter Configure mode.
`(config)# hardware-profile filter twamp-ipv4 enable`	Enable hardware filter for ipv4 to configure TWAMP measurement configs
`(config)#commit`	Commit the configuration
`(config)# twamp-light reflector`	Enable TWAMP light Reflector on PE2
`(config-twamp-light-ref)# reflec-tor-admin-state enable`	Enable the TWAMP reflector admin state
`(config-twamp-light-ref)# reflector-name pe2 reflector-ip ipv4 11.1.1.8`	Configure TWAMP reflector IP as PE2 interface IP
`(config-twamp-light-ref)#commit`	Commit the configurations
`(config-if)#end`	Return to privilege mode

Validation

1. Verify ping from PE1 to PE2

```
PE1#ping 11.1.1.8
Press CTRL+C to exit
PING 11.1.1.8 (11.1.1.8) 56(84) bytes of data.
64 bytes from 11.1.1.8: icmp_seq=1 ttl=63 time=0.683 ms
64 bytes from 11.1.1.8: icmp_seq=2 ttl=63 time=0.491 ms
64 bytes from 11.1.1.8: icmp_seq=3 ttl=63 time=0.594 ms
```

2. Verify mpls l3vpn ping from PE1

```
PE1#ping mpls l3vpn vrf100 101.1.1.0/24
Sending 5 MPLS Echos to 101.1.1.0, timeout is 5 seconds

Codes:
'!' - Success, 'Q' - request not sent, '.' - timeout,
'x' - Retcode 0, 'M' - Malformed Request, 'm' - Errored TLV,
'N' - LBL Mapping Err, 'D' - DS Mismatch,
'U' - Unknown Interface, 'R' - Transit (LBL Switched),
'B' - IP Forwarded, 'F' No FEC Found, 'f' - FEC Mismatch,
'P' - Protocol Error, 'X' - Unknown code,
'Z' - Reverse FEC Validation Failed

 Type 'Ctrl+C' to abort

  !
  !
  !
  !
  !

     Success Rate is 100.00 percent (5/5)
```

3. Verify the TWAMP statistics on all the configured interfaces on PE1

In the below verification command, packets sent and received showing as equal. So all the TWAMP packets received reply for all the sent packets for the delay measurement. Showing all the Round Trip Delay and Reverse Delay timers.

```
PE1#sh twamp-statistics

CHAPTER 4 DHCP Relay Agent Over L3VPN Configuration

Refer to DHCP Relay Agent Over L3VPN Configuration section in *System Management Configuration* guide.

CHAPTER 5 DSCP Preserve

Overview

Layer 3 VPN services use the DSCP field in the IP header to convey QoS information, determining packet priority and treatment (e.g., DSCP 46 for high-priority voice traffic). When L3 VPN traffic enters the MPLS domain, QoS is managed by the EXP field in the MPLS label, typically derived from the DSCP value. In Qumran-based systems, the EXP field is updated based on the remarked DSCP value. By default, remarking the DSCP at the access interface affects both the IP header DSCP field and the MPLS EXP field. Service managers need control over whether to remark the DSCP or not while configuring EXP field updates.

Network operator can control preserving DSCP in the edge routers at gobal level or per VRF level or combination of both. To provide more control, the following DSCP preservation settings are available:

- DSCP Preserve Global - When DSCP preserve is enabled globally, it applies to all VRFs, preserving the DSCP value even if remarking is configured.
- DSCP Preserve Per-VRF - Per-VRF configuration allows DSCP preservation only for specific VPN services, offering more granular control for network administrators.

DSCP Preserve Behavior: Below table shows the way DSCP preserve global and per VRF configuration impact the DSCP value of the traffic received on the VRF of interest when dscp-to-queue profile is updated with remark DSCP option.

Table 5-15:

DSCP-preserve	per-vrf not configured	per-vrf enabled	per-vrf disabled
Global enable	preserved	preserved	not preserved
Global disable	not preserved	preserved	not preserved

Network administrators can further refine control using global or custom DSCP-to-queue profiles and policy-map configurations to remark DSCP values based on specific match criteria. This provides flexible and tailored QoS management across different VPN services.

DSCP Preserve Characteristics

- QoS information mapping ensures that the QoS information carried in the DSCP field of the IP header is correctly mapped to the MPLS EXP field.
- DSCP remarking controls whether the DSCP value in the IP header is remarked at the access interface, affecting both customer traffic and the MPLS domain.
- In hardware like Qumran, the EXP field update is based on the remarked DSCP value, requiring configuration to manage how and if DSCP values are modified.
- Ingress configuration requirement introduces the need for ingress-side configuration to properly align the DSCP and EXP field values, ensuring correct QoS handling.
- DSCP preserve provides service managers with control over whether DSCP values are modified or preserved during the process of mapping to MPLS headers.

© 2025 IP Infusion Inc. Proprietary

DSCP Preserve Global

This method of configuration allows Network operator to enable or disable DSCP preserve for all the services in an edge router.

Prerequisites

The L3VPN service will operate seamlessly from end to end without any packet loss, using either OSPF or IS-IS as the IGP, with traffic profiles configured based on user-defined DSCP values.

- Globally enable dscp-preserve using the `mpls lsp-encap-dscp-preserve` command.
- Global level configuration for PE1:

```
config t
qos enable
!
qos profile dscp-to-queue profile1
dscp 24 queue 3 dscp 32
```

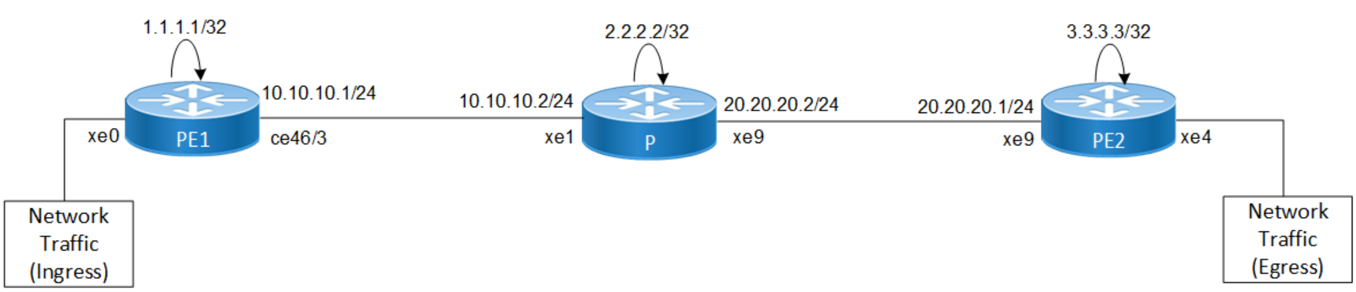
- interface level configuration for PE1:

```
interface xe3
qos map-profile dscp-to-queue profile1
!
```

Configuration for DSCP Preserve Global

Topology

The topology above illustrates the DSCP Preserve Global feature, with PE1 and PE2 serving as the edge routers for L3VPN services, and the P node acting as a transit router between them. Traffic received on PE1 with a user-defined DSCP value, which can be preserved or modified depending on the configuration applied to the ingress PE router.



DSCP Preserve Global

Configure DSCP Preserve and L3VPN Services on PE1 Router

1. Enable QoS Globally: This command enables global QoS functionality, allowing configuration of any QoS-related settings. It is mandatory to enable this feature for any QoS configurations to be effective.

```
PE1(config)#qos enable
PE1(config)#commit
```

2. Configure DSCP Preserve Globally: This command enables preserving the customer's DSCP values across the network.

```
PE1(config)#mpls lsp-encap-dscp-preserve
```

3. Configure QoS profiles or class-map profiles for remarking the incoming customer defined DSCP value to customized DSCP value.
   - Method 1: QoS Profile (dscp-to-queue): Use a QoS profile to remap the incoming DSCP value to a user-defined queue and DSCP value.

```
PE1(config)#qos profile dscp-to-queue dscp_profile1
PE1(config-ingress-dscp-map)#dscp 24 queue 3 dscp 32
PE1(config-ingress-dscp-map)#commit
PE1(config-ingress-dscp-map)#exit
PE1(config)#Interface xe0.100
PE1(config-if)#qos map-profile dscp-to-queue dscp_profile1
PE1(config-if)#commit
PE1(config-if)#exit
```

   - Method 2: Class-Map and Policy-Map: Use class-map and policy-map to match the incoming DSCP value and set a new DSCP value.

```
PE1(config)#class-map type qos match-any class1
PE1(config-qos-match-any)#match dscp 24
PE1(config-qos-match-any)#commit
PE1(config-qos-match-any)#exit

PE1(config)#policy-map type qos pmap1
PE1(config-pmap-qos)#class type qos class1
PE1(config-pmap-qos)#set dscp 32
PE1(config-pmap-qos)#commit
PE1(config-pmap-qos)#exit

PE1(config)#Interface xe0.100
PE1(config-if)#service-policy type qos input pmap1
PE1(config-if)#commit
```

4. Configure EXP Encapsulation on the Egress Interface: Modify the incoming EXP value to a user-defined EXP value for MPLS traffic.
   - Example config on Qumran 1:

```
PE1(config)#qos profile exp-encap exp_profile1
PE1(config-egress-exp-encap-map)#l3 dscp 32 exp 5
PE1(config-egress-exp-encap-map)#commit
PE1(config-egress-exp-encap-map)#exit
PE1(config)#interface ce46/3
PE1(config-if)#label-switching
PE1(config-if)#qos map-profile exp-encap exp_profile1
PE1(config-if)#commit
PE1(config-if)#exit
```

   - Example config on Qumran 2:

```
PE1(config)#qos profile queue-to-exp exp_profile1
PE1(config-egress-queue-exp-map)#queue 3 color all exp 5
PE1(config-egress-queue-exp-map)#commit
PE1(config-egress-queue-exp-map)#exit
PE1(config)#interface ce46/3
PE1(config-if)#label-switching
PE1(config-if)#qos map-profile queue-to-exp exp_profile1
```

5. Define an IP VRF: Create a VRF with Route Distinguisher (RD) and Route Target (RT) to isolate customer routing information.

```
PE1(config)# ip vrf vrf100
PE1(config-vrf)# rd 1.1.1.1:100
PE1(config-vrf)# route-target both 100:100
```

```
PE1(config-vrf)#commit
```

6. Associate Interfaces with VRF: Bind interfaces to the VRF to ensure that the VRF receives the necessary routes.

```
PE1(config)#interface xe0
PE1(config-if)#ip vrf forwarding vrf100
PE1(config-if)#ip address 100.100.100.1/24
PE1(config-if)#exit
PE1(config)#commit
```

7. Configure CE Neighbor for VPN with BGP: Establish a BGP session between the PE router and the CE device, and configure it to advertise routes within the VRF.

```
PE1(config)#router bgp 100
PE1(config-router)# bgp router-id 1.1.1.1
PE1(config-router)#neighbor 3.3.3.3 remote-as 100
PE1(config-router)#neighbor 3.3.3.3 update-source lo
PE1(config-router)#neighbor 3.3.3.3 advertisement-interval 0
PE1(config-router)#address-family ipv4 unicast
PE1(config-router-af)# network 1.1.1.1/32
PE1(config-router-af)#exit-address-family

PE1(config-router)#address-family vpnv4 unicast
PE1(config-router-af)# neighbor 3.3.3.3 activate
PE1(config-router-af)#exit-address-family

PE1(config-router)#address-family ipv4 vrf vrf100
PE1(config-router-af)#redistribute connected
PE1(config-router-af)#neighbor 100.100.100.2 remote-as 100
PE1(config-router-af)#neighbor 100.100.100.2 activate
PE1(config-router-af)#exit-address-family
PE1(config-router)#commit
```

PE1#
```

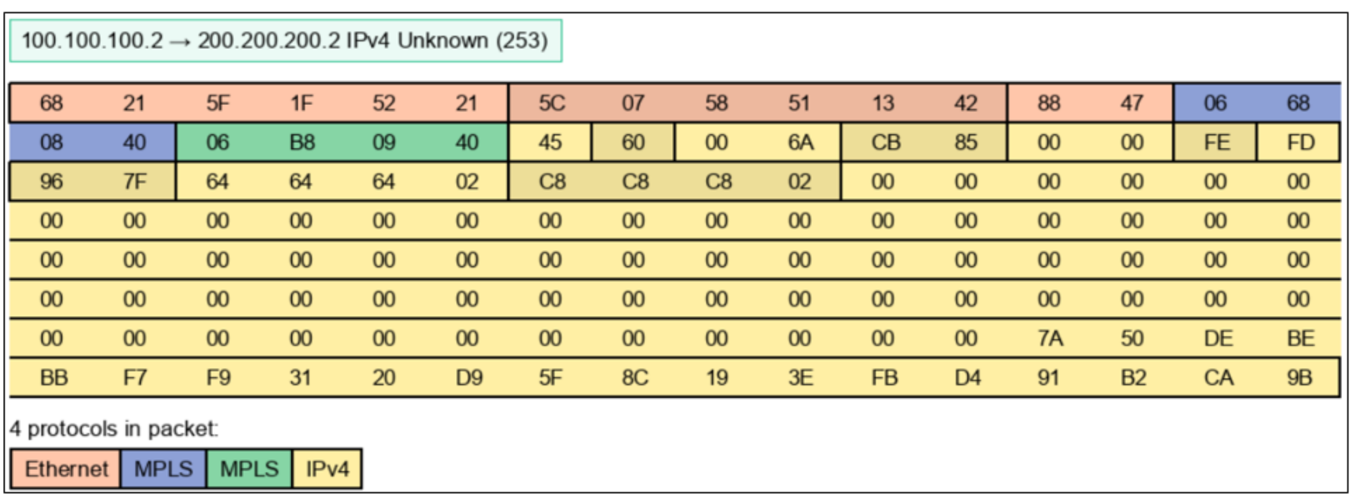
Once the end to end traffic is verified, capture the packet on egress interface of the ingress node. Below is the example packet capture.



100.100.100.2 → 200.200.200.2 IPv4 Unknown (253)

68	21	5F	1F	52	21	5C	07	58	51	13	42	88	47	06	68

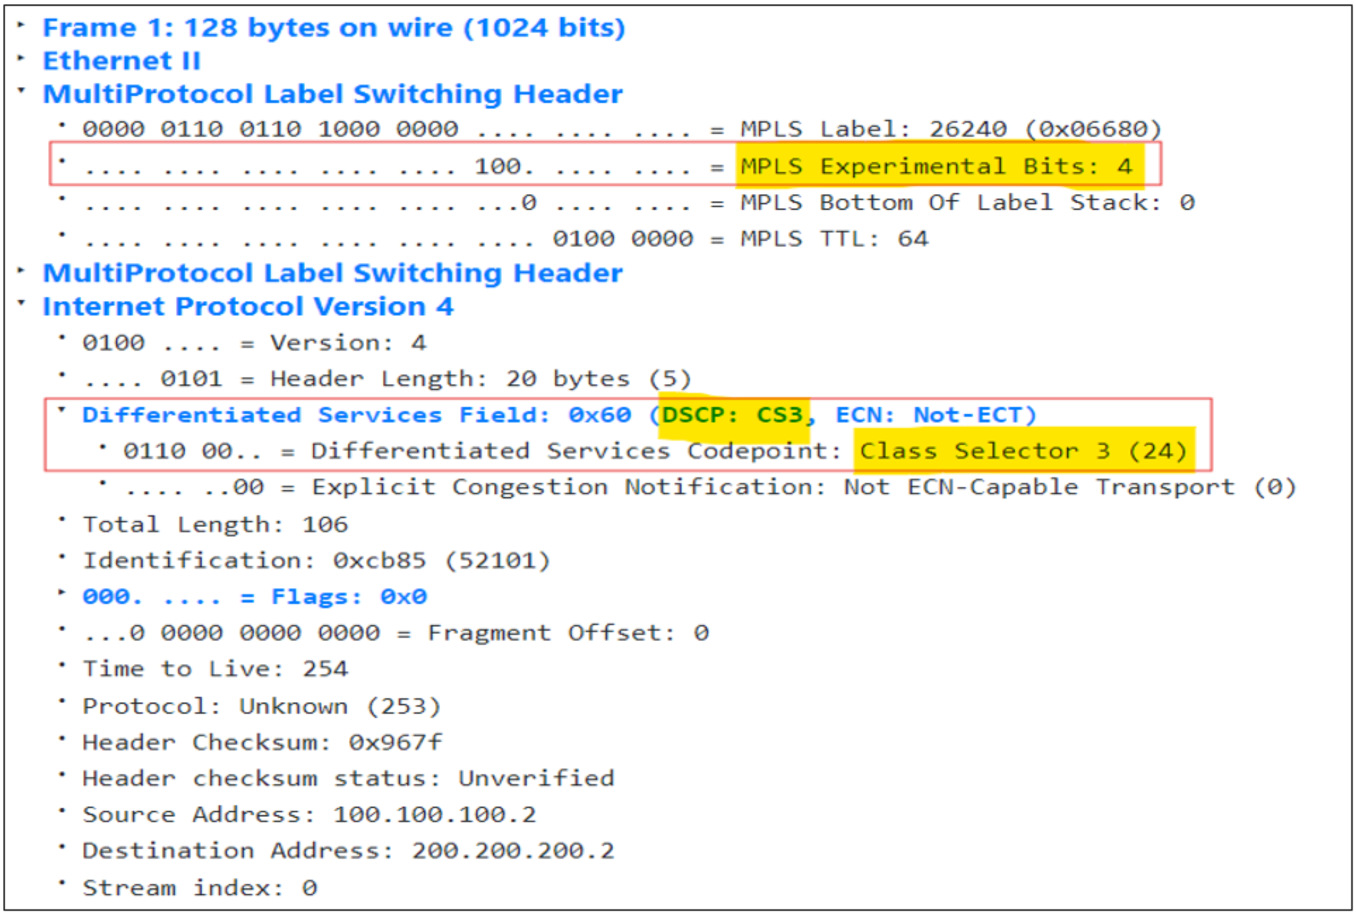
4 protocols in packet:
Ethernet MPLS MPLS IPv4

Below snapshot is the decoded output of the packet capture. Here we can see that EXP bit is 4 and preserved DSCP value is 24.



```
Frame 1: 128 bytes on wire (1024 bits)
Ethernet II
MultiProtocol Label Switching Header
  0000 0110 0110 1000 0000 .... .... .... = MPLS Label: 26240 (0x06680)
  .... .... .... .... .... 100. .... .... = MPLS Experimental Bits: 4
  .... .... .... .... .... ...0 .... .... = MPLS Bottom Of Label Stack: 0
  .... .... .... .... .... .... 0100 0000 = MPLS TTL: 64
MultiProtocol Label Switching Header
Internet Protocol Version 4
  0100 .... = Version: 4
  .... 0101 = Header Length: 20 bytes (5)
  Differentiated Services Field: 0x60 (DSCP: CS3, ECN: Not-ECT)
    0110 00.. = Differentiated Services Codepoint: Class Selector 3 (24)
    .... ..00 = Explicit Congestion Notification: Not ECN-Capable Transport (0)
  Total Length: 106
  Identification: 0xcb85 (52101)
  000. .... = Flags: 0x0
  ...0 0000 0000 0000 = Fragment Offset: 0
  Time to Live: 254
  Protocol: Unknown (253)
  Header Checksum: 0x967f
  Header checksum status: Unverified
  Source Address: 100.100.100.2
  Destination Address: 200.200.200.2
  Stream index: 0

PE1#
```

CLI Commands

The DSCP preserve introduces the following configuration commands.

mpls lsp-encap-dscp-preserve

Use this command to preserve DSCP for IP packets encapsulated into MPLS headers when dscp is remarked on access interface. By default, DSCP is not preserved for IP packets encapsulated into MPLS headers.

Use the no parameter with this to unconfigure DSCP preserve.

Note: In Qumran1 devices, DSCP preserve feature is not supported when the transport is Segment Routing.

Command Syntax

```
mpls lsp-encap-dscp-preserve
no mpls lsp-encap-dscp-preserve
```

Default

By default, mpls local packet handling is disabled

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.5.2 for Qumran 1. Extended the support for Qumran 2 in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#mpls lsp-encap-dscp-preserve
(config)#commit

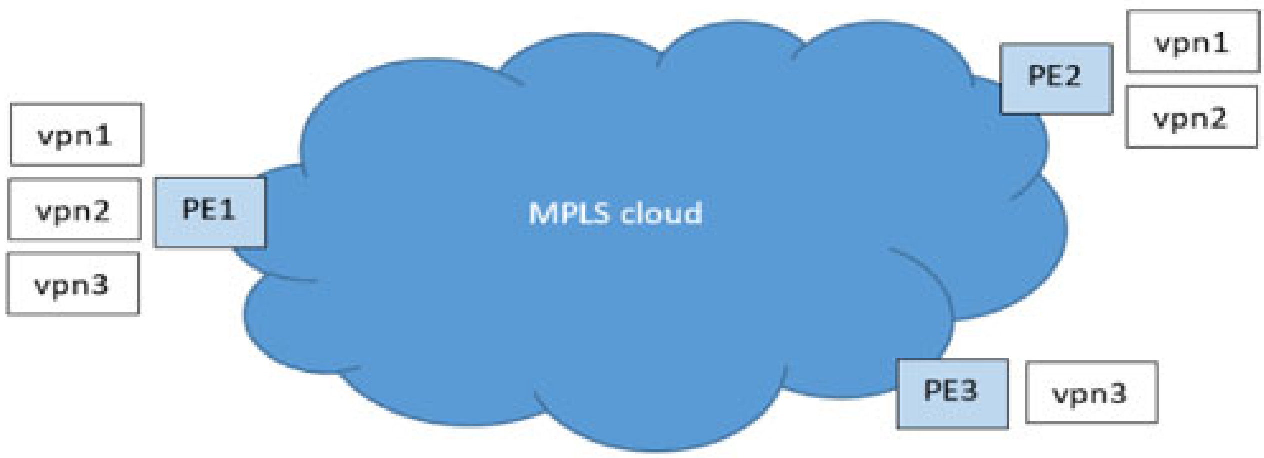
#configure terminal
(config)#no mpls lsp-encap-dscp-preserve
(config)#commit
```

DSCP Preserve Per-VRF

This method of configuration allows Network operator to enable or disable DSCP preserve for specific L3 VPN services in an edge router.

DSCP Preserve Per-VRF Characteristics

The MPLS cloud connects edge routers that provision L3 VPN services for multiple customers. Each edge router can support multiple VPN services, with different QoS (DSCP) remarking needs. Some customers may want to retain the DSCP field in the IP header, while others may need to update it as traffic enters the MPLS network. By default, the DSCP field in customer packets is not preserved when remarking occurs.



Prerequisites

The L3VPN service will operate seamlessly from end to end without any packet loss, using either OSPF or IS-IS as the IGP, with traffic profiles configured based on user-defined DSCP values.

- Global level configuration for PE1:

```
config t
qos enable
!
qos profile dscp-to-queue profile1
dscp 24 queue 3 dscp 32
```

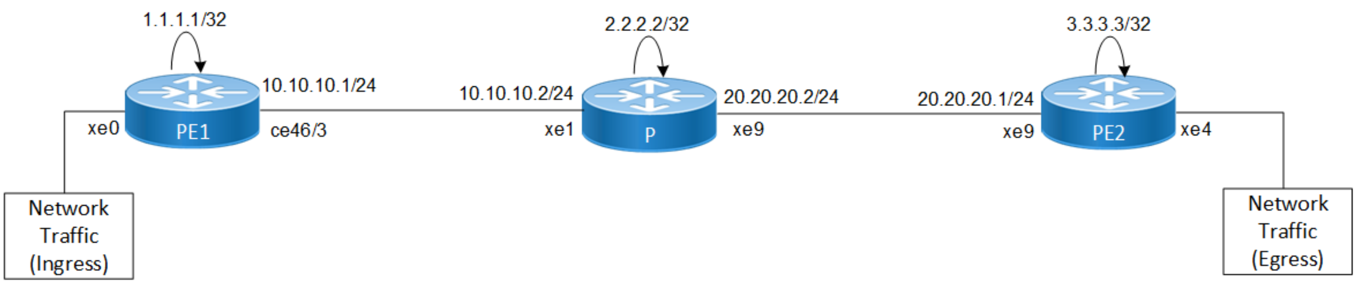
- interface level configuration for PE1:

```
interface xe3
qos map-profile dscp-to-queue profile1
!
```

Configuration for DSCP Preserve Per-VRF

Topology

The topology illustrates the DSCP preserve feature, with PE1 and PE2 as the edge routers running L3VPN services, and the P router functioning as a transit router between them. PE1 receiving L3VPN and 6PE traffic with user-defined DSCP values, which can be either preserved or modified depending on the configurations applied at the ingress PE router. Multiple VRFs will be configured, each representing a different customer, where DSCP-preserve can be enabled or disabled at the per-VRF level.



Per- VRF DSCP Preserve

Configure DSCP Preserve and L3VPN Services on PE1 Router

1. Enable QoS Globally: This command is mandatory to configure any QoS-related settings. Without it, QoS configurations will not function.

```
PE1(config)# qos enable
PE1(config)# commit
```

2. (Optional) Configure DSCP Preserve globally for L3VPN and 6PE Traffic: This command provides control over remarking user-defined DSCP values. Enabling this will preserve the DSCP value throughout the network. If DSCP preserve to be enabled only for specific L3 VPN services, then this command need not to be configured.

```
PE1(config)#mpls lsp-encap-dscp-preserve
```

3. Configure DSCP Preserve globally for 6PE Traffic: This command provides control over remarking user-defined DSCP values. Enabling this will preserve the DSCP value throughout the network.

```
PE1(config)# mpls 6pe lsp-encap-dscp-preserve (enable | disable)
```

4. Configure QoS Profiles or Class-Map Profiles for remarking incoming DSCP values as follows:

   - Method 1: QoS Profile: Use the “dscp-to-queue” profile to remark the incoming DSCP value via a user-defined queue.

```
PE1(config)# qos profile dscp-to-queue dscp_profile1
PE1(config-ingress-dscp-map)# dscp 24 queue 3 dscp 32
PE1(config-ingress-dscp-map)# commit
PE1(config-ingress-dscp-map)# exit
PE1(config)# interface xe0.100
PE1(config-if)# qos map-profile dscp-to-queue dscp_profile1
PE1(config-if)# commit
PE1(config-if)# exit
```

   - Method 2: Class-Map/Policy-Map: Use the “match” criteria to remark the incoming DSCP value to a user-defined DSCP value.

```
PE1(config)# class-map type qos match-any class1
PE1(config-qos-match-any)# match dscp 24
```

```
PE1(config-qos-match-any)# commit
PE1(config-qos-match-any)# exit
PE1(config)# policy-map type qos pmap1
PE1(config-pmap-qos)# class type qos class1
PE1(config-pmap-qos)# set dscp 32
PE1(config-pmap-qos)# commit
PE1(config-pmap-qos)# exit
PE1(config)# interface xe0.100
PE1(config-if)# service-policy type qos input pmap1
PE1(config-if)# commit
```

5. Configure EXP Encapsulation on the Egress Interface: This profile modifies the incoming EXP value to the user-defined EXP value, which is then reflected in the MPLS EXP bit.
   - Example Config on Qumran 1:

```
PE1(config)# qos profile exp-encap exp_profile1
PE1(config-egress-exp-encap-map)# l3 dscp 32 exp 5
PE1(config-egress-exp-encap-map)# commit
PE1(config-egress-exp-encap-map)# exit
PE1(config)# interface ce46/3
PE1(config-if)# label-switching
PE1(config-if)# qos map-profile exp-encap exp_profile1
PE1(config-if)# commit
PE1(config-if)# exit
```

   - Example Config on Qumran 2:

```
PE1(config)# qos profile queue-to-exp exp_profile1
PE1(config-egress-queue-exp-map)# queue 3 color all exp 5
PE1(config-egress-queue-exp-map)# commit
PE1(config-egress-queue-exp-map)# exit
PE1(config)# interface ce46/3
PE1(config-if)# label-switching
PE1(config-if)# qos map-profile queue-to-exp exp_profile1
```

6. Define Multiple IP VRFs: Configure VRFs with appropriate Route Distinguisher (RD) and Route Target (RT) values to isolate IP address routing for multiple customers.

```
PE1(config)# ip vrf vrf100
PE1(config-vrf)# rd 1.1.1.1:100
PE1(config-vrf)# route-target both 100:100
PE1(config-vrf)# commit

PE1(config)# ip vrf vrf101
PE1(config-vrf)# rd 1.1.1.1:101
PE1(config-vrf)# route-target both 101:101
PE1(config-vrf)# commit

PE1(config)# ip vrf vrf102
PE1(config-vrf)# rd 1.1.1.1:102
PE1(config-vrf)# route-target both 102:102
PE1(config-vrf)# commit
```

7. Associate Interfaces to VRFs: After defining the VRFs, assign interfaces to them to allow the PE router to recognize which interfaces belong to each VRF.

```
PE1(config)# interface xe0.100
PE1(config-if)# encapsulation dot1q 100
PE1(config-if)# ip vrf forwarding vrf100
PE1(config-if)# ip address 100.100.100.1/24
PE1(config-if)# exit
```

```
PE1(config)# commit

PE1(config)# interface xe0.101
PE1(config-if)# encapsulation dot1q 101
PE1(config-if)# ip vrf forwarding vrf101
PE1(config-if)# ip address 100.100.101.1/24
PE1(config-if)# exit
PE1(config)# commit

PE1(config)# interface xe0.102
PE1(config-if)# encapsulation dot1q 102
PE1(config-if)# ip vrf forwarding vrf102
PE1(config-if)# ip address 100.100.102.1/24
PE1(config-if)# exit
PE1(config)# commit

PE1(config)# interface xe0.103
PE1(config-if)# encapsulation dot1q 103
PE1(config-if)# ipv6 address 1001::2/64
PE1(config-if)# exit
PE1(config)# commit
```

8. Configure CE Neighbor for VPN Using BGP: To provide a VPN service, configure the PE router to associate any routing information learned from a VPN customer interface with a particular VRF.

```
PE1(config)# router bgp 100
PE1(config)# bgp router-id 1.1.1.1
PE1(config)# neighbor 3.3.3.3 remote-as 100
PE1(config)# neighbor 3.3.3.3 update-source lo
PE1(config)# neighbor 3.3.3.3 advertisement-interval 0
PE1(config)# neighbor 1001::2 remote-as 100
PE1(config-router)# address-family ipv4 unicast
PE1(config-router-af)# redistribute connected
PE1(config-router-af)# exit-address-family
PE1(config-router)# address-family ipv4 vrf vrf100
PE1(config-router)# neighbor 100.100.100.2 remote-as 100
PE1(config-router-af)# neighbor 100.100.100.2 activate
PE1(config-router-af)# exit-address-family
PE1(config-router)# address-family ipv4 vrf vrf101
PE1(config-router)# neighbor 100.100.101.2 remote-as 100
PE1(config-router-af)# neighbor 100.100.101.2 activate
PE1(config-router-af)# exit-address-family
PE1(config-router)# address-family ipv4 vrf vrf102
PE1(config-router)# neighbor 100.100.102.2 remote-as 100
PE1(config-router-af)# neighbor 100.100.102.2 activate
PE1(config-router-af)# exit-address-family
PE1(config-router)# address-family ipv6 unicast
PE1(config-router-af)# neighbor 1001::2 activate
PE1(config-router-af)# exit-address-family
PE1(config-router)# commit
```

9. Now enable or disable dscp-preserve based on requirement globally and per-vrf level for L3VPN and 6PE traffic.

```
PE1(config)#ip vrf vrf100
PE1(config-vrf)#mpls lsp-encap-dscp-preserve enable
PE1(config)#ip vrf vrf101
PE1(config-vrf)#mpls lsp-encap-dscp-preserve disable
PE1(config)#ip vrf vrf102
PE1(config-vrf)#mpls lsp-encap-dscp-preserve enable
```

Running Configuration on PE1 Router is as follows:

CLI Commands

The Per-VRF DSCP preserve introduces the following configuration commands.

mpls lsp-encap-dscp-preserve

Use this command to preserve DSCP for IP packets encapsulated into MPLS headers when DSCP is remarked on access interface. By default, DSCP is not preserved for IP packets encapsulated into MPLS headers.

Use the `no` parameter with this to unconfigure DSCP preserve.

Note: In Qumran1 devices, DSCP preserve feature is not supported when the transport is Segment Routing.

Command Syntax

```
mpls lsp-encap-dscp-preserve (enable | disable)
no mpls lsp-encap-dscp-preserve
```

Parameters

`enable`	Enable the configuration.
`disable`	Disable the configuration

Default

disable

Command Mode

VRF mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

Example for enabling or disabling DSCP preserve based on requirement per-vrf level:

```
#configure terminal
(config)#ip vrf vrf100
(config-vrf)#mpls lsp-encap-dscp-preserve (enable | disable)
(config-vrf)#commit
(config-vrf)#exit
```

Example for unconfiguring DSCP preserve:

```
#configure terminal
(config)#ip vrf vrf100
(config-vrf)#no mpls lsp-encap-dscp-preserve
(config-vrf)#commit
(config-vrf)#exit
```

mpls 6pe lsp-encap-dscp-preserve

Use this command to preserve DSCP for IP packets encapsulated into MPLS headers when DSCP is remarked on access interface. By default, DSCP is not preserved for IP packets encapsulated into MPLS headers.

Use the `no` parameter with this to unconfigure DSCP preserve.

Note: In Qumran1 devices, DSCP preserve feature is not supported when the transport is Segment Routing.

Command Syntax

```
mpls 6pe lsp-encap-dscp-preserve (enable | disable)
no mpls 6pe lsp-encap-dscp-preserve
```

Parameters

`enable`	Enable the configuration.
`disable`	Disable the configuration

Default

disable

Command Mode

Config mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

Example for enabling or disabling DSCP preserve for 6PE services:

```
#configure terminal
(config)#mpls 6pe lsp-encap-dscp-preserve (enable | disable)
(config)#commit
(config)#exit
```

Example for unconfiguring DSCP preserve for 6PE services:

```
#configure terminal
(config)#no mpls 6pe lsp-encap-dscp-preserve
(config)#commit
(config)#exit
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
DSCP	Differentiated Services Code Point (DSCP) is a 6-bit value used to classify the priority of Layer-3 packets upon entry into a network. DSCP values range from 0 to 63, 63 being the highest priority, 0 being best-effort traffic.
IS-IS	Intermediate System to Intermediate System (IS-IS) An Interior Gateway Protocol (IGP) that floods link state information throughout a network of routers. Each IS-IS router independently builds a database of the network's topology, aggregating the flooded network information. A Routing Information Base (RIB) is calculated from the database by constructing a shortest path tree (SPT).
MPLS	Multi-Protocol Label Switching (MPLS) A method for forwarding packets through a network. MPLS operates between the traditional definitions of Layer 2 (L2) and Layer 3 (L3).
QoS	Quality of Service (QoS) The ability to guarantee the delivery, control the bandwidth, set priorities for specific network traffic, and provide an appropriate level of security. QoS provides a level of predictability and control beyond the best effort delivery that a device provides by default.

Label Distribution Protocol Configuration

CHAPTER 1 LDP Configuration

This chapter contains LDP (Label Distribution Protocol) configuration examples.

Label Distribution Protocol Overview

The Label Distribution Protocol (LDP) is a routing protocol used in MPLS technology. The LDP daemon (`ldpd`) uses NSM services to obtain routing information. Routers send Hello packets to establish Hello Adjacencies with other nearby routers. This opens the way for sessions between routers to be established during which routers exchange labels in preparation for forwarding packets.

LDP generates labels for and exchanges labels between peer routers. It works in with other routing protocols (RIP, OSPF and BGP) to create label-switched paths (LSP) used when forwarding packets. A label-switched path is the path taken by all packets that belong to the Forwarding Equivalence Class (FEC) corresponding to that LSP. This is analogous to establishing a virtual circuit in ATM (Asynchronous Transfer Mechanism). In this way, OcNOS LDP assigns labels to every destination address and destination prefix provided by OcNOS. The LDP interface to the MPLS forwarder adds labels to, and deletes labels from, the forwarding tables.

LDP Adjacencies

LDP defines a mechanism for discovering adjacent, LDP capable Label Switching Routers (LSR) that participate in label switching (adjacencies). Whenever a new router comes up it sends out a hello packet to a specified, multicast address announcing itself to the network. Every router directly connected to the network receives the packet. Receipt of a hello packet from another LSR creates a *Hello Adjacency* with that LSR. To create a Hello Adjacency with an LSR that cannot send/receive multicast packets, LDP allows a router to be manually configured to send unicast Hello packets to non-multicast LSRs . This non-multicast LSR is a *targeted peer*. Adjacencies are maintained by sending out periodic Hello packets to the multicast group and to all targeted peers. Hello packets are sent using UDP.

LDP Session

LDP capable LSRs establish a session before exchanging label information. All the session messages are sent using TCP to ensure reliable delivery. After the LSRs establish a session and negotiate options, a given pair of routers may exchange label information. The labels exchanged over a session are valid only during the lifetime of the session and routers release them when session is closed.

Forwarding Equivalence Class

A Forwarding Equivalence Class (FEC) section defines a set of packets that are forwarded on the same path by the MPLS network. Two common methods to define FEC are by advertising the IPv4 routes using:

- **Host Address** The LSR uses the address of the destination host to create this FEC. This means that all the packets going to this destination will take the same LSP.
- **Prefix** The LSR uses destination prefix to create this FEC. This means that all the packets take the LSP corresponding to the longest matching prefix.

Label Generation

An LDP Label is a 20-bit number the LSR uses to forward a packet to its destination. When an LSR creates a new FEC, the router generates new labels and distributes them to its peers. A router keeps both incoming and outgoing labels in its database.

Label Distribution Modes

The OcNOS LDP implementation supports two label distribution modes:

- **Downstream Unsolicited** In this mode, next hop LSRs distribute labels to peers without waiting for a label request.
- **Downstream on Demand** In this mode, a LSR distributes a label to a peer only if there is a pending label request from the peer.

Label Retention Mode

The OcNOS LDP implementation supports two label retention modes:

- **Liberal Retention Mode** In this mode, the LSR retains all labels received from all sources. This mode helps in fast LSP setup in case of a change in next hop.
- **Conservative Retention Mode** In this mode, the LSR retains only those labels received from peers that are the next hop for a given FEC. This mode is used by LSRs that have a constraint on the number of labels that it can retain at any given time.

LSP Control

LSPs can be set up in the following two ways:

- **Ordered Control** In this mode, an LSR distributes a label for a FEC to its peer only if it has a corresponding label from its next hop or it is the egress node.
- **Independent Control** In this mode, an LSR may distribute a label to its peers without waiting for a corresponding label from its next hop.

Loop Detection

Loop detection can be enabled to detect routing loops in LSPs. There are two methods supported for the loop detection mechanism:

- **Hop Count** During setup of an LSP, the LSP passes hop count with the LSP setup messages. This hop count is incriminated by each node router participating in LSP establishment. If the hop count exceeds the maximum configured value, the LSP setup process is stopped and a notification message is passed back to the message originator.
- **Path Vector** A path vector contains a list of LSR identifiers. This is passed as a part of LSP setup messages. Each LSR participating in the LSP establishment adds its own LSR identifier to the path vector. If an LSR finds its own identifier in the path vector, it drops the message and sends a message back to the originator.

The use of these messages ensures that a loop is detected while establishing a label switched path and before any data is passed over that LSP.

Configure LDP

The `enable-ldp ipv4` command is used to enable LDP for IPv4 on a specified interface, as follows:

- `enable-ldp ipv4` enables only IPv4 on the interface

For the examples covered in this section, the command `enable-ldp ipv4` is used.

Enable Label Switching

Running LDP on a system requires the following tasks:

1. Enabling label-switching on the interface on NSM.
2. Enabling LDP on an interface in the LDP daemon.
3. Running an IGP (Internal Gateway Protocol), for example, OSPF, to distribute reachability information within the MPLS cloud.
4. Configuring the transport address.

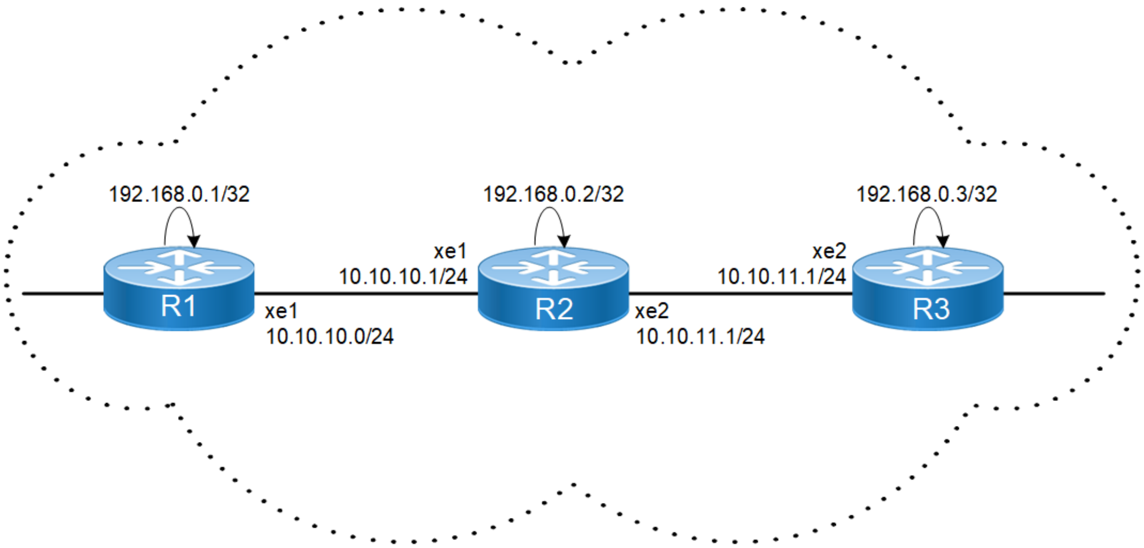

Figure 1-32: Basic LDP Topology

R1 - NSM

`#configure terminal`	Enter configure mode.
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#ip address 10.10.10.1/24`	Assign IP address to interface.
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Specify the loopback (`lo`) interface to be configured.
`(config-if)#ip address 192.168.0.1/32 secondary`	Set the IP address of the loopback interface to `192.168.0.1/32`.
`(config-if)#commit`	Commit the transaction.

R1 - LDP

`(config)#router ldp`	Enter `Router` mode for LDP.
`(config-router)#router-id 192.168.0.1`	Set the router ID to IP address `192.168.0.1`.

`(config-router)#transport-address ipv4 192.168.0.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. **Note**: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
`(config-router)#targeted-peer ipv4 192.168.0.3`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode.
`(config-router)#exit`	Exit the `Router` mode and return to the `Configure` mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP on `xe1`.
`(config-if)#commit`	Commit the transaction.

R1 - OSPF

`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 192.168.0.1/32 area 0`	Define the interface on which OSPF runs and associate the area ID `(0)` with the interface.
`(config-router)#commit`	Commit the transaction.

R2 - NSM

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback (`lo`) interface to be configured.
`(config-if)#ip address 192.168.0.2/32 secondary`	Set the IP address of the loopback interface to `192.168.0.2/32`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#ip address 10.10.10.2/24`	Assign IP address to interface
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Specify the interface `(xe2)` to be configured.
`(config-if)#ip address 10.10.11.1/24`	Assign IP address to interface.
`(config-if)#label-switching`	Enable label switching on interface `xe2`.
`(config-if)#commit`	Commit the transaction.

R2 - LDP

`(config)#router ldp`	Enter `Router` mode.
`(config-router)#router-id 192.168.0.2`	Set the router ID to IP address `192.168.0.2`.

(config-router)#transport-address ipv4 192.168.0.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. **Note**: It is preferable to use the loopback address as transport address. In addition, use the parameter “ipv6” if you are configuring an IPv6 interface.
(config-router)#exit	Exit `Router` mode and return to `Configure` mode.
(config)#interface xe1	Specify the interface `(xe1)` to be configured.
(config-if)#enable-ldp ipv4	Enable LDP on a specified interface (`xe1`).
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Specify the interface `(xe2)` to be configured.
(config-if)#enable-ldp ipv4	Enable LDP on a specified interface (`xe`.
(config-if)#commit	Commit the transaction.

R2 - OSPF

(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.10.10.0/24 area 0 (config-router)#network 10.10.11.0/24 area 0 (config-router)#network 192.168.0.2/32 area 0	Define the interfaces on which OSPF runs and associate the area ID `(0)` with them.
(config-router)#commit	Commit the transaction.

R3 - NSM

#configure terminal	Enter configure mode.
(config)#interface lo	Specify the loopback (`lo`) interface to be configured.
(config-if)#ip address 192.168.0.3/32 secondary	Set the IP address of the loopback interface to `192.168.0.3/32`.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Specify the interface `(xe2)` to be configured.
(config-if)#ip address 10.10.11.1/24	Set the IP address of the interface to `10.10.11.1/24`.
(config-if)#label-switching	Enable label switching on interface `xe2`.
(config-if)#commit	Commit the transaction.

R3 - LDP

(config)#router ldp	Enter `Router` mode.
(config-router)#router-id 192.168.0.3	Set the router ID for IP address `192.168.0.3`.
(config-router)#transport-address ipv4 192.168.0.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. **Note**: It is preferable to use the loopback address as transport address. In addition, use the parameter “ipv6” if you are configuring an IPv6 interface.

`(config-router)#targeted-peer ipv4 192.168.0.1`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode.
`(config-router)#exit`	Exit the `Router` mode and return to the `Configure` mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP on `xe2`.
`(config-if)#commit`	Commit the transaction.

R3 - OSPF

`(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.11.0/24 area 0` `(config-router)#network 192.168.0.3/32 area 0`	Define the interfaces on which OSPF runs and associate the area ID `(0)` with them.
`(config-router)#commit`	Commit the transaction.

Validation

LDP MD5 Authentication

LDP MD5 configuration enables LDP MD5 password authentication on a per-peer basis.

Direct LDP Session

In this example, MD5 authentication is configured for a direct LDP session.

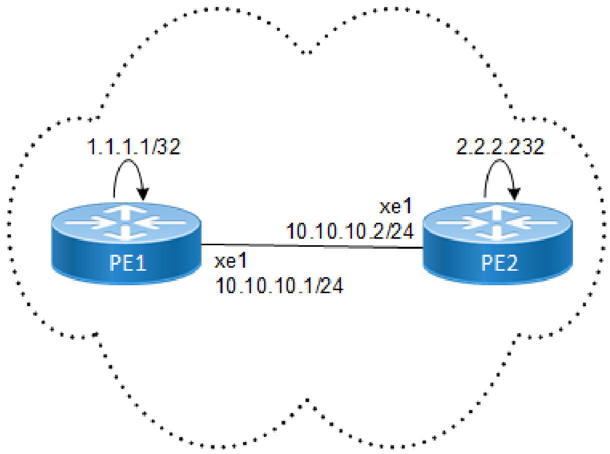

Figure 1-33: Topology for Direct Session MD5

R1

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter `Router` mode.
`(config)#router-id 1.1.1.1`	Configure the router id.
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
`(config-router)#neighbor 10.10.10.2 auth md5 password 0 pwd1`	Configure the MD5 authentication and password, `pwd1`, for the neighbor, `10.10.10.2`.
`(config-router)#exit`	Exit the `Router` mode and return to the `Configure` mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to `1.1.1.1/32`.
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#ip address 10.10.10.1/24`	Set the IP address of the interface to `10.10.10.1/24..`
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#enable-ldp ipv4`	Enable LDP on interface `xe1`.
`(config-if)#commit`	Commit the transaction.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter `Router` mode.
`(config)#router-id 2.2.2.2`	Configure the router id.
`(config-router)#transport-address ipv4 2.2.2.2`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.

`(config-router)#neighbor 10.10.10.1 auth md5 password 0 pwd1`	Configure the MD5 authentication and password, `pwd1`, for the neighbor, `10.10.10.1`.
`(config-router)#exit`	Exit the `Router` mode and return to the `Configure` mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to `2.2.2.2/32`.
`(config)#interface xe1`	Specify the interface `(xe1)` to be configured.
`(config-if)#ip address 10.10.10.2/24`	Set the IP address of the interface to `10.10.10.2/24`.
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#enable-ldp ipv4`	Enable LDP on interface `xe1`.
`(config-if)#commit`	Commit the transaction.

Validation

PE1

```
PE1#show ldp session
Peer IP Address          IF Name    My Role    State          KeepAlive  UpTime

```

Configure LDP MD5 for Targeted LDP Session

In this example, MD5 authentication is configured for the targeted LDP session established between R1 and R3.

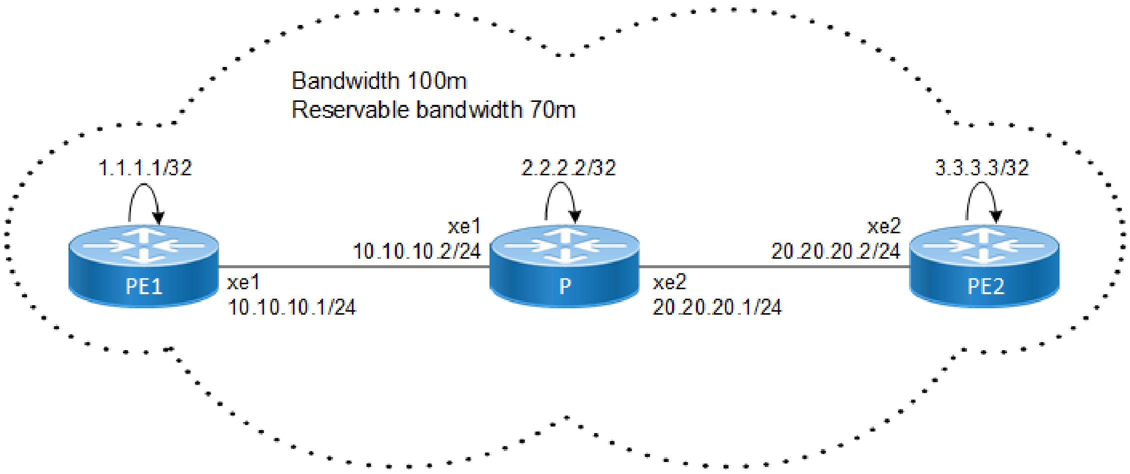

Figure 1-34: Topology for Targeted Session MD5

PE1

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter `Router` mode.
`(config-router)#neighbor 10.10.10.2 auth md5 password 0 pwd1`	Configure the MD5 authentication and password, `pwd1`, for the neighbor, `10.10.10.2`.
`(config-router)#targeted-peer ipv4 3.3.3.3`	Configure the targeted peer IP address (R3 loopback address).
`(config-router-targeted-peer)#exit`	Exit targeted peer mode.
`(config-router)#neighbor 3.3.3.3 auth md5 password 0 pwd2`	Configure the MD5 authentication and password, `pwd2`, for the targeted peer, `3.3.3.3`.
`(config-router)#exit`	Exit the `Router` mode and return to the `Configure` mode.
`(config)#interface lo`	Specify the loopback interface `(lo)` to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to 1.1.1.1/ 32.
`(config-if)#commit`	Commit the transaction.
`(config)#interface xe1`	Specify the interface (xe1) to be configured.
`(config-if)#ip address 10.10.10.1/24`	Set the IP address of the interface to 10.10.10.1/24.
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#enable-ldp ipv4`	Enable LDP on interface `xe1`.

P

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter `Router` mode to enable LDP.
`(config)#router-id 2.2.2.2`	Configure the router ID.
`(config-router)#transport-address ipv4 2.2.2.2`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface.
`(config-router)#exit`	Exit the `Router` mode and return to the `Configure` mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.

(config-if)#ip address 2.2.2.2/32 secondary	Set the IP address of the loopback interface to 2.2.2.2/32
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Specify the interface (xe1) to be configured.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe1.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Specify the interface (xe2) to be configured.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe2.
(config-if)#commit	Commit the transaction.

PE2

#configure terminal	Enter configure mode.
(config)#router ldp	Enter Router mode.
(config-router)#router-id 3.3.3.3	Configure the router-id
(config-router)#transport-address ipv4 3.3.3.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4.
(config-router)#targeted-peer ipv4 1.1.1.1	Configure the targeted peer IP address (R1 loopback address).
(config-router-targeted-peer)#exit	Exit targeted peer mode.
(config-router)#neighbor 1.1.1.1 auth md5 password 0 pwd2	Configure the MD5 authentication and password, pwd2, for the targeted peer, 1.1.1.1.
(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#interface lo	Specify the loopback (lo) interface to be config.
(config-if)#ip address 3.3.3.3/32 secondary	Set the IP address of the loopback interface to 3.3.3.3/32
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Specify the interface (xe2) to be configured.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#enable-ldp ipv4	Enable LDP on interface xe2.
(config-if)#commit	Commit the transaction.

Removing MD5 Authentication for LDP Session

This example shows removing the MD5 authentication configuration from an LDP session.

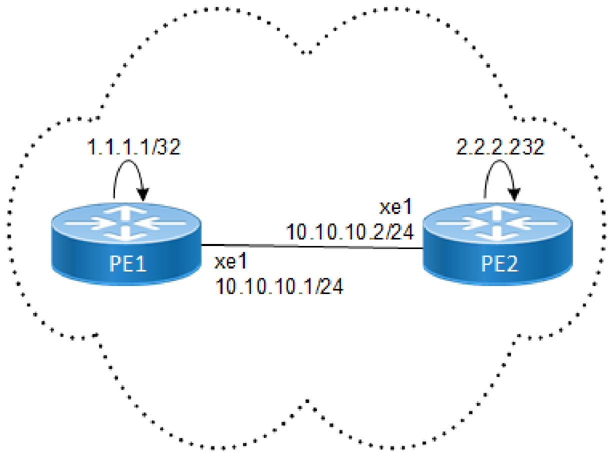

Figure 1-35: LDP Session Topology

PE1

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter `Router` mode.
`(config-router)#no neighbor 10.10.10.2 auth md5 password`	Remove MD5 authentication for the neighbor, `10.10.10.2`.
`(config-router)#commit`	Commit the transaction.

PE2

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enter `Router` mode.
`(config-router)#no neighbor 10.10.10.1 auth md5 password`	Remove MD5 authentication for the neighbor, `10.10.10.1`.
`(config-router)#commit`	Commit the transaction.
`(config)#interface lo`	Specify the loopback (lo) interface to be config
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to `2.2.2.2/32`
`(config-if)#exit`	Exit lo interface
`(config-if)#interface xe1`	Specify the interface (`xe1`) to be configured.
`(config-if)#ip address 10.10.10.2/24`	Set the IP address of the interface to `10.10.10.2/24`
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#enable-ldp ipv4`	Enable LDP on interface `xe1`.
`(config-if)#commit`	Commit the transaction.

Validation for LDP Session Count

This example shows the number of configured LDP basic neighbors and targeted neighbors count.

```
#show ldp session count
--------------------------------------------
Basic sessions      : 100          [UP: 100]
```

```
 Targeted sessions   : 500          [UP: 500]
 Total Sessions      : 600          [UP: 600]
 --------------------------------------------
 #show ldp targeted-peer count

LDP Session Protection

LDP Session Protection is an optimization feature. It is used when directly connected LDP peer sessions (via multicast) become unavailable but still have IP reachability over a different path. LDP bindings are kept in the LIB to save time from full synchronization when the direct connections comes back up.

There are two types of LDP connections:

- Direct LDP Session - directly connected LSR, one hop away.
- Targeted LDP Session - not directly connected LSR, multiple hops away.

By default if the directly connected LDP session loses connectivity to its peer, all bindings are flushed from the LIB. When interfaces come up and LDP sessions are re-established, LDP has to synchronize its label bindings.

Enable session protection for indirect link failures to protect the labels until the session is active when multicast adjacency gets deleted. When multicast and TLDP connection exists between the same peer, the interface down notification is received only on the router with the link failure but not in the peer. When the interface goes down the multicast adjacency and the labels get deleted without notifying the peer device. When the interface comes up before the adjacency hold timer expires in the peer node, multicast adjacency is added and advertises the labels to the peer but does not receive any labels from the peer as there is no change in the adjacency.

LDP Session Protection is an optimization, when enabled, will not flush the LIB when direct LDP sessions go down. As long as there exists another path to the LDP Peer, it will maintain the LIB synchronized using Targeted LDP Session. IGP will cause a reroute, but the label bindings will still be present from the old peer. When interfaces come back up, LDP will not need to synchronize since it maintains the state using the targeted sessions.

1. Running LDP Session Protection on a system requires the following tasks:
2. Enabling label-switching on the interface on NSM.
3. Enabling LDP on an interface in the LDP daemon.
4. Running an IGP (Internal Gateway Protocol), for example, OSPF, to distribute reachability information within the MPLS cloud.
5. Configuring the transport address.
6. Configuring LDP Session Protection.

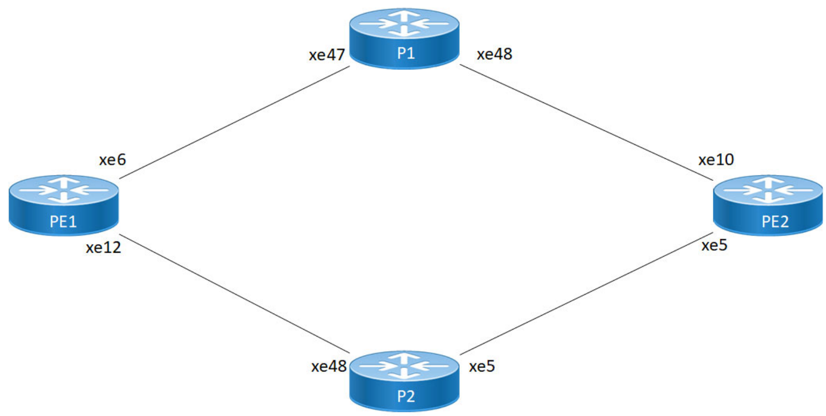

Figure 1-36: Basic LDP Topology

PE1 - NSM

`#configure terminal`	Enter configure mode.
`(config)#interface xe6`	Specify the interface (xe6) to be configured.
`(config-if)#ip address 10.10.10.1/24`	Configure IPv4 address for xe6
`(config-if)#label-switching`	Enable label switching on interface xe6.
`(config)#interface xe12`	Specify the interface (xe12) to be configured.
`(config-if)#ip address 30.30.30.1/24`	Configure IPv4 address for xe12
`(config-if)#label-switching`	Enable label switching on interface xe12.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 1.1.1.1/32`	Set the IP address of the loopback interface to 1.1.1.1/32.
`(config-if)#commit`	Commit the transaction.

PE1 - LDP

`(config)#router ldp`	Enter Router mode for LDP.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
`(config-router)#exit`	Exit the Router mode and return to the Configure mode.
`(config)#interface xe6`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP on xe6.
`(config)#interface xe12`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP on xe12.
`(config-if)#commit`	Commit the transaction.

PE1 - OSPF

(config)#router ospf 1	Configure the routing process and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 1.1.1.1	Configure Router ID
(config-router)#network 1.1.1.1/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.10.10.1/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 30.30.30.1/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

P1 - NSM

#configure terminal	Enter configure mode.
(config)#interface xe47	Specify the interface (xe47) to be configured.
(config-if)#ip address 10.10.10.2/24	Configure IPv4 address for xe47
(config-if)#label-switching	Enable label switching on interface xe47.
(config)#interface xe48	Specify the interface (xe48) to be configured.
(config-if)#ip address 20.20.20.1/24	Configure IPv4 address for xe48
(config-if)#label-switching	Enable label switching on interface xe48.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 2.2.2.2/32 secondary	Set the IP address of the loopback interface to 2.2.2.2/32.
(config-if)#commit	Commit the transaction.

© 2025 IP Infusion Inc. Proprietary

P1 - LDP

(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2
(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#interface xe47	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe47.
(config)#interface xe48	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe48.
(config-if)#commit	Commit the transaction.

P1 - OSPF

(config)#router ospf 1	Configure the routing process and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 2.2.2.2	Configure Router ID
(config-router)#network 2.2.2.2/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.10.10.2/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 20.20.20.1/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

P2 - NSM

#configure terminal	Enter configure mode.
(config)#interface xe48	Specify the interface (xe48) to be configured.
(config-if)#ip address 30.30.30.2/24	Configure IPv4 address for xe48
(config-if)#label-switching	Enable label switching on interface xe48.
(config)#interface xe5	Specify the interface (xe5) to be configured.
(config-if)#ip address 40.40.40.1/24	Configure IPv4 address for xe5
(config-if)#label-switching	Enable label switching on interface xe5.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 4.4.4.4/32 secondary	Set the IP address of the loopback interface to 4.4.4.4/32.
(config-if)#commit	Commit the transaction.

P2 - LDP

(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 4.4.4.4	Set the router ID to IP address 4.4.4.4
(config-router)#transport-address ipv4 4.4.4.4	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#interface xe48	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe48.
(config)#interface xe5	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe5.
(config-if)#commit	Commit the transaction.

P2 - OSPF

(config)#router ospf 1	Configure the routing process and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 4.4.4.4	Configure Router ID
(config-router)#network 4.4.4.4/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 20.20.20.2/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 30.30.30.1/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

PE2 - NSM

#configure terminal	Enter configure mode.
(config)#interface xe10	Specify the interface (xe10) to be configured.
(config-if)#ip address 20.20.20.2/24	Configure IPv4 address for xe10
(config-if)#label-switching	Enable label switching on interface xe10.
(config)#interface xe5	Specify the interface (xe5) to be configured.
(config-if)#ip address 40.40.40.2/24	Configure IPv4 address for xe5
(config-if)#label-switching	Enable label switching on interface xe5.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 3.3.3.3/32 secondary	Set the IP address of the loopback interface to 3.3.3.3/32.
(config-if)#commit	Commit the transaction.

PE2 - LDP

(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 3.3.3.3	Set the router ID to IP address 3.3.3.3
(config-router)#transport-address ipv4 3.3.3.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter "ipv6" if you are configuring an IPv6 interface.
(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#interface xe10	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe10.
(config)#interface xe5	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe5.
(config-if)#commit	Commit the transaction.

PE2 - OSPF

(config)#router ospf 1	Configure the routing process and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 3.3.3.3	Configure Router ID
(config-router)#network 3.3.3.3/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 20.20.20.2/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 40.40.40.2/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.

```

Configure Session Protection:

Note: Recommended to configure both ends.

Configure session protection under LDP in both nodes.

PE1

(config)#router ldp	Enter Router mode for LDP.
(config-router)#session-protection	Session-protection protect label indefinitely if no timer mentioned.
(config-router)#commit	Commit and exit

P1

(config)#router ldp	Enter Router mode for LDP.
(config-router)#session-protection	Session-protection protect label indefinitely if no timer mentioned.
(config-router)#commit	Commit and exit

Validation

With session protection command enabled

Verify that session protection status shown once session protection enabled in both peer nodes.

```

CHAPTER 2 LDP Inter-Area Configuration

This chapter contains LDP inter-area configuration examples.

Overview

Provider-based MPLS (Multiprotocol Label Switching) networks are expanding with the success of Layer 3 Virtual Private Networks and the new deployments of Layer 2 VPNs. Service providers MPLS backbones are significantly growing both in terms of density with the addition of Provider Edge (PE) routers to connect new customers and in terms of footprint as traditional Layer 2 aggregation networks may be replaced by IP/MPLS networks. As a consequence, many providers need to introduce IGP areas. Inter-area LSPs (that is, LSPs that traverse at least two IGP areas) are required to ensure MPLS connectivity between PEs located in distinct IGP areas.

On a large MPLS networks, multiple IGP areas need to be configured for flexible network deployment and fast route convergence. When advertising routes between IGP areas, to prevent a large number of routes from consuming too many resources, an Area Border Router (ABR) needs to aggregate the routes in the area and advertises the aggregated route to the neighboring IGP areas. By default, when establishing LSPs, LDP searches the routing table for the route that exactly matches the FEC in the received Label Mapping message.

The LDP inter-area feature provides a longest-match label mapping procedure where a label is used if the Forwarding Equivalence Class (FEC) matches an entry in the Routing Information Base (RIB). Matching is defined by an IP longest-match search and does not mandate an exact match.

Configure LDP Inter-Area

The LDP Inter-Area configuration process can be divided into the following tasks:

1. Enable label-switching on the interface in NSM.
2. Enable LDP on an interface in LDP.
3. Run an IGP (Internal Gateway Protocol) such as OSPF or ISIS to distribute reachability information within the MPLS cloud.
4. Give the `inter-area-lsp` command in LDP router mode to enable creation of inter-area LSPs.

To configure a summary route on an ABR, configure two networks such R4 and R5 in Figure 2-1, so that two prefixes are summarized. For example, 4.4.4.0/24 is a summary route for the networks 4.4.4.1/32 and 4.4.4.2/32.

Give the `area-range` command on the routers to summarize the networks. For example: area 2 range 4.4.4.0/24.

Note: LDP Downstream-On-Demand not supported with inter-area configuration. LDP Inter-Area Graceful Restart (GR) is not supported in this release.

Topology

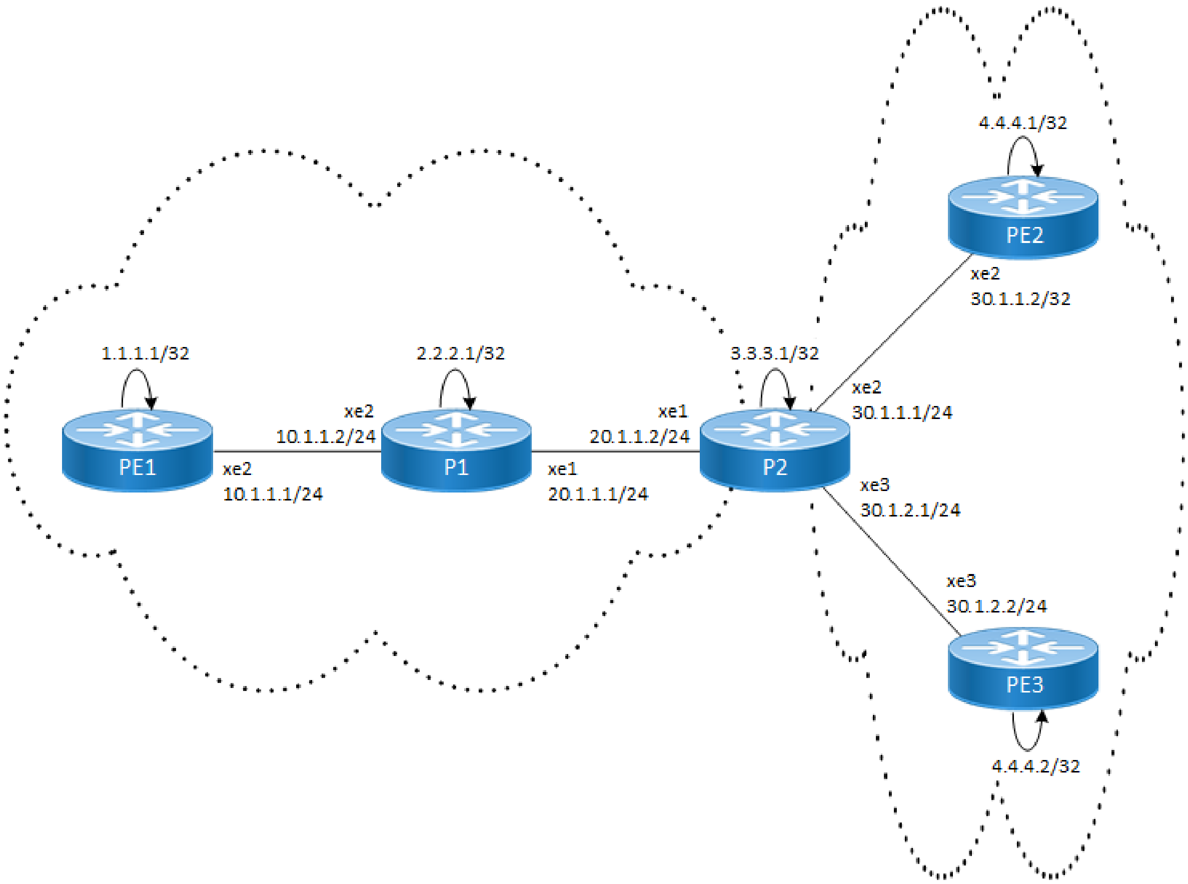

Figure 2-1: LDP inter-area topology

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to 1.1.1.1/32.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 4.4.4.1`	Configure targeted peer.
`(config-router-targeted-peer)#targeted-peer ipv4 4.4.4.2`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode.
`(config)#interface xe2`	Enter interface mode.

(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 10.1.1.1/24	Set the IP address of the interface to 10.1.1.1/24
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#network 1.1.1.1/32 area 0 (config-router)#network 10.1.1.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config)#interface xe2	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe2.
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter LDP router mode.
(config-router)#inter-area-lsp	Enable the inter-area-LSP command.
(config-router)#commit	Commit the transaction.

P1

#configure terminal	Enter configure mode.
(config)#router ldp	Enter router mode for LDP.
(config-router)#router-id 2.2.2.1	Set the router ID to IP address 2.2.2.1
(config-router)#transport-address ipv4 2.2.2.1	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#exit	Exit router mode.
(config)#interface xe2	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 2.2.2.1/32	Set the IP address of the loopback interface to 2.2.2.1/32.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 10.1.1.2/24	Set the IP address of the interface to 10.1.1.2/24
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#ip address 20.1.1.1/24	Set the IP address of the interface to 20.1.1.1/24
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).

(config-router)#network 2.2.2.1/32 area 0 (config-router)#network 10.1.1.0/24 area 0 (config-router)#network 20.1.1.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config)#interface xe2	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe2.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe1.
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter LDP router mode.
(config-router)#inter-area-lsp	Enable the inter-area-LSP command.
(config-router)#commit	Commit the transaction.

P2

#configure terminal	Enter configure mode.
(config)#interface xe1	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 3.3.3.1/32 secondary	Set the IP address of the loopback interface to 3.3.3.1/32.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.
(config-if)#ip address 20.1.1.2/24	Set the IP address of the interface to 20.1.1.2/24
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#ip address 30.1.1.1/24	Set the IP address of the interface to 30.1.1.1/24
(config-if)#exit	Exit interface mode.
(config)#interface xe3	Specify the interface (xe3) to be configured.
(config-if)#label-switching	Enable label switching on interface xe1.
(config-if)#enable-ldp ipv4	Enable LDP on xe1.
(config-if)#ip address 30.1.2.1/24	Set the IP address of the interface to 30.1.2.1/24
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#network 3.3.3.1/32 area 0 (config-router)#network 20.1.1.0/24 area 0 (config-router)#network 30.1.1.0/24 area 2 (config-router)#network 30.1.2.0/24 area 2	Define the interface on which OSPF runs and associate the area ID (0 and 2) respectively with the interface.
(config)#router ldp	Enter LDP router mode.

© 2025 IP Infusion Inc. Proprietary

(config-router)#transport-address ipv4 3.3.3.1	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#router-id 3.3.3.1	Set the router ID to IP address 3.3.3.1
(config-router)#exit	Exit router mode.
(config)#interface xe1	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe1.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe2.
(config-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe3.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#area 2 range 4.4.4.0/24	Configure the summary route with range command.
(config-router)#commit	Commit the transaction.

PE2

#configure terminal	Enter configure mode.
(config)#interface xe2	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 4.4.4.1/32 secondary	Set the IP address of the loopback interface to 4.4.4.1/32.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 30.1.1.2/24	Set the IP address of the interface to 30.1.1.2/24
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#network 4.4.4.1/32 area 2 (config-router)#network 30.1.1.0/24 area 2	Define the interface on which OSPF runs and associate the area ID (2) with the interface.
(config)#router ldp	Enter LDP router mode.
(config-router)#router-id 4.4.4.1	Set the router ID to IP address to 4.4.4.1
(config-router)#transport-address ipv4 4.4.4.1	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#exit	Exit router mode.
(config)#interface xe2	Enter interface mode.

(config-if)#enable-ldp ipv4	Enable LDP on xe2.
(config-if)#commit	Commit the transaction.

PE3

#configure terminal	Enter configure mode.
(config)#interface xe3	Specify the interface (xe3) to be configured.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 4.4.4.2/32 secondary	Set the IP address of the loopback interface to 4.4.4.2/32.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 30.1.2.2/24	Set the IP address of the interface to 30.1.2.2/24
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#network 4.4.4.2/32 area 2 (config-router)#network 30.1.2.0/24 area 2	Define the interface on which OSPF runs and associate the area ID (2) with the interface.
(config)#router ldp	Enter LDP router mode.
(config-router)#router-id 4.4.4.2	Set the router ID to IP address to 4.4.4.2
(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#exit	Exit router mode.
(config)#interface xe3	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP on xe3.
(config-if)#commit	Commit the transaction.

CHAPTER 3 MPLS LDP-IGP Synchronization

This chapter contains configurations for MPLS LDP-IGP Synchronization.

Overview

Multi-Protocol Label Switching (MPLS) Label Distribution Protocol (LDP) Interior Gateway Protocol (IGP) Synchronization ensures that LDP is fully established before the IGP path is used for switching. In certain networks, there is dependency on the edge-to-edge Label Switched Paths (LSPs) setup by the Label Distribution Protocol (LDP), e.g., networks that are used for Multi-Protocol Label Switching (MPLS) Virtual Private Network (VPN) applications. For such applications, it is not possible to rely on Internet Protocol (IP) forwarding if the MPLS LSP is not operating appropriately. Labeled traffic can be dropped due to presence of black holes in situations where the Interior Gateway Protocol (IGP) is operational on a link but LDP sessions are not up as the label distribution is not completed. While the link could still be used for IP forwarding, it is not useful for MPLS forwarding, for example, MPLS VPN applications or Border Gateway Protocol (BGP) route-free cores.

The MPLS LDP-IGP Synchronization feature ensures that the Label Distribution Protocol (LDP) is fully established before the Interior Gateway Protocol (IGP) path is used for packet forwarding. It is useful for cases in which the router is the ingress and the decision of whether to take the MPLS LSP or IGP path is decided there.

LDP-IGP synchronization is an interface level feature. It can be selectively enabled in the required interfaces. For each interface there are two commands available for synchronization, one each for IS-IS. Once configured the IGP saves the required information, and also notifies LDP. In between the IGP increases the link cost to maximum and sends advertisements to its peer. This discourages its peers from taking routes that pass via it.

When all LDP sessions hosted on the interface become operational, it sends a notification to the IGP. This is termed as LDP convergence. The IGP then advertises normal cost, so that all traffic now coming to the interface takes the MPLS LSP path established by LDP and not be IP routed.

Prerequisites

Only interfaces that are running Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS) processes are capable of LDP-IGP synchronization. The router must also be running LDP.

Topology

The sample topology diagram is applicable to all configurations in this chapter.

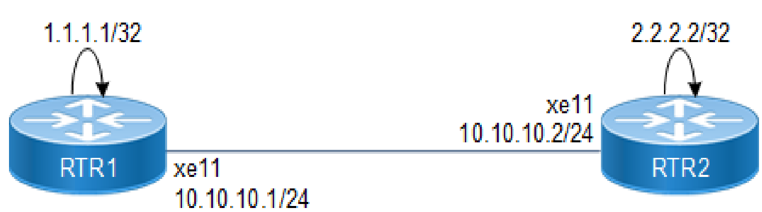

Figure 3-2: Sample Topology for LDP-IGP Synchronization

LDP-IGP Synchronization with OSPF

When IGP synchronization is enabled on OSPF-enabled interfaces, OSPF sends Maximum/Normal cost based on LDP session Down or Up state messages to interfaces until the hold-down-timer expires or synchronization is achieved.

Before configuring LDP-IGP synchronization, the NSM, OSPF and LDP configurations must be completed. The tables below contain examples of how this is done.

RTR1 - NSM

`#configure terminal`	Enter configuration mode.
`(config)#interface xe11`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure IPv4 address for xe11.
`(config-if)#label-switching`	Enable label switching on interface xe11.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to 1.1.1.1/32.
`(config-if)#commit`	Commit the transaction.

RTR1 - OSPF

`(config)#router ospf 100`	Configure the routing process and specify the Process ID 100. The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 1.1.1.1`	Configure OSPF router ID same as loopback IP address.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 1.1.1.1/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the transaction.

RTR1 - LDP

`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1.
`(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit router mode.
`(config)#interface xe11`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe11.
`(config-if)#commit`	Commit the transaction.

© 2025 IP Infusion Inc. Proprietary

RTR2 - NSM

`#configure terminal`	Enter configuration mode.
`(config)#interface xe11`	Enter interface mode.
`(config-if)#ip address 10.10.10.2/24`	Configure IPv4 address for xe11.
`(config-if)#label-switching`	Enable label switching on interface xe11.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to 2.2.2.2/32.
`(config-if)#commit`	Commit the transaction.

RTR2 - OSPF

`(config)#router ospf 100`	Configure the routing process and specify the Process ID 100. The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 2.2.2.2`	Configure OSPF router ID same as loopback IP address.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 2.2.2.2/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the transaction.

RTR2 - LDP

`(config)#router ldp`	Enter Router mode for LDP.
`(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2.
`(config-router)#transport-address ipv4 2.2.2.2`	Configure the transport address for IPV4 (for IPV6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as transport address.
`(config-router)#exit`	Exit the Router mode and return to the Configure mode.
`(config)#interface xe11`	Enter interface mode.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe11.
`(config-if)#commit`	Commit the transaction.

LDP-IGP Synchronization

Now that NSM, OSPF and LDP are all enabled, the LDP-IGP synchronization can be configured.

RTR1

`(config)#interface xe11`	Enter interface mode.
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe11 belonging to an OSPF process and 500 seconds is holddown-timer value for IGP to wait until LDP converges. **OSPF:** This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#mpls ldp-igp sync-delay 60`	Configure time delay in seconds for notification of LDP convergence to IGP. This is not applicable for notification of non-convergence. Range is 5 to 60 seconds. This command is optional. **LDP:** This command is part of LDP Process. **Default:** If not configured the delay is 0 seconds.
`(config-if)#commit`	Commit the transaction.

RTR2

`(config)#interface xe11`	Enter interface mode.
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for interfaces (xe11) belonging to an OSPF process.and 500 secs is Holddown-timer value for IGP to wait until LDP Converge. **OSPF:** This command is part of the OSPF Process.vNote: Holddown-timer range is <1-2147483> seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use command mpls ldp-igp sync ospf to configure without a holddown-timer.

(config-if)#mpls ldp-igp sync-delay 60	Configure the time delay in seconds for the notification of LDP convergence to IGP. (This is not applicable for notification of non-convergence.) Range is 5 to 60 seconds. This command is optional. **LDP:** This command is part of LDP Process. **Default:** If not configured the delay is 0 seconds.
(config-if)#commit	Commit the transaction.

RTR1 Validation

When LDP IGP SYNC is Configured with hold-down and sync-delay timer

LDP-IGP Synchronization with IS-IS

When IGP synchronization is enabled on an IS-IS enabled interfaces, IS-IS sends Maximum/Normal cost based on LDP session or Up state on interfaces until hold-down-timer expires or synchronization is achieved.

Before configuring LDP-IGP synchronization, the NSM, IS-IS and LDP configurations must be completed. The tables below contain examples of how this is done.

RTR1 - NSM

#configure terminal	Enter configuration mode.
(config)#interface xe11	Enter interface mode.
(config-if)#ip address 10.10.10.1/24	Set the IP address of the xe11 to 10.10.10.1/24.
(config-if)#label-switching	Enable label switching on xe11.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 1.1.1.1/32 secondary	Set the IP address of the loopback interface to 1.1.1.1/32.
(config-if)#commit	Commit the transaction.

RTR1 - IS-IS

(config)#router isis 1	Configure the IS-IS routing instance and specify the TAG (1). The TAG should be a WORD - ISO routing area tag.
(config-router)#is-type level-1	Define the IS to the specified level of routing for router.
(config-router)#net 49.0001.0000.0000.0001.00	Configure the Network Entity Title (NET) for the instance.

(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#interface xe11	Enter interface mode.
(config-if)#ip router isis 1	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
(config-if)#isis circuit-type level-1	Define the circuit type for the interface on which IS-IS runs and associate the level 1.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter interface mode for the loopback interface (lo).
(config-if)#ip router isis 1	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
(config-if)#isis circuit-type level-1	Define the circuit type for the interface on which IS-IS runs and associate the level 1.
(config-if)#commit	Commit the transaction.

RTR1 - LDP

(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 1.1.1.1	Set the router ID to IP address 1.1.1.1.
(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address for IPV4 (for IPv6 use an IPv6 address) to use for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as transport address.
(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#interface xe11	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on xe11.
(config-if)#commit	Commit the transaction.

RTR2 - NSM

#configure terminal	Enter configuration mode
(config)#interface xe11	Enter interface mode.
(config-if)#ip address 10.10.10.2/24	Set the IP address of xe11 to 10.10.10.2/24
(config-if)#label-switching	Enable label switching on interface xe11.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 2.2.2.2/32 secondary	Set the IP address of the loopback interface to 2.2.2.2/32.
(config-if)#commit	Commit the transaction.

RTR2 - IS-IS

(config)#router isis 1	Configure the IS-IS routing instance and specify the TAG as 1. The TAG should be a WORD - ISO routing area tag.
(config-router)#is-type level-1	Define the IS to the specified level of routing for router.
(config-router)#net 49.0001.0000.0000.0002.00	Configure the Network Entity Title (NET) for the instance.

(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#interface xe11	Enter interface mode.
(config-if)#ip router isis 1	Configure IS-IS IPv4 routing on the interface with is-is tag instance 1.
(config-if)#isis circuit-type level-1	Define the circuit type for the interface on which IS-IS runs and associate the level type (1).
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter interface mode for the loopback (lo) interface.
(config-if)#ip router isis 1	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
(config-if)#isis circuit-type level-1	Define the circuit type for the interface on which IS-IS runs and associate the level 1.
(config-if)#commit	Commit the transaction.

RTR2 - LDP

(config)#router ldp	Enter Router mode for LDP.
(config-router)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2.
(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address for IPv4 (for IPv6 use an IPv6 address) to use for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as transport address.
(config-router)#exit	Exit the Router mode and return to the Configure mode.
(config)#interface xe11	Enter interface mode.
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on xe11.
(config-if)#commit	Commit the transaction.

LDP-IGP SYNC Configuration

Now that NSM, IS-IS and LDP are all enabled, the LDP-IGP synchronization can be configured.

© 2025 IP Infusion Inc. Proprietary

RTR1

`(config)#interface xe11`	Enter interface mode.
`(config-if)#mpls ldp-igp sync isis level-1 holddown-timer 700`	Configure LDP-IGP Synchronization for interface xe11 belonging to an IS-IS process with corresponding IS-IS level.700 seconds is the holddown-timer value for IGP to wait until LDP converges. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. **IS-IS:** This command is part of ISIS Process. **Default:** Mandatory configuration. No default option. Note: The holddown-timer Range is 1 to 2147483 seconds. If no holddown timer is configured, IGP waits indefinitely for LDP to Converge. Use the command mpls ldp-igp sync is-is <level-type> to configure without a holddown-timer.
`(config-if)#mpls ldp-igp sync-delay 55`	Set the time delay in seconds for the notification of LDP convergence to IGP. This is not applicable for notification of non-convergence. Range is 5 to 60 seconds. This command is optional. **LDP:** This command is part of LDP Process. **Default:** If not configured, the delay is 0 seconds.
`(config-if)#commit`	Commit the transaction.

LDP-IGP SYNC Configuration

Now that NSM, IS-IS and LDP are all enabled, the LDP-IGP synchronization can be configured.

RTR2

`(config)#interface xe11`	Enter interface mode.
`(config-if)#mpls ldp-igp sync isis level-1 holddown-timer 700`	Configure LDP-IGP Synchronization for interface xe11 belonging to an IS-IS process with corresponding IS-IS level.700 secs is the holddown-timer value for IGP to wait until LDP converges. The parameters level-1|level-2-only|level-1-2 identify the IS-IS instance level. The interface can be acting on any level, but sync is applicable only when it matches with the level given in IGP sync command. **IS-IS:** This command is part of IS-IS Process. **Default:** Mandatory configuration. No default option. Note: The holddown-timer Range is 1 to 2147483 seconds. If no holddown timer is configured, IGP waits indefinitely for LDP to Converge. Use command mpls ldp-igp sync is-is <level-type> to configure without a holddown-timer.

(config-if)#mpls ldp-igp sync-delay 55	Set the time delay in seconds for notification of LDP convergence to IGP. This is not applicable for notification of non-convergence. Range is 5 to 60 seconds. This command is optional. **LDP:** This command is part of LDP Process. **Default:** If not configured, the delay is 0 seconds.
(config-if)#commit	Commit the transaction.

CHAPTER 4 LDP-FRR Configuration

LDP Fast Re-route (FRR) is a technology which helps the router to reduce the MPLS traffic loss in cases of convergence during network failure. A router's convergence time is in general in the order of hundreds of milliseconds, but some applications may be very sensitive to data-loss. This technology helps the router to minimize the MPLS traffic loss by calculating and installing alternate backup paths prior to failure.

LDP FRR improves convergence in case of a single link or single node failure in the network. Convergence times will be in the order of 10s of milliseconds (Max convergence - 50 milliseconds). This is important to some application services (like VoIP) which are sensitive to traffic loss when running over the MPLS network.

Without FRR, link and/or node failures inside an MPLS LDP network result in traffic loss in the order of 100s of milliseconds. The reason for that is that LDP depends on the convergence of the underlying IGP (IS-IS sending LSPs/ OSPF sending LSAs in this case). Post IGP convergence, LDP itself needs to compute new primary Next-Hop Label Forwarding Entries (NHLFEs) for all affected Forwarding Equivalence Classes (FECs). Finally, the different Label Forwarding Information Bases (LFIBs) are updated.

When FRR is configured on a node, the node pre-computes primary NHLFEs for all FECs and in addition it will pre-compute backup NHLFEs for all FECs. The backup NHLFE corresponds to the label received for the same FEC from a Loop-Free Alternate (LFA) next-hop.

Note: This implementation requires either ISIS LFA or OSPF LFA and LDP IGP synchronization.

Topology

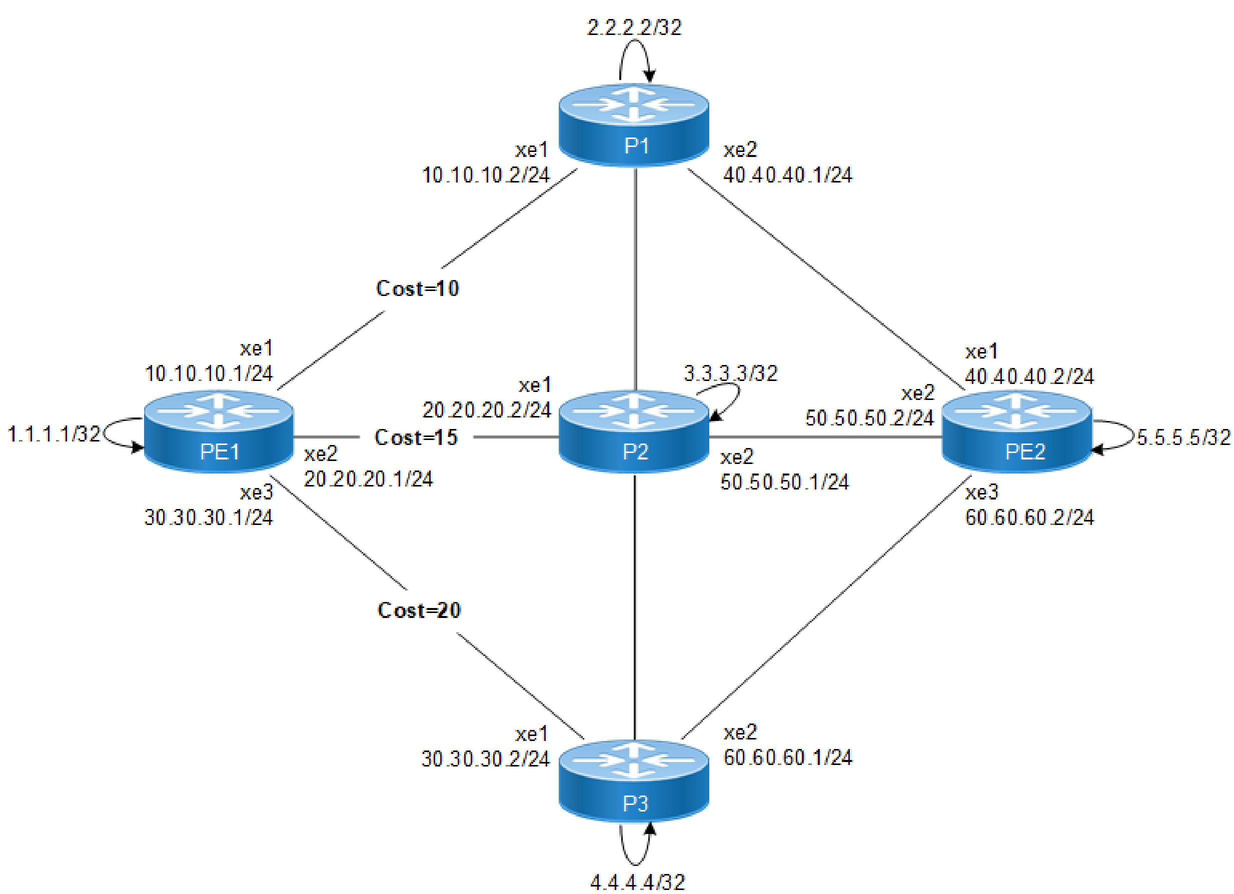

Figure 4-3: LDP-FRR Topology

LDP-FRR with OSPF as IGP Configuration

Below are the configurations and validations involving NSM, OSPF, LDP before configuring fast-reroute for IGP and LDP

PE1

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1
`(config-router)#transport-address ipv4 1.1.1.1 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 5.5.5.5`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure IPv4 address for xe1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#ip ospf cost 10`	Assign ospf cost to the interface
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IPv4 address for xe2
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.
`(config-if)#ip ospf cost 15`	Assign ospf cost to the interface

© 2025 IP Infusion Inc. Proprietary

`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe3`	Enter interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IPv4 address for xe3
`(config-if)#label-switching`	Enable label switching on interface xe3
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe3
`(config-if)#ip ospf cost 20`	Assign OSPF cost to the interface
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync OSPF to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 1`	Configure the routing process and specify the Process ID 100. The Process ID should be a unique positive integer identifying the routing process.
`(config)#ospf router-id 1.1.1.1`	Configure OSPF router-ID same as loopback interface IP address
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 20.20.20.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 30.30.30.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#bfd all-interfaces`	Enable the OSPF enabled interfaces with bfd
`(config-if)#exit`	Exit interface mode.
`(config)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval
`(config)#commit`	Commit all the configurations

P1

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to 2.2.2.2/32
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2
`(config-router)#transport-address ipv4 2.2.2.2 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.2/24`	Configure IPv4 address for xe1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 40.40.40.1/24`	Configure IPv4 address for xe2
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 1`	Configure the routing process and specify the Process ID • The Process ID should be a unique positive integer identifying the routing process.

`(config)#ospf router-id 2.2.2.2`	Configure OSPF router-ID same as loopback interface IP address
`(config-router)#network 2.2.2.2/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#network 40.40.40.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#bfd all-interfaces`	Enable the OSPF enabled interfaces with bfd
`(config-if)#exit`	Exit interface mode.
`(config)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval
`(config)#commit`	Commit all the configurations

P2

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 3.3.3.3/32 secondary`	Set the IP address of the loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 3.3.3.3`	Set the router ID to IP address 3.3.3.3
`(config-router)#transport-address ipv4 3.3.3.3 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 20.20.20.2/24`	Configure IPv4 address for xe1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 50.50.50.1/24`	Configure IPv4 address for xe2
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.

`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 1`	Configure the routing process and specify the Process ID • The Process ID should be a unique positive integer identifying the routing process.
`(config)#ospf router-id 3.3.3.3`	Configure OSPF router-ID same as loopback interface IP address
`(config-router)#network 3.3.3.3/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#network 20.20.20.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#network 50.50.50.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface
`(config-router)#bfd all-interfaces`	Enable the OSPF enabled interfaces with bfd
`(config-if)#exit`	Exit interface mode.
`(config)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval
`(config)#commit`	Commit all the configurations

P3

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 4.4.4.4/32 secondary`	Set the IP address of the loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 4.4.4.4`	Set the router ID to IP address 4.4.4.4
`(config-router)#transport-address ipv4 4.4.4.4 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 30.30.30.2/24`	Configure IPv4 address for xe1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.

(config-if)#mpls ldp-igp sync ospf holddown-timer 500	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
(config-if)#exit	Exit interface mode
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 60.60.60.1/24	Configure IPv4 address for xe2
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on xe2.
(config-if)#mpls ldp-igp sync ospf holddown-timer 500	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
(config-if)#exit	Exit interface mode
(config)#router ospf 1	Configure the routing process and specify the Process ID • The Process ID should be a unique positive integer identifying the routing process.
(config)#ospf router-id 4.4.4.4	Configure OSPF router-ID same as loopback interface IP address.
(config-router)#network 4.4.4.4/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 30.30.30.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 60.60.60.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-if)#exit	Exit interface mode.
(config)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval
(config)#commit	Commit all the configurations

PE2

#configure terminal	Enter configuration mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 5.5.5.5/32 secondary	Set the IP address of the loopback interface to 5.5.5.5/32
(config-if)#exit	Exit interface mode.

`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 5.5.5.5`	Set the router ID to IP address 5.5.5.5
`(config-router)#transport-address ipv4 5.5.5.5 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 1.1.1.1`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 40.40.40.2/24`	Configure IPv4 address for xe1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 50.50.50.2/24`	Configure IPv4 address for xe2
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.
`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe3`	Enter interface mode.
`(config-if)#ip address 60.60.60.2/24`	Configure IPv4 address for xe3
`(config-if)#label-switching`	Enable label switching on interface xe3
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe3

© 2025 IP Infusion Inc. Proprietary

`(config-if)#mpls ldp-igp sync ospf holddown-timer 500`	Enable LDP-IGP Synchronization for xe1 belonging to an OSPF process.500 seconds is holddown-timer value for IGP to wait until LDP converges. OSPF: This command is part of OSPF Process. Note: Holddown-timer range is 1 to 2147483 seconds. If holddown timer is not configured, IGP waits indefinitely for LDP to converge. Use the command mpls ldp-igp sync ospf to configure without a holddown-timer.
`(config-if)#exit`	Exit interface mode
`(config)#router ospf 1`	Configure the routing process and specify the Process ID • The Process ID should be a unique positive integer identifying the routing process.
`(config)#ospf router-id 5.5.5.5`	Configure OSPF router-ID same as loopback interface IP address
`(config-router)#network 5.5.5.5/32 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 40.40.40.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 50.50.50.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#network 60.60.60.0/24 area 0`	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
`(config-router)#bfd all-interfaces`	Enable the OSPF enabled interfaces with bfd
`(config-if)#exit`	Exit interface mode.
`(config)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval
`(config)#commit`	Commit all the configurations

RTR1 - FRR Configuration

Now that NSM, OSPF and LDP are all configured, FRR for IGP and LDP can be enabled using below configurations.

`#configure terminal`	Enter configuration mode.
`(config)#router ospf 1`	Configure the routing process and specify the Process ID • The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#fast-reroute keep-all-paths`	Configure OSPF LFA-FRR to calculate the available backup path
`(config-router)#exit`	Exit router mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#fast-reroute`	Configure LDP LFA-FRR to calculate the available backup path
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit all the configurations

Validation

```

To prohibit an interface from being used as a repair path, disable fast reroute calculation on the interface:

`#configure terminal`	Enter configuration mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip ospf fast-reroute per-prefix candidate disable`	Disable fast reroute calculation on the interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit all the configurations

Verify that the xe2 interface is not used for backup path calculation.

LDP-FRR with ISIS as IGP Configuration

Below are the configurations and validations involving NSM, ISIS, LDP before configuring fast-reroute for IGP and LDP.

PE1

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 1.1.1.1`	Set the router ID to IP address 1.1.1.1
`(config-router)#transport-address ipv4 1.1.1.1 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#targeted-peer ipv4 5.5.5.5`	Configure targeted peer.
`(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure IPv4 address for xe1.
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#isis wide-metric 20 level-1`	Assign isis wide-metric to the interface
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe1 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IPv4 address for xe2
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.
`(config-if)#isis wide-metric 15 level-1`	Assign isis wide-metric to the interface

`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe2 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe3`	Enter interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IPv4 address for xe3
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe3
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe3
`(config-if)#isis wide-metric 60 level-1`	Assign isis wide-metric to the interface
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe3 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#net 49.0001.0000.0000.0001.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance
`(config-router)#is-type level-1`	Configure instance as level-1-only routing.
`(config-router)#metric-style wide`	Configure the new style of metric type as wide
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#bfd all-interfaces`	Enable BFD for ISIS on all interfaces
`(config-router)#capability cspf`	Enable CSPF feature for ISIS instance.
`(config-if)#exit`	Exit interface mode.
`(config)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval
`(config)#commit`	Commit all the configurations

P1

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to 2.2.2.2/32
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.

`(config-router)#router-id 2.2.2.2`	Set the router ID to IP address 2.2.2.2
`(config-router)#transport-address ipv4 2.2.2.2 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.2/24`	Configure IPv4 address for xe1.
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe1 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 40.40.40.1/24`	Configure IPv4 address for xe2
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe2 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#net 49.0001.0000.0000.0002.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance
`(config-router)#is-type level-1`	Configure instance as level-1-only routing.
`(config-router)#metric-style wide`	Configure the new style of metric type as wide
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#bfd all-interfaces`	Enable BFD for ISIS on all interfaces
`(config-router)#capability cspf`	Enable CSPF feature for ISIS instance.
`(config-if)#exit`	Exit interface mode.

© 2025 IP Infusion Inc. Proprietary

`(config)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval
`(config)#commit`	Commit all the configurations

P2

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 3.3.3.3/32 secondary`	Set the IP address of the loopback interface to 3.3.3.3/32
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 3.3.3.3`	Set the router ID to IP address 3.3.3.3
`(config-router)#transport-address ipv4 3.3.3.3 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 20.20.20.2/24`	Configure IPv4 address for xe1.
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe1 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 50.50.50.1/24`	Configure IPv4 address for xe2
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe2 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.

`(config-if)#exit`	Exit interface mode
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#net 49.0001.0000.0000.0003.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance
`(config-router)#is-type level-1`	Configure instance as level-1-only routing.
`(config-router)#metric-style wide`	Configure the new style of metric type as wide
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#bfd all-interfaces`	Enable BFD for ISIS on all interfaces
`(config-router)#capability cspf`	Enable CSPF feature for ISIS instance.
`(config-if)#exit`	Exit interface mode.
`(config)#bfd interval 3 minrx 3 multiplier 3`	Configure BFD interval
`(config)#commit`	Commit all the configurations

P3

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Specify the loopback (lo) interface to be configured.
`(config-if)#ip address 4.4.4.4/32 secondary`	Set the IP address of the loopback interface to 4.4.4.4/32
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#exit`	Exit interface mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#router-id 4.4.4.4`	Set the router ID to IP address 4.4.4.4
`(config-router)#transport-address ipv4 4.4.4.4 0`	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
`(config-router)#exit`	Exit router mode
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 30.30.30.2/24`	Configure IPv4 address for xe1.
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe1 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.

(config-if)#ip address 60.60.60.1/24	Configure IPv4 address for xe2
(config-if)#ip router isis 1	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on xe2.
(config-if)#mpls ldp-igp sync isis level-1	Configure LDP-IGP Synchronization for interface xe2 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
(config-if)#exit	Exit interface mode
(config)#router isis 1	Create an IS-IS routing instance for area 49 with instance 1
(config-router)#net 49.0001.0000.0000.0004.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID
(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance
(config-router)#is-type level-1	Configure instance as level-1-only routing.
(config-router)#metric-style wide	Configure the new style of metric type as wide
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)#bfd all-interfaces	Enable BFD for ISIS on all interfaces
(config-router)#capability cspf	Enable CSPF feature for ISIS instance.
(config-if)#exit	Exit interface mode.
(config)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval
(config)#commit	Commit all the configurations

PE2

#configure terminal	Enter configuration mode.
(config)#interface lo	Specify the loopback (lo) interface to be configured.
(config-if)#ip address 5.5.5.5/32 secondary	Set the IP address of the loopback interface to 5.5.5.5/32
(config-if)#ip router isis 1	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
(config-if)#exit	Exit interface mode.
(config)#router ldp	Enter router mode for LDP.
(config-router)#router-id 5.5.5.5	Set the router ID to IP address 5.5.5.5
(config-router)#transport-address ipv4 5.5.5.5 0	Configure the transport address for IPv4 (for IPv6 use ipv6) to be used for a TCP session over which LDP will run. Note: It is preferable to use the loopback address as the transport address.
(config-router)#targeted-peer ipv4 1.1.1.1	Configure targeted peer.
(config-router-targeted-peer)#exit	Exit-targeted-peer-mode
(config-router)#exit	Exit router mode
(config)#interface xe1	Enter interface mode.

`(config-if)#ip address 40.40.40.2/24`	Configure IPv4 address for xe1.
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe1.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe1.
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe1 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 50.50.50.2/24`	Configure IPv4 address for xe2
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe2.
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe2.
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe2 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe3`	Enter interface mode.
`(config-if)#ip address 60.60.60.2/24`	Configure IPv4 address for xe3
`(config-if)#ip router isis 1`	Configure IS-IS IPv4 routing on the interface with IS-IS tag instance 1.
`(config-if)#label-switching`	Enable label switching on interface xe3
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on xe3
`(config-if)#mpls ldp-igp sync isis level-1`	Configure LDP-IGP Synchronization for interface xe3 belonging to an IS-IS process with corresponding IS-IS level. The values level-1|level-2-only|level-1-2 identify the IS-IS level instance. The interface can be acting on any level, but the sync is applicable only when it matches with the level given in IGP sync command. IS-IS: This command is part of ISIS Process. Default: Mandatory configuration. No default option.
`(config-if)#exit`	Exit interface mode
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#net 49.0001.0000.0000.0005.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance

(config-router)#is-type level-1	Configure instance as level-1-only routing.
(config-router)#metric-style wide	Configure the new style of metric type as wide
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)#bfd all-interfaces	Enable BFD for ISIS on all interfaces
(config-router)#capability cspf	Enable CSPF feature for ISIS instance.
(config-if)#exit	Exit interface mode.
(config)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval
(config)#commit	Commit all the configurations

RTR1 - FRR Configuration

Now that NSM, ISIS and LDP are all configured, FRR for IGP and LDP can be enabled using below configurations.

`#configure terminal`	Enter configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#fast-reroute per-prefix level-1 proto ipv4 all`	Configure LFA-FRR to calculate the available backup path for all L1 ipv4 prefixes learnt
`(config-router)#exit`	Exit router mode.
`(config)#router ldp`	Enter router mode for LDP.
`(config-router)#fast-reroute`	Configure LDP LFA-FRR to calculate the available backup path
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit all the configurations

Validation

To prohibit an interface from being used as a repair path, disable fast reroute calculation on the interface:

`#configure terminal`	Enter configuration mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#isis fast-reroute per-prefix candidate disable level-1`	Disable fast reroute calculation on the interface.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit all the configurations

Verify that the xe1 interface is not used for backup path calculation.

Backup Path based on Route-Map Prefixes

`(config)#ip access-list A`	Create an access-list
`(config-ip-acl)#10 permit any host 40.40.40.0 any`	Configuring rule to permit only one prefix
`(config)#route-map R permit 10`	Create a route-map
`(config-route-map)#match ip address A`	Apply above created access-list in route-map
`(config-route-map)#exit`	Exit route-map mode
`(config)#commit`	Commit all the configurations

Apply the above created route-map with fast-reroute:

`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#no fast-reroute per-prefix level-1 proto ipv4`	Un-configure LFA-FRR to calculate available path for all prefixes
`(config-router)#fast-reroute per-prefix level-1 proto ipv4 route-map R`	Configure LFA-FRR to calculate the available backup path for routes allowed through route-map
`(config-router)#exit`	Exit router mode
`(config)#commit`	Commit all the configurations

Validation

CHAPTER 5 TCP MSS configuration for LDP sessions

Overview

Label Distribution Protocol (LDP) uses Transmission Control Protocol (TCP) to establish sessions between the devices. This feature enables the configuration of TCP Maximum Segment Size (MSS) that defines the maximum segment size in a single TCP segment during a communication session.TCP segment is a unit of data transmitted in a TCP connection. TCP uses three-way handshake process for initial establishment of a TCP connection. In the three-way handshake process, the sending host sends a SYN packet. Once the receiving host receives the SYN packet, it acknowledges and sends back a SYN-ACK packet to the sending host. Once the sending host receives the SYN-ACK packet from the receiving host, it sends an ACK packet, establishing a reliable connection. In this three way handshake process, the MSS is negotiated between the LDP neighbors.

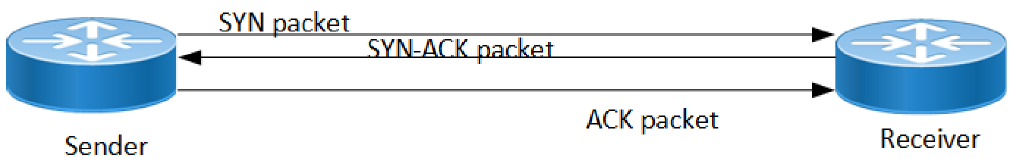

Figure 5-4: Three-way handshake

Feature Characteristics

The configuration of the TCP MSS for LDP neighbors helps the neighbors adjust the MSS value of the TCP SYN packet. Configure the TCP MSS through the CLI and NetConf interface. The configurable MSS range is offered from 560 to 1440. By default, the MTU value for ethernet cable is 1500 bytes. When configuring the highest MSS value that is 1440, the total MSS becomes 1440 bytes (MSS) plus 20 bytes (IP Header Size), 20 bytes (TCP Header), and Ethernet header which does not cross the default path MTU value.

Note: After configuring TCP MSS, use clear ldp session command to apply the MSS for the operational session.

Configuring TCP MSS

Benefits

By default, the interface MTU value determines the MSS value of an LDP packet. When the interface MTU value exceeds the default ethernet path MTU value of 1500 bytes, the MSS value also crosses the default ethernet path MTU value, resulting in packet fragmentation. The configuration of the specific MSS value limits the packet size irrespective of the interface MTU value, preventing packet fragmentation.[

Prerequisites

Requires the knowledge on TCP handshake and the formation of LDP neighbors.

Configuration

This section shows the procedure to configure TCP MSS for LDP session.

Enable Label Switching

Running LDP on a system requires the following tasks:

1. Enabling label-switching on the interface on NSM.
2. Enabling LDP on an interface in the LDP daemon.
3. Running an Internal Gateway Protocol (IGP), for example, Open Shortest Path first (OSPF), to distribute reachability information within the MPLS cloud.
4. Configuring the transport address.
5. Configure the TCP MSS neighbor on peer node (Active node).

Topology

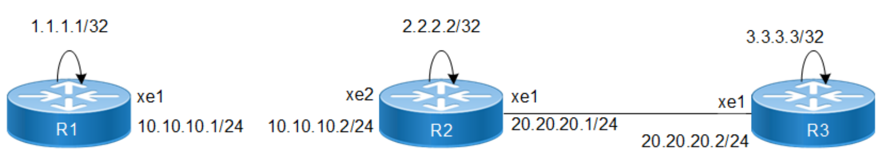

Figure 5-5: Device topology for TCP MSS for LDP

Configuration

The below configuration shows how to configure the TCP MSS value for the LDP neighbors.

R1 - NSM

`R1#configure terminal`	Enter configure mode.
`R1(config)#interface xe1`	Specify the interface `xe1` to be configured.
`R1(config-if)#ip address 10.10.10.1/24`	Assign IP address `10.10.10.1/24` to interface.
`R1(config-if)#label-switching`	Enable label switching on interface `xe1`.
`R1(config-if)#exit`	Exit interface mode.

`R1(config)#interface lo`	Specify the loopback interface to be configured.
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address of the loopback interface to `1.1.1.1/32`.
`R1(config-if)#commit`	Commit the transaction.

R1 - LDP

`R1(config)#router ldp`	Enter Router mode for LDP.
`R1(config-router)#router-id 1.1.1.1`	Set the router ID to IP address `1.1.1.1`.
`R1(config-router)#transport-address ipv4 1.1.1.1`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter `ipv6` if you are configuring an IPv6 interface.
`R1(config-router)#targeted-peer ipv4 3.3.3.3`	Configure targeted peer `3.3.3.3`.
`R1(config-router-targeted-peer)#exit`	Exit targeted peer-mode.
`R1(config-router)#exit`	Exit the router mode and return to the configure mode.
`R1(config)#interface xe1`	Enter interface mode `xe1`.
`R1(config-if)#enable-ldp ipv4`	Enable LDP on `xe1`.
`R1(config-if)#commit`	Commit the transaction.

R1 - OSPF

`R1(config)#router ospf 100`	Configure the routing process and specify the process ID `100`. The process ID should be a unique positive integer identifying the routing process.
`R1(config-router)#network 10.10.10.0/24 area 0`	Define the interface `10.10.10.0/24`,on which OSPF runs and associate the area ID `0` with the interface.
`R1(config-router)#network 1.1.1.1/32 area 0`	Define the interface `1.1.1.1/32`, on which OSPF runs and associate the area ID `0` with the interface.
`R1(config-router)#commit`	Commit the transaction.

R2 - NSM

`R2#configure terminal`	Enter configure mode.
`R2(config)#interface lo`	Specify the loopback interface to be configured.
`R2(config-if)#ip address 2.2.2.2/32 secondary`	Set the IP address of the loopback interface to `2.2.2.2/32`.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe1`	Specify the interface `xe1` to be configured.
`R2(config-if)#ip address 20.20.20.1/24`	Assign IP address `20.20.20.1/24` to interface.
`R2(config-if)#label-switching`	Enable label switching on interface `xe1`.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe2`	Specify the interface `xe2` to be configured.

© 2025 IP Infusion Inc. Proprietary

R2(config-if)#ip address 10.10.10.2/24	Assign IP address 10.10.10.2/24 to interface.
R2(config-if)#label-switching	Enable label switching on interface xe2.
R2(config-if)#commit	Commit the transaction.

R2 - LDP

R2(config)#router ldp	Enter Router mode.
R2(config-router)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2.
R2(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter ipv6 if you are configuring an IPv6 interface.
R2(config-router)#neighbor 1.1.1.1 tcp-mss 600	Configure the TCP MSS value on peer node which have active side only.
R2(config-router)#exit	Exit router mode and return to configure mode.
R2(config)#interface xe1	Specify the interface xe1 to be configured.
R2(config-if)#enable-ldp ipv4	Enable LDP on a specified interface xe1.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe2	Specify the interface xe2 to be configured.
R2(config-if)#enable-ldp ipv4	Enable LDP on a specified interface xe2.
R2(config-if)#commit	Commit the transaction.

R2 - OSPF

R2(config)#router ospf 100	Configure the routing process and specify the process ID 100. The process ID should be a unique positive integer identifying the routing process.
R2(config-router)#network 10.10.10.0/24 area 0	Define the interfaces 10.10.10.0/24, on which OSPF runs and associate the area ID 0 with them.
R2(config-router)#network 20.20.20.0/24 area 0	Define the interfaces 20.20.20.0/24, on which OSPF runs and associate the area ID 0 with them.
R2(config-router)#network 2.2.2.2/32 area 0	Define the interfaces 2.2.2.2/32, on which OSPF runs and associate the area ID 0 with them.
R2(config-router)#commit	Commit the transaction.

R3 - NSM

R3#configure terminal	Enter configure mode.
R3(config)#interface lo	Specify the loopback interface to be configured.
R3(config-if)#ip address 3.3.3.3/32 secondary	Set the IP address of the loopback interface to 3.3.3.3/32.
R3(config-if)#exit	Exit interface mode.
R3(config)#interface xe1	Specify the interface xe1 to be configured.

`R3(config-if)#ip address 20.20.20.2/24`	Set the IP address of the interface to `20.20.20.2/24`.
`R3(config-if)#label-switching`	Enable label switching on interface `xe1`.
`R3(config-if)#commit`	Commit the transaction.

R3 - LDP

`R3(config)#router ldp`	Enter Router mode.
`R3(config-router)#router-id 3.3.3.3`	Set the router ID for IP address `3.3.3.3`.
`R3(config-router)#transport-address ipv4 3.3.3.3`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter `ipv6` if you are configuring an IPv6 interface.
`R3(config-router)#neighbor 2.2.2.2 tcp-mss 650`	Configure the TCP MSS value on peer node which have active side only.
`R3(config-router)#targeted-peer ipv4 1.1.1.1`	Configure targeted peer.
`R3(config-router-targeted-peer)#exit`	Exit targeted peer-mode.
`R3(config-router)#exit`	Exit the router mode and return to the configure mode.
`R3(config)#interface xe1`	Enter interface mode `xe1`.
`R3(config-if)#enable-ldp ipv4`	Enable LDP on `xe1`.
`R3(config-if)#commit`	Commit the transaction.

R3 - OSPF

`R3(config)#router ospf 100`	Configure the routing process and specify the Process ID `100`. The Process ID should be a unique positive integer identifying the routing process.
`R3(config-router)#network 20.20.20.0/24 area 0`	Define the interfaces `20.20.20.0/24`, on which OSPF runs and associate the area ID `0` with them.
`R3(config-router)#network 3.3.3.3/32 area 0`	Define the interfaces `3.3.3.3/32`, on which OSPF runs and associate the area ID `0` with them.
`R3(config-router)#commit`	Commit the transaction.

Configure TCP MSS on ALL neighbor

R1 - NSM

R1#configure terminal	Enter configure mode.
R1(config)#interface xe1	Specify the interface xe1 to be configured.
R1(config-if)#ip address 10.10.10.1/24	Assign IP address 10.10.10.1/24 to interface.
R1(config-if)#label-switching	Enable label switching on interface xe1.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface lo	Specify the loopback interface to be configured.
R1(config-if)#ip address 1.1.1.1/32 secondary	Set the IP address of the loopback interface to 1.1.1.1/32.
R1(config-if)#commit	Commit the transaction.

R1 - LDP

R1(config)#router ldp	Enter Router mode for LDP.
R1(config-router)#router-id 1.1.1.1	Set the router ID to IP address 1.1.1.1.
R1(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter ipv6 if you are configuring an IPv6 interface.
R1(config-router)#targeted-peer ipv4 3.3.3.3	Configure targeted peer.
R1(config-router)#neighbor all tcp-mss 700	Configure the TCP MSS value with all neighbor.
R1(config-router-targeted-peer)#exit	Exit-targeted-peer-mode.
R1(config-router)#exit	Exit the Router mode and return to the Configure mode.
R1(config)#interface xe1	Enter interface mode xe1.
R1(config-if)#enable-ldp ipv4	Enable LDP on xe1.
R1(config-if)#commit	Commit the transaction.

R1 - OSPF

R1(config)#router ospf 100	Configure the routing process and specify the process ID (100). The process ID should be a unique positive integer identifying the routing process.
R1(config-router)#network 10.10.10.0/24 area 0	Define the interface 10.10.10.0/24, on which OSPF runs and associate the area ID (0) with the interface.
R1(config-router)#network 1.1.1.1/32 area 0	Define the interface 1.1.1.1/32, on which OSPF runs and associate the area ID (0) with the interface.
R1(config-router)#commit	Commit the transaction.

R2 - NSM

R2#configure terminal	Enter configure mode.
R2(config)#interface lo	Specify the loopback (lo) interface to be configured.
R2(config-if)#ip address 2.2.2.2/32 secondary	Set the IP address of the loopback interface to 2.2.2.2/32.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe1	Specify the interface xe1 to be configured.
R2(config-if)#ip address 20.20.20.1/24	Assign IP address 20.20.20.1/24 to interface.
R2(config-if)#label-switching	Enable label switching on interface xe1.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe2	Specify the interface xe2 to be configured.
R2(config-if)#ip address 10.10.10.2/24	Assign IP address 10.10.10.2/24 to interface.
R2(config-if)#label-switching	Enable label switching on interface xe2.
R2(config-if)#commit	Commit the transaction.

R2 - LDP

R2(config)#router ldp	Enter Router mode.
R2(config-router)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2.
R2(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter ipv6 if you are configuring an IPv6 interface.
R2(config-router)#neighbor all tcp-mss 710	Configure the TCP MSS value with all neighbor.
R2(config-router)#exit	Exit Router mode and return to configure mode.
R2(config)#interface xe1	Specify the interface xe1 to be configured.
R2(config-if)#enable-ldp ipv4	Enable LDP on a specified interface xe1.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe2	Specify the interface xe2 to be configured.
R2(config-if)#enable-ldp ipv4	Enable LDP on a specified interface xe2.
R2(config-if)#commit	Commit the transaction.

R2 - OSPF

R2(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
R2(config-router)#network 10.10.10.0/24 area 0	Define the interfaces 10.10.10.0/24, on which OSPF runs and associate the area ID (0) with them.
R2(config-router)#network 20.20.20.0/24 area 0	Define the interfaces 20.20.20.0/24, on which OSPF runs and associate the area ID (0) with them.

© 2025 IP Infusion Inc. Proprietary

R2(config-router)#network 2.2.2.2/32 area 0	Define the interfaces 2.2.2.2/32, on which OSPF runs and associate the area ID (0) with them.
R2(config-router)#commit	Commit the transaction.

R3 - NSM

R3#configure terminal	Enter configure mode.
R3(config)#interface lo	Specify the loopback interface to be configured.
R3(config-if)#ip address 3.3.3.3/32 secondary	Set the IP address of the loopback interface to 3.3.3.3/32.
R3(config-if)#exit	Exit interface mode.
R3(config)#interface xe1	Specify the interface xe1 to be configured.
R3(config-if)#ip address 20.20.20.2/24	Set the IP address of the interface to 20.20.20.2/24.
R3(config-if)#label-switching	Enable label switching on interface xe1.
R3(config-if)#commit	Commit the transaction.

R3 - LDP

R3(config)#router ldp	Enter Router mode.
R3(config-router)#router-id 3.3.3.3	Set the router ID for IP address 3.3.3.3.
R3(config-router)#transport-address ipv4 3.3.3.3	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter ipv6 if you are configuring an IPv6 interface.
R3(config-router)#neighbor all tcp-mss 720	Configure the TCP MSS value with all neighbor.
R3(config-router)#targeted-peer ipv4 1.1.1.1	Configure targeted peer.
R3(config-router-targeted-peer)#exit	Exit-targeted-peer-mode.
R3(config-router)#exit	Exit the Router mode and return to the Configure mode.
R3(config)#interface xe1	Enter interface mode.
R3(config-if)#enable-ldp ipv4	Enable LDP on xe1.
R3(config-if)#commit	Commit the transaction.

R3 - OSPF

R3(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
R3(config-router)#network 20.20.20.0/24 area 0	Define the interfaces 20.20.20.0/24, on which OSPF runs and associate the area ID (0) with them.
R3(config-router)#network 3.3.3.3/32 area 0	Define the interfaces 3.3.3.3/32, on which OSPF runs and associate the area ID (0) with them.
R3(config-router)#commit	Commit the transaction.

Configuration of TCP MSS with Auto-targeted

R1 - NSM

R1#configure terminal	Enter configure mode.
R1(config)#interface xe1	Specify the interface xe1 to be configured.
R1(config-if)#ip address 10.10.10.1/24	Assign IP address 10.10.10.1/24 to interface.
R1(config-if)#label-switching	Enable label switching on interface xe1.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface lo	Specify the loopback interface to be configured.
R1(config-if)#ip address 1.1.1.1/32 secondary	Set the IP address of the loopback interface to 1.1.1.1/32.
R1(config-if)#commit	Commit the transaction.

R1 - LDP

R1(config)#router ldp	Enter Router mode for LDP.
R1(config-router)#router-id 1.1.1.1	Set the router ID to IP address 1.1.1.1.

R1(config-router)#transport-address ipv4 1.1.1.1	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter ipv6 if you are configuring an IPv6 interface.
R1(config-router)#targeted-peer ipv4 3.3.3.3	Configure targeted peer.
R1(config-router-targeted-peer)#exit	Exit-targeted-peer-mode.
R1(config-router)#exit	Exit the Router mode and return to the configure mode.
R1(config)#interface xe1	Enter interface mode.
R1(config-if)#enable-ldp ipv4	Enable LDP on xe1.
R1(config-if)#commit	Commit the transaction.

R1 - OSPF

R1(config)#router ospf 100	Configure the routing process and specify the process ID (100). The process ID should be a unique positive integer identifying the routing process.
R1(config-router)#network 10.10.10.0/24 area 0	Define the interface 10.10.10.0/24, on which OSPF runs and associate the area ID (0) with the interface.
R1(config-router)#network 1.1.1.1/32 area 0	Define the interface 1.1.1.1/32, on which OSPF runs and associate the area ID (0) with the interface.
R1(config-router)#commit	Commit the transaction.

R2 - NSM

R2#configure terminal	Enter configure mode.
R2(config)#interface lo	Specify the loopback interface to be configured.
R2(config-if)#ip address 2.2.2.2/32 secondary	Set the IP address of the loopback interface to 2.2.2.2/32.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe1	Specify the interface xe1 to be configured.
R2(config-if)#ip address 20.20.20.1/24	Assign IP address 20.20.20.1/24 to interface.
R2(config-if)#label-switching	Enable label switching on interface xe1.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe2	Specify the interface xe2 to be configured.
R2(config-if)#ip address 10.10.10.2/24	Assign IP address 10.10.10.2/24 to interface.
R2(config-if)#label-switching	Enable label switching on interface xe2.
R2(config-if)#commit	Commit the transaction.

R2 - LDP

R2(config)#router ldp	Enter Router mode.
R2(config-router)#router-id 2.2.2.2	Set the router ID to IP address 2.2.2.2.

R2(config-router)#transport-address ipv4 2.2.2.2	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter `ipv6` if you are configuring an IPv6 interface.
R2(config-router)#neighbor auto-targeted tcp-mss 800	Configure the TCP MSS value on all `auto-targeted` neighbors.
R2(config-router)#exit	Exit Router mode and return to configure mode.
R2(config)#interface xe1	Specify the interface `xe1` to be configured.
R2(config-if)#enable-ldp ipv4	Enable LDP on a specified interface `xe1`.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe2	Specify the interface `xe2` to be configured.
R2(config-if)#enable-ldp ipv4	Enable LDP on a specified interface `xe2`.
R2(config-if)#commit	Commit the transaction.

R2 - OSPF

R2(config)#router ospf 100	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
R2(config-router)#network 10.10.10.0/24 area 0	Define the interfaces `10.10.10.0/24`, on which OSPF runs and associate the area ID (0) with them.
R2(config-router)#network 20.20.20.0/24 area 0	Define the interfaces `20.20.20.0/24`, on which OSPF runs and associate the area ID (0) with them.
R2(config-router)#network 2.2.2.2/32 area 0	Define the interfaces `2.2.2.2/32`, on which OSPF runs and associate the area ID (0) with them.
R2(config-router)#commit	Commit the transaction.

R3 - NSM

R3#configure terminal	Enter configure mode.
R3(config)#interface lo	Specify the loopback interface to be configured.
R3(config-if)#ip address 3.3.3.3/32 secondary	Set the IP address of the loopback interface to `3.3.3.3/32`.
R3(config-if)#exit	Exit interface mode.
R3(config)#interface xe1	Specify the interface `xe1` to be configured.
R3(config-if)#ip address 20.20.20.2/24	Set the IP address of the interface to `20.20.20.2/24`.
R3(config-if)#label-switching	Enable label switching on interface `xe1`.
R3(config-if)#commit	Commit the transaction.

R3 - LDP

R3(config)#router ldp	Enter Router mode.
R3(config-router)#router-id 3.3.3.3	Set the router ID for IP address `3.3.3.3`.

`R3(config-router)#transport-address ipv4 3.3.3.3`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface. Note: It is preferable to use the loopback address as transport address. In addition, use the parameter `ipv6` if you are configuring an IPv6 interface.
`R3(config-router)#neighbor auto-targeted tcp-mss 810`	Configure the TCP MSS value on all `auto-targeted` neighbors.
`R3(config-router)#targeted-peer ipv4 1.1.1.1`	Configure targeted peer.
`R3(config-router-targeted-peer)#exit`	Exit-targeted-peer-mode.
`R3(config-router)#exit`	Exit the Router mode and return to the configure mode.
`R3(config)#interface xe1`	Enter interface mode `xe1`.
`R3(config-if)#enable-ldp ipv4`	Enable LDP on `xe1`.
`R3(config-if)#commit`	Commit the transaction.

R3 - OSPF

`R3(config)#router ospf 100`	Configure the routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`R3(config-router)#network 20.20.20.0/24 area 0`	Define the interfaces `20.20.20.0/24`, on which OSPF runs and associate the area ID (0) with them.
`R3(config-router)#network 3.3.3.3/32 area 0`	Define the interfaces `3.3.3.3/32`, on which OSPF runs and associate the area ID (0) with them.
`R3(config-router)#commit`	Commit the transaction.

```

New CLI Command

neighbor tcp-mss

Use this command to set the TCP MSS for an LDP session. MSS is a TCP parameter that defines the maximum amount of data in a TCP segment that can be transmitted.

Use the `no` command to remove the TCP MSS from an LDP session.

Command Syntax

```
neighbor (A.B.C.D| auto-targeted | all) tcp-mss <560-1440>
no neighbor (A.B.C.D | auto-targeted | all) tcp-mss
```

Parameters

`A.B.C.D`	To set MSS for the specific peer.
`auto-targeted`	To set MSS for auto-targeted LDP peer. Auto-targeted LDP sessions automatically establish the TCP connection with neighboring routers and do not require the manual configuration of each peer.
`all`	To set MSS for all LDP peers
`<560-1440>`	Configure the TCP MSS between this range.

Default

By default, `neighbor tcp-mss` is disabled and the MSS value is 1460 bytes.

Command Mode

Router LDP mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS(config)#router ldp
OcNOS(config-router)#neighbor 2.2.2.2 tcp-mss 900
OcNOS(config-router)#neighbor all tcp-mss 1000
OcNOS(config-router)#neighbor auto-targeted tcp-mss 800
OcNOS(config-router)#commit
```

Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

Acronym	Description
ACK	Acknowledgment
IGP	Interior Gateway Protocol
LDP	Label Distribution Protocol
MSS	Maximum Segment Size
MTU	Maximum Transmission Unit
OSPF	Open Short Path First
SYN	Synchronize
TCP	Transmission Control Protocol

Glossary

The following provides definitions for key terms used throughout this document:

LDP	LDP is a routing protocol that manages and distributes the labels to the route in a Multiprotocol Label Switching (MPLS) network. Adding a label to a route helps to control the flow of network traffic and increases the forwarding speed, ensuring a smooth and optimized data transmission.
LDP session	LDP session is the connection established between LDP routers in an MPLS network.
MSS	MSS is a TCP parameter that defines the maximum amount of data in a TCP segment that can be transmitted.
TCP	TCP is one of the main protocols in the Internet Protocol (IP) suite. It offers a secure and reliable connection between two devices.
TCP segment	TCP segment is a unit of data transmitted in a TCP connection. The segment consists of header and payload. The header contains the control information to manage the transmission, and the payload contains the actual data that needs to be transmitted.

CHAPTER 6 LDP Remote Loop-Free Alternate (RLFA)

A basic mechanism using Loop-Free Alternates (LFAs) is described in RFC5286 that provides good repair coverage in many topologies, especially those that are highly meshed.

However, some topologies, notably ring-based topologies, are not well protected by LFAs alone. This is because there is no neighbor of the Point of Local Repair (PLR) that has a cost to the destination via a path that does not traverse the failure that is cheaper than the cost to the destination via the failure.

RFC 7490 provides extensions to the basic repair mechanism in which tunnels are used to provide additional logical links that can be used as loop-free alternates where none exist in the original topology. It provides loop-free alternates that guarantee only link protection.

RFC 8102 provides remote-loop-free-based IP fast reroute mechanisms that specifies procedures for determining whether or not a given PQ-node provides node protection for a specific destination. It provides node protection for all destinations covered by the same remote-LFA alternate, in case of failure of the primary next-hop node

ISIS shall compute PQ node and LDP shall dynamically create tunnel to PQ node so that if primary path fails traffic can be rerouted to backup rLFA tunnel and hence to destination.

Remote LFA involves the use of a tunnel to a next-hop that is not directly connected. This is the primary difference between the LFA and Remote LFA.

RLFA Terminology

Terms used for defining tunnel as below:

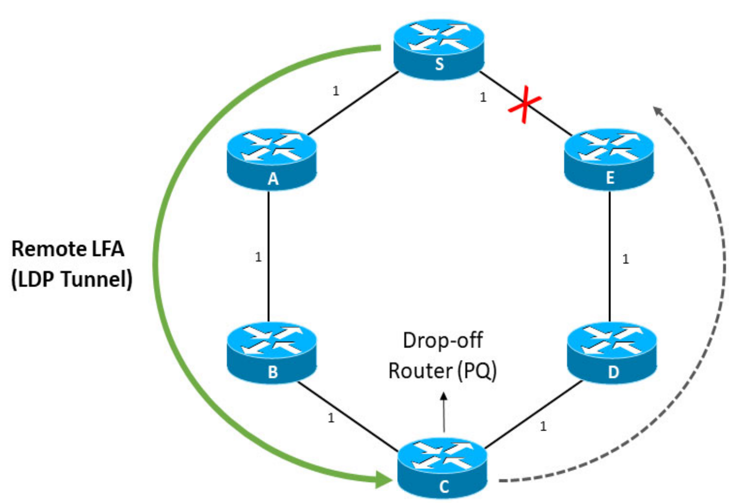

Figure 6-6: Understanding RLFA

Repair tunnel

A tunnel established for the purpose of providing a virtual neighbor that is a Loop-Free Alternate.

P-space

The P-space of a router with respect to a protected link is the set of routers reachable from that specific router using the pre-convergence shortest paths, without any of those paths (including equal cost path splits) transiting that protected link.

For example, the P-space of S with respect to link S-E is the set of routers that S can reach without using the protected link S-E.

Extended P-space

Consider the set of neighbors of a router protecting a link. Exclude the router reachable over the protected link from that set of routers. The extended P-space of the protecting router with respect to the protected link is the union of the P spaces of the neighbors in that set of neighbors with respect to the protected link.

Q-space

Q-space of a router with respect to a protected link is the set of routers from which that specific router that can be reached without any path (including ECMP Splits) transiting that protected link.

PQ node

A PQ node of a node S with respect to a protected link S-E is a node that is a member of both the P-space (or the extended P-space) of S with respect to that protected link S-E and the Q-space of E with respect to that protected link S-E. A repair tunnel endpoint is chosen from the set of PQ-nodes.

Remote LFA (RLFA)

The use of a PQ node rather than a neighbor of the repairing node as the next hop in an LFA repair.

In Figure 6-6, S can reach A, B, and C without going via S-E; these form S's extended P-space with respect to S-E. The routers that can reach E without going through S-E will be in E's Q-space with respect to link S-E; these are D and C.B has equal-cost paths to E via B-A-S-E and B-C-D-E, and so the forwarder at S might choose to send a packet to E via link S-E. Hence, B is not in the Q-space of E with respect to link S-E. The single node in both S's extended P-space and E's Q-space is C; thus, node C is selected as the repair tunnel's endpoint. Thus, if a tunnel is provided between S and C as shown in Figure 2, then C, now being a direct neighbor of S, would become an LFA for D and E.

Establishing RLFA Tunnel

To calculate the Remote LFA backup path and to determines the Remote LFA node the software requirement can be broadly classified as below:

IS-IS

ISIS shall calculate Repair path that are P space (routers it can reach without traversing the protected link) and Q space (routers that can reach the protected destination without traversing the protected link). Hence routers that belong to both spaces called as PQ routers has to be calculated. It has to inform LDP about PQ node so that RLFA tunnel can be established.

LDP

LDP shall establish targeted session with PQ node and shall advertise label to peer node for the destination FEC. LDP shall send primary and backup path FTN/ILM add/delete info to NSM for further programing.

NSM

NSM shall maintain Primary and Backup path FTN/ILM and shall send information to HSL for data-plane programing.

HSL

HSL program primary and backup FTN/ILM entry in hardware.

Configure LDP Remote Loop-Free Alternate (RLFA)

The LDP RLFA configuration process can be divided into the following tasks:

1. Enable label-switching on the interface on NSM.
2. Establish ISIS routing between the nodes (to distribute reachability information within the MPLS cloud)
3. Configure ISIS RLFA on Source node
4. Enabling LDP on an interface in the LDP daemon
5. Configure LDP FRR with Auto-targeted-session (Allow creating TLDP session dynamically)
6. Enable BFD interval globally and for all ISIS enabled interfaces

Note: Faster convergence can be achieved with lower BFD interval enabled globally.

Note: Dynamically created RLFA T-LDP sessions will be removed only after disabling LDP `auto-targeted-session` CLI or LDP FRR.

Note: When `targeted-peer ipv4` CLI is configured with `auto-targeted-session` CLI, T-LDP session created for targeted-peer only remove after disabling `auto-targeted-session` CLI.

Note: After Enabling ISIS RLFA, Both LFA and RLFA computation will be done and RLFA path will be preferred to provide node-protection.

Note: Better convergence can be achieved with LDP-IGP-SYNC enabled.

Assumptions and limitations

- RLFA Backup path computation will be supported only via IGP as IS-IS.
- Only LDP(MPLS) will be used as a tunnel mechanism to reach a Remote-LFA repair node.
- Only IPv4 protocol is supported.
- RFC 7916 [LFA-MANAGE] is not supported.
- ECMP will not be supported for RLFA next-hop.

Topology

Figure 6-7 shows the configuration required to enable the RLFA feature.

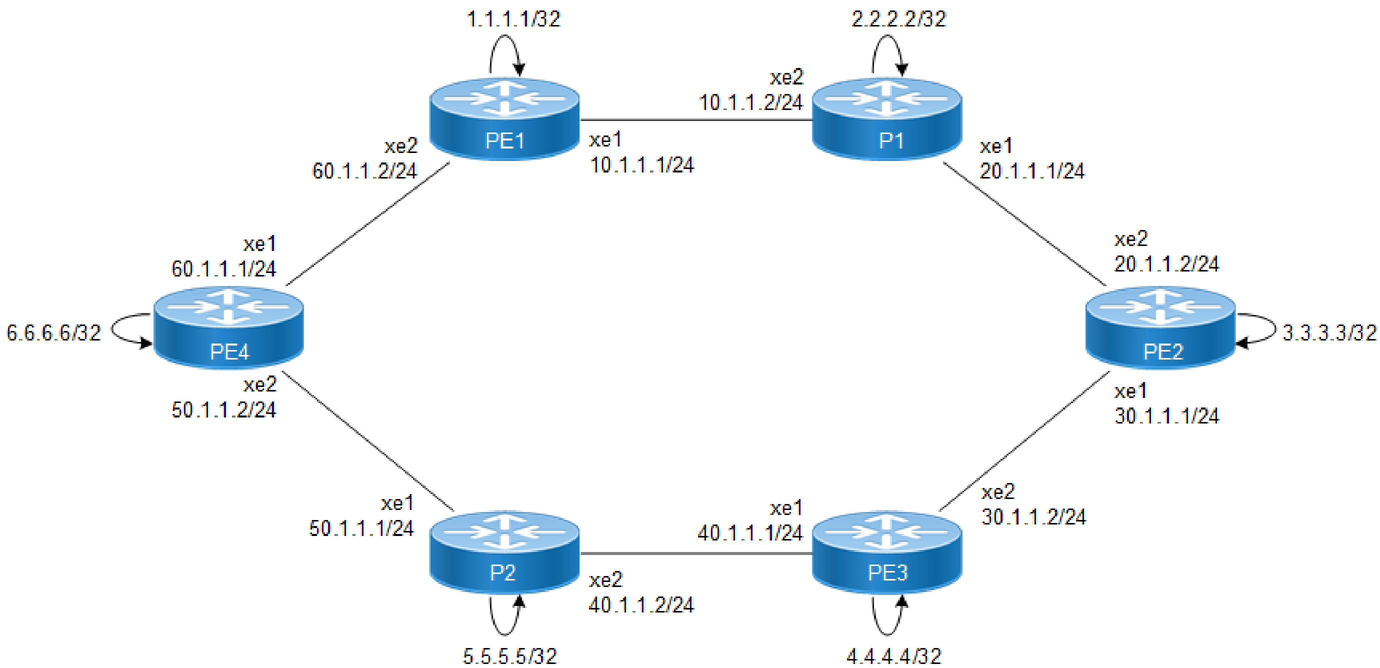

Figure 6-7: RLFA Topology

Configuration

PE1

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enable LDP process
`(config-router)#fast-reroute`	Enable LDP FRR
`(config-router)#auto-targeted-session`	To Allow creating TLDP session dynamically
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config-router)#exit`	Exit LDP process
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip router isis rlfa`	Enable IS-IS routing on an interface for area 49 (rlfa)
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)#enable-ldp ipv4`	Enable ldp process on xe1 interface
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 60.1.1.2/24`	Configure the IP address of the interface.
`(config-if)#ip router isis rlfa`	Enable IS-IS routing on an interface for area 49 (rlfa).
`(config-if)#label-switching`	Enable label-switching on interface

(config-if)#enable-ldp ipv4	Enable ldp process on xe2 interface
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 1.1.1.1/32 secondary	Configure the IP address of the interface
(config-if)#ip router isis rlfa	Enable IS-IS routing on an interface for area 49 (rlfa).
(config-if)#exit	Exit interface mode.
(config)#router isis rlfa	Create an IS-IS routing instance for area 49 (rlfa).
(config-router)#is-type level-1	Configure instance as level-1-only routing.
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)# mpls traffic-eng router-id 1.1.1.1	Configure MPLS-TE unique router-id TLV.
(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
(config-router)# net 49.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)# fast-reroute per-prefix remote-lfa level-1 proto ipv4 tunnel mpls-ldp	Configure Remote LFA to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
(config-router)# bfd all-interfaces	Enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.
(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#end	Exit router mode.
(config)# bfd interval 3 minrx 3 multiplier 3	Configure bfd interval globally

P1

#configure terminal	Enter configure mode.
(config)#router ldp	Enable LDP process
(config-router)#fast-reroute	Enable LDP FRR
(config-router)#auto-targeted-session	To Allow creating TLDP session dynamically
(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#exit	Exit LDP process
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 10.1.1.2/24	Configure the IP address of the interface.
(config-if)#ip router isis rlfa	Enable IS-IS routing on an interface for area 49 (rlfa)
(config-if)#label-switching	Enable label-switching on interface
(config-if)#enable-ldp ipv4	Enable ldp process on xe2 interface
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.

(config)#interface xe1	Enter interface mode.
(config-if)#ip address 20.1.1.1/24	Configure the IP address of the interface.
(config-if)#ip router isis rlfa	Enable IS-IS routing on an interface for area 49 (rlfa).
(config-if)#label-switching	Enable label-switching on interface
(config-if)#enable-ldp ipv4	Enable ldp process on xe1 interface
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 2.2.2.2/32 secondary	Configure the IP address of the interface
(config-if)#ip router isis rlfa	Enable IS-IS routing on an interface for area 49 (rlfa).
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis rlfa	Create an IS-IS routing instance for area 49 (rlfa).
(config-router)#is-type level-1	Configure instance as level-1-only routing.
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)# mpls traffic-eng router-id 1.1.1.1	Configure MPLS-TE unique router-id TLV.
(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
(config-router)# net 49.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)# bfd all-interfaces	Enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.
(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#exit	Exit router mode.
(config)# bfd interval 3 minrx 3 multiplier 3	Configure bfd interval globally
(config)#commit	Commit the candidate configuration to the running configuration

PE2

#configure terminal	Enter configure mode.
(config)#router ldp	Enable LDP process
(config-router)#fast-reroute	Enable LDP FRR
(config-router)#auto-targeted-session	To Allow creating TLDP session dynamically
(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#exit	Exit LDP process
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 20.1.1.2/24	Configure the IP address of the interface.
(config-if)#ip router isis rlfa	Enable IS-IS routing on an interface for area 49 (rlfa)

(config-if)#label-switching	Enable label-switching on interface
(config-if)#enable-ldp ipv4	Enable ldp process on xe2 interface
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.
(config-if)#ip address 30.1.1.1/24	Configure the IP address of the interface.
(config-if)#ip router isis rlfa	Enable IS-IS routing on an interface for area 49 (rlfa).
(config-if)#label-switching	Enable label-switching on interface
(config-if)#enable-ldp ipv4	Enable ldp process on xe1 interface
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 3.3.3.3/32 secondary	Configure the IP address of the interface
(config-if)#ip router isis rlfa	Enable IS-IS routing on an interface for area 49 (rlfa).
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis rlfa	Create an IS-IS routing instance for area 49 (rlfa).
(config-router)#is-type level-1	Configure instance as level-1-only routing.
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)# mpls traffic-eng router-id 3.3.3.3	Configure MPLS-TE unique router-id TLV.
(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
(config-router)# net 49.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)# bfd all-interfaces	Enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.
(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#exit	Exit router mode.
(config)# bfd interval 3 minrx 3 multiplier 3	Configure bfd interval globally
(config)#commit	Commit the candidate configuration to the running configuration

PE3

#configure terminal	Enter configure mode.
(config)#router ldp	Enable LDP process
(config-router)#fast-reroute	Enable LDP FRR
(config-router)#auto-targeted-session	To Allow creating TLDP session dynamically

`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)#enable-ldp ipv4`	Enable ldp process on xe1 interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 6.6.6.6/32 secondary`	Configure the IP address of the interface
`(config-if)#ip router isis rlfa`	Enable IS-IS routing on an interface for area 49 (rlfa).
`(config-if)#exit`	Exit interface mode.
`(config)#router isis rlfa`	Create an IS-IS routing instance for area 49 (rlfa).
`(config-router)#is-type level-1`	Configure instance as level-1-only routing.
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)# mpls traffic-eng router-id 6.6.6.6`	Configure MPLS-TE unique router-id TLV.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)# net 49.0000.0000.0005.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

`(config-router)# bfd all-interfaces`	Enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)# bfd interval 3 minrx 3 multiplier 3`	Configure bfd interval globally
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation

PE1

Check LDP neighborship before enabling RLFA

```
PE1#show ldp session
Peer IP Address          IF Name    My Role    State       KeepAlive  UpTime
2.2.2.2                  xe1        Passive   OPERATIONAL   30    00:02:19
6.6.6.6                  xe2        Passive   OPERATIONAL   30    00:02:19
```

Check the output of "show clns neighbors" to verify that ISIS adjacency is up.

```
PE1#show clns neighbors

Total number of L1 adjacencies: 2
Total number of L2 adjacencies: 0
Total number of adjacencies: 2
Tag rlfa:  VRF : default
System Id      Interface   SNPA                State  Holdtime   Type Protocol
0000.0000.0006 xe2         e8c5.7a78.7132      Up     23         L1   IS-IS
0000.0000.0002 xe1         e8c5.7a98.c48a      Up     23         L1   IS-IS
```

Check the ISIS route installation in the ISIS table and RIB table.

```
PE1#show ip isis route

Codes: C - connected, E - external, L1 - IS-IS level-1, L2 - IS-IS level-2

CHAPTER 7 LDP MD5 Password For Auto Targeted Sessions

A basic mechanism using Loop-Free Alternates (LFAs) is described in RFC5286 that provides good repair coverage in many topologies, especially those that are highly meshed.

However, some topologies, notably ring-based topologies, are not well protected by LFAs alone. This is because there is no neighbor of the Point of Local Repair (PLR) that has a cost to the destination via a path that does not traverse the failure that is cheaper than the cost to the destination via the failure.

When LDP RLFA creates a virtual path in the network to provide an alternate path, it uses MPLS labels distributed by a targeted session between the local node and the PLR (PQ node), the session is established without any MD5 Password protection mechanism, as it is only available for non-automatic targeted sessions. A set of configurable options will be provided to associate MD5 passwords to the auto-targeted sessions.

Topology

Figure 7-8 shows the configuration required to enable the RLFA feature.

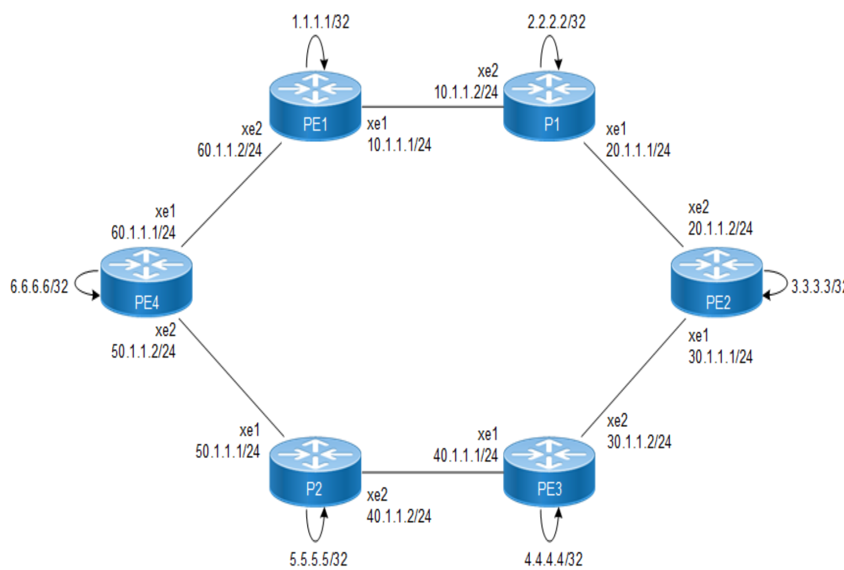

Figure 7-8: RLFA Topology

Configuration

RTR 1

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enable LDP process
`(config-router)#fast-reroute`	Enable LDP FRR
`(config-router)#auto-targeted-session`	To Allow creating TLDP session dynamically
`(config-router)#neighbor auto-targeted auth md5 password plain-text test2`	Configure md5 authentication for auto-targeted peers

(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#exit	Exit LDP process
(config)#router rsvp	Enable RSPVP
(config-router)#srlg-disjoint forced	Configure srlg to enable mpls-TE
(config-router)#commit	Commit the candidate configuration to the running configuration
(config)#interface xe1	Enter interface mode.
(config-if)#ip address 10.1.1.1/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 10	Configure the ospf cost
(config-if)#label-switching	Enable label-switching on interface
(config-if)#enable-ldp ipv4	Enable ldp process on xe1 interface
(config-if)#mpls traffic-eng srlg 11	Enable Mpls-TE
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 60.1.1.1/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 10	Configure ospf cost
(config-if)#label-switching	Enable label-switching on interface
(config-if)#mpls traffic-eng srlg 11	Enable mpls-TE
(config-if)#enable-ldp ipv4	Enable ldp process on xe2 interface
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 1.1.1.1/32 secondary	Configure the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Create an ospf instance
(config-router)# ospf router-id 1.1.1.1	Configure router id
(config-router)# bfd all-interfaces	Configure bfd
(config-router)# timers spf exp 50 50	Configure the ospf timers
(config-router)# timers throttle lsa all 0 1 1	Configure the ospf timer lsa throttle
(config-router)# timers lsa arrival 1	Configure the ospf timer lsa arrival
(config-router)# fast-reroute per-prefix remote-lfa area 0.0.0.0 tunnel mpls-ldp	. Configure Remote LFA to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities
(config-router)# network 1.1.1.1/32 area 0.0.0.0	Configure the network command to advertise the prefixes
(config-router)# network 10.1.1.0/24 area 0.0.0.0	Configure the network command to advertise the prefixes
(config-router)# network 60.1.1.0/24 area 0.0.0.0	Configure the network command to advertise the prefixes

(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#end	Exit router mode.
(config)# bfd interval 3 minrx 3 multiplier 3	Configure bfd interval globally

RTR 2

#configure terminal	Enter configure mode.
(config)#router ldp	Enable LDP process
(config-router)#fast-reroute	Enable LDP FRR
(config-router)#auto-targeted-session	To Allow creating TLDP session dynamically
(config-router)#neighbor auto-targeted auth md5 password plain-text test2	Configure md5 authentication for auto-targeted peers
(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#exit	Exit LDP process
(config)#router rsvp	Enable RSPVP
(config-router)#srlg-disjoint forced	Configure srlg to enable mpls-TE
(config-router)#commit	Commit the candidate configuration to the running configuration
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 10.1.1.2/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 10	Configure the ospf cost
(config-if)#label-switching	Enable label-switching on interface
(config-if)#enable-ldp ipv4	Enable ldp process on xe1 interface
(config-if)#mpls traffic-eng srlg 11	Enable Mpls-TE
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.
(config-if)#ip address 20.1.1.1/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 10	Configure ospf cost
(config-if)#label-switching	Enable label-switching on interface
(config-if)#mpls traffic-eng srlg 11	Enable mpls-TE
(config-if)#enable-ldp ipv4	Enable ldp process on xe2 interface
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 2.2.2.2/32 secondary	Configure the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Create an ospf instance
(config-router)# ospf router-id 2.2.2.2	Configure router id

(config-router)# bfd all-interfaces	Configure bfd
(config-router)# timers spf exp 50 50	Configure the ospf timers
(config-router)# timers throttle lsa all 0 1 1	Configure the ospf timer lsa throttle
(config-router)# timers lsa arrival 1	Configure the ospf timer lsa arrival
(config-router)# network 2.2.2.2/32 area 0.0.0.0	Configure the network command to advertise the prefixes
(config-router)# network 10.1.1.0/24 area 0.0.0.0	Configure the network command to advertise the prefixes
(config-router)# network 20.1.1.0/24 area 0.0.0.0	Configure the network command to advertise the prefixes
(config-router)#commit	Commit the candidate configuration to the running configuration
(config)# bfd interval 3 minrx 3 multiplier 3	Configure bfd interval globally
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	Exit router mode.

RTR 3

#configure terminal	Enter configure mode.
(config)#router ldp	Enable LDP process
(config-router)#fast-reroute	Enable LDP FRR
(config-router)#auto-targeted-session	To Allow creating TLDP session dynamically
(config-router)#neighbor auto-targeted auth md5 password plain-text test2	Configure md5 authentication for auto-targeted peers
(config-router)#commit	Commit the candidate configuration to the running configuration
(config-router)#exit	Exit LDP process
(config)#router rsvp	Enable RSPVP
(config-router)#srlg-disjoint forced	Configure srlg to enable mpls-TE
(config-router)#commit	Commit the candidate configuration to the running configuration
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 20.1.1.2/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 10	Configure the ospf cost
(config-if)#label-switching	Enable label-switching on interface
(config-if)#enable-ldp ipv4	Enable ldp process on xe1 interface
(config-if)#mpls traffic-eng srlg 11	Enable Mpls-TE
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.
(config-if)#ip address 30.1.1.1/24	Configure the IP address of the interface.

`(config-if)#ip ospf cost 10`	Configure ospf cost
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)#mpls traffic-eng srlg 11`	Enable mpls-TE
`(config-if)#enable-ldp ipv4`	Enable ldp process on xe2 interface
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Create an ospf instance
`(config-router)# ospf router-id 3.3.3.3`	Configure router id
`(config-router)# bfd all-interfaces`	Configure bfd
`(config-router)# timers spf exp 50 50`	Configure the ospf timers
`(config-router)# timers throttle lsa all 0 1 1`	Configure the ospf timer lsa throttle
`(config-router)# timers lsa arrival 1`	Configure the ospf timer lsa arrival
`(config-router)# network 3.3.3.3/32 area 0.0.0.0`	Configure the network command to advertise the prefixes
`(config-router)# network 20.1.1.0/24 area 0.0.0.0`	Configure the network command to advertise the prefixes
`(config-router)# network 30.1.1.0/24 area 0.0.0.0`	Configure the network command to advertise the prefixes
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config)# bfd interval 3 minrx 3 multiplier 3`	Configure bfd interval globally
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit router mode.

RTR 4

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enable LDP process
`(config-router)#fast-reroute`	Enable LDP FRR
`(config-router)#auto-targeted-session`	To Allow creating TLDP session dynamically
`(config-router)#neighbor auto-targeted auth md5 password plain-text test2`	Configure md5 authentication for auto-targeted peers
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config-router)#exit`	Exit LDP process
`(config)#router rsvp`	Enable RSPVP
`(config-router)#srlg-disjoint forced`	Configure srlg to enable mpls-TE

(config-router)#commit	Commit the candidate configuration to the running configuration
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 30.1.1.2/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 10	Configure the ospf cost
(config-if)#label-switching	Enable label-switching on interface
(config-if)#enable-ldp ipv4	Enable ldp process on xe1 interface
(config-if)#mpls traffic-eng srlg 11	Enable Mpls-TE
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.
(config-if)#ip address 40.1.1.1/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 10	Configure ospf cost
(config-if)#label-switching	Enable label-switching on interface
(config-if)#mpls traffic-eng srlg 11	Enable mpls-TE
(config-if)#enable-ldp ipv4	Enable ldp process on xe2 interface
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 4.4.4.4/32 secondary	Configure the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Create an ospf instance
(config-router)# ospf router-id 4.4.4.4	Configure router id
(config-router)# bfd all-interfaces	Configure bfd
(config-router)# timers spf exp 50 50	Configure the ospf timers
(config-router)# timers throttle lsa all 0 1 1	Configure the ospf timer lsa throttle
(config-router)# timers lsa arrival 1	Configure the ospf timer lsa arrival
(config-router)# network 4.4.4.4/32 area 0.0.0.0	Configure the network command to advertise the prefixes
(config-router)# network 40.1.1.0/24 area 0.0.0.0	Configure the network command to advertise the prefixes
(config-router)# network 30.1.1.0/24 area 0.0.0.0	Configure the network command to advertise the prefixes
(config-router)#commit	Commit the candidate configuration to the running configuration
(config)# bfd interval 3 minrx 3 multiplier 3	Configure bfd interval globally
(config)#commit	Commit the candidate configuration to the running configuration
(config)#end	Exit router mode.

RTR 5

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enable LDP process
`(config-router)#fast-reroute`	Enable LDP FRR
`(config-router)#auto-targeted-session`	To Allow creating TLDP session dynamically
`(config-router)#neighbor auto-targeted auth md5 password plain-text test2`	Configure md5 authentication for auto-targeted peers
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config-router)#exit`	Exit LDP process
`(config)#router rsvp`	Enable RSPVP
`(config-router)#srlg-disjoint forced`	Configure srlg to enable mpls-TE
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 40.1.1.2/24`	Configure the IP address of the interface.
`(config-if)#ip ospf cost 10`	Configure the ospf cost
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)#enable-ldp ipv4`	Enable ldp process on xe1 interface
`(config-if)#mpls traffic-eng srlg 11`	Enable Mpls-TE
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 50.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip ospf cost 10`	Configure ospf cost
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)#mpls traffic-eng srlg 11`	Enable mpls-TE
`(config-if)#enable-ldp ipv4`	Enable ldp process on xe2 interface
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 5.5.5.5/32 secondary`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Create an ospf instance
`(config-router)# ospf router-id 5.5.5.5`	Configure router id
`(config-router)# bfd all-interfaces`	Configure bfd
`(config-router)# timers spf exp 50 50`	Configure the ospf timers
`(config-router)# timers throttle lsa all 0 1 1`	Configure the ospf timer lsa throttle
`(config-router)# timers lsa arrival 1`	Configure the ospf timer lsa arrival

`(config-router)# network 5.5.5.5/32 area 0.0.0.0`	Configure the network command to advertise the prefixes
`(config-router)# network 50.1.1.0/24 area 0.0.0.0`	Configure the network command to advertise the prefixes
`(config-router)# network 40.1.1.0/24 area 0.0.0.0`	Configure the network command to advertise the prefixes
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config)# bfd interval 3 minrx 3 multiplier 3`	Configure bfd interval globally
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit router mode.

RTR 6

`#configure terminal`	Enter configure mode.
`(config)#router ldp`	Enable LDP process
`(config-router)#fast-reroute`	Enable LDP FRR
`(config-router)#auto-targeted-session`	To Allow creating TLDP session dynamically
`(config-router)#neighbor auto-targeted auth md5 password plain-text test2`	Configure md5 authentication for auto-targeted peers

Rtr1#
```

Note: The following CLI will be used to configure different types of MD5 authentication.

- To configure dedicated MD5 password to a neighbor (under router ldp):
  `neighbor A.B.C.D auth md5 password (plain-text|encrypt) WORD`
  The same should be configured on neighbour A.B.C.D.
- To set password for all LDP neighbors (under router ldp):
  `neighbor all auth md5 password (plain-text|encrypt) WORD`
- To exclude password for a neighbor (under router ldp)
  `neighbor A.B.C.D auth md5 password exclude`

- To set password for auto-targeted sessions (under router ldp):
```
neighbor auto-targeted auth md5 password (plain-text|encrypt) WORD
```
- To create session group (under router ldp)
```
session-group name WORD
```
- To set password for the session group (under session group)
```
auth md5 password (plain-text|encrypt) WORD
```
- To add neighbors in the group (under session group)
```
neighbor prefix-list <prefix-list-name>
```

CHAPTER 8 LDP ECMP Configuration

This chapter contains configurations of LDP ECMP detailed tests that are used to verify the functionality of LDP ECMP (Equal-cost multipath).

Topology

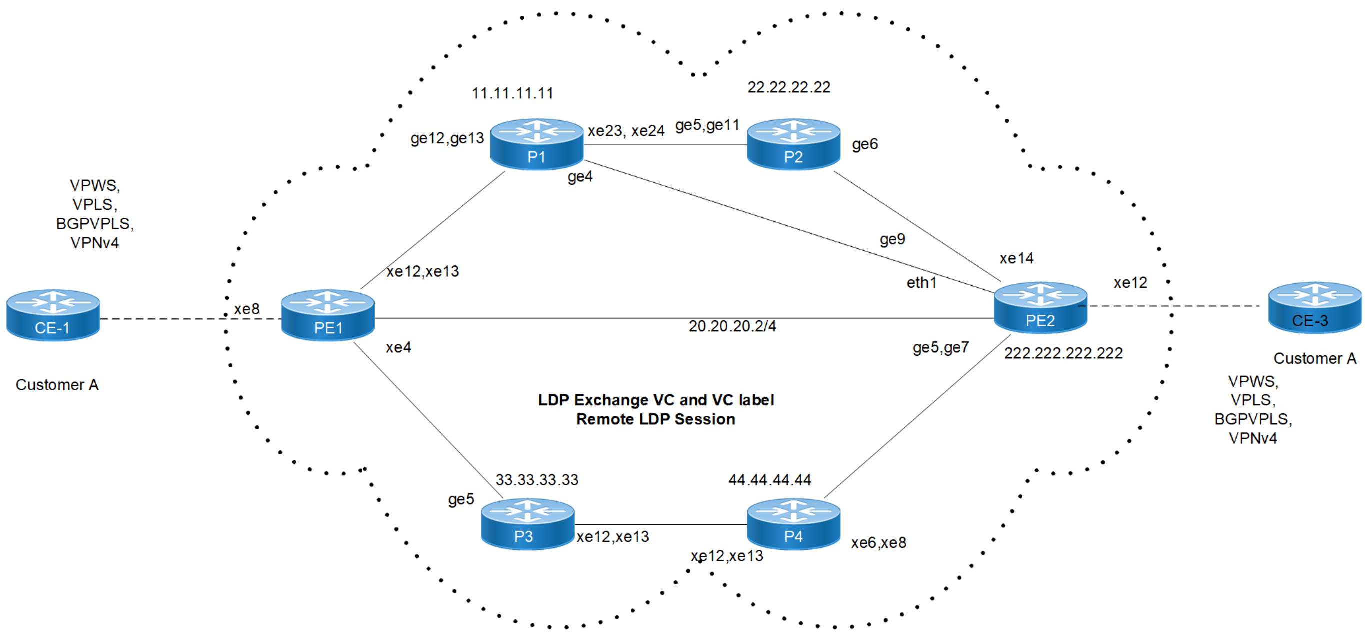

Figure 8-9: LDP-ECMP configuration topology

Configurations

PE-1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter interface mode
`(config -if)#ip address 111.111.111.111/32 secondary`	Configure IP address for the loopback interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#router-id 111.111.111.111`	Configure Router-id
`(config-router)#targeted-peer ipv4 222.222.222.222`	Configuring targeted LDP sessions to PE-2

`(config-router)#explicit-null`	Configure explicit-null.
`(config-router)#entropy-label-capability`	Enable entropy capability in ldp
`(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit from targeted-peer mode
`(config-router)#transport-address ipv4 111.111.111.111`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#interface xe13`	Enter interface mode
`(config-if)#speed 1g`	Configure interface speed to 1g
`(config-if)#ip address 10.0.1.10/24`	Configure IP address on interface
`(config-if)#ip ospf cost 10`	Assign ospf cost to the interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#interface po1000`	Enter the Interface mode for po1000
`(config-if)#exit`	Exit interface mode
`(config)#interface po1000.1000`	Enter interface mode for po1000.1000
`(config-if)#encapsulation dot1q 1000`	Configure encapsulation under a subinterface
`(config-if)#ip address 10.0.0.10/24`	Configure IP address on interface
`(config-if)#ip ospf cost 10`	Assign ospf cost to the interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#interface xe4`	Enter interface mode
`(config-if)#speed 1g`	Configure interface speed to 1g
`(config-if)#ip address 16.0.0.10/24`	Configure IP address on interface
`(config-if)#ip ospf cost 10`	Assign ospf cost to the interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#interface xe4.1001`	Enter interface mode
`(config-if)#encapsulation dot1q 1001`	Configure encapsulation under a subinterface
`(config-if)#ip address 16.0.1.10/24`	Configure IP address on interface
`(config-if)#ip ospf cost 10`	Assign ospf cost to the interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration

(config-if)#exit	Exit interface mode
(config-if)#interface xe12	Enter interface mode
(config-if)#speed 1g	Configure interface speed to 1g
(config-if)#channel-group 1000 mode active	Moving interface to Dynamic LAG
(config-if)#exit	Exit interface mode
(config)#ip vrf l3vpnvrf300	IP VRF config with name l3vpnvrf300
(config-vrf)#rd 300:1	Route-distinguisher value
(config-vrf)#route-target both 300:1	Route target value
(config-vrf)#exit	Exit to config mode
(config)#router ospf 100	Configure the routing process and specify the Process ID, (100). The Process ID should be a unique positive integer to identifying the routing process.
(config-router)#ospf router-id 111.111.111.111	Configure ospf Router-id
(config-router)#network 10.0.0.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.0.1.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 16.0.0.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 16.0.1.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 111.111.111.111/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#commit	Commit the transaction.
(config-router)#exit	Exit from router mode
(config)#router bgp 100	Configure router bgp in AS 100
(config-router)#bgp router-id 111.111.111.111	Configure BGP router ID
(config-router)#neighbor 222.222.222.222 remote-as 100	Configure neighbor in remote-as 100
(config-router)#neighbor 222.222.222.222 update-source lo	Configure neighbor with update-source loopback
(config-router)#address-family vpnv4 unicast	Enter VPNv4 Address family mode
(config-router-af)#neighbor 222.222.222.222 activate	mode Activate VPNv4 neighbor
(config-router-af)#exit-address-family	Exit from Address Family configuration
(config-router)#address-family l2vpn vpls	Enter vpls Address family mode
(config-router-af)#neighbor 222.222.222.222 activate	mode Activate vpls neighbor
(config-router-af)#exit-address-family	Exit from Address Family configuration
(config-router)#address-family vrf l3vpnvrf300	Configure VRF address family
(config-router-af)#redistribute connected	Redistribute connected addresses
(config-router-af)#exit-address-family	Exit from Address Family configuration
(config-router)#exit	Exit from router mode

(config)#mpls vplsldp100 100	Configuring VPLS instance with name and VPLS ID
(config-vpls)#signaling ldp	Enabling LDP signaling for the VPLS instance
(config-vpls-sig)# vpls-peer 222.222.222.222	Configuring VPLS mesh peers
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode
(config-vpls)#exit-vpls	Exit from VPLS mode
(config)#mpls l2-circuit VPWS400 400 222.222.222.222	Configuring VPWS instance with name and VPWS ID
(config)#mpls vpls vplsbgp200 200	Configuring VPLS instance with name and VPLS ID
(config-vpls)#signaling bgp	Enabling LDP signaling for the VPLS instance
(config-vpls-sig)#ve-id 200	Configure VE ID, which is mandatory for BGP VPLS,
otherwise, signaling does not take place. VE ID should be	
unique per VPLS instance	
(config-vpls-sig)#exit-signaling	Exit from VPLS signaling mode
(config-vpls)#exit-vpls	Exit from VPLS mode
(config-if)#interface xe8.100 switchport	Enter sub interface mode
(config-if)#encapsulation dot1q 100	Configure encapsulation under a subinterface
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-acc-if-vpls)#mpls-vpls vplsldp100	Associating the VPLS Instance to the attachment circuit interface.
(config-acc-if-vpls)#exit	Exit from access mode
(config-if)#interface xe8.400 switchport	Enter sub interface mode
(config-if)#encapsulation dot1q 400	Configure encapsulation under a subinterface
(config-if)#access-if-vpws	Access VPWS under sub interface
(config-acc-if-vpws)#mpls-vpws VPWS400	Associating the VPWS Instance to the attachment circuit interface.
(config-acc-if-vpws)#exit	Exit from access mode
(config-if)#interface xe8.200 switchport	Enter sub interface mode
(config-if)#split-horizon group access1	Configure split-horizon group on sub-interface
(config-if)#split-horizon group access1	Configure split-horizon group on sub-interface
(config-if)#encapsulation dot1q 200	Configure encapsulation under a subinterface
(config-if)#access-if-vpls	Access VPLS under sub interface
(config-acc-if-vpls)#mpls-vpls vplsbgp200	Associating the VPLS Instance to the attachment circuit interface.
(config-acc-if-vpls)#exit	Exit from access mode
(config-if)#interface xe8.300	Enter sub interface mode
(config-if)#encapsulation dot1q 300	Configure encapsulation under a subinterface
(config-if)#ip vrf forwarding l3vpnvrf300	Attaching xe8.300 to as part of l3vpnvrf300
(config-if)#ip address 110.110.110.1/24	Configure the IP address of the interface.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the configuration
(config)#end	Return to privilege mode

P1

`#configure terminal`	Enter Configure mode.
`(config)#mpls ilm-ecmp`	Enable ilm ecmp
`(config)#interface lo`	Enter interface mode
`(config -if)#ip address 11.11.11.11/32 secondary`	Configure IP address for the loopback interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#router ldp`	Enter router mode for LDP
`(config-router)#router-id 11.11.11.11`	Configure Router-id
`(config-router)#transport-address ipv4 11.11.11.11`	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
`(config-router)#commit`	Commit the configuration
`(config-router)#exit`	Exit from router mode
`(config)#interface ge13`	Enter interface mode
`(config-if)#ip address 10.0.1.20/24`	Configure IP address on interface
`(config-if)#ip ospf cost 10`	Assign ospf cost to the interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#interface po1000`	Enter the Interface mode for po1000
`(config-if)#exit`	Exit interface mode
`(config)#interface po1000.1000`	Enter interface mode for po1000.1000
`(config-if)#encapsulation dot1q 1000`	Configure encapsulation under a subinterface
`(config-if)#ip address 10.0.0.20/24`	Configure IP address on interface
`(config-if)#ip ospf cost 10`	Assign ospf cost to the interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface
`(config-if)#commit`	Commit the configuration
`(config-if)#exit`	Exit interface mode
`(config)#interface po2000`	Enter the Interface mode for po2000
`(config-if)#exit`	Exit interface mode
`(config)#interface po2000.100`	Enter interface mode for po2000.100
`(config-if)#encapsulation dot1q 100`	Configure encapsulation under a subinterface
`(config-if)#ip address 11.0.0.10/24`	Configure IP address on interface
`(config-if)#ip ospf cost 10`	Assign ospf cost to the interface
`(config-if)#label-switching`	Enable label switching capability on the interface
`(config-if)#enable-ldp ipv4`	Enabling LDP on the interface

(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#interface ge4	Enter interface mode
(config-if)#ip address 9.0.0.10/24	Configure IP address on interface
(config-if)#ip ospf cost 20	Assign ospf cost to the interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#interface ge12	Enter interface mode
(config-if)#channel-group 1000 mode active	Moving interface to Dynamic LAG
(config)#interface xe23	Enter interface mode
(config-if)#channel-group 2000 mode active	Moving interface to Dynamic LAG
(config-if)#speed 1g	Configure speed 1g
(config)#interface xe24	Enter interface mode
(config-if)#channel-group 2000 mode active	Moving interface to Dynamic LAG
(config-if)#speed 1g	Configure speed 1g
(config-if)#exit	Exit interface mode
(config)#commit	Commit the transaction.
(config)#router ospf 100	Configure the routing process and specify the Process ID, (100). The Process ID should be a unique positive integer to identifying the routing process.
(config-router)#ospf router-id 11.11.11.11	Configure ospf Router-id
(config-router)#network 10.0.0.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 10.0.1.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 11.0.0.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 9.0.0.0/24 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#network 11.11.11.11/32 area 0	Define the interface on which OSPF runs and associate the area ID (0) with the interface.
(config-router)#exit	Exit from router mode
(config)#commit	Commit the transaction.

P2

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter interface mode
(config -if)#ip address 22.22.22.22/32 secondary	Configure IP address for the loopback interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode

(config)#router ldp	Enter router mode for LDP
(config-router)#router-id 22.22.22.22	Configure Router-id
(config-router)#transport-address ipv4 22.22.22.22	Configure the transport address to be used for a TCP session over which LDP will run on an IPv4 interface
(config-router)#commit	Commit the configuration
(config-router)#exit	Exit from router mode
(config)#interface ge6.300	Enter interface mode
(config-if)#encapsulation dot1q 300	Configure encapsulation under a subinterface
(config-if)#ip address 15.0.0.10/24	Configure IP address on interface
(config-if)#ip ospf cost 10	Assign ospf cost to the interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#interface ge6.1001	Enter interface mode
(config-if)#encapsulation dot1q 1001	Configure encapsulation under a subinterface
(config-if)#ip address 15.0.1.10/24	Configure IP address on interface
(config-if)#ip ospf cost 10	Assign ospf cost to the interface
(config-if)#label-switching	Enable label switching capability on the interface
(config-if)#enable-ldp ipv4	Enabling LDP on the interface
(config-if)#commit	Commit the configuration
(config-if)#exit	Exit interface mode
(config)#interface po2000	Enter the Interface mode for po2000
(config-if)#exit	Exit interface mode
(config)#interface po2000.100	Enter interface mode for po2000.100

PE1#show mpls l2-circuit
MPLS Layer-2 Virtual Circuit: VPWS400, id: 400  PW-INDEX: 2 service-tpid: dot1.q
 Endpoint: 222.222.222.222
 Control Word: 0
 Flow Label Status: Disabled, Direction: None, Static: No
 MPLS Layer-2 Virtual Circuit Group: none
 Bound to interface: xe8.400
 Subinterface Match Criteria(s) :
  dot1q 400
 Virtual Circuit Type: Ethernet VLAN
 Virtual Circuit is configured as Primary
 Virtual Circuit is configured as Active
 Virtual Circuit is active

CHAPTER 9 LDP Graceful Restart

LDP graceful restart (GR) minimizes the negative effects on MPLS traffic caused by control-plane restarts in Label Switching Routers (LSR), especially by the restart of the Label Distribution Protocol (LDP).

LDP graceful restart enables a router whose LDP control plane is undergoing a restart to continue forwarding traffic while recovering its state from neighboring routers. This requires a restarting LDP router that retains established LSP labels. In helper mode, the router maintains label bindings as stale and reprocesses them, after the router undergoing graceful restart reestablishes its LDP session.

The MPLS forwarding state, which is the minimum state required to avoid any disturbance to LSPs traversing a restarting LSR, is preserved during the restart. This mechanism does not require any of the LDP-related states to be preserved across the restart. This means that when LDP restarts, there are minimal or no changes made to the forwarding table entries, and MPLS forwarding continues uninterrupted. This supports Graceful Restart in restarting routers as well as in neighbor routers.

Topology

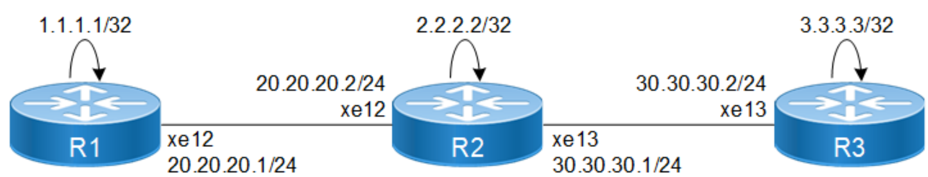

Figure 9-10: LDP Graceful Restart

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode for loopback.
`(config-if)# ip address 1.1.1.1/32 secondary`	Assign secondary IP address.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)# router ldp`	Enter the Router LDP mode
`(config-router)# router-id 1.1.1.1`	Assign router id for LDP
`(config-router)# graceful-restart full`	Enable graceful restart in LDP configure mode
`(config-router)# graceful-restart timers neighbor-liveness 130`	Configuring graceful neighbor-liveness timer to 130 sec.
`(config-router)# graceful-restart timers max-recovery 150`	Configuring graceful max recovery timer to 150 sec
`(config-router)# exit`	Exit Router LDP mode and return to Configure mode.
`(config)#interface ce49`	Enter Interface mode for ce49.
`(config-if)# ip address 20.20.20.1/24`	Assign IP address on ce49 interface.
`(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`(config-if)# label-switching`	Enable Label switching on the interface
`(config-if)#exit`	Exit Interface mode and return to Configure mode.

`(config)# router ospf`	Enter the Router OSPF mode
`(config-router)# network 1.1.1.1/32 area 0.0.0.0`	Advertise loopback address in OSPF
`(config-router)# network 20.20.20.0/24 area 0.0.0.0`	Advertise network address in OSPF
`(config-router)# redistribute connected`	Configure redistribution connected.
`(config-router)#exit`	Exit from Router OSPF mode and enter into config mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit from configuration mode

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode for loopback.
`(config-if)# ip address 2.2.2.2/32 secondary`	Assign secondary IP address.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)# router ldp`	Enter the Router LDP mode
`(config-router)# router-id 2.2.2.2`	Assign router id for LDP
`(config-router)# graceful-restart helper-only`	Enable graceful restart helper in LDP configure mode
`(config-router)# exit`	Exit Router LDP mode and return to Configure `mode`.
`(config)#interface ce0`	Enter Interface mode for ce0.
`(config-if)# ip address 20.20.20.2/24`	Assign IP address on ce0 interface.
`(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`(config-if)# label-switching`	Enable Label switching on the interface
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe13`	Enter Interface mode for xe13.
`(config-if)# ip address 30.30.30.1/24`	Assign IP address on xe13 interface.
`(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`(config-if)# label-switching`	Enable Label switching on the interface
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)# router ospf`	Enter the Router OSPF mode
`(config-router)# network 2.2.2.2/32 area 0.0.0.0`	Advertise loopback address in OSPF
`(config-router)# network 20.20.20.0/24 area 0.0.0.0`	Advertise network address in OSPF
`(config-router)# network 30.30.30.0/24 area 0.0.0.0`	Advertise network address in OSPF
`(config-router)#exit`	Exit from Router OSPF mode and enter into config mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit from configuration mode

R3

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode for loopback.
`(config-if)# ip address 3.3.3.3/32 secondary`	Assign secondary IP address.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)# router ldp`	Enter the Router LDP mode
`(config-router)# router-id 3.3.3.3`	Assign router id for LDP
`(config-router)# graceful-restart helper-only`	Enable graceful restart helper in LDP configure mode
`(config-router)# exit`	Exit Router LDP mode and return to Configure mode.
`(config)#interface xe13`	Enter Interface mode for xe13.
`(config-if)# ip address 30.30.30.2/24`	Assign IP address on xe13 interface.
`(config-if)# enable-ldp ipv4`	Enable LDP on the interface.
`(config-if)# label-switching`	Enable Label switching on the interface
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)# router ospf`	Enter the Router OSPF mode
`(config-router)# network 3.3.3.3/32 area 0.0.0.0`	Advertise loopback address in OSPF
`(config-router)# network 30.30.30.0/24 area 0.0.0.0`	Advertise network address in OSPF
`(config-router)# redistribute connected`	Configure redistribution connected.
`(config-router)#exit`	Exit from Router OSPF mode and enter into config mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit from configuration mode

Validation

CHAPTER 10 LDP Tunneling over RSVP-TE

Overview

LDP-over-RSVP-TE tunneling is a technique used in MPLS networks to combine the strengths of Label Distribution Protocol (LDP) and Resource Reservation Protocol Traffic Engineering (RSVP-TE). This approach allows LDP Label Switched Paths (LSPs) to be encapsulated within RSVP-TE LSPs, providing enhanced traffic engineering capabilities while maintaining operational simplicity.

Feature Characteristics

LDP-over-RSVP-TE facilitates the integration of LDP LSPs within RSVP-TE tunnels, leveraging the strengths of both protocols. It harnesses RSVP-TE's traffic engineering capabilities for path computation, bandwidth reservation, and quality of service (QoS) provisioning. Ingress nodes execute FEC resolution to designate the suitable RSVP-TE tunnel for tunneling LDP LSPs, establishing hierarchical LSPs with RSVP-TE as the outer label and LDP as the inner label.

Benefits

LDP-over-RSVP-TE offers significant benefits are:

- **Advanced Traffic Engineering**: By leveraging RSVP-TE's advanced traffic engineering mechanisms, LDP-over-RSVP-TE enables efficient path computation, bandwidth reservation, and Quality of Service (QoS) provisioning.
- **Simplified Network Topology**: eliminates the need for a full mesh of intra-area RSVP LSPs (Label Switched Paths) between PE (Provider Edge) nodes.
- **Enhanced Resilience with Fast Reroute (FRR)**: Inherit RSVP-TE's Fast Reroute (FRR) capabilities. This means that in case of link or node failures, the network can quickly reroute traffic along pre-established backup paths
- **Flexible Hierarchical LSP Design**: Provides flexibility in network design by allowing for hierarchical LSPs (Label Switched Paths) where RSVP-TE serves as the outer label and LDP as the inner label.

Prerequisites

Before configuring this feature, ensure the following:

- A functional MPLS network with support for both LDP and RSVP-TE protocols.
- Network devices (routers or switches) capable of supporting LDP and RSVP-TE functionalities.

Limitations

The limitations are:

- LDP-over-RSVP tunneling is supported only with ISIS as IGP.
- Tunneling over inter-domain IGP area is not supported.
- LDP LSP tunneling over RSVP multipath is not supported.
- MPLS trace route is not supported in LDP-over-RSVP tunneling path.
- Dynamic TLDP sessions are not supported, TLDP session has to be explicitly configured.

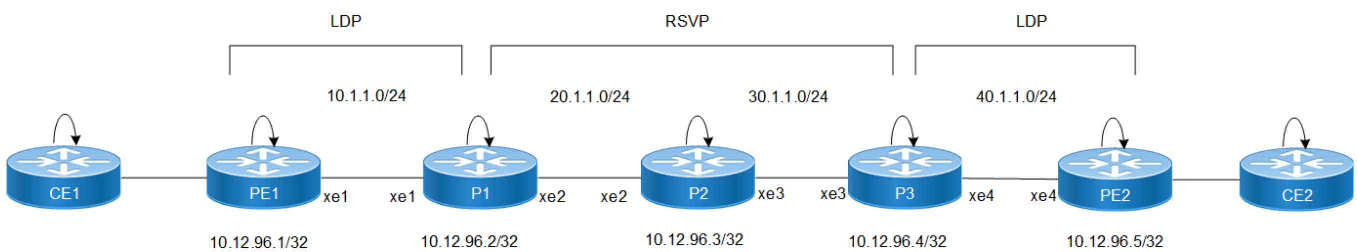
- LFA and/or RLFA protection is not supported for LDP-over-RSVP tunnels.
- MPLS EVPN ELAN services over LoR are not supported.

Configuration for LDP Tunneling Over RSVP

Configure various nodes within the topology to set up a LDP Tunneling over RSVP session.

Topology

This sample topology provides basic connectivity and routing between the devices.



LDP Tunneling over RSVP Configuration

Configure LDP Tunneling over RSVP on PE1 Router

Follow the steps to configure the LDP tunneling over RSVP on PE1 router:

1. Configure the loopback interface with an IP address.
```
PE1(config)#interface lo
PE1(config-if)#ip address 10.12.96.1/32 secondary
```
2. Configure the global LDP parameters including the router ID and transport address.
```
PE1(config)#router ldp
PE1(config-router)#router-id 10.12.96.1
PE1(config-router)#transport-address ipv4 10.12.96.1
```
3. Configure global RSVP parameters.
```
PE1(config)#router rsvp
```
4. Configure the interface facing the network side with an IP address, enable label switching, and enable LDP.
```
PE1(config)#interface xe1
PE1(config-if)#ip address 10.1.1.1/24
PE1(config-if)#label-switching
PE1(config-if)#enable-ldp ipv4
```
5. If using ISIS as the Interior Gateway Protoco (IGP), configure ISIS parameters including traffic engineering.
```
PE1(config)#router isis ISIS-IGP
PE1(config-router)#is-type level-1
PE1(config-router)#metric-style wide
PE1(config-router)#mpls traffic-eng router-id 10.12.96.1
PE1(config-router)#mpls traffic-eng level-1
PE1(config-router)#capability cspf
PE1(config-router)#dynamic-hostname
PE1(config-router)#net 49.0000.0000.0001.00
```

```
PE1(config-router)#exit
```

Configure LDP Tunneling over RSVP on P1 Router

Follow the steps to configure the LDP tunneling over RSVP on P1 router:

1. Configure the loopback interface with an IP address.
```
P1(config)#interface lo
P1(config-if)# ip address 10.12.96.2/32 secondary
```
2. Configure the global TLDP parameters including the router ID and transport address.
```
P1(config)#router ldp
P1(config-router)#router-id 10.12.96.2
P1(config-router)# targeted-peer ipv4 10.12.96.4
P1(config-router-targeted-peer)#exit
P1(config-router)# transport-address ipv4 10.12.96.2
```
3. Configure LDP to prefer tunneling over RSVP.
```
P1(config)#router ldp
P1(config-router)# prefer-tunnel-in-tunnel rsvp
```
4. Configure global RSVP parameters.
```
P1(config)#router rsvp
```
5. Configure a RSVP trunk towards the neighbor router (assuming 10.12.96.4 is the neighbor) and enable ldp-tunneling to allow tunneling LDP LSPs.
```
P1(config)# rsvp-trunk t1 ipv4
P1(config-trunk)#to 10.12.96.4
P1(config-trunk)#ldp-tunneling
```
6. Configure the interface facing the network side with an IP address, enable label switching, and enable LDP and RSVP.
   - For interface xe1:
```
P1(config)#interface xe1
P1(config-if)#ip address 10.1.1.2/24
P1(config-if)#label-switching
P1(config-if)#enable-ldp ipv4
```
   - For interface xe2:
```
P1(config)#interface xe2
P1(config-if)#ip address 20.1.1.1/24
P1(config-if)#label-switching
P1(config-if)#enable-rsvp
```
7. If using ISIS as the Interior Gateway Protoco (IGP), configure ISIS parameters including traffic engineering.
```
P1(config)#router isis ISIS-IGP
P1(config-router)#is-type level-1
P1(config-router)#metric-style wide
P1(config-router)#mpls traffic-eng router-id 10.12.96.2
P1(config-router)#mpls traffic-eng level-1
P1(config-router)#capability cspf
P1(config-router)#dynamic-hostname
P1(config-router)#net 49.0000.0000.0002.00
P1(config-router)#exit
```

Configure LDP Tunneling over RSVP on P2 Router

Follow the steps to configure the LDP tunneling over RSVP on P2 router:

1. Configure the loopback interface with an IP address.

```
P2(config)#interface lo
P2(config-if)# ip address 10.12.96.3/32 secondary
```

2. Configure the global LDP parameters including the router ID and transport address.

```
P2(config)#router ldp
P2(config-router)#router-id 10.12.96.3
P2(config-router)# transport-address ipv4 10.12.96.3
```

3. Configure global RSVP parameters.

```
P2(config)#router rsvp
```

4. Configure the interface facing the network side with an IP address, enable label switching, and enable RSVP.
   - For interface xe2:

```
P2(config)#interface xe2
P2(config-if)#ip address 20.1.1.2/24
P2(config-if)#label-switching
P2(config-if)#enable-rsvp
```

   - For interface xe3:

```
P2(config)#interface xe3
P2(config-if)#ip address 30.1.1.1/24
P2(config-if)#label-switching
P2(config-if)#enable-rsvp
```

5. If using ISIS as the Interior Gateway Protoco (IGP), configure ISIS parameters including traffic engineering.

```
P2(config)#router isis ISIS-IGP
P2(config-router)#is-type level-1
P2(config-router)#metric-style wide
P2(config-router)#mpls traffic-eng router-id 10.12.96.3
P2(config-router)#mpls traffic-eng level-1
P2(config-router)#capability cspf
P2(config-router)#dynamic-hostname
P2(config-router)#net 49.0000.0000.0003.00
P2(config-router)#exit
```

Configure LDP Tunneling over RSVP on P3 Router

Follow the steps to configure the LDP tunneling over RSVP on P3 router:

1. Configure the loopback interface with an IP address.
```
P3(config)#interface lo
P3(config-if)# ip address 10.12.96.4/32 secondary
```
2. Configure the global LDP parameters including the router ID and transport address.
```
P3(config)#router ldp
P3(config-router)#router-id 10.12.96.4
P3(config-router)# targeted-peer ipv4 10.12.96.2
P3(config-router-targeted-peer)#exit
P3(config-router)# transport-address ipv4 10.12.96.4
```
3. Configure global RSVP parameters.
```
P3(config)#router rsvp
```
4. Configure prefix lists.
```
P3(config)# ip prefix-list fec_list
P3(config-ip-prefix-list)# seq 5 permit 10.12.96.5/32
P3(config)# ip prefix-list peer_list
P3(config-ip-prefix-list)# seq 5 permit 10.12.96.2/32
```
5. Configure prefix lists to control label advertisement between peers.
```
P3(config)# router ldp
P3(config-router)# advertise-labels for fec_list to peer_list
```
6. Configure the interface facing the network side with an IP address, enable label switching, and enable RSVP.
   - For interface xe3:
```
P3(config)#interface xe3
P3(config-if)#ip address 30.1.1.2/24
P3(config-if)#label-switching
P3(config-if)#enable-rsvp
```
   - For interface xe4:
```
P3(config)#interface xe4
P3(config-if)#ip address 40.1.1.1/24
P3(config-if)#label-switching
P3(config-if)#enable-ldp ipv4
```
7. If using ISIS as the Interior Gateway Protoco (IGP), configure ISIS parameters including traffic engineering.
```
P3(config)#router isis ISIS-IGP
P3(config-router)#is-type level-1
P3(config-router)#metric-style wide
P3(config-router)#mpls traffic-eng router-id 10.12.96.4
P3(config-router)#mpls traffic-eng level-1
P3(config-router)#capability cspf
P3(config-router)#dynamic-hostname
P3(config-router)#net 49.0000.0000.0004.00
P3(config-router)#exit
```

Configure LDP Tunneling over RSVP on PE2 Router

Follow the steps to configure the LDP tunneling over RSVP on PE2 router:

1. configure the loopback interface with an IP address.
```
PE2(config)#interface lo
PE2(config-if)# ip address 10.12.96.5/32 secondary
```
2. Configure the global LDP parameters including the router ID and transport address.
```
PE2(config)#router ldp
PE2(config-router)#router-id 10.12.96.5
PE2(config-router)# transport-address ipv4 10.12.96.5
```
3. Configure the interface facing the network side with an IP address, enable label switching, and enable LDP.
```
PE2(config)#interface xe4
PE2(config-if)#ip address 40.1.1.2/24
PE2(config-if)#label-switching
PE2(config-if)#enable-ldp ipv4
```
4. If using ISIS as the Interior Gateway Protoco (IGP), configure ISIS parameters including traffic engineering.
```
PE2(config)#router isis ISIS-IGP
PE2(config-router)#is-type level-1
PE2(config-router)#metric-style wide
PE2(config-router)#mpls traffic-eng router-id 10.12.96.5
PE2(config-router)#mpls traffic-eng level-1
PE2(config-router)#capability cspf
PE2(config-router)#dynamic-hostname
PE2(config-router)#net 49.0000.0000.0005.00
PE2(config-router)#exit
```

Snippet Configuration on P1 Router

Follow the steps to configure the LDP tunneling over RSVP on P1 router using snippet:

```
P1#show running-config isis
!
!
router isis ISIS-IGP-100
 is-type level-1
 metric-style wide
 mpls traffic-eng router-id 10.12.96.2
 mpls traffic-eng level-1
 capability cspf
 dynamic-hostname
 net 49.0001.0000.0000.0002.00
!

P1#show running-config ldp
!
router ldp
 router-id 10.12.96.2
 prefer-tunnel-in-tunnel rsvp
 targeted-peer ipv4 10.12.96.4
  exit-targeted-peer-mode
 transport-address ipv4 10.12.96.2
!
```

```
interface xe1
 enable-ldp ipv4

P1#show running-config rsvp
!
router rsvp
!
!
interface xe2
 enable-rsvp
!
!
rsvp-trunk t1 ipv4
 to 10.12.96.4
 ldp-tunneling
!
```

Snippet Configuration on P3 Router

Follow the steps to configure the LDP tunneling over RSVP on P3 router using snippet:

```
P3#show running-config ldp
!
router ldp
 targeted-peer ipv4 10.12.96.2
  exit-targeted-peer-mode
 transport-address ipv4 10.12.96.4
 advertise-labels for fec_list to peer_list
!
interface xe4
 enable-ldp ipv4
!
```

Validation

```
Validation on P1 node:

P1#show ldp session
Codes: m - MD5 password is not set/unset.
       g - GR configuration not set/unset.
       t - TCP MSS not set/unset.
       Session has to be cleared manually

Code  Peer IP Address      IF Name    My Role    State      KeepAlive  UpTime
       10.12.96.1             xe1      Active    OPERATIONAL   30    00:05:42
       10.12.96.4              xe2      Passive   OPERATIONAL   30    00:05:44
P1#
P1#
P1#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to 
Secondary
indicates the session is active with local repair at one or more nodes
```

```
(P) indicates the secondary-priority session is acting as primary

CLI Commands for LDP Tunneling over RSVP-TE

The LDP Tunneling over RSVP-TE introduces the following configuration commands.

ldp-tunneling

Use this command to enable LDP tunneling over RSVP trunk. When a specific RSVP trunk is enabled for tunneling, user traffic is tunneled using LDP LSP over RSVP LSP. If more than one trunk is enabled for tunneling LDP LSP, following trunk selection method is followed:

- If there are more than one trunk with same tunnel end-node, trunk with best metric (lower cost) is selected.
- If a destination FEC is reachable via more than one tunnel-endpoint, a tunnel-endpoint which is closer to destination is selected for tunneling.

Note: TLDP sessions should be manually established with RSVP tunnel end-nodes. Additionally, the 'advertise-labels' CLI must be explicitly configured to permit label advertisement over TLDP sessions.

Use `no` parameter of this command to disable tunneling from a trunk.

Command Syntax

```
ldp-tunneling
no ldp-tunneling
```

Parameters

None

Default

Disabled

Command Mode

rsvp-trunk mode

Applicability

Introduced in OcNOS version 6.5.2.

Example

The following example describes how to enable LDP tunneling over RSVP trunk:

```
OcNOS#configure terminal
OcNOS(config)#rsvp-trunk t2
OcNOS(config-trunk)#to 4.4.4.4
OcNOS(config-trunk)#ldp-tunneling
OcNOS(config-trunk)#commit
OcNOS(config-trunk)#end
```

prefer-tunnel-in-tunnel rsvp

Use this command for prioritizing RSVP trunk over LDP-LSP for forwarding LDP traffic. By default incoming LDP traffic is forwarded using LDP LSP. However when this CLI is configured and if RSVP trunk has been enabled for tunneling LDP LSP, user data (incoming LDP LSP) is tunneled over RSVP tunnels. If this CLI is not enabled and RSVP trunk has been enabled for tunneling LDP LSP, user data still can be forwarded over RSVP trunk if no LDP LSP exist.

Use `no` parameter of this command to prioritizing LDP-LSP over RSVP trunk while forwarding LDP traffic.

Command Syntax

```
prefer-tunnel-in-tunnel rsvp
no prefer-tunnel-in-tunnel rsvp
```

Parameters

None

Default

LDP-LSP is selected over RSVP trunks for forwarding.

Command Mode

Router LDP mode

Applicability

Introduced in OcNOS version 6.5.2.

Example

The following example describes how to prioritize RSVP trunk over LDP-LSP for forwarding LDP traffic:

```
OcNOS#configure terminal
OcNOS(config)#router ldp
OcNOS(config-router)#prefer-tunnel-in-tunnel rsvp
OcNOS(config-router)#commit
OcNOS(config-router)#end
```

© 2025 IP Infusion Inc. Proprietary

Show Commands for LDP Over RVSP

show ldp tunneling fec

This command displays the LDP tunneling FEC mappings.

Command Syntax

```
show ldp tunneling-fec
```

Parameters

None

Command Mode

EXEC mode

Applicability

Introduced in OcNOS version 6.5.2.

Example

The following configuration illustrates how to view the FEC mappings on router R2:

```
R2#show ldp tunneling-fec
FEC                  Tunnel-name                    Tunnel-endpoint
Upstream-Peer   In-label  Out-label
52.1.1.0/24        t2                       4.4.4.4/32        1.1.1.1
26253     26250
53.1.1.0/24        t2                       4.4.4.4/32        1.1.1.1
26255     26241

Total LDP Tunneled FEC : 2
```

show ldp tunneling

This command displays the LDP tunneling.

Command Syntax

```
show ldp tunneling
```

Parameters

None

Command Mode

EXEC mode

Applicability

Introduced in OcNOS version 6.5.2.

Example

The following example describes how to view the LDP tunneling on router R2:

```
Tunnel Name        : t1
```

```
Tunnel Endpoint    : 10.12.96.4/32
Tunnel Cost        : 20
Tunnel Owner       : RSVP
Tunnel Status      : Up

FEC                 Upstream-Peer   In-Label   Out-Label
==========================================================
10.12.96.5/32       10.12.96.1      26242     26244

Total FEC tunneld by t1 : 1
```

show ldp tunneling-tunnels.

This command displays the LDP tunneling tunnels.

Command Syntax

```
show ldp tunneling-tunnels
```

Parameters

None

Command Mode

EXEC mode

Applicability

Introduced in OcNOS version 6.5.2.

Example

The following example describes how to view the LDP tunneling on router R2:

```
R2#show ldp tunneling-tunnels
Tunnel-name                   Tunnel-endpoint     Status    Cost
t2                            4.4.4.4/32          Up        20
```

Glossary

Note: List key terms used in this document and add the term and explanation to our existing Glossary.

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
Forward Error Correction (FEC)	A system of error control that allows the receiver to correct some errors without having to request a re-transmission of data.
Interior Gateway Protocol (IGP)	An intradomain protocol used to exchange network reachability and routing information among devices within an autonomous system (AS), such as Intermediate System to Intermediate System (IS-IS), Open Shortest Path First (OSPF), or Routing Information Protocol (RIP). Contrast with Exterior Gateway Protocol (EGP).

© 2025 IP Infusion Inc. Proprietary

Label Distribution Protocol (LDP)	A protocol for distributing labels in non-traffic-engineered applications. LDP allows routers to create label-switched path (LSP) instances through a network by mapping network layer routing information directly to data-link layer switched paths.
Resource Reservation Protocol (RSVP)	A signaling protocol for reserving resources across a network. RSVP is rarely used by itself, but Resource Reservation Protocol—Traffic Engineering (RSVP-TE) is widely used.
Targeted Label Distribution Protocol (TLDP)	A specialized form of LDP (Label Distribution Protocol) sessions.

CHAPTER 11 BGP Auto-Discovery (AD) for LDP VPLS

Overview

The BGP Auto-Discovery enables automatic discovery of VPLS peers, eliminating the need for manual peer configuration. Once discovered, pseudo-wires (PWs) between peers are established using LDP signaling, streamlining the VPLS setup process.

Note: In BGP AD VPLS, if rd and/or router-target is configured in ASN4:nn format while BGP extended ASN support is disabled or vice-versa then BGP auto-discovery will not work and mesh PW will not come up. In such scenarios user is expected to remove the BGP AD VPLS instance and configure it again with correct rd and route-target config as per the BGP extended ASN support.

Benefits

The BGP Auto-Discovery provides in following aspects:

- Simplifies the VPLS configuration process.
- Enhances network scalability.
- Improves scaling efficiency when used with route reflectors.

Prerequisites

- **Define Interfaces and Loopback Addresses:**

  Configure Layer 2 interfaces, such as port channel interfaces (e.g., po1), and assign IP addresses for identification and routing. Additionally, configure loopback IP addresses to establish key connectivity points. These settings ensure efficient network routing and communication.

```
!
interface lo
 ip address 127.0.0.1/8
 ip address 2.2.2.2/32 secondary
 ipv6 address ::1/128

interface xe14
 ip address 30.1.1.2/24
```

- **Configure IGP for Dynamic Routing:**

  Enable ISIS to facilitate dynamic routing on all nodes within the net-work. Define ISIS router instances to match loopback IP addresses and add network segments to ISIS areas for proper route distribution.Set up neighbor relationships using loopback IP addresses, ensuring efficient route advertisement and convergence for optimal network performance.

  - **ISIS Configuration:**

```
router isis 1
 is-type level-2-only
 metric-style wide
 microloop-avoidance level-2
```

```
 mpls traffic-eng router-id 2.2.2.2
 mpls traffic-eng level-2
 capability cspf
 dynamic-hostname
 bfd all-interfaces
 net 49.0000.0000.0002.00
 passive-interface lo
!
interface xe14
 mpls ldp-igp sync isis level-2
 isis network point-to-point
 ip router isis 1
```

- **OSPF Configuration:**

```
router ospf 1
ospf router-id 2.2.2.2
network 2.2.2.2/32 area 0.0.0.0
 network 30.1.1.0/24 area 0.0.0.0!
!
interface xe14
ip ospf network point-to-point
```

- LDP Configuration:

```
router ldp
 router-id 100.1.1.1
 transport-address ipv4 100.1.1.1
```

- BGP Configuration:

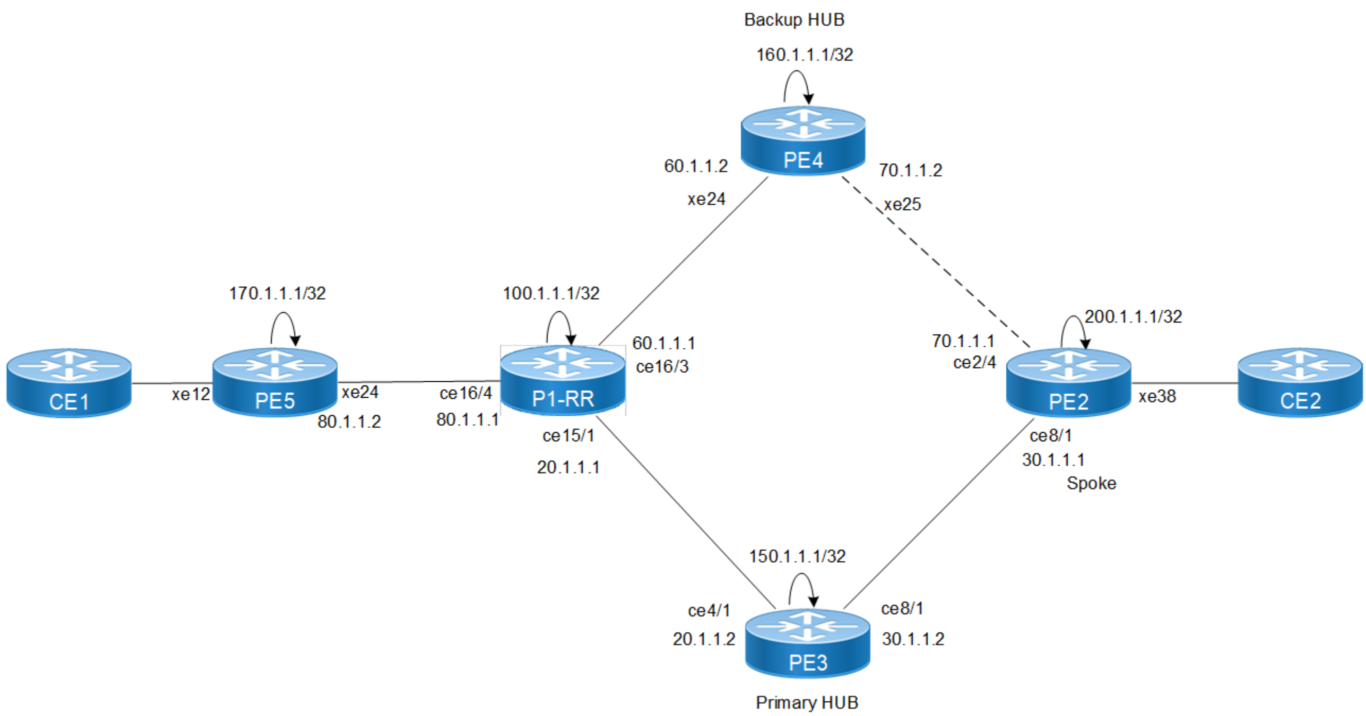
```
!
router bgp 64000
 bgp router-id 100.1.1.1
 neighbor BGP-AD peer-group
 neighbor BGP-AD remote-as 64000
 neighbor BGP-AD update-source lo
 neighbor BGP-AD fall-over bfd multihop
 neighbor 150.1.1.1 peer-group BGP-AD
 neighbor 160.1.1.1 peer-group BGP-AD
 neighbor 170.1.1.1 peer-group BGP-AD
 !
 address-family ipv4 unicast
 redistribute connected
 neighbor BGP-AD activate
 exit-address-family
 !
 address-family l2vpn vpls
 neighbor BGP-AD activate
 neighbor BGP-AD route-reflector-client
 exit-address-family
 !
 exit
!
```

Configuration

Configure various nodes within the topology to set up a H-VPLS session.

Topology

This sample topology provides basic connectivity and routing between the devices.



BGP-A-D LDP VPLS Topology Diagram

Configuring BGP-A-D LDP VPLS

Configure PE5 router as follows:

1. Configure router LDP.

```
PE5(config)#router ldp
PE5(config-router)# router-id 170.1.1.1
PE5(config-router)# transport-address ipv4 170.1.1.1
PE5(config-router)# pw-status-tlv
```

2. Configure loopback interface.

```
PE5(config)#interface lo
PE5(config-af)#ip address 170.1.1.1/32 secondary
```

3. Enable LDP and label-switching for core interface.

```
PE5(config)#interface xe24
PE5(config-if)#ip address 80.1.1.2/24
PE5(config-if)#label-switching
PE5(config-if)#mpls ldp-igp sync ospf
```

```
PE5(config-if)#ip ospf network point-to-point
PE5(config-if)#enable-ldp ipv4

PE5(config-if)#router ospf 100
PE5(config-if)#network 80.1.1.0/24 area 0.0.0.0
PE5(config-if)#network 170.1.1.1/32 area 0.0.0.0
```

4. Configure BGP.

```
PE5(config)#router bgp 64000
PE5(config-router)#bgp router-id 170.1.1.1
PE5(config-router)#neighbor BGP-AD peer-group
PE5(config-router)#neighbor BGP-AD remote-as 64000
PE5(config-router)#neighbor BGP-AD update-source lo
PE5(config-router)#neighbor BGP-AD fall-over bfd multihop
PE5(config-router)#neighbor 100.1.1.1 peer-group BGP-AD

PE5(config-router-af)#exit-address-family
PE5(config-router)#exit
```

5. Configure VPLS instance.

```
PE5(config)#mpls vpls vpls2 2
PE5(config-vpls)#signaling ldp
PE5(config-vpls-sig)#bgp-auto-discovery
PE5(config-vpls-ldp-sig-bgp-ad)#l2vpn-id 200:1001
PE5(config-vpls-ldp-sig-bgp-ad)#rd 10.10.10.10:1001
PE5(config-vpls-ldp-sig-bgp-ad)#route-target both 2:100
PE5(config-vpls-ldp-sig-bgp-ad)#exit-bgp-auto-discovery
PE5(config-vpls-sig)#exit-signaling
PE5(config-vpls)#exit-vpls
```

6. Configure sub-interface and attach vpls-instance to sub-interface.

```
PE5(config)#interface xe12.2 switchport
PE5(config-if)#encapsulation dot1q 2
PE5(config-if)#access-if-vpls
PE5(config-acc-if-vpls)#mpls-vpls vpls2
PE5(config-acc-if-vpls)#exit
PE5(config-if)#exit
```

Configure P1 router as follows:

1. Configure router LDP.

```
P1(config)#router ldp
P1(config-router)#router-id 100.1.1.1
P1(config-router)#transport-address ipv4 100.1.1.1
```

2. Enable LDP and label-switching for core interface.

```
P1(config)#interface ce15/1
P1(config-if)#ip address 20.1.1.1/24
P1(config-if)#label-switching
P1(config-if)#mpls ldp-igp sync ospf
P1(config-if)#ip ospf network point-to-point
P1(config-if)#enable-ldp ipv4
```

3. Configure network interface.

```
P1(config)#interface ce16/3
P1(config-if)#ip address 60.1.1.1/24
P1(config-if)#label-switching
```

```
P1(config-if)#mpls ldp-igp sync ospf
P1(config-if)#ip ospf network point-to-point
P1(config-if)#enable-ldp ipv4

P1(config)#interface ce16/4
P1(config-if)#ip address 80.1.1.1/24
P1(config-if)#label-switching
P1(config-if)#mpls ldp-igp sync ospf
P1(config-if)#ip ospf network point-to-point
P1(config-if)#enable-ldp ipv4
```

4. Configure loopback interface.

```
P1(config)#interface lo
P1(config-if)#ip address 100.1.1.1/32 secondary
```

5. Configure OSPF.

```
P1(config)#router ospf 100
P1(config-router)#network 20.1.1.0/24 area 0.0.0.0
P1(config-router)#network 60.1.1.0/24 area 0.0.0.0
P1(config-router)#network 80.1.1.0/24 area 0.0.0.0
P1(config-router)#network 100.1.1.1/32 area 0.0.0.0
```

6. Configure BGP.

```
P1(config)#router bgp 64000
P1(config-router)#bgp router-id 100.1.1.1
P1(config-router)#neighbor BGP-AD peer-group
P1(config-router)#neighbor BGP-AD remote-as 64000
P1(config-router)#neighbor BGP-AD update-source lo
P1(config-router)#neighbor BGP-AD fall-over bfd multihop
P1(config-router)#neighbor 150.1.1.1 peer-group BGP-AD
P1(config-router)#neighbor 160.1.1.1 peer-group BGP-AD
P1(config-router)#neighbor 170.1.1.1 peer-group BGP-AD
P1(config-router-af)#address-family l2vpn vpls
P1(config-router-af)#neighbor BGP-AD activate
P1(config-router-af)#neighbor BGP-AD route-reflector-client
P1(config-router-af)#exit-address-family
P1(config-router)#exit
```

Configure PE3 router as follows:

1. Configure router LDP.

```
PE3(config)#router ldp
PE3(config-router)# router-id 150.1.1.1
PE3(config-router)# transport-address ipv4 150.1.1.1
```

2. Enable LDP and label-switching for core interface.

```
PE3(config)#interface ce4/1
PE3(config-if)#ip address 20.1.1.2/24
PE3(config-if)#label-switching
PE3(config-if)#mpls ldp-igp sync ospf
PE3(config-if)#ip ospf network point-to-point
PE3(config-if)#enable-ldp ipv4

PE3(config)#interface ce8/1
PE3(config-if)#ip address 30.1.1.2/24
PE3(config-if)#label-switching
PE3(config-if)#mpls ldp-igp sync ospf
```

```
PE3(config-if)#ip ospf network point-to-point
PE3(config-if)#enable-ldp ipv4
```

3. Configure loopback interface.

```
PE3(config)#interface lo
PE3(config-if)#ip address 150.1.1.1/32 secondary
```

4. Configure OSPF.

```
PE3(config)#router ospf 100
PE3(config-router)#network 20.1.1.0/24 area 0.0.0.0
PE3(config-router)#network 30.1.1.0/24 area 0.0.0.0
PE3(config-router)#network 150.1.1.1/32 area 0.0.0.0
```

5. Configure BGP.

```
PE3(config)#router bgp 64000
PE3(config-router)#bgp router-id 150.1.1.1
PE3(config-router)#neighbor BGP-AD peer-group
PE3(config-router)#neighbor BGP-AD remote-as 64000
PE3(config-router)#neighbor BGP-AD update-source lo
PE3(config-router)#neighbor BGP-AD fall-over bfd multihop
PE3(config-router)#neighbor 100.1.1.1 peer-group BGP-AD
PE3(config-router-af)#address-family l2vpn vpls
PE3(config-router-af)#neighbor BGP-AD activate
PE3(config-router-af)#neighbor BGP-AD route-reflector-client
PE3(config-router-af)#exit-address-family
PE3(config-router)#exit
```

6. Configure an MPLS L2 Circuit.

```
PE3(config)#mpls l2-circuit vc1 101 200.1.1.1
```

7. Configure an MPLS VPLS Instance.

```
PE3(config)#mpls vpls vpls2 2
PE3(config-vpls-spoke)#vpls-vc vc1
PE3(config-vpls-spoke)#exit-spoke
PE3(config-vpls)#signaling ldp
PE3(config-vpls-sig)#bgp-auto-discovery
PE3(config-vpls-ldp-sig-bgp-ad)#l2vpn-id 200:1001
PE3(config-vpls-ldp-sig-bgp-ad)#rd 10.10.10.10:1001
PE3(config-vpls-ldp-sig-bgp-ad)#route-target both 2:100
PE3(config-vpls-ldp-sig-bgp-ad)#exit-bgp-auto-discovery
PE3(config-vpls-sig)#exit-signaling
PE3(config-vpls)#exit-vpls
```

8. Configure the network Interface.

```
PE3(config)#interface ce4/2.2 switchport
PE3(config-if)#encapsulation dot1q 2
PE3(config-if)#access-if-vpls
PE3(config-acc-if-vpls)#mpls-vpls vpls2
PE3(config-acc-if-vpls)#exit
PE3(config-if)#exit
```

Configure PE4 router as follows:

1. Configure router LDP.

```
PE4(config)#router ldp
PE4(config-router)# router-id 160.1.1.1
PE4(config-router)# transport-address ipv4 160.1.1.1
```

2. Configure loopback interface.

```
PE4(config)#interface lo
PE4(config-if)#ip address 160.1.1.1/32 secondary
```

3. Enable LDP and label-switching for core interface.

```
PE4(config)#interface xe24
PE4(config-if)#ip address 60.1.1.2/24
PE4(config-if)#label-switching
PE4(config-if)#mpls ldp-igp sync ospf
PE4(config-if)#ip ospf network point-to-point
PE4(config-if)#enable-ldp ipv4

PE4(config)#interface xe25
PE4(config-if)#ip address 70.1.1.2/24
PE4(config-if)#label-switching
PE4(config-if)#mpls ldp-igp sync ospf
PE4(config-if)#ip ospf network point-to-point
PE4(config-if)#enable-ldp ipv4
```

4. Configure OSPF.

```
PE4(config)#router ospf 100
PE4(config-router)#network 60.1.1.0/24 area 0.0.0.0
PE4(config-router)#network 70.1.1.0/24 area 0.0.0.0
PE4(config-router)#network 160.1.1.1/32 area 0.0.0.0
```

5. Configure BGP.

```
PE4(config)#router bgp 64000
PE4(config-router)#bgp router-id 160.1.1.1
PE4(config-router)#neighbor BGP-AD peer-group
PE4(config-router)#neighbor BGP-AD remote-as 64000
PE4(config-router)#neighbor BGP-AD update-source lo
PE4(config-router)#neighbor BGP-AD fall-over bfd multihop
PE4(config-router)#neighbor 100.1.1.1 peer-group BGP-AD
PE4(config-router-af)#address-family l2vpn vpls
PE4(config-router-af)#neighbor BGP-AD activate
PE4(config-router-af)#exit-address-family
PE4(config-router)#exit
```

6. Configure an MPLS L2 Circuit.

```
PE4(config)#mpls l2-circuit vc1001 1101 200.1.1.1
```

7. Configure an MPLS VPLS Instance.

```
PE4(config)#mpls vpls vpls2 2
PE4(config-vpls-spoke)#vpls-vc vc1001
PE4(config-vpls-spoke)#exit-spoke
PE4(config-vpls)#signaling ldp
PE4(config-vpls-sig)#bgp-auto-discovery
PE4(config-vpls-ldp-sig-bgp-ad)#l2vpn-id 200:1001
PE4(config-vpls-ldp-sig-bgp-ad)#rd 10.10.10.10:1001
PE4(config-vpls-ldp-sig-bgp-ad)#route-target both 2:100
PE4(config-vpls-ldp-sig-bgp-ad)#exit-bgp-auto-discovery
PE4(config-vpls-sig)#exit-signaling
PE4(config-vpls)#exit-vpls
```

8. Configure the network Interface.

```
PE4(config)#interface xe12.2 switchport
PE4(config-if)#encapsulation dot1q 2
PE4(config-if)#access-if-vpls
PE4(config-acc-if-vpls)#mpls-vpls vpls2
```

```
PE4(config-acc-if-vpls)#exit
PE4(config-if)#exit
```

Configure PE2 router as follows:

1. Configure router LDP.
```
PE4(config)#router ldp
PE4(config-router)# router-id 200.1.1.1
PE4(config-router)# transport-address ipv4 200.1.1.1
```
2. Enable LDP and label-switching for core interface.
```
PE4(config)#interface ce2/4
PE4(config-if)#ip address 70.1.1.2/24
PE4(config-if)#label-switching
PE4(config-if)#mpls ldp-igp sync ospf
PE4(config-if)#ip ospf network point-to-point
PE4(config-if)#enable-ldp ipv4

PE4(config)#interface ce8/1
PE4(config-if)#ip address 30.1.1.2/24
PE4(config-if)#label-switching
PE4(config-if)#mpls ldp-igp sync ospf
PE4(config-if)#ip ospf network point-to-point
PE4(config-if)#enable-ldp ipv4
```
3. Configure loopback interface.
```
PE4(config)#interface lo
PE4(config-if)#ip address 200.1.1.1/32 secondary
```
4. Enable LDP and label-switching for core interface.
```
PE4(config)#interface xe42
PE4(config-if)#ip address 10.1.1.2/24
PE4(config-if)#label-switching
PE4(config-if)#mpls ldp-igp sync ospf
PE4(config-if)#ip ospf network point-to-point
PE4(config-if)#enable-ldp ipv4
```
5. Configure OSPF.
```
PE4(config)#router ospf 100
PE4(config-router)#network 10.1.1.0/24 area 0.0.0.0
PE4(config-router)#network 30.1.1.0/24 area 0.0.0.0

CLI Commands

The BGP Auto-Discovery (AD) introduces the following configuration commands.

bgp-auto-discovery

Use this command to enable BGP Auto-Discovery for LDP peers.

Use `no` parameter of this command to disable BGP Auto-Discovery for LDP peers.

Command Syntax

```
bgp-auto-discovery
no bgp-auto-discovery
```

Parameters

None

Default

Disabled

Command Mode

SIGNALING LDP mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

Explain or describe the example.

```
#configure terminal
(config)#mpls vpls VPLS100 100
(config-vpls)#signaling ldp
(config-vpls-sig)#bgp-auto-discovery
(config-vpls-ldp-sig-bgp-ad)#exit-bgp-auto-discovery
(config-vpls-sig)#exit
(config-vpls)#exit
```

l2vpn-id

Use this command to assign a Layer 2 VPN ID for the LDP VPLS.

Use `no` form command to remove the Layer 2 VPN ID configuration.

Command Syntax

```
l2vpn-id  ASN:nn_or_IP-address:nn
no l2vpn-id  ASN:nn_or_IP-address:nn
```

Parameters

`ASN:nn_or_IP-address:nn`
: AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

Default

The default value is set to ASN:VPLS ID when BGP external ASN support is disabled and the BGP ASN is less than 65535; otherwise, specifying a value is mandatory.

Command Mode

BGP AUTO DISCOVERY mode

Applicability

This command is introduced in OcNOS version 6.0.0.

Examples

```
#configure terminal
(config)#mpls vpls VPLS100 100
(config-vpls)#signaling ldp
(config-vpls-sig)#bgp-auto-discovery
(config-vpls-ldp-sig-bgp-ad)#l2vpn-id 3.3.3.3:3333
(config-vpls-ldp-sig-bgp-ad)#exit-bgp-auto-discovery
(config-vpls-sig)#exit
(config-vpls)#exit
```

rd (route distinguisher)

Use this command to assign a route distinguisher (RD) for the BGP AD VPLS. The route distinguisher value must be unique within all BGP AD VPLS instances on the router.

Note: BGP auto-discovery requires an RD configuration. Once configured, the RD can be modified but not removed individually; you must remove the entire bgp-auto-discovery configuration block.

Command Syntax

```
rd ASN:nn_or_IP-address:nn
```

Parameters

`ASN:nn_or_IP-address:nn`

AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

Default

None

Command Mode

BGP AUTO DISCOVERY mode

Applicability

This command is introduced in OcNOS version 6.0.0.

Examples

```
#configure terminal
(config)#mpls vpls VPLS100 100
(config-vpls)#signaling ldp
(config-vpls-sig)#bgp-auto-discovery
(config-vpls-ldp-sig-bgp-ad)#rd 1.1.1.1:1111
(config-vpls-ldp-sig-bgp-ad)#exit-bgp-auto-discovery
(config-vpls-sig)#exit
(config-vpls)#exit
```

route-target

Use this command to configure a route-target of type both to the BGP AD VPLS.

Note: Only one route-target of type "both" is supported, and once it is configured, it cannot be modified. To change it, the entire bgp-auto-discovery configuration block must be removed.

Command Syntax

```
route-target (both) (ASN:nn_or_IP-address:nn|)
```

Parameters

`both` Import and export routing information

`ASN:nn_or_IP-address:nn`
: AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

Default

None

Command Mode

BGP AUTO DISCOVERY mode

Applicability

This command is introduced in OcNOS version 6.0.0.

Examples

```
#configure terminal
(config)#mpls vpls VPLS100 100
(config-vpls)#signaling ldp
(config-vpls-sig)#bgp-auto-discovery
(config-vpls-ldp-sig-bgp-ad)#route-target both 2.2.2.2:2222
(config-vpls-ldp-sig-bgp-ad)#exit-bgp-auto-discovery
(config-vpls-sig)#exit
(config-vpls)#exit
```

Label Distribution Protocol Command Reference

CHAPTER 1 LDP Commands

This chapter is a reference for the LDP commands:

advertise-labels

Use this command to prevent the distribution of any locally assigned labels.

Use the `no` parameter to enable the distribution of all locally assigned labels to all LDP neighbors.

Command Syntax

```
advertise-labels for any to none
advertise-labels for PREFIX to (PEER|any)
no advertise-labels for any to none
no advertise-labels for PREFIX to (PEER|any)
```

Parameters

`for`	Specify the permitted destinations
`any`	Specify to permit any locally assigned labels
`PREFIX`	Specify the destinations which have labels are advertised
`to`	Specify the given neighbor
`PEER`	Specify the LDP neighbors which receive these advertisements
`none`	Specify that there are no LDP neighbors

Default

The labels of all destinations are advertised to all LDP neighbors.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#advertise-labels for any to none

#configure terminal
(config)#router ldp
(config-router)#advertise-labels for PREFIX to any

#configure terminal
(config)#router ldp
(config-router)#advertise-labels for PREFIX to PEER
```

advertise-label-for-default-route

Use this command to enable label advertisement for default route.

Use `no` form to disable the label advertisement for default route.

Command Syntax

```
advertise-label-for-default-route
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 4.2.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#advertise-label-for-default-route
```

advertisement-mode

Use this command to set the label advertisement mode for all the interfaces for the current LSR. Specifying `downstream-on-demand` and `downstream-unsolicited` mode affects which LSR initiates mapping requests and mapping advertisements.

This command is a global command used to set the label advertisement mode for all interfaces for the current LSR. The advertisement mode set for a specific interface overrides the value set by this command (see ldp advertisement-mode). Use this command before starting the interface as it closes and restarts all sessions.

Use the `no` parameter to revert to the default advertisement mode value.

Command Syntax

```
advertisement-mode (downstream-on-demand|downstream-unsolicited)
no advertisement-mode (downstream-on-demand|downstream-unsolicited)
```

Parameters

`downstream-on-demand`

Sends label upon request. When a users uses this mode, a router distributes a label to a peer only if there is a pending label request from a peer. The reaction of the downstream router to this request depends on the label advertising mode supported on the next hop. This mode is typically used with the conservative label retention mode.

`downstream-unsolicited`

Sends label without waiting request. This mode distributes labels to peers without waiting for a label request, and is typically used with the liberal label retention mode.

Default

By default, advertisement mode is downstream-unsolicited

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example, the LSR will use the downstream-unsolicited advertisement mode for an LDP session on its interfaces.

```
#configure terminal
(config)#router ldp
(config-router)#advertisement-mode downstream-unsolicited
```

auto-targeted-session

Use this command at remote LFA node, to accept received targeted hello and allow creating TLDP session dynamically to establish rLFA tunnel. This command is used for remote LFA only.

Use the no parameter to disable dynamically TLDP session creation.

Dynamically created TLDP session can be deleted only when "auto-targeted-session" or "fast-reroute" configuration is removed.

Command Syntax

```
auto-targeted-session
no auto-targeted-session
```

Parameters

None

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
#configure terminal
(config)#router ldp
(config-router)#auto-targeted-session
(config-router)#
```

clear ldp adjacency

Use this command to clear an adjacency with a specified peer, or to clear all adjacencies for the current LSR.

Command Syntax

```
clear ldp adjacency (A.B.C.D|*)
```

Parameters

`*`	Specify to clear all adjacencies.
`A.B.C.D`	Specify to clear IPv4 address of the peer.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ldp adjacency 123.123.123.33
```

© 2025 IP Infusion Inc. Proprietary

clear ldp session

Use this command to clear a session established with a specified peer, or to clear all sessions for the current LSR.

Command Syntax

```
clear ldp session (A.B.C.D|*)
```

Parameters

`*`	Specify to clear all sessions.
`A.B.C.D`	Specify to clear IPv4 address of the peer.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ldp session 123.123.123.33
```

clear ldp statistics

Use this command to clear LDP statistics. This command clears the count per each operation filtered by an advertisement list.

Command Syntax

```
clear ldp statistics
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ldp statistics
```

clear ldp statistics advertise-labels

Use this command to clear LDP advertise-labels statistics. This command clears the count per each operation filtered by an advertisement list.

Command Syntax

```
clear ldp statistics advertise-labels
clear ldp statistics advertise-labels for PREFIX
clear ldp statistics advertise-labels for PREFIX to PEER
```

Parameters

`advertise-labels`	Specify the IP prefix list of advertise-labels.
`for`	Specify the permitted destinations.
`PREFIX`	Specify the destinations that have their labels advertised.
`to`	Specify the given neighbor.
`PEER`	Specify the LDP neighbors that receive these advertisements.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ldp statistics advertise-labels
```

control-mode

Use this command to set the control mode for label processing. Ordered processing sets the mode to strict chain-of-command; an LSR replies to a request packet from an LSR higher in the chain only after it receives a label from an LSR lower in the chain. Independent processing sets the mode to instant replies.

In independent control mode, each LSR might advertise label mappings to its neighbors at any time. In independent downstream-on-demand mode, an LSR might answer requests for label mappings immediately, without waiting for a label mapping from the next hop. In independent downstream unsolicited mode, an LSR might advertise a label mapping for an Forwarding Equivalence Class (FEC) to its neighbors whenever it is prepared to label-switch that FEC. In independent mode, an upstream label can be advertised before a downstream label is received.

In ordered control mode, an LSR may initiate the transmission of label mapping only for an FEC for which it has a label mapping for the FEC next hop, or for which the LSR is the egress. For each FEC for which the LSR is not the egress and no mapping exists, the LSR must wait until a label from a downstream LSR is received. An LSR may be an egress for some FECs and a non-egress for others. Changes in control mode only affect labels that were sent or received after the change was made.

Use the `no` parameter to revert to default control mode.

Note: Control mode "independent" is supported with advertisement mode "DU" only.

Note: When the advertisement mode is set as "DU", control mode automatically sets to "independent".

Note: Control mode "independent" is not supported with advertisement mode "DOD".

Note: Control mode "ordered" is supported with advertisement mode "DOD" only.

Note: Control mode "ordered" is not supported with advertisement mode "DU".

Note: When the advertisement mode is set as "DOD", control mode automatically sets to "ordered".

Command Syntax

```
control-mode (ordered|independent)
no control-mode
```

Parameters

`independent`	Sets control mode to independent processing.
`ordered`	Sets control mode to ordered processing.

Command Mode

Router mode

Default

By default, control mode is independent

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#control-mode ordered
```

debug ldp advertise-labels

Use this command to enable the debugging of LDP advertise-label events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command in `configure` mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp advertise-labels
no debug ldp advertise-labels
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp advertise-labels
```

debug ldp all

Use this command to enable the debugging of all LDP events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command in `configure` mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp all
no debug ldp all
no debug all
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp all
```

debug ldp dsm

Use this command to enable the debugging of LDP DSM events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command in `configure` mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp dsm
no debug ldp dsm
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp dsm
```

debug ldp events

Use this command to enable the debugging of all LDP events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command in `configure` mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp events
no debug ldp events
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp advertise-labels
(config)#debug ldp all
(config)#debug ldp dsm
(config)#debug ldp events
```

debug ldp fsm

Use this command to enable the debugging of LDP FSM events.

On using the debug command, the router continues to generate an output until the no parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the log syslog command in configure mode to redirect the debugging output to a file or the syslog.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ldp fsm
no debug ldp fsm
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp fsm
```

debug ldp hexdump

Use this command to enable the debugging of LDP hexdump events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command in `configure` mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp hexdump
no debug ldp hexdump
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp hexdump
```

debug ldp inter-area

Use this command to enable the debugging of LDP inter-area events.

On using the debug command, the router continues to generate an output until the no parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the log syslog command in configure mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp inter-area
no debug ldp inter-area
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 4.0.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp inter-area
```

debug ldp nsm

Use this command to enable the debugging of LDP NSM events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp nsm
no debug ldp nsm
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp nsm
```

debug ldp packet

Use this command to enable the debugging of LDP packet events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command in `configure` mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp packet
debug ldp packet (notification|hello|initialization|keepalive|address|label)
no debug ldp packet
no debug ldp packet (notification|hello|initialization|keepalive|address|label)
```

Parameters

`notification`	Debug LDP notification packets.
`hello`	Debug LDP hello packets.
`initialization`	Debug LDP initialization packets.
`keepalive`	Debug LDP keepalive packets.
`address`	Debug LDP address (withdraw) packets.
`label`	Debug LDP address label packets.

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp packet hello
```

debug ldp usm

Use this command to enable the debugging of LDP USM events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command in `configure` mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp usm
no debug ldp usm
```

Parameters

None

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp usm
```

debug ldp vc usm

Use this command to enable the debugging of LDP VC events.

On using the debug command, the router continues to generate an output until the `no` parameter is used with this command. The debug output and system error messages are written on the virtual terminal. Use the `log syslog` command in `configure` mode to redirect the debugging output to a file or the syslog.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ldp vc dsm
debug ldp vc usm
no debug ldp vc dsm
no debug ldp vc usm
```

Parameters

`dsm`	Debug LDP downstream SM.
`usm`	Debug LDP upstream SM.

Command Mode

Configure mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
(config)#debug ldp vc dsm
(config)#debug ldp vc usm
```

disable-ldp

Use this command to disable LDP IPv4 on a specified interface.

This command disables the transmission of Hello packets through the current interface, and clears all created sessions and adjacencies for this interface. Use `disable-ldp` alone to disable only LDP IPv4 on the interface.

Command Syntax

```
disable-ldp (ipv4|)
```

Parameters

`ipv4`	Disables IPv4 on the interface.

Default

By default, disable ldp is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example disables LDP IPv4 on interface eth0.

```
#configure terminal
(config)#interface eth0
(config-if)#disable-ldp
```

The following example disables LDP IPv4 on interface eth0.

```
#configure terminal
(config)#interface eth0
(config-if)#disable-ldp ipv4
```

enable-ldp

Use this command to enable LDP IPv4 on a specified interface. This command enables the transmission of Hello packets through the current interface, so that LDP adjacencies and LDP sessions can be created.

Note: The corresponding interface must be enabled for label-switching using the label-switching command.

Command Syntax

```
enable-ldp ipv4
```

Parameters

None

Default

By default, enable ldp is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example enables LDP IPv4 on interface eth0.

```
#configure terminal
(config)#interface eth0
(config-if)#enable-ldp ipv4
```

© 2025 IP Infusion Inc. Proprietary

explicit-null

Use this command to configure the router to send explicit-null labels for directly connected FECs instead of implicit-null labels. Implicit-nulls are the default labels.

This command controls the label value advertised on the egress router of an LSP. By default, implicit null label (label 3) is advertised for directly connected FECs. LDP advertises an Implicit Null label that causes the previous hop router to perform penultimate hop popping. Use the `explicit null` command to avoid the penultimate router from penultimate hop popping, and to force it to replace the incoming label with the explicit null label.

Note: Do not use this command if the LDP is concurrently used for MPLS/BGP VPNs.

Use the `no` parameter to stop sending explicit-null labels for directly connected FECs and resume sending implicit-null labels for them.

Command Syntax

```
explicit-null
no explicit-null
```

Parameters

None

Default

By default, sends implicit-null labels.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#explicit-null
```

fast-reroute

Use this command to enable the installation of backup paths advertised by IGP LFA (and/or rLFA) fast reroute.

Use no form CLI to disable the feature.

Command Syntax

```
fast-reroute
no fast-reroute
```

Parameters

None

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 5.1.

Examples

```
#configure terminal
(config)#router ldp
(config)fast-reroute
```

© 2025 IP Infusion Inc. Proprietary

global-merge-capability

Use this command to override the default merge capability setting of all the interfaces for the current LSR.

The merge capability aggregates multiple incoming flows with the same destination address into a single outgoing flow. This reduces the label-space shortage by sharing labels for different flows with the same destination, or the same FEC (Forwarding Equivalence Class).

Use the `no` parameter to revert to the default merge capability settings of all the interfaces for this LSR.

Command Syntax

```
global-merge-capability (merge-capable|non-merge-capable)
no global-merge-capability
```

Parameters

`merge-capable` Maps all incoming labels that are destined for the same FEC to the same outgoing label (this is the Ethernet default.)

`non-merge-capable`
Maps all incoming labels, regardless of destination FEC to unique outgoing labels (this is the non-Ethernet default.)

Default

By default, global merge capability is merge capable.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#global-merge-capability merge-capable
```

graceful-restart

Use this command to enable the Graceful-Restart capability for LDP.

Use the `no` parameter to disable the GR capability for LDP.

Command Syntax

```
graceful-restart full
graceful-restart helper-only
graceful-restart timers max-recovery <15-600>
graceful-restart timers neighbor-liveness <5-300>
no graceful-restart
no graceful-restart timers max-recovery
no graceful-restart timers neighbor-liveness
```

Parameters

`full`	Configuring with full enable the complete GR capability
`helper-only`	Configuring with helper-only enables only helper mode
`timers`	Non-default recovery and reconnect timer values.
`max-recovery`	Maximum recovery time
`<15-600>`	Interval until which LDP preserves route after peer restart
`neighbor-liveness`	Neighbor Liveness Time
`<5-300>`	Hold timer for a targeted LDP peer

Default

GR capability is not enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 5.0.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#graceful-restart full
(config-router)#graceful-restart helper-only
(config-router)#graceful-restart timers max-recovery 100
(config-router)#graceful-restart timers neighbor-liveness 200
```

hello-interval

Use this command to set the interval after which `hello` packets are sent out.

LDP defines a mechanism for discovering adjacent Label Switching Routers (LSRs) that participate in label switching (adjacencies). Hello messages are sent to the All Routers Multicast Group (224.0.0.2). Whenever a new router comes up, it sends out a hello packet to a specified, multicast address announcing itself to the network. Every router directly connected to the network receives the packet. Receipt of a hello packet from another LSR creates a `hello adjacency` with that LSR. Use this command to specify the interval after which the hello packets will be sent.

Used as a global command, the hello-interval value may be overridden by the hello-interval set on the interface (see ldp hello-interval). For optimum performance, set this value to no more than one-third the value of the hold-time specified.

Use the `no` parameter to revert to default hello interval.

Command Syntax

```
hello-interval <1-21845>
no hello-interval
```

Parameters

`<1-21845>`	Specify the interval in seconds. The default is 5 seconds.

Default

By default, hello interval is 5 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows how to set the hello-interval value for all interfaces of an LSR.

```
#configure terminal
(config)#router ldp
(config-router)#hello-interval 35

(config-router)#no hello-interval
```

hold-time

Use this command to set the global value for the hold-time after which the LSR rejects adjacencies.

An LSR maintains a record of `hellos` received from peers. `Hold-time` specifies the time an LSR maintains its record of hellos from a peer on not receiving another hello from that peer. A pair of LSRs negotiates the hold-time they use for hellos from each other. Each proposes a hold time value, and the LSR uses the lower of the two hold-time values. The hold-time value set on the interface overrides the hold-time value set by this command (see ldp hold-time). For optimum performance, set this value to no less than three times the value of the hello-interval specified.

Use the `no` parameter to revert to the default hold time.

Command Syntax

```
hold-time <3-65535>
no hold-time
```

Parameters

`<3-65535>`	Specify the hold-time value in seconds.

Default

By default, hold time is 15 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to set the hold-time value for all interfaces of an LSR.

```
#configure terminal
(config)#router ldp
(config-router)#hold-time 635

(config-router)#no hold-time
```

© 2025 IP Infusion Inc. Proprietary

import-bgp-routes

Use this command to import BGP routes into LDP. BGP routes are not imported into LDP by default.

Use the `no` parameter to flush out all BGP routes currently being used by LDP, and to reject any further BGP specific routing updates from OcNOS.

Command Syntax

```
import-bgp-routes
no import-bgp-routes
```

Parameters

None

Default

By default, import bgp route is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#import-bgp-routes
```

inter-area-lsp

Use this command to enable creation of inter-area LSPs.

Use the `no` form of the command to disable this configuration.

Command Syntax

```
inter-area-lsp (PREFIX_ACL|)(config-only|)
no inter-area-lsp
```

Parameters

`PREFIX_ACL`	Access-list name for Prefix Based inter-area lsp
`config-only`	Optional. When this option is used, existing LDP sessions are not torn down.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 4.0.

Example

```
#configure terminal
(config)#router ldp
(config-router)#inter-area-lsp

#configure terminal
(config)#router ldp
(config-router)#inter-area-lsp config-only

#configure terminal
(config)#router ldp
(config-router)#inter-area-lsp acl1

#configure terminal
(config)#router ldp
(config-router)#inter-area-lsp acl1 config-only
```

keepalive-interval

Use this command to set the global value for the interval after which keep-alive packets are sent out.

Each LSR must send keep-alive messages at regular intervals to its LDP peers to keep the sessions active. The keep-alive interval determines the time interval between successive keep-alive messages. Use this command to set this interval. This value is overridden by the keep-alive interval set on the interface. For optimum performance, set this value to no more than one-third the value of the specified keep-alive time-out value.

Use the `no` parameter to revert to default keep-alive interval.

Command Syntax

```
keepalive-interval <10-21845>
no keepalive-interval
```

Parameters

`<10-21845>`	Specify the value of interval in seconds.

Default

By default, keepalive interval is 10 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to set the keep-alive timer for all interfaces of an LSR.

```
#configure terminal
(config)#router ldp
(config-router)#keepalive-interval 635

(config-router)#no keepalive-interval
```

keepalive-timeout

Use this command to set the global value for the time-out after which sessions are rejected.

Use this command to set the time period for which an LSR must wait for successive keep-alive messages from LDP peers. The keep-alive time-out value is overridden by the keep-alive time-out set on the interface (see ldp keepalive-timeout). For optimum performance, set this value to no less than three times the value of the specified keep-alive interval value.

Use the `no` parameter to revert to default keep-alive time-out.

Command Syntax

```
keepalive-timeout <30-65535>
no keepalive-timeout
```

Parameters

`<30-65535>`	Specify the time-out value in seconds.

Default

By default, keepalive timeout is 30 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to set the keep-alive time-out value for all interfaces of an LSR.

```
#configure terminal
(config)#router ldp
(config-router)#keepalive-timeout 635

(config-router)#no keepalive-timeout
```

label-retention-mode

Use this command to set the retention mode to be used for all labels exchanged.

When an LSR receives a label binding for a particular FEC (Forwarding Equivalence Class) from another LSR that is not its next hop for that FEC, it might keep track of such bindings or discard them. Use the `liberal` parameter to retain all labels binding to FEC received from label distribution peers, even if the LSR is not the current next-hop. Use the `conservative` parameter to maintain only the label bindings for valid next-hops in a LSP. Liberal label retention mode allows for quicker adaptation to routing changes, whereas conservative label retention mode requires an LSR to maintain fewer labels.

Note: The retention mode value set on the interface (see ldp label-retention-mode) overrides the value set by this command.

Note: Any changes made to the retention mode for an interface (after a session is already operational) will only apply to labels received after the mode has been changed. All previously received labels will remain as they were.

Use the `no` parameter to revert to default retention mode.

Note: label-retention-mode "liberal" is supported with advertisement mode "DU" only.

Note: label-retention-mode "liberal" is not supported with advertisement mode "DOD".

Note: When the advertisement mode is set as "DU", label-retention-mode automatically sets to "liberal".

Note: label-retention-mode "conservative" is supported with advertisement mode "DOD" only.

Note: label-retention-mode "conservative" is not supported with advertisement mode "DU".

Note: When the advertisement mode is set as "DOD", label-retention-mode automatically sets to "conservative".

Command Syntax

```
label-retention-mode (conservative|liberal)
no label-retention-mode (conservative|liberal)
```

Parameters

`conservative`	Specify to delete all unused labels and FECs.
`liberal`	Specify to retain all labels, regardless of use.

Default

By default, label retention mode is liberal

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to set the retention mode for all interfaces of an LSR.

```
#configure terminal
(config)#router ldp
(config-router)#label-retention-mode liberal
```

ldp advertisement-mode

Use this command to set the label advertisement mode for an interface for the current LSR to either downstream-on-demand (label is sent only when requested) or downstream-unsolicited (label is sent unrequested). Specifying downstream-on-demand and downstream-unsolicited mode affects which LSR initiates mapping requests and mapping advertisements.

This is an interface-specific command; it overrides the advertisement mode set for an LSR using the advertisement-mode command (see advertisement-mode). Use this command after the advertisement-mode command sets all the interface advertisement modes. In addition, users should use this command before starting the interface, since all affected sessions will be closed and restarted.

Use the `no` parameter to revert to the advertisement mode value set for the main LDP process.

Command Syntax

```
ldp advertisement-mode (downstream-on-demand|downstream-unsolicited)
no ldp advertisement-mode (downstream-on-demand|downstream-unsolicited)
```

Parameters

`downstream-on-demand`

Indicates that the sent label was requested. When a user uses this parameter, a router distributes a label to a peer only if there is a pending label request from a peer. The reaction of the downstream router to this request depends on the label advertising mode supported on the next hop. The downstream-on-demand mode is typically used with the conservative label retention mode.

`downstream-unsolicited`

Indicates that the label was sent unrequested. This parameter distributes labels to peers without waiting for a label request. This mode is typically used with the liberal label retention mode.

Default

By default, ldp advertisement mode is downstream unsolicited mode

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ldp advertisement-mode downstream-on-demand
```

ldp hello-interval

Use this command to set the interval for sending multicast Hello packets via an interface.

LDP defines a mechanism for discovering adjacent Label Switching Routers (LSR) that participate in label switching (adjacencies). Whenever a new router comes up, it sends out a hello packet to a specified, multicast address announcing itself to the network. Every router directly connected to the network receives the packet. Receipt of a hello packet from another LSR creates a hello adjacency with that LSR. Use this command to specify the interval after which the hello packets will be sent.

For optimum performance, set the hello-interval value to no more than one-third the hold-time value.

Note: This command is an interface-specific command and overrides the value set for an LSR using the global hello-interval command.

Use the `no` parameter with this command to revert to the hello-interval value set for the main LDP process.

Command Syntax

```
ldp hello-interval <1-21845>
no ldp hello-interval
```

Parameters

`<1-21845>`	Specify the interval in seconds.

Default

By default, ldp hello interval is 5 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows how to set the hello-interval for a specific interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ldp hello-interval 635

(config-if)#no ldp hello-interval
```

ldp hold-time

Use this command to set the hold-time value after which the LSR rejects adjacencies.

The hold-time timer is reset every time a hello packet is received from the peer in question. For optimum performance, set this value to no less than three times the hello-interval value.

Note: This command is an interface-specific command, and overrides the value set for an LSR using the global hold-time command.

Use the `no` parameter to revert to the hold-time value set for the main LDP process.

Command Syntax

```
ldp hold-time <3-65535>
no ldp hold-time
```

Parameters

`<3-65535>`	Specify the hold-time value in seconds.

Default

By default, ldp hold time is 15 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to set the hold-time for a specific interface:

```
#configure terminal
(config)#interface eth0
(config-if)#ldp hold-time 635

(config-if)#no ldp hold-time
```

ldp keepalive-interval

Use this command to set the interval for sending keep-alive messages to the peer in order to maintain a session.

Each LSR must send keep-alive messages at regular intervals to its LDP peers to keep the sessions active. The keep-alive interval determines the time-interval between successive keep-alive messages. This command sets this interval.

Note: This command is an interface-specific command, and overrides the value set for an LSR using the global `keepalive-interval` command.

Use the `no` parameter to revert to the keep-alive interval set for the main LDP process.

Command Syntax

```
ldp keepalive-interval <1-21845>
no ldp keepalive-interval
```

Parameters

`<1-21845>`	Specify the interval in seconds.

Default

By default, ldp keepalive interval is 10 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows how to set the hello-interval for a specific interface:

```
#configure terminal
(config)#interface eth0
(config-if)#ldp keepalive-interval 635

(config-if)#no ldp keepalive-interval
```

ldp keepalive-timeout

Use this command to set the keep-alive time-out value for rejecting a session with a peer.

Use this command to set the time period for which an LSR must wait for successive keep-alive messages from LDP peers. The keep-alive timer is reset every time a keep-alive packet is received from the peer in question. For optimum performance, set this value to no more than three times the keep-alive interval value.

Note: This command is an interface-specific command and overrides the value set for an LSR using the global `keepalive-timeout` command.

Use the `no` parameter to revert to the keep-alive time-out set for the main LDP process.

Command Syntax

```
ldp keepalive-timeout <3-65535>
no ldp keepalive-timeout
```

Parameters

<3-65535>	Specify the value in seconds.

Default

By default, ldp keepalive timeout is 30 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to set the keep-alive time-out timer for a specific interface:

```
#configure terminal
(config)#interface eth0
(config-if)#ldp keepalive-timeout 635

(config-if)#no ldp keepalive-timeout
```

ldp label-retention-mode

Use this command to set the retention mode to be used for all labels exchanged via the given interface.

When an LSR receives a label binding for a particular FEC (Forwarding Equivalence Class) from another LSR that is not its next hop for that FEC, it might keep track of such bindings or discard them. Use the `liberal` parameter to retain all labels binding to FEC received from label distribution peers, even if the LSR is not the current next-hop. Use the `conservative` parameter to maintain only the label bindings for valid next-hops in a LSP. Liberal label retention mode allows for quicker adaptation to routing changes, whereas conservative label retention mode requires an LSR to maintain fewer labels.

Note: The retention mode value set on the interface (see label-retention-mode) overrides the value set by this command. This command is an interface-specific command, and overrides the setting for an LSR using the global `label-retention-mode` command.

Use the `no` parameter to revert to the retention mode set for the main LDP process.

Command Syntax

```
ldp label-retention-mode (conservative|liberal)
no ldp label-retention-mode (conservative|liberal)
```

Parameters

`conservative`	Specify to delete all unused labels and FECs.
`liberal`	Specify to retain all labels, regardless of use.

Default

By default, ldp label retention mode is liberal

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to set the label retention mode for a specific interface:

```
#configure terminal
(config)#interface eth0
(config-if)#ldp label-retention-mode liberal
```

ldp multicast-hellos

Use this command to enable multicast hello exchange on a specified interface.

Use the `no` parameter to disable multicast hello exchange. R

Command Syntax

```
ldp multicast-hellos
no ldp multicast-hellos
```

Parameters

None

Default

By default, ldp multicast hello is enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ldp multicast-hellos
```

ldp-optimization

This command helps optimize the resetting of an LDP session by enabling the following two scalability features for LDP:

- Resets the session keepalive timer on receipt of a hello message
- Resets the hold timer on receipt of any LDP control message

Use the `no` parameter to disable the two previously listed scalability features.

Command Syntax

```
ldp-optimization
no ldp-optimization
```

Parameters

None

Default

By default, ldp optimization is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#ldp-optimization
```

loop-detection

Use this command to enable loop detection on the current LSR. This command detects looping LSPs, and prevent Label Request messages from looping because of non-merge capable LSRs. This loop detection mechanism is useful for networks of non time-to-live (non TTL) decrementing devices that can not allocate resources among traffic flows.

There are two methods supported for the loop detection mechanism: A Hop Count detection system, that is always enabled; and the Path Vector detection system, that can be toggled:

- Hop Count - During the setup of an LSP, the LSP passes a hop count with the LSP setup messages. This hop count is incremented by each node router participating in LSP establishment. If the hop count exceeds the maximum configured value, the LSP setup process is stopped, and a notification message is passed back to the message originator.
- Path Vector - A path vector contains a list of LSR identifiers. This is passed as a part of LSP setup messages. Each LSR participating in the LSP establishment adds its own LSR identifier to the path vector. If an LSR finds its own identifier in the path vector, it drops the message, and sends a message back to the originator.

The use of these messages ensures that a loop is detected while establishing a label switched path and before any data is passed over that LSP.

Use the `no` parameter to disable loop detection.

Command Syntax

```
loop-detection
no loop-detection
```

Parameters

None

Default

By default, loop detection is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#loop-detection
```

loop-detection-hop-count

Use this command to set the loop detection hop count, which determines the maximum hop-count value.

This command sets the maximum hop count value, which specifies the permitted maximum permitted hop-count. An LSR that detects a maximum hop count behaves as if the containing message has traversed a loop. The use of this command ensures that a loop is detected while establishing a label switched path before any data is passed via LSP.

Use the `no` parameter to revert to the default loop detection count

Command Syntax

```
loop-detection-hop-count <1-255>
```

Parameters

`<1-255>`	Indicates the loop detection hop count.

Default

By default, loop detection hop is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#loop-detection-hop-count 128
```

loop-detection-path-vec-count

Use this command to set the loop detection vec (vector) count, which determines the maximum supported path vectors.

This command sets the maximum supported path vectors for loop detection, which specifies the permitted path vector length. An LSR that detects a path vector has reached the maximum length behaves as if the containing message has traversed a loop. This command ensures that a loop is detected while establishing a label switched path before any data is passed over that LSP.

Use the `no` parameter to revert to the default loop detection count

Command Syntax

```
loop-detection-path-vec-count <1-255>
```

Parameters

`<1-255>`	Indicates the loop detection hop count.

Default

By default, loop detection path vec count is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#loop-detection-path-vec-count 123
```

mpls ldp-igp sync isis

Use this command to enable LDP ISIS synchronization and to set the holddown timer for synchronization.

Use the `no` parameter to disable the LDP ISIS synchronization.

Note: Holddown timer value should be higher than LDP IGP sync timer.

Command Syntax

```
mpls ldp-igp sync isis (level-1|level-2|level-1-2) (holddown-timer <1-2147483>| )
```

Parameters

`level-1|level-2|level-1-2`
: The ISIS level.

`holddown-timer`
: How long IGP should wait for LDP to converge in seconds.

Default

None

Command Mode

Interface configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
#int eth 1
#mpls ldp-igp sync isis level-1-2 holddown-timer 500
```

mpls ldp-igp sync ospf

Use this command to enable LDP-OSPF synchronization. This command also provides option to configure the hold-down timer for which OSPF will wait for LDP to converge and advertises Max cost. When the configured time expires, OSPF starts advertising the actual cost in the Router-LSA.

Note: Holddown timer value should be higher than LDP IGP sync timer.

Command Syntax

```
mpls ldp-igp sync ospf (holddown-timer <1-2147483>|)
```

Parameters

`holddown-timer`	Set holddown timer for the OSPF Sync
`<1-2147483>`	Hold down timer in seconds

Default

OSPF waits infinite when no hold-down timer is configured.

Command Mode

Interface configuration mode

Applicability

This command was introduced before OcNOS version 4.0.

Example

Enabling OSPF-LDP sync in interface eth3

```
#conf t
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#int eth3
(config-if)#mpls ldp-igp sync ospf
(config-if)#end
```

Enabling OSPF-LDP sync with holdown-timer enabled

```
#conf t
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#int eth3
(config-if)#mpls ldp-igp sync ospf holddown-timer 200
(config-if)#no mpls ldp-igp sync ospf
(config-if)#end
#
```

mpls ldp-igp sync-delay

Use this command to set the time delay for LDP-IGP synchronization.

Use the `no` parameter to disable the time delay.

Command Syntax

```
mpls ldp-igp sync-delay <5-60>
no mpls ldp-igp sync-delay
```

Parameters

`sync-delay`	Time delay for LDP to converge in seconds.
`<5-60>`	Time delay for notification of LDP convergence to IGP, in seconds

Default

If not configured the delay will be 0 seconds.

Command Mode

Interface configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config-if)# interface eth0
(config-if)# mpls ldp-igp sync-delay 15
(config-if)# no mpls ldp-igp sync-delay
```

multicast-hellos

Use this command to enable multicast hello exchange on all interfaces enabled for LDP. This is used for auto-discovery of LDP peers on directly connected networks. This option is enabled by default.

Use the `no` parameter with this command to disable multicast hello exchange.

Command Syntax

```
multicast-hellos
no multicast-hellos
```

Parameters

None

Default

By default, multicast hello is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#multicast-hellos
```

neighbor

Use this command to configure neighbors of LDP.

Use the `no` parameter with this command to unconfigure the LDP neighbor.

Command Syntax

```
neighbor A.B.C.D auth AUTH-TYPE password (0|7) WORD
no neighbor A.B.C.D auth AUTH-TYPE password
```

Parameters

`A.B.C.D`	Neighbor address
`auth AUTH-TYPE`	Authentication Type md5
`password`	Set password to the neighbor
`(0|7)`	Password Type
`WORD`	Password

Default

By default, neighbor is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#neighbor 1.1.1.1 auth md5 password 0 myPass

(config-router)#no neighbor 1.1.1.1 auth md5 password
```

propagate-release

Use this command to propagate the release of labels to downstream routers.

Use the `no` parameter to prevent the propagate-release of labels.

Command Syntax

```
propagate-release
no propagate-release
```

Parameters

None

Default

By default, propagate release is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#propagate-release
```

pw-status-tlv

Use this command to enable the use of the PW Status TLV to signal the pseudowire status.

Use the `no` option with this command to disable the use of the PW Status TLV to signal the pseudowire status.

Command Syntax

```
pw-status-tlv
no pw-status-tlv
```

Parameters

None

Default

By default, pw status tlv is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#pw-status-tlv
```

request-labels-for

Use this command to request labels for the prefixes in the given IP prefix list. LDP request labels for the prefixes only if the valid and exact route is present for that prefix.

Use the no form of this command to disable multicast hello exchange.

Command Syntax

```
request-labels-for prefix-list-ipv4 NAME
no request-labels-for prefix-list-ipv4
```

Parameters

NAME	IPv4 prefix list name

Command Mode

LDP router mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#request-labels-for prefix-list-ipv4 myPrefixList
```

request-retry

Use this command to enable the retry of requests once a request for a label has been rejected for a valid reason. This command enables the LSR to send a maximum of five label requests if a label request is rejected by an LDP peer.

Use the `no` parameter to disable the retry of requests.

Command Syntax

```
request-retry
no request-retry
```

Parameters

None

Default

By default, request retry is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#request-retry
```

request-retry-timeout

Use this command to set the interval between retries. Before this time is over, a request is re-sent to a peer. This command changes the interval between request messages that are resent to a peer to account for routing changes.

Use the `no` parameter to revert to the default request-retry time-out set.

Command Syntax

```
request-retry-timeout <1-65535>
no request-retry-timeout
```

Parameter

`<1-65535>`	Specify the interval between retries in seconds.

Default

By default, timeout is 5 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#request-retry-timeout 512

(config-router)#no request-retry-timeout
```

restart ldp graceful

Use this command to restart ldp gracefully.

Command Syntax

```
restart ldp graceful
```

Parameter

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#restart ldp graceful

% Warning : LDP process will stop and needs to restart manually,
You may loose LDP configuration, if not saved
Proceed for graceful restart? (y/n):y
```

rlfa-ilm-optimization

Use this command to enable ILM optimization for rLFA. When ILM optimization is enabled, ILM delete and POP operations are delayed. ILM delete/POP configuration is delayed to make sure rLFA backup path is not removed immediately upon IGP network convergence.

Use the `no` parameter with this command to revert this configuration.

Command Syntax

```
rlfa-ilm-optimization
no rlfa-ilm-optimization
```

Parameter

None

Default

By default, ILM optimization is disabled.

Command Mode

Router(LDP) Config mode.

Applicability

This command was introduced before OcNOS version 6.2.0.

Example

```
(config)#router ldp
(config-router)# rlfa-ilm-optimization
```

router ldp

This command is used to enter the LDP specific command-line mode in which global attributes for the LDP process can be set. Without this command, the LSR does not perform any LDP operations, such as sending `hello` packets.

Use the `no` parameter with this command to disable this configuration.

Command Syntax

```
router ldp
no router ldp
```

Parameters

None

Default

By default, router ldp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows the change in the prompt after using this `router ldp` command to enter router mode.

```
#configure router
(config)#router ldp
(config-router)#
```

router-id

Use this command to set the router-id to the supplied IP address; the router uses this address to generate the LDP-ID.

OcNOS has three methods to choose the router-id of LDP. The first priority router-id is the configured router-id in router mode (local configured router-id). The second priority router-id is the configured router-id in configure mode (global configured router-id). The lowest priority router-id is chosen by OcNOS among interfaces (global computed router-id).

Use the `no` parameter with this command to revert to using the first IP address configured on the box as the router-id for LDP-ID generation purposes.

Command Syntax

```
router-id A.B.C.D
no router-id A.B.C.D
no router-id
```

Parameter

`A.B.C.D`	Indicates the LDP router ID value.

Default

By default, router id is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure router
(config)#router ldp
(config-router)#router-id 123.123.123.8
```

snmp restart ldp

Use this command to restart SNMP in Label Distribution Protocol (LDP)

Command Syntax

```
snmp restart ldp
```

Parameters

None

Default

By default, snmp restart ldp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#snmp restart ldp
```

© 2025 IP Infusion Inc. Proprietary

targeted-peer ipv4

Use this command to enter a targeted IPv4 LDP peer mode.

A targeted session is an LDP session between non-directly connected LSRs. Set this command to send a targeted hello messages to specific IP addresses. This command is specific to a targeted IPv4 LDP peer.

Command Syntax

```
targeted-peer ipv4 A.B.C.D
no targeted-peer ipv4 A.B.C.D
```

Parameter

A.B.C.D	Specify the IPv4 address of the targeted peer.

Default

By default, targeted peer IPv4 is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ldp
(config-router)#targeted-peer ipv4 10.10.10.10
(config-router-targeted-peer)#
```

targeted-peer-hello-interval

Use this command to set the interval for sending unicast `hello` packets to targeted peers.

Use the `no` parameter with this command to revert to the default targeted-peer hello-interval value.

Command Syntax

```
targeted-peer-hello-interval <1-21845>
no targeted-peer-hello-interval
```

Parameter

`<1-21845>`	Specify the interval in seconds.

Default

By default, targeted peer hello interval is 15 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#targeted-peer-hello-interval 1
```

targeted-peer-hold-time

Use this command to set the time-out value that is the time that the router waits before rejecting an adjacency with targeted peers.

Use the `no` parameter to revert to the default targeted-peer hold-time value.

Command Syntax

```
targeted-peer-hold-time <3-65535>
no targeted-peer-hold-time
```

Parameter

`<3-65535>`	Specify the interval in seconds.

Default

By default, hold time is 45 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ldp
(config-router)#targeted-peer-hold-time 555

(config-router)#no targeted-peer-hold-time
```

transport-address ipv4

Use this command to configure the IPv4 transport address for a label space.

The transport address is the address used for the TCP session over which LDP is running. Use this command to manually configure the transport address. Transport addresses may either be bound to a loopback interface, or to a physical interface that is bound to the label space in question. A transport address can also be manually configured using the CLI with the loopback address as the transport address.

Note: The CLI accepts only the loopback address to be configured as the transport address.

Use the `no` parameter to stop using the transport address as the IPv4 transport address. If the label space is not specified for either form of this command, a label space of zero is assumed.

Command Syntax

```
transport-address ipv4 A.B.C.D
transport-address ipv4 A.B.C.D 0
no transport-address ipv4 A.B.C.D
no transport-address ipv4 A.B.C.D 0
```

Parameters

`A.B.C.D`	Specify the IPv4 address to be used as the transport address. Only addresses bound to a loopback interface are valid for manual transport address configuration.
`0`	Platform-wide label space for which a transport address is being configured (Platformwide labels are used for all interfaces that can share the same labels)

Default

Transport addresses are chosen for label spaces. By default, the loopback address is selected as the transport address. If a loopback address is not configured, the label space value is examined. The IP address of the interface is bound to the same label space is chosen as the transport address.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure router
(config)#router ldp
(config-router)#transport-address ipv4 10.10.0.5 0
```

CHAPTER 2 LDP Show Commands

This chapter provides an alphabetized reference for each of the LDP commands. It includes the following commands:

show debugging ldp

Use this command to display the status of the debugging of the LDP system.

Command Syntax

```
show debugging ldp
```

Parameter

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show debugging ldp` command.

```
#show debugging ldp
LDP debugging status:
  LDP event debugging is on
  LDP packet debugging is on
  LDP finite state machine debugging is on
  LDP pdu hexdump debugging is on
  LDP downstream state machine debugging is on
  LDP upstream state machine debugging is on
  LDP trunk state machine debugging is on
  LDP QoS debugging is on
  LDP CSPF debugging is on
  LDP VC USM debugging is on
  LDP VC DSM debugging is on
  LDP NSM debugging is on
  LDP Advertise-labels debugging is on
#
```

Table 2-1 explains the show command output fields.

Table 2-1: show debugging ldp output fields details

Field	Description
LDP debugging status	Status of the LDP debugging protocol.

show ldp

Use this command to display basic LDP attributes defined for the current LSR.

Command Syntax

```
show ldp
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following is a sample output from the `show ldp` command displaying basic LDP attributes.

```
#show ldp
Router ID : 20.1.1.1
LDP Version : 1
Global Merge Capability : Merge Capable
Label Advertisement Mode : Downstream Unsolicited
Label Retention Mode : Liberal
Label Control Mode : Independent
Instance Loop Detection : On
Instance Hop Count Limit : 255
Instance Path Vec Count : 255
Request Retry : Off
Propagate Release : Disabled
Graceful Restart : Disabled
Hello Interval : 5
Targeted Hello Interval : 15
Hold time : 15
Targeted Hold time : 45
Keepalive Interval : 10
Keepalive Timeout : 30
Request retry Timeout : 5
Transport Address data :
Labelspace 0 : 20.1.1.1 (in use)
Import BGP routes : No
#
```

Table 2-2 explains the show command output fields.

Table 2-2: show ldp output fields details:

Field	Description
Router ID	Router identifier in IP address format for this system.
LDP Version	Details of Link Layer Discovery Protocol (LLDP) version.
Global Merge Capability	Used to override the default merge capability setting of all the interfaces for the current LSR.
Label Advertisement Mode	Used to set the label advertisement mode for an interface for the current LSR to either downstream-on-demand (label is sent only when requested) or downstream-unsolicited (label is sent unrequested).
Label Retention Mode	Used for all labels exchanged via the given interface.
Label Control Mode	LSR generates a local label for a FEC which the router learned from routing table independently from other LSRs.
Loop Detection	Used to enable loop detection on the current LSR.
Loop Detection Count	Indicates the loop detection hop count.
Request Retry	Enables the LSR to send a maximum of five label requests.
Propagate Release	Used to propagate the release of labels to downstream routers.
Hello Interval	Sets the interval for sending unicast hello packets to peers.
Targeted Hello Interval	Sets the interval for sending unicast hello packets to targeted peers.
Hold time	Sets the time-out value to peers.
Targeted Hold time	Sets the time-out value that is the time that the router waits before rejecting an adjacency with targeted peers.
Keepalive Interval	Used to set the interval for sending keep-alive messages to the peer in order to maintain a session.
Keepalive Timeout	Time-out value for rejecting a session with a peer.
Request retry Timeout	Used to set the interval between retries.
Targeted Hello Receipt	Status of the hello receipt.
Transport Address	The transport address is the address used for the TCP session over which LDP is running.
Transport Interface	Interface is used for the TCP session over which LDP is running.
Import BGP routes	Used to import BGP routes into LDP.

show ldp adjacency

Use this command to display all the adjacencies for the current LSR.

Command Syntax

```
show ldp adjacency
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show ldp adjacency` command displaying all the adjacencies for this LSR.

```
#show ldp adjacency
Remote-Address   Local-Address   Mode        Intf-Name  Holdtime   LDP-Identifier
11.11.11.11      12.0.1.20       Targeted    ge11       45         11.11.11.11:0
33.33.33.33      11.0.1.20       Targeted    ge9        45         33.33.33.33:0
44.44.44.44      20.0.1.20       Targeted    xe14       45         44.44.44.44:0
11.0.1.10        11.0.1.20       Interface   ge9        15         33.33.33.33:0
12.0.1.10        12.0.1.20       Interface   ge11       15         11.11.11.11:0
20.0.1.10        20.0.1.20       Interface   xe14       15         44.44.44.44:0
```

Table 2-3 explains the show command output fields.

Table 2-3: show ldp adjacency output fields details

Field	Description
Remote Address	IP address of the interface.
Local Address	Local address of the LDP adjacency.
Interface Name	Name of the interface.
Hold time	Sets the time-out value to peers.
LDP ID	LDP identifier for this protocol.

show ldp advertise-labels

Use this command to display the IP access list of LDP advertise-labels.

Command Syntax

```
show ldp advertise-labels
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show ldp advertise-labels` command.

```
#show ldp advertise-labels
Advertisement spec:
    Prefix list = pfx1; Peer plist = pfx1
    Prevent the distribution of any assigned labels
```

Table 2-4 explains the show command output fields.

Table 2-4: show ldp advertise-labels output fields details

Field	Description
Advertisement spec	Details of the advertisement spec.
Prefix list	The label is advertised to all peers permitted by the peer plist.
Peer plist	The prefix list permits the prefix and there is a peer plist.

show ldp downstream

Use this command to display the status of all downstream sessions and the label information exchanged.

Command Syntax

```
show ldp downstream
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3 and was updated in OcNOS version 5.1.

Example

The following is an output from the `show ldp downstream` command showing the status of all downstream sessions.

When LDP LFA FRR in not enabled:

```
#show ldp downstream
Session peer 44.1.1.1:
  FEC               Nexthop Addr   State          Label       Req.ID      Attr
 192.168.254.0/24  connected      Established    impl-null   0
 33.1.1.1/32       10.0.4.1       Established    24323       0
 10.0.4.0/31       connected      Established    impl-null   0
 10.0.2.0/31       connected      Established    24322       0
 44.1.1.1/32       10.0.4.1       Established    impl-null   0
 10.0.3.0/31       10.0.4.1       Established    impl-null   0
Session peer 22.1.1.1:
  FEC               Nexthop Addr   State           Label      Req.ID      Attr
 192.168.254.0/24  connected      Established     impl-null  0
 10.0.3.0/31       connected      Established     24323      0
 10.0.1.0/31       connected      Established     impl-null  0
 33.1.1.1/32      10.0.1.1        Established     24324      0
 22.1.1.1/32      10.0.1.1        Established     impl-null  0
  10.0.2.0/31     10.0.1.1        Established     impl-null  0
```

When LDP LFA FRR in enabled:

```
#show ldp downstream
Codes: P - Primary route, B - Backup route
Session peer 44.1.1.1:
  FEC          Nexthop Addr     State          Label        Req.ID      Attr       Code
 192.168.254.0/24   connected      Established     impl-null   0
```

```
  33.1.1.1/32        10.0.4.1        Established     24323      0
P
  33.1.1.1/32        10.0.4.1        Established     24323      0
B
  10.0.4.0/31        connected       Established     impl-null   0
  10.0.2.0/31        connected       Established     24322      0
  10.0.2.0/31        10.0.4.1        Established     24322      0

  44.1.1.1/32        10.0.4.1        Established     impl-null   0
P
  10.0.3.0/31        10.0.4.1        Established     impl-null   0
P
Codes: P - Primary route, B - Backup route
Session peer 22.1.1.1:
  FEC                 Nexthop Addr     State           Label      Req.ID      Attr       Code
  192.168.254.0/24  connected         Established     impl-null  0
  10.0.3.0/31        connected        Established     24323      0
  10.0.3.0/31        10.0.1.1         Established    24323       0                       B
  10.0.1.0/31        connected        Established    impl-null   0
  33.1.1.1/32        10.0.1.1         Established    24324       0                       P
  33.1.1.1/32        10.0.1.1         Established    24324       0                       B
  22.1.1.1/32        10.0.1.1         Established    impl-null   0                       P
  10.0.2.0/31        10.0.1.1         Established    impl-null   0                       P
```

Table 2-5 explains the show command output fields.

Table 2-5: show ldp downstream output fields details

Field	Description
Session peer	Used to group and apply the configuration of general session commands to groups of neighbors that share common session configuration elements.
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
Nexthop addr	Displays the IP address of the next hop.
State	Displays the current status of the ldp.
Label	Details of the ldp downstream labels.
Req.ID	Request identifier for the protocol.
Attr	The attribute is used to sent to a customer router.
Code	Show if an entry is principal or backup.

show ldp fec

Use the following command to display all FECs (Forwarding Equivalence Classes) known to this LSR.

Command Syntax

```
show ldp fec
show ldp fec (prefix)
show mpls ldp fec
show mpls ldp fec (prefix|)
```

Parameter

prefix	Display prefix FEC information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3 and was updated in OcNOS version 5.1.

Example

When LDP LFA FRR in not enabled:

```
#show ldp fec
LSR codes    : E/N - LSR is egress/non-egress for this FEC,
               L - LSR received a label for this FEC,
               > - LSR will use this route for the FEC
FEC                  Code    Session             Out Label   ELC   Nexthop Addr
10.0.1.0/31          NL      22.1.1.1            impl-null   No    connected

```

Table 2-6 shows the codes at the end of each route entry that indicate where the route originated.

Table 2-6: Origin Codes

Origin Code	Description	Comments
E/N	Egress/Non-egress	LSR is egress/non-egress for this FEC.
L	LSR	LSR received a label for this FEC.
>		LSR will use this route for the FEC.
P	Primary route	When LDP LFA FRR is enabled
B	LFA Backup route	When LDP LFA FRR is enabled
R	Remote LFA Backup route	When LDP LFA FRR is enabled

Table 2-7 explains the show command output fields.

Table 2-7: show ldp fec output fields details

Field	Description
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
Session	Reports the current session state.
Out Label	Label received from downstream neighbor for route.
ELC	Displays if route has ELC
Nexthop addr	Displays the IP address of the next hop.

show ldp igp sync

Use the following command to display the LDP synchronization status.

Command Syntax

```
show ldp igp sync
show mpls ldp igp sync
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ldp igp sync
eth1
LDP configured; LDP-IGP Synchronization enabled.
Sync status: sync achieved
Delay timer: Not Configured , Not Running
```

show ldp inter-area-fecs

Use this command to show all FECs using the LPM-based mapping procedure.

Command Syntax

```
show ldp inter-area-fecs
show ldp inter-area-fecs (ipv4|ipv6|) (count)
```

Parameter

`ipv4`	IPv4 FECs
`ipv6`	IPv6 FECs
`count`	Count of FECs

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 4.0 and the command was updated in OcNOS version 4.1.

Example

```
#show ldp inter-area-fecs
LSR codes : E/N - LSR is egress/non-egress for this FEC,
L - LSR received a label for this FEC,
> - LSR will use this route for the FEC
Code FEC Session Out Label Nexthop Addr
Matching RIB prefix - 1.1.1.0
NL> 1.1.1.1/32 33.33.33.33 52485 11.11.11.1
NL> 1.1.1.2/32 33.33.33.33 52486 11.11.11.1

#show ldp inter-area-fecs count
------------------------
Num. IPv4 FEC(s) : 9
------------------------
------------------------
Num. IPv6 FEC(s) : 0
------------------------
------------------------
Total Num. FEC(s): 9
------------------------

#show ldp inter-area-fecs ipv4 count
------------------------
Num. IPv4 FEC(s) : 9
------------------------

#show ldp inter-area-fecs ipv6 count
------------------------
```

```
Num. IPv6 FEC(s) : 0
------------------------
```

show ldp inter-area-fecs prefix

Use this command to show all LDP inter-area FECs by prefix.

Use parameter count to show FEC count for each prefix.

Command Syntax

```
show ldp inter-area-fecs prefix (A.B.C.D/M|X:X::X:X/M) count
```

Parameter

`A.B.C.D/M`	IP prefix <network>/<length>, e.g., 35.0.0.0/8
`X:X::X:X/M`	IPv6 prefix <network>/<length>, e.g., 3ffe::/16
`count`	Count of FECs

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS version 4.1.

Examples

```
#show ldp inter-area-fecs prefix 4.4.4.0/30
LSR codes    : E/N - LSR is egress/non-egress for this FEC,
               L - LSR received a label for this FEC,
               > - LSR will use this route for the FEC
FEC                     Code    Session         Out Label       ELC     Nexthop Addr
Matching RIB prefix - 4.4.4.0/30

#show ldp inter-area-fecs prefix 4.4.4.0/30 count
Matching RIB prefix - 4.4.4.0/30
------------------------
Num. IPv4 FEC(s): 3
------------------------

#show ldp inter-area-fecs prefix 3ffe::/16
LSR codes    : E/N - LSR is egress/non-egress for this FEC,
               L - LSR received a label for this FEC,
               > - LSR will use this route for the FEC
FEC                     Code    Session         Out Label       ELC     Nexthop Addr

#show ldp inter-area-fecs prefix 3ffe::/16 count
```

show ldp interface

Table 2-8: show ldp fec output fields details

Field	Description
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
Session	Reports the current session state.
Out Label	Label received from downstream neighbor for route.
Nexthop addr	Displays the IP address of the next hop.

Use this command to display the list of all interfaces on the current LSR, and to indicate whether a given interface is label-switching or not.

Command Syntax

```
show ldp interface
show ldp interface IFNAME
```

Parameter

`IFNAME` Displays the name of the interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following output displays a list of all interfaces on the LSR.

```
#show ldp interface
InterfaceLDP IdentifierLabel-switchingMerge Capability
eth010.10.0.11:0DisabledN/A
lo10.10.0.11:0DisabledN/A
eth110.10.0.11:0Enabled Merge capable
eth210.10.0.11:0Enabled Merge capable
vmnet1 10.10.0.11:0Disabled N/A
```

The following is a sample output from the `show ldp interface IFNAME` command displaying information about the specified interface `eth1`.

```
#show ldp interface eth1
Status                   : Enabled
Primary IP Address       : 192.168.3.4
Interface Type           : Ethernet
Label Merge Capability   : Merge Capable
Hello Interval           : 5
Targeted Hello Interval  : 15
Hold Time                : 15
Targeted Hold Time       : 45
```

```
Keepalive Interval      : 10
Keepalive Timeout       : 30
Advertisement Mode      : Downstream On Demand
Label Retention Mode    : Liberal
Administrative Groups   : myGroup
```

Table 2-9 explains the show command output fields.

Table 2-9: show ldp interface output fields details

Field	Description
Interface	Name of the interface.
LDP Identifier	LDP identifier for this protocol.
Label-switching	Status of the label-switching on interface..
Merge Capability	Used to override the default merge capability setting of all the interfaces.
Status	Status of the ldp interface.
Primary IP Address	Address of the primary Internet protocol in the interface.
Interface Type	Type of interface.
Label Merge Capability	Used to override the default merge capability setting of all the interfaces for the label.
Hello Interval	Sets the interval for sending unicast hello packets to peers.
Targeted Hello Interval	Sets the interval for sending unicast hello packets to targeted peers.
Hold time	Sets the time-out value to peers.
Targeted Hold time	Sets the time-out value that is the time that the router waits before rejecting an adjacency with targeted peers.
Keepalive Interval	Used to set the interval for sending keep-alive messages to the peer in order to maintain a session.
Keepalive Timeout	Time-out value for rejecting a session with a peer.
Label Advertisement Mode	Used to set the label advertisement mode for an interface for the current LSR to either downstream-on-demand (label is sent only when requested) or downstream-unsolicited (label is sent unrequested).
Label Retention Mode	Used for all labels exchanged via the given interface.
Administrative Groups	Administrative group to be used for links.

show ldp lsp

Use this command to display LDP LSP and, optionally, advertise-label information.

Command Syntax

```
show ldp lsp
show ldp lsp prefix detail
show ldp lsp (prefix|detail)
```

Parameter

`prefix`	Displays advertise-label information in addition to LDP LSP information.
`detail`	Displays advertise-label information in addition to LDP LSP information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3. and was updated in OcNOS version 5.1.

Example

The following is a sample output from the `show ldp lsp prefix detail` command displaying LDP LSP prefix information with advertise-label information.

When LDP LFA FRR in not enabled:

```
#show ldp lsp
DOWNSTREAM LSP :
  FEC                 Nexthop Addr   State           Label     Req.ID    Attr
  10.0.1.0/31         connected       Established     impl-null  0
  10.0.1.0/31        connected        Established      none      0         None
  10.0.2.0/31         connected      Established      24322     0
  10.0.2.0/31         10.0.1.1        Established      impl-null  0
  10.0.3.0/31         connected      Established      24323     0

```

Table 2-10 explains the show command output fields.

Table 2-10: show ldp lsp output fields details

Field	Description
Session peer	Used to group and apply the configuration of general session commands to groups of neighbors that share common session configuration elements.
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
Nexthop addr	Displays the IP address of the next hop.
State	Displays the current status of the ldp.
Label	Details of the ldp downstream labels.
Req.ID	Request identifier for the protocol.
Attr	The attribute is used to sent to a customer router.
Code	Show if an entry is principal or backup.

show ldp mpls-l2-circuit

Use this command to display summarized Layer-2 Virtual Circuit information about all MPLS virtual circuits configured on the current LSR. When the Virtual Circuit ID is specified, this command displays summarized information for the Virtual Circuit matching the specified ID only.

Command Syntax

```
show ldp mpls-l2-circuit

show ldp mpls-l2-circuit <1-4294967295>

show ldp mpls-l2-circuit detail

show ldp mpls-l2-circuit count

show ldp mpls-l2-circuit <1-4294967295> detail
```

Parameter

`<1-4294967295>`	Indicates the virtual circuit ID.
`detail`	Displays detailed LDP information.
`count`	Count of PWs from LDP standpoint.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of this command displaying summarized information of VID 1000:

```
#show ldp mpls-l2-circuit 1000
Transport Client     VC     Trans    Local        Remote       Destination
VC ID     Binding    State  Type     VC Label     VC Label     Address
1000      eth2       UP     ethernet 640          640          192.168.0.80

#show ldp mpls-l2-circuit
Transport Client     VC     Trans    Local        Remote       Destination
VC ID     Binding    State  Type     VC Label     VC Label     Address
1000      eth2       UP     ethernet 640          640          192.168.0.80
2000      eth3       UP     ethernet 641          648          192.168.0.80
3000      eth4       UP     ethernet 642          645          192.168.0.90
```

The following is a sample output of this command when using the `detail` parameter:

```
#show ldp mpls-l2-circuit detail
vcid: 100, type: ethernet, local groupid: 4, remote groupid: 4 (vc is up)
destination: 10.0.0.2, Peer LDP Ident: 10.0.0.2
Local label: 53120, remote label: 53120
Access IF: eth3, Network IF: eth4
Local MTU: 1500, Remote MTU: 1500
Local Control Word: 0, Remote Control Word: 0
Local PW Status Capability : enabled
```

```
Remote PW Status Capability : enabled
Current PW Status TLV : enabled
Local PW Status :
Not Forwarding
Remote PW Status :
Not Forwarding
Standby
```

Table 2-11 explains the show command output fields.

Table 2-11: show ldp mpls-l2-circuit output fields details

Field	Description
Transport VC ID	Transport VC identifier for the protocol.
Client Binding	Show whether the interface is client bound and (if bound) with which client.
VC State	State of the VC.
Trans Type	Type of transmit.
Local VC Label	Incoming VC label details.
Remote VC Label	Outgoing VC label details.
Destination Address	Destination IP address for the protocol.
VCid	Address for the VC.
Type	Type of Ethernet interface.
local groupid	Address for the local group.
remote groupid	Address for the remote group.
destination	Destination IP address.
Peer LDP Ident	Identification for the peer LDP.
Local label	Number of Local label
remote label	Number remote label.
Access IF	Map the access port.
Network IF	Map the network port in the interface.
Local MTU	Number of local MTU., Remote MTU - Number of local MTU.
Local Control Word	Number of local control word.
Remote Control Word	Number of local control word.
Local PW Status Capability	PW Status capability of Local end of PW.

Table 2-11: show ldp mpls-l2-circuit output fields details (Continued)

Field	Description
Remote PW Status Capability	PW Status capability of Remote end of PW.
Current PW Status TLV	A data structure used to encode optional information in a data communications protocol.
Local PW Status	PW Status of Local end of PW.
Remote PW Status	PW Status of Remote end of PW.

show ldp rlfa-routes

Use this command to display LDP remote LFA routes.

Command Syntax

```
show ldp rlfa-routes
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
#show ldp rlfa-routes
Fec             Primary-NH     Backup-NH     rLFA-Addr     Out-Intf  Outer-
label  Inner-label
2.2.2.2          20.1.1.1        30.1.1.1        1.1.1.1         xe5
24320       24324
3.3.3.3          30.1.1.1        20.1.1.1        1.1.1.1         xe12
24320       24325
```

show ldp routes

Use this command to display LDP routes.

Command Syntax

```
show ldp routes
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3 and was updated in OcNOS version 5.1.

Example

```
When LDP LFA FRR in not enabled:

#show ldp routes
Prefix Addr         Nexthop Addr     Intf
10.0.1.0/31         0.0.0.0          eth2
10.0.2.0/31         10.0.1.1         eth2
                    10.0.4.1         eth1
10.0.3.0/31         10.0.4.1         eth1
                    10.0.1.1         eth2
10.0.4.0/31         0.0.0.0          eth1
11.1.1.1/32         0.0.0.0          lo
22.1.1.1/32         10.0.1.1         eth2
33.1.1.1/32         10.0.1.1         eth2
                    10.0.4.1         eth1
44.1.1.1/32         10.0.4.1         eth1
192.168.254.0/24    0.0.0.0          eth0

When LDP LFA FRR in enabled:

#show ldp routes
Prefix Addr         Nexthop Addr     Intf        Backup Addr      Backup Intf
10.0.1.0/31         0.0.0.0          eth2        -                -
10.0.2.0/31         10.0.1.1         eth2        10.0.4.1         eth1
10.0.3.0/31         10.0.4.1         eth1        10.0.1.1         eth2
10.0.4.0/31         0.0.0.0          eth1        -                -
11.1.1.1/32         0.0.0.0          lo          -                -
22.1.1.1/32         10.0.1.1         eth2        -                -
33.1.1.1/32         10.0.1.1         eth2        10.0.4.1         eth1
                    10.0.4.1         eth1        10.0.1.1         eth2
44.1.1.1/32         10.0.4.1         eth1        -                -
192.168.254.0/24    0.0.0.0          eth0        -                -
```

Table 2-12 explains the show command output fields.

Table 2-12: show ldp routes output fields details

Prefix Addr	Details of the network address prefix.
Nexthop Addr	Displays the IP address of the next hop.
Intf	Displays an interface name.
Backup Addr	Displays the IP address of the backup next hop.
Backup Intf	Displays a backup interface name.

show ldp session

Use this command to display sessions established between this LSR and other LSRs.

Command Syntax

```
show ldp session
show ldp session A.B.C.D
show ldp session X:X::X:X
show mpls ldp session
show mpls ldp session A.B.C.D
show mpls ldp session X:X::X:X
```

Parameter

`A.B.C.D`	IPv4 address of the peer.
`X:X::X:X`	IPv6 address of the peer.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
OcNOS#show ldp session 192.168.3.5
Session state: OPERATIONAL
Session role: Passive
TCP Connection: Established
IP Address for TCP: 192.168.3.5
Interface being used : eth1
Peer LDP ID: 10.10.0.18:0
Peer Password : mypwd
Authentication type: MD5
Adjacencies: 192.168.3.5
192.168.4.5
Advertisement mode: Downstream Unsolicited
Label retention mode : Liberal
Graceful Restart             : Capable
Reconnect Timeout            : 120
Recovery Timeout (max)       : 120
Recovery Timeout [negotiated] : 0 [120]
Keepalive Timeout: 30
Reconnect Interval: 15
Address List received : 192.168.3.5
192.168.4.5
Received Labels :FecLabelMaps To
IPV4:10.10.0.0/24
impl-null none
IPV4:192.168.3.0/24 impl-null none
IPV4:192.168.4.0/24 impl-null none
```

```
IPV4:192.168.5.0/24 impl-null none
Sent Labels :FecLabelMaps To
IPV4:10.10.0.0/24
impl-null none
IPV4:192.168.3.0/24 impl-null none
IPV4:192.168.4.0/24 impl-null none
```

Table 2-13 explains the show command output fields.

Table 2-13: show ldp session output fields details

Field	Description
Session state	Reports the current session state.
Session role	Displays the status of the session role.
TCP Connection	Details of the TCP connection.
IP Address for TCP	Transmission control protocol IP address for the network.
Interface	Name of interface used in the network.
Peer LDP ID	Identifier for the peer LDP.
Peer Password	Credential details for the neighbor.
Authentication type	Type of authentication.
Adjacencies	IP address for the neighbor adjacencies.
Advertisement mode	Details of the advertisement mode.
Label retention mode	Details of the label retention mode.
Graceful Restart	Indicates if the peer session is “Capable” or “Not Capable”.
Reconnect Timeout	The amount of time the router keeps the labels until session re-connection, the value is the lower value between local and remote neighbor-liveness timer. It appears when the session is GR capable.
Recovery Timeout (max)	Indicates the amount of time for the recovery session to send the initialization message to the peer, according to the local max-recovery timer. It appears when the session is GR capable.
Recovery Timeout [negotiated]	Indicates the actual timer value and the initial amount of time to recovery session (between brackets) that is negotiated with the peer to the lower value between local and remote values. Negotiated value 0 indicates the labels are not preserved after session disconnection. It appears when the session is GR capable.
Keepalive Interval	Used to set the interval for sending keep-alive messages to the peer in order to maintain a session.
Keepalive Timeout	Time-out value for rejecting a session with a peer.
Address List received	List of address that is received from neighbor.
Received Labels	Number of labels received from neighbor session.
Sent Labels	Number of labels transmitted to neighbor session.

show ldp statistics

Use this command to display LDP statistics.

Command Syntax

```
show ldp statistics
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show ldp statistics` command.

```
#show ldp statistics

=======================================================
 LSR ID = 0.0.0.0:0 : TARGETED PEER: 10.10.10.10
=======================================================
  PacketType                      Total
                             Sent        Received
  Notification                 0            0
  Hello                        0            0
  Initialization               0            0
  Keepalive                    0            0
  Address                      0            0
  Address Withdraw             0            0
  Label Mapping                0            0
  Label Request                0            0
  Label Withdraw               0            0
  Label Release                0            0
  Request Abort                0            0
=======================================================
#
```

Table 2-14 explains the show command output fields.

Table 2-14: show ldp statistics output fields details

Field	Description
LSR ID	Identifier of the LSR.
Targeted Peer	Targeted LDP neighbor can improve the label convergence time compared to the convergence time with directly connected LDP peers when there are flapping links.

Table 2-14: show ldp statistics output fields details (Continued)

Field	Description
Packet Type	Type of packet in the interface that has been received or transmitted to the neighbors.
Total	Number of total packets that has been received and transmitted.

show ldp statistics advertise-labels

Use this command to display the count per each operation filtered by an advertisement list.

Command Syntax

```
show ldp statistics advertise-labels
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show ldp statistics advertise-labels` command.

```
#show ldp statistics advertise-labels
Advertisement spec:
    Prefix list = pfx1; Peer plist = pfx1
      Deny : Label Mapping = 2
             Label Request = 0
    Prevent the distribution of any assigned labels
      Deny : Label Mapping = 9
             Label Request = 3
#
```

Table 2-15 explains the show command output fields.

Table 2-15: show ldp statistics advertise-labels output fields details

Field	Description
Advertisement spec	Details of the advertisement spec.
Prefix list	It is an ordered list and entries are evaluated in order of increasing sequence number.
Peer plist	The peer keyword enables the device to receive time requests and used to synchronize itself to the servers specified in the access list.
Label Mapping	Number of label mapping that is denied.
Label Request	Number of label request that is denied.

show ldp targeted-peers

Use this command to display the list of targeted peers configured on the current LSR.

Command Syntax

```
show ldp targeted-peers
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show ldp targeted-peers` command.

```
#show ldp targeted-peers
IP Address          Interface

192.168.201.2       eth1
```

Table 2-16 explains the show command output fields.

Table 2-16: show ldp targeted-peers output fields details

Field	Description
IP Address	Internet protocol address for the interface.
Interface	Name of the interface.

show ldp upstream

Use this command to display the status of all upstream sessions and label information exchanged.

Command Syntax

```
show ldp upstream
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show ldp upstream` command showing the status of all upstream sessions.

```
#show ldp upstream
Session peer 1.1.1.1:
  FEC                           State                Label     Req.ID    Attr
  60.0.0.0/24                 Established            52486        0      None
  4.4.4.4/32                  Established            52484        0      None
  50.0.0.0/24                 Established            52483        0      None
  40.0.0.0/24                 Established        impl-null        0      None
  30.0.0.0/24                 Established        impl-null        0      None
  20.0.0.0/24                 Established        impl-null        0      None

  5.5.5.5/32                  Established            52482        0      None
  3.3.3.3/32                  Established            52481        0      None
  2.2.2.2/32                  Established        impl-null        0      None
Session peer 3.3.3.3:
  FEC                           State                Label     Req.ID    Attr
  60.0.0.0/24                 Established            52487        0      None
  4.4.4.4/32                  Established            52485        0      None
  1.1.1.1/32                  Established            52480        0      None
  40.0.0.0/24                 Established        impl-null        0      None
  30.0.0.0/24                 Established        impl-null        0      None
  20.0.0.0/24                 Established        impl-null        0      None
  10.0.2.0/24                 Established        impl-null        0      None
  2.2.2.2/32                  Established        impl-null        0      None
Session peer 4.4.4.4:
  FEC                           State                Label     Req.ID    Attr
  50.0.0.0/24                 Established            52483        0      None
  40.0.0.0/24                 Established        impl-null        0      None
  30.0.0.0/24                 Established        impl-null        0      None
  20.0.0.0/24                 Established        impl-null        0      None
  10.0.2.0/24                 Established        impl-null        0      None
  3.3.3.3/32                  Established            52481        0      None
  2.2.2.2/32                  Established        impl-null        0      None
  1.1.1.1/32                  Established            52480        0      None
```

Table 2-17 explains the show command output fields.

Table 2-17: show ldp upstream output fields details

Field	Description
Session peer	Details of the session peers.
FEC	Displays the Forward Equivalency Class (FEC) for this entry.
State	Reports the current session state.
Label	Number of Label received from upstream neighbor for route.
Req.ID	Requested session identifier for the protocol.
Attr	The attribute is used to sent packets to a customer router.

show ldp vpls

Use this command to display information about all VPLS instances. Specify the VPLS ID to display information about a specific VPLS instance.

Command Syntax

```
show ldp vpls <1-4294967295> (count|)
show ldp vpls count
show ldp vpls detail
show ldp vpls (no-vc|)
```

Parameter

`<1-4294967295>`	Display the VPLS identifier.
`count`	Display VPLS count from LDP standpoint.
`detail`	Display detailed LDP VPLS information.
`no-vc`	Specify not display L2VC information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show ldp vpls` command displaying information about all VPLS instances.

```
#show ldp vpls
VPLS-ID      Peer Address       State  Type        Label-Sent   Label-Rcvd
1            192.168.0.80       Up     vpls        16           640
1            192.168.0.90       Up     vpls        18           642
2            192.168.0.80       Up     vpls        19           641
2            192.168.0.90       Up     vpls        17           643
```

The following is an output of the `show ldp vpls detail` command:

```
#show ldp vpls detail
 VPLS Identifier    : 1
 Peer IP            : 192.168.0.80
 VC State           : UP
 VC Type            : vpls
 VC Label Sent      : 16
 VC Label Received  : 640

 VPLS Identifier    : 1
 Peer IP            : 192.168.0.90
 VC State           : UP
 VC Type            : vpls
 VC Label Sent      : 18
 VC Label Received  : 642
```

```
VPLS Identifier    : 2
Peer IP            : 192.168.0.80
VC State           : UP
VC Type            : vpls
VC Label Sent      : 19
VC Label Received  : 641
```

The following is a sample output of `show ldp vpls count` displaying information about total, active and inactive VPLS instances from LDP.

```
#show ldp vpls count
-------------------------------
Total VPLS instances    : 2
Active VPLS instances   : 2
Inactive VPLS instances : 0
-------------------------------
```

Table 2-18 explains the show command output fields.

Table 2-18: show ldp vpls output fields details

Field	Description
VPLS-ID	Identification details of the VPLS.
Peer Addr	IP address of the peer device.
State	Reports the current session state.
Type	Type of protocol in network.
Label-Sent	Number of packets transmitted to neighbor.
Label-Rcvd	Number of packets received from neighbor.
Total VPLS instances	Number of total VPLS instance in the protocol.
Active VPLS instances	Number of active VPLS instance.
Inactive VPLS instances	Number of inactive VPLS instance.

show mpls ldp discovery

Use this command to display the sources for locally generated LDP Discovery Hello PDUs, and to indicate whether an interface is label-switching.

Command Syntax

```
show mpls ldp discovery
show mpls ldp discovery IFNAME
```

Parameter

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls ldp discovery
InterfaceLDP IdentifierLabel-switchingMerge Capability
eth010.10.0.11:0DisabledN/A
lo10.10.0.11:0DisabledN/A
eth110.10.0.11:0Enabled Merge capable
eth210.10.0.11:0Enabled Merge capable
vmnet110.10.0.11:0  Disabled N/A
```

Table 2-19 explains the show command output fields.

Table 2-19: show ldp discovery output fields details

Field	Description
Interface	Name of the interface.
LDP Identifier	LDP identifier for this protocol.
Label-switching	Status of the label-switching on interface.
Merge Capability	Used to override the default merge capability setting of all the interfaces.

show mpls ldp neighbor

Use this command to display LDP neighbor information.

Command Syntax

```
show mpls ldp neighbor
show mpls ldp neighbor detail
```

Parameter

detail	Details for adjacencies.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls ldp neighbor detail
IP AddressInterface NameHoldtimeLDP ID
192.168.3.5eth11510.10.0.18:0
192.168.4.5eth21510.10.0.18:0
```

Table 2-20 explains the show command output fields.

Table 2-20: show mpls ldp neighbor output fields

Field	Description
IP Address	Address of the interface.
Interface Name	Name of the interface.
Holdtime	The amount of time this device waits between SPFs.
LDP ID	Local label space ID. The first four bytes of an LDP ID is a platform IP address called the LDP router ID. The last two bytes are called the local label space ID.

show mpls ldp parameter

Use this command to display LDP configuration parameters.

Command Syntax

```
show mpls ldp parameter
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mpls ldp parameter
Router ID                    : 0.0.0.0
LDP Version                  : 1
Global Merge Capability      : Merge Capable
Label Advertisement Mode : Downstream Unsolicited
Label Retention Mode         : Liberal
Label Control Mode           : Independent
Instance Loop Detection      : Off
Request Retry                : Off
Propagate Release            : Disabled
Graceful Restart             : Disabled
Hello Interval               : 5
Targeted Hello Interval      : 15
Hold time                    : 15
Targeted Hold time           : 45
Keepalive Interval           : 10
Keepalive Timeout            : 30
Request retry Timeout        : 5
Transport Address data       :
  Labelspace 0               : 192.168.201.2 (not in use)
Import BGP routes            : No
```

Table 2-21 explains the show command output fields.

Table 2-21: show mpls ldp parameters output fields

Field	Description
Router ID	A preferred interface address for LDP router.
LDP Version	Latest LDP version details.

Table 2-21: show mpls ldp parameters output fields

Field	Description
Global Merge Capability	Override the default merge capability setting of all the interfaces.
Label Advertisement mode	Label advertisement mode details in the interface.
Label retention mode	Label retention mode details in the interface.
Label Control Mode	Controls the mode used for handling label binding requests on interfaces.
Instance Loop Detection	Disables the LDP optional loop detection mechanism.
Request Retry	Request causes the target peer to respond with targeted Hello messages.
Propagate Release	Propagate release is disabled in the interface.
Graceful Restart	Graceful Restart (GR) is a mechanisms to prevent routing protocol re-convergence during a processor switchover. Hello Interval - Hello interval sets the interval for sending unicast hello packets to peers.
Targeted Hello Interval	Targeted hello interval sets the interval for sending unicast hello packets to targeted peers.
Hold time	Hold time sets the time-out value to peers.
Targeted Hold time	Time-out value is the time that the router waits before rejecting an adjacency with targeted peers.
Keepalive Interval	Keepalive interval sets the interval for sending keep-alive messages to the peer in order to maintain a session.
Keepalive Timeout	Time-out value for rejecting a session with a peer.
Request retry Timeout	Request for the maximum retry duration (the number of retries times the length of the timeout).
Transport Address data	Transport address advertised in LDP Discovery Hello messages sent on an interface.
Label space	Label used in a label binding is allocated from a set of possible labels called a label space.
Import BGP routes	The BGP Support for IP Prefix Import from Global Table into a VRF Table feature introduces the capability to import IPv4 unicast prefixes from the global routing table into a Virtual Private Network (VPN) routing/forwarding (VRF) instance table using an import route map.

Resource Reservation Protocol Configuration

CHAPTER 1 RSVP-TE Configuration

This chapter contains configurations for Resource Reservation Protocol - Traffic Engineering (RSVP-TE).

RSVP-TE Overview

RSVP-TE is a signaling protocol that supports explicit routing capabilities, To do this, an Explicit Route (ER) object is incorporated into RSVP PATH messages. This object encapsulates a sequence of hops that constitute the explicitly-routed path. Using the ER object, the paths taken by label-switched RSVP-MPLS flows can be pre-determined without conventional IP routing. An ER path can be administratively specified or computed based on CSPF and any policy requirements dictated by the operator through the trunk node, taking the current network state into consideration. A useful application of explicit routing is Traffic Engineering (TE). Using explicitly-routed LSPs, an ingress node can control the path through which traffic flows from itself, through the MPLS network, to the egress node. Explicit routing is therefore useful for the optimization of network resources and an increase in the quality of traffic-oriented performance.

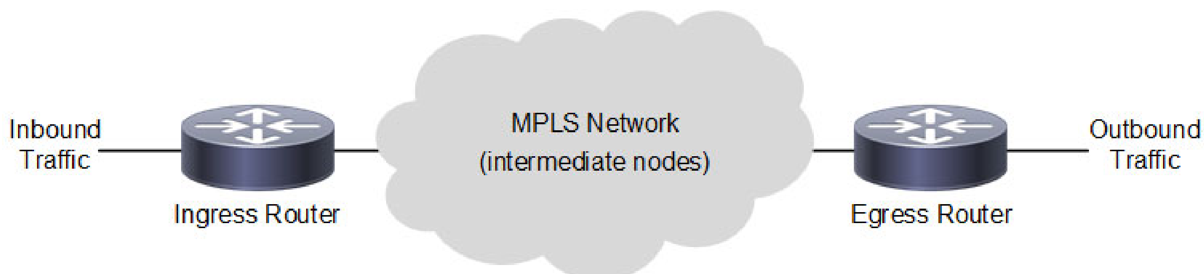

Figure 1-11: Basic RSVP-TE Topology

RSVP-TE Architecture

RSVP-TE is a signaling protocol that supports explicit routing capabilities to establish LSPs in a MPLS network. OcNOS RSVP-TE:

- Creates explicitly-routed paths, which might not agree with the route suggested by the IGP (OSPF, RIP) being used. Explicitly-routed LSPs, by definition, do not follow the paths suggested by IGPs.
- Queries CSPF for a complete, end-to-end, explicit route based on constraints specified by the operator using RSVP commands.
- Performs make-before-break type re-routing of tunnels. (Make-before-break is the creation of a new LSP before the old one is torn down).
- Exchanges Hello messages to make node failures easier to detect. This means when there is no hello exchange between routers, then other node is assumed dead or offline (except in the case when the peer is known to not support Hellos).
- Provides statistical information of RSVP messages exchanged.

In addition, OcNOS RSVP-TE may be used in unison with BGP to generate MPLS/BGP VPNs, and in unison with LDP to generate Layer-2 Virtual Circuits.

Configure RSVP-TE

Note: The following configuration for establishing a trunk is required on all routers participating in label-switching. Based on the assumption that minimal configurations exist on all participating routers, other examples do not repeat this configuration.

Enable Label Switching - Minimal Configuration

To establish a trunk on a system:

1. Enable label-switching and RSVP-TE on all participating interfaces.
2. Configure a trunk on the ingress router to use the best available IGP path.

   In this example, the Label Switched Path (LSP) is configured using minimal configuration and is setup using the best IP nexthop available. Each router along the path is chosen by the previous router by looking up the best nexthop available in its IP routing table.

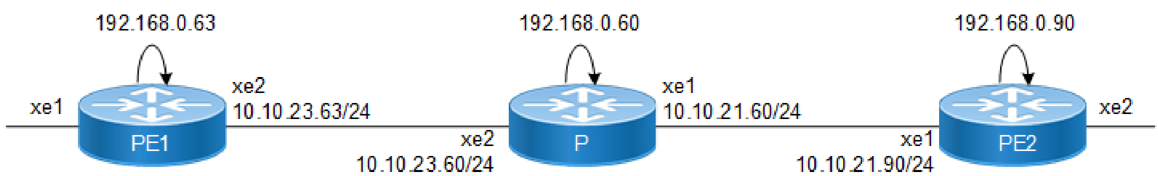

Figure 1-12: Topology for Minimal Configuration

PE1 - NSM

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 192.168.0.63/32 secondary	Set the IP address for the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 10.10.23.63/24	Set the IP address for the interface.
(config-if)#label-switching	Enable label switching on interface xe2.
(config-if)#commit	Commit the transaction.

PE1 - RSVP-TE

(config)#router rsvp	Enter Configure Router mode.
(config-router)#exit	Exit Router mode.
(config)#interface xe2	Enter interface mode.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#commit	Commit the transaction.

PE1 - OSPF

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the Routing process and specify the Process ID `(100)`. The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#router-id 192.168.0.63`	Configure OSPF router-ID same as loopback interface IP address
`(config-router)#network 10.10.23.0/24 area 0`	Define the network `(10.10.23.0/24)` on which OSPF runs and associate the area ID `(0)`.
`(config-router)#network 192.168.0.63/32 area 0`	Set the IP address of the loopback interface to `192.168.0.63/32`.
`(config-router)#commit`	Commit the transaction.

P - NSM

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.60/32 secondary`	Set the IP address for the interface.
`(config-if)#exit`	Enable label switching on interface `lo`.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 10.10.23.60/24`	Set the IP address for the interface.
`(config-if)#label-switching`	Enable label switching on interface `xe2`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.21.60/24`	Set the IP address for the interface.
`(config-if)#label-switching`	Enable label switching on interface `xe1`.
`(config-if)#commit`	Commit the transaction.

P - RSVP-TE

`(config)#router rsvp`	Enter `Configure Router` mode.
`(config-router)#exit`	Exit `Router` mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#enable-rsvp`	Enable RSVP message exchange on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#enable-rsvp`	Enable RSVP message exchange on this interface.
`(config-if)#commit`	Commit the transaction.

P - OSPF

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#router-id 192.168.0.60`	Configure OSPF router-ID same as loopback interface IP address
`(config-router)#network 10.10.23.0/24 area 0`	Define the first network (`10.10.23.0/24`) on which OSPF runs and associate the area ID (`0`).
`(config-router)#network 10.10.21.0/24 area 0`	Define the second network (`10.10.21.0/24`) on which OSPF runs and associate the area ID (`0`).
`(config-router)#network 192.168.0.60/32 area 0`	Set the IP address of the loopback interface to `192.168.0.63/32`.
`(config-router)#commit`	Commit the transaction.

PE2 - NSM

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.90/32 secondary`	Set the IP address for the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.21.90/24`	Set the IP address for the interface.
`(config-if)#label-switching`	Enable label switching on interface `xe2`.
`(config-if)#commit`	Commit the transaction.

PE2 - RSVP-TE

`(config)#router rsvp`	Enter `Configure Router` mode.
`(config-router)#exit`	Exit `Router` mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#enable-rsvp`	Enable RSVP message exchange on this interface.
`(config-if)#commit`	Commit the transaction.

PE2 - OSPF

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#router-id 192.168.0.90`	Configure OSPF router-ID same as loopback interface IP address

(config-router)#network 10.10.21.0/24 area 0	Define the network (10.10.21.0/24) on which OSPF runs and associate the area ID (0).
(config-router)#network 192.168.0.90/32 area 0	Set the IP address of the loopback interface to 192.168.0.63/32.
(config-router)#commit	Commit the transaction.

Establish a Trunk with CSPF Disabled

OcNOS, Constrained Shortest Path First (CSPF) calculation is enabled by default.Typically, CSPF is disabled when all of the participating nodes do not support the required traffic engineering extensions and LSPs are configured manually to use an explicit path. In this case, an LSP is established only along the path specified by the operator.

Note: This example is based on the assumption that a minimal configuration exists on all participating routers as described in Enable Label Switching - Minimal Configuration.

Topology

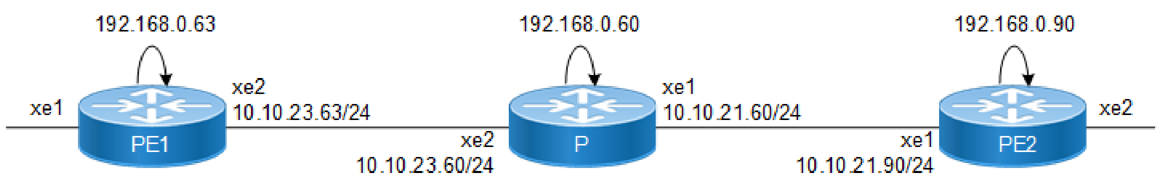

Figure 1-13: Basic Topology

PE1 - RSVP-TE

#configure terminal	Enter configure mode.
(config)#rsvp-trunk T1	Create an RSVP trunk T1 and enter the Trunk mode.
(config-trunk)#no primary cspf	Specify no primary cspf since CSPF is enabled by default.
(config-trunk)#to 192.168.0.90	Specify the IPv4 egress (destination point) for the LSP.
(config-trunk)#commit	Commit the transaction.

Establish a Trunk Using CSPF

The RSVP trunk can be configured using CSPF (Constraint-based Shortest Path First). In this case, the RSVP daemon (rsvpd) sends a request to the CSPF server to compute a path through the network to reach the destination. CSPF returns a hop-by-hop path called the Explicit Route to the RSVP daemon to be used in the Explicit Route Object (ERO). Each router along the path sends a `Path` message only to the nexthop specified in the ERO. In the OcNOS implementation, CSPF is enabled by default and if `no cspf` is not specified, the trunk is CSPF enabled automatically.

Note: This example is based on the assumption that a minimal configuration exists on all participating routers as described in Enable Label Switching - Minimal Configuration.

PE1 (RSVP Daemon)

#configure terminal	Enter configure mode.
(config)#rsvp-trunk T1	Create an RSVP trunk T1 and enter the Trunk mode.

`(config-trunk)#to 192.168.0.90`	Specify the IPv4 egress (destination point) for the LSP.
`(config-trunk)#commit`	Commit the transaction.

Mapping a Route to a Trunk

In the OcNOS implementation, a network can be mapped to a particular trunk using map-route configuration.

Note: This example is based on the assumption that a minimal configuration exists on all participating routers. For configuration details, refer to the “Establishing a Trunk - Minimal Configuration” section.

Topology

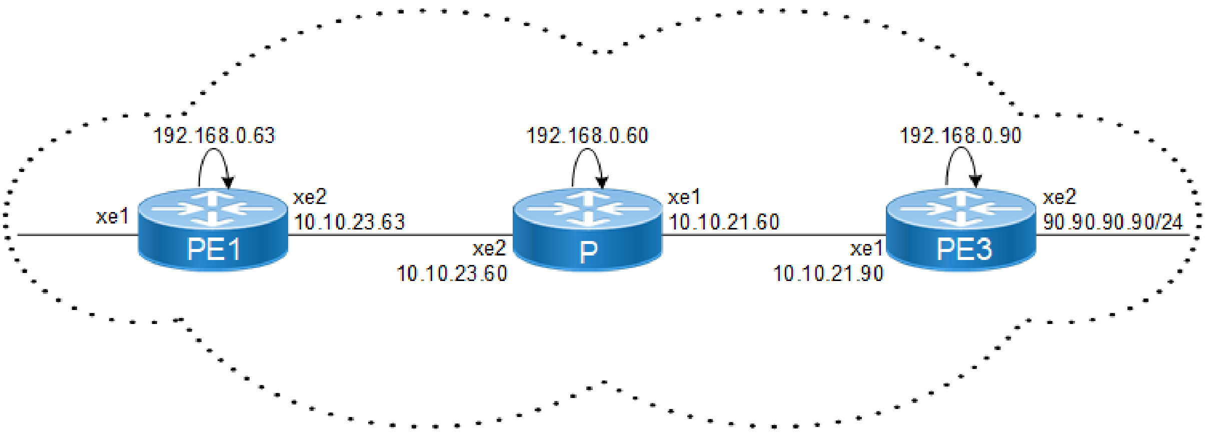

Figure 1-14: Topology for route mapping

PE1 - RSVP-TE

`#configure terminal`	Enter configure mode.
`(config)#router rsvp`	Enable RSVP globally.
`(config-router)#rsvp-path PE2`	Configure RSVP path.
`(config-path)#rsvp-trunk T1`	Create an RSVP trunk T1 and enter the Trunk mode.
`(config-trunk)#map-route 90.90.90.0/24`	Specify the destination prefix that needs to mapped to this trunk.
`(config-trunk)#to 192.168.0.90`	Specify the IPv4 egress (destination point) for the LSP.
`(config-trunk)#commit`	Commit the transaction.

Establish a Trunk Using Explicitly-Defined Path

Explicit Route hops can be configured manually in the trunk configuration. In this case, the RSVP daemon uses the configured hops as Explicit Route Objects (ERO). It sets up the LSP using specified hops only.

An ERO is composed of IP addresses called hops. An ERO hop can be defined as loose or strict. A loose hop can be reached by any available route. A strict hop must be reached via a direct link and cannot be routed over any alternate routers in between. In this example, since PE3 is defined as loose hop, P can use P2 as an intermediate hop to reach PE2. However, if it was a strict hop, then P would have to use interface `xe1` to reach PE3 directly.

Note: This example is based on the assumption that a minimal configuration exists on all participating routers as described in Enable Label Switching - Minimal Configuration.

Topology

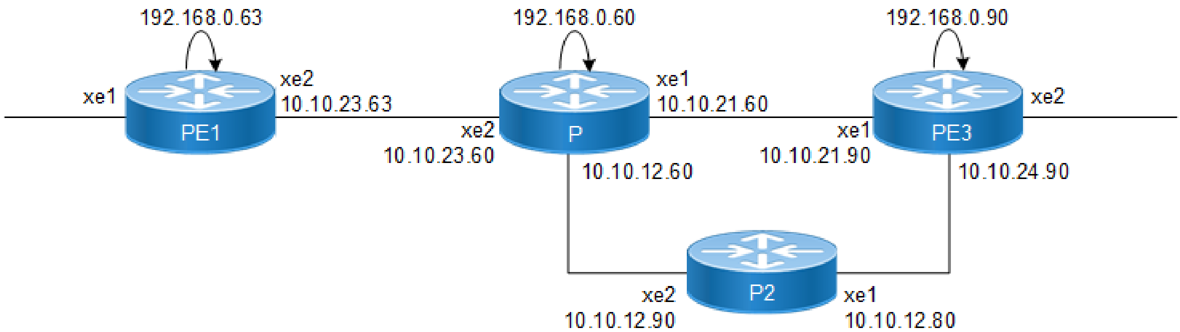

Figure 1-15: Topology for Explicitly Defined Path

PE1 - RSVP-Path

`#configure terminal`	Enter configure mode.
`(config)#rsvp-path P1`	Create an RSVP Path `P1` and enter the `Path` mode.
`(config-path)#10.10.23.60 strict`	Configure this explicit route path as a `strict` hop.
`(config-path)#10.10.21.90 loose`	Configure this explicit route path as a `loose` hop.
`(config-path)#exit`	Exit `Path` mode.
`#configure terminal`	Enter configure mode.
`(config)#rsvp-trunk T1`	Create an RSVP trunk `T1` and enter the Trunk mode.
`(config-trunk)#no primary cspf`	Since CSPF is enabled by default, specify `no primary cspf` if CSPF is not required.
`(config-trunk)#primary path P1`	Configure trunk `T1` to use the defined path.
`(config-trunk)#to 192.168.0.90`	Specify the IPv4 egress (destination point) for the LSP.
`(config-trunk)#commit`	Commit the transaction.

```

Add a Secondary LSP to the Trunk

Although the attributes of a Secondary LSP are independent of the Primary LSP, a Secondary LSP cannot be configured without first configuring a Primary LSP. In addition to information on how to configure a secondary LSP, this example illustrates how to define a non-default setup and the hold priority for an LSP. Setup and hold priorities are used to determine which LSP should be given a preference when competing for resources. Specifically, the setup priority of an un-established LSP is compared to the hold priorities of established LSPs, and the numerically lower one is given a preference. However, once the LSP is established, its setup priority is never used until it is pre-empted or reset and is being brought up again.

Note: This example is based on the assumption that a minimal configuration exists on all participating routers as described in Enable Label Switching - Minimal Configuration.

Note: If user provides the RSVP path option for secondary, the primary path exclusion logic gets disabled. User needs to keep primary and secondary path mutually exclusive. Else, RSVP-Primary LSP and RSVP-Secondary LSP may select the same next hop, when RSVP is configured with "loose". Hence RSVP-Path first next-hop should be "strict".

PE1 - RSVP-TE

`#configure terminal`	Enter configure mode.
`(config)#rsvp-path myPath`	Specify an RSVP path to be used.
`(config-path)#10.10.23.60 strict`	Configure this explicit route path as a `strict` hop.
`(config-path)#exit`	Exit Path mode.
`(config)#rsvp-path myPath2`	Specify an RSVP path to be used.

`(config-path)#10.10.23.60 loose`	Configure this explicit route path as a `loose` hop.
`(config-path)#exit`	Exit Path mode.
`(config)#rsvp-trunk T1`	Create an RSVP trunk `T1` and enter the Trunk mode.
`(config-trunk)#no primary cspf`	Since CSPF is enabled by default, specify `no secondary cspf` if CSPF is not required.
`(config-trunk)#primary path myPath`	Specify an RSVP path to be used.
`(config-trunk)#no secondary cspf`	Specify the `no secondary cspf` option for the Secondary LSP.
`(config-trunk)#secondary path myPath2`	Specify an RSVP path to be used.
`(config-trunk)#to 192.168.0.90`	Specify the IPv4 egress (destination point) for the LSP.
`(config-trunk)#commit`	Commit the transaction.

Validation

This example shows the number of configured RSVP sessions in a router.

PE1

```
#show rsvp session count
Total configured: 1, Up 1, Down 0

Total ingress sessions: 1, Up 1, Down 0
Total transit sessions: 0, Up 0, Down 0
Total egress sessions: 0, Up 0, Down 0
```

PE2

```
#show rsvp session count
Total configured: 1, Up 1, Down 0

Total ingress sessions: 0, Up 0, Down 0
Total transit sessions: 0, Up 0, Down 0
Total egress sessions: 1, Up 1, Down 0
```

Add Multiple Secondary LSP to the trunk

RSVP Multiple Secondary feature tries to provide continuous protection when multiple failures happen. In majority scenarios, feature tries to provide seamless protection. This is a proprietary feature where user can configure multiple secondary sessions in a rsvp-trunk. Each secondary will be associated with a priority. Priority secondary sessions must be programmed with a predefined path. User can configure a maximum of five priority levels. Lowest priority number corresponds to highest priority. Highest priority session will be signaled to be programmed as secondary session. If highest priority session cannot come up, then next available secondary will be selected based on polling. During primary session fail-over, programmed secondary priority session will protect the primary and then goes for an MBB update to act as the primary session until primary comes up. Once the highest priority session comes up as acting primary session, next available secondary priority session will be programmed to signal and come up secondary. Re-optimization timer executed once in every 5 minutes to ensure the best priority session serves as secondary. Configuration updates on secondary priority configurations doesn't trigger MBB and session will be restarted. This example illustrates how to create SVI, enable IGP protocols and RSVP on SVI.

Note: Ensure that the VLAN is configured before creating SVI.

Topology

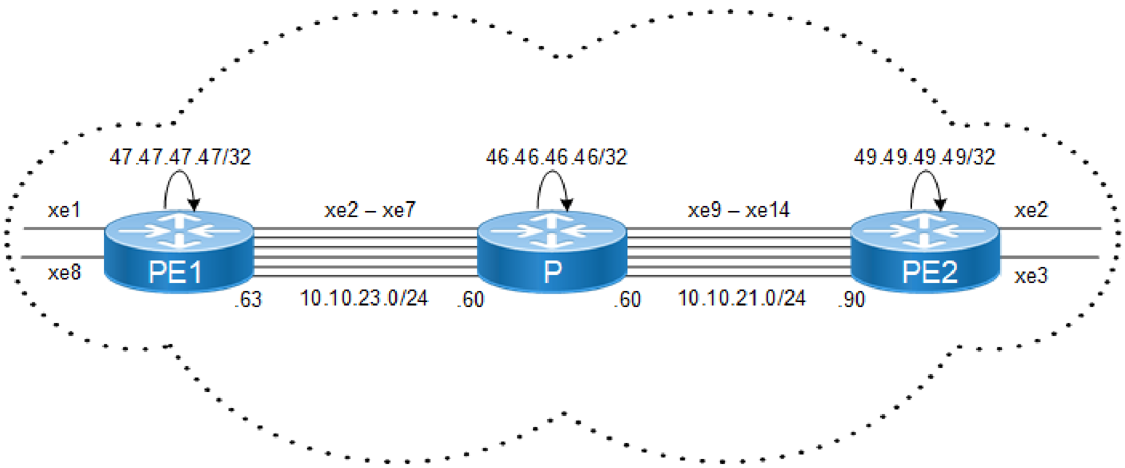

Figure 1-16: Topology for Multiple Secondary Protection

Bridge Configuration

```
bridge 1 protocol ieee vlan-bridge
no bridge 1 spanning-tree enable bridge-forward
```

VLAN creation

```
vlan database
vlan 2-7  bridge 1 state enable
 vlan 501-506 bridge 1 state enable
```

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 47.47.47.47/32 secondary`	Set the secondary IP address for the lo interface
`(config-if)#exit`	Exit interface mode.
`(config)#router rsvp`	Enable RSVP globally.
`(config-router)#exit`	Exit RSVP mode.
`(config)#interface vlan1.2`	Enter the interface mode.
`(config-if)#ip address 10.10.23.1/24`	Configure the IP Address
`(config-if)#mtu 1600`	Configure MTU size.
`(config-if)#label-switching`	Enable MPLS.

`(config-if)#switchport trunk allowed vlan add 14,524`	Configure allowed VLANs
`(config-if)#switchport trunk native vlan 524`	Configure native VLAN.
`(config-if)#load-interval 30`	Set load interval
`(config-if)#mtu 9192`	Configure the MTU Size.
`(config-if)#exit`	Exit the interface mode.
`(conf)#rsvp-path sp1-r3-r1 mpls`	Create RSVP path
`(conf-path)#10.10.21.1 strict`	Configure nexthop
`(conf-path)#10.10.23.1 strict`	Configure nexthop
`(conf)#rsvp-path sp2-r3-r1 mpls`	Create RSVP path
`(conf-path)#10.10.22.1 strict`	Configure nexthop
`(conf-path)#10.10.24.1 strict`	Configure nexthop
`(conf)#rsvp-path sp2-r3-r1 mpls`	Create RSVP path
`(conf-path)#10.10.29.2 strict`	Configure nexthop
`(conf-path)#10.10.25.1 strict`	Configure nexthop
`(conf)#rsvp-path sp3-r3-r1 mpls`	Create RSVP path
`(conf-path)#10.10.30.1 strict`	Configure nexthop
`(conf-path)#10.10.26.1 strict`	Configure nexthop
`(conf)#rsvp-path sp4-r3-r1 mpls`	Create RSVP path
`(conf-path)#10.10.31.1 strict`	Configure nexthop
`(conf-path)#10.10.27.1 strict`	Configure nexthop
`(conf)#rsvp-path sp5-r3-r1 mpls`	Create RSVP path
`(conf-path)#10.10.32.1 strict`	Configure nexthop
`(conf-path)#10.10.28.1 strict`	Configure nexthop
`(conf)#rsvp-trunk 49-47-test ipv4`	Create a RSVP trunk link
`(conf-trunk)#primary path p1-r3-r1`	Configure primary path for trunk link
`(conf-trunk)#secondary-priority 1 path sp1-r3-r1`	Configure secondary link for trunk link
`(conf-trunk)#secondary-priority 2 path sp2-r3-r1`	Configure secondary link for trunk link
`(conf-trunk)#secondary-priority 3 path sp3-r3-r1`	Configure secondary link for trunk link
`(conf-trunk)#secondary-priority 4 path sp4-r3-r1`	Configure secondary link for trunk link

(conf-trunk)#secondary-priority 5 path sp5-r3-r1	Configure secondary link for trunk link
(conf-trunk)#to 47.47.47.47	Configure remote node for the LSP
(conf-trunk)#commit	Commit the transaction.

OSPF configurations

#configure terminal	Enter configure mode.
(config)#router ospf 100	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#ospf router-id 49.49.49.49	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 10.10.21.0/24 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#network 10.10.22.0/24 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#network 10.10.29.0/24 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#network 10.10.30.0/24 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#network 10.10.31.0/24 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#network 10.10.32.0/24 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#network 49.49.49.49/32 area 0	Define the network on which OSPF runs and associate the area ID
(config-router) #commit	Commit the transaction.

Validation

This example shows the number of configured RSVP sessions in a router.

PE2

```
 #show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to
Secondary
* indicates the session is active with local repair at one or more nodes
(P) indicates the secondary-priority session is acting as primary

Ingress RSVP:
To              From            Type    LSPName                       State Uptime    Rt

Add Administrative Group Constraints to an LSP

To add administrative group constraints (also known as color constraints) to an LSP:

- Configure support for required administrative groups in NSM on all participating routers
- Configure required administrative groups on all participating interfaces

The configuration in this example forces the primary LSP to be setup through links that belong either to administrative group A or C. A link that does not belong to either of these administrative groups will not be used for setting up the LSP.

Note: This example is based on the assumption that a minimal configuration exists on all participating routers as described in Enable Label Switching - Minimal Configuration.

PE1 - NSM

#configure terminal	Enter configure mode.
(config)#admin-group A 0	Add new administrative groups, specify their names and assign bit values to them.
(config)#admin-group B 1	
(config)#admin-group C 2	
(config)#admin-group D 3	
(config)#admin-group E 4	
(config)#interface xe0	Enter interface mode.
(config-if)#admin-group A	Add administrative groups to the links. When used in the interface mode, this command adds a link between an interface and a group. The name is the name of the group previously configured. You can have multiple groups per interface.
(config-if)#admin-group B	
(config-if)#admin-group C	

`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#admin-group E`	Add administrative groups to the links. When used in the interface mode, this command adds a link between an interface and a group. The name is the name of the group previously configured. You can have multiple groups per interface.
`(config-if)#admin-group D`	
`(config-if)#commit`	Commit the transaction.

P - NSM

`#configure terminal`	Enter configure mode.
`(config)#admin-group A 0`	Add new administrative groups and specify their names and assign bit values to them.
`(config)#admin-group C 2`	
`(config)#interface xe2`	Enter interface mode
`(config-if)#admin-group A`	Add administrative groups to the links. When used in the interface mode, this command adds a link between an interface and a group. The name is the name of the group previously configured. You can have multiple groups per interface.
`(config-if)#admin-group C`	
`(config-if)#commit`	Commit the transaction.

PE1 - RSVP-TE

`(config)#router rsvp`	Enter the router mode for RSVP.
`(config-router)#rsvp-path P1`	Configure RSVP path.
`#configure terminal`	Enter configure mode.
`(config)#rsvp-trunk T1`	Create an RSVP trunk `T1` and enter the Trunk mode.
`(config-trunk)#no primary cspf`	Since CSPF is enabled by default, specify n`o primary cspf` if CSPF is not required.
`(config-trunk)#primary path P1`	Specify an RSVP primary path to be used.
`(config-trunk)#no primary cspf`	Specify the `no primary cspf` option for the LSP.
`(config-trunk)#primary include-any A`	Set up the LSP with admin group constraint A.
`(config-trunk)#primary include-any C`	Set up the LSP with admin group constraint C.
`(config-trunk)#to 192.168.0.90`	Specify the IPv4 egress (destination point) for the LSP.
`(config-trunk)#commit`	Commit the transaction.

Configure Global Parameters

Some common parameters can be configured in the Router mode on the RSVP-TE daemon. These parameters are global and affect all LSPs. In the following example the interval between two consecutive hello messages is set. The neighbor is defined by the neighbor command. Hello exchanges are enabled only between explicitly configured neighbors (configure this router as a neighbor on P (IP address `10.10.23.60`).

Note: This example is based on the assumption that a minimal configuration exists on all participating routers as described in Enable Label Switching - Minimal Configuration.

PE1 - RSVP-TE

`#configure terminal`	Enter configure mode.
`(config)#router rsvp`	Enter the router mode for RSVP.
`(config-router)#hello-interval 10`	Set the `hello-interval` (in seconds) between hello packets.
`(config-router)#hello-timeout 35`	Set the `hello-timeout value`. If an LSR has not received a Hello message from a peer within this period, all sessions shared with this peer are reset.
`(config-router)#neighbor 10.10.23.60`	Explicitly specify the neighbor to exchange Hello messages with.
`(config-router)#commit`	Commit the transaction.

P - RSVP-TE

`#configure terminal`	Enter configure mode.
`(config)#router rsvp`	Enter the router mode for RSVP.
`(config-router)#hello-interval 10`	Set the `hello-interval` (in seconds) between hello packets.
`(config-router)#hello-timeout 35`	Set the `hello-timeout value`. If an LSR has not received a Hello message from a peer within this period, all sessions shared with this peer are reset.
`(config-router)#neighbor 10.10.23.63`	Explicitly specify the neighbor to exchange Hello messages with.
`(config-router)#commit`	Commit the transaction.

Fast Reroute Configuration (one-to-one method)

The Fast Reroute (FRR) configuration is a MPLS resiliency technology that provides fast traffic recovery when there is a link or router failure on mission critical services. These mechanisms enable the re-direction of traffic onto backup LSP tunnels in tens of milliseconds, in the event of a failure. The one-to-one backup method creates detour LSPs for each protected LSP at each potential point of local repair. This method is used to protect links and nodes during network failure.

In the below configurations each FRR trunk is mapped to VPWS,VPLS, and L3 VPN services.So it includes configurations of VPWS,VPLS and L3 VPN also.

Figure 1-17 is a simple topology example for FRR:

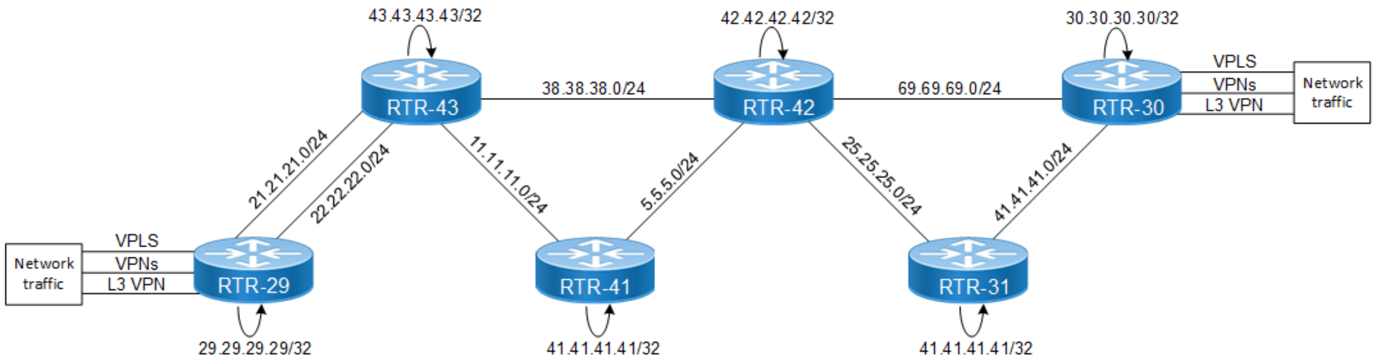

Figure 1-17: Topology Example for Fast Reroute

RTR-29

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 29.29.29.29/32 secondary`	Set a secondary IP address of the interface
`(config-if)#no shutdown`	Administratively bring the interface up.
`(config-if)#exit`	Exit interface mode.
`(config)#router-id 29.29.29.29`	Configure the router ID.
`(config)#router rsvp`	Enter to router rsvp mode.
`(config-router)#exit`	Exit the router mode
`(config)#router ldp`	Enter to router LDP mode.
`(config-router)#targeted-peer ipv4 30.30.30.30`	Configure targeted peer.
`(config-router-targeted-peer)#exit-targeted-peer-mode`	Exit-targeted-peer-mode
`(config-router)#exit`	Exit router mode
`(config)#interface xe21`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching on interface.
`(config-if)#ip address 21.21.21.29/24`	Set an IP address of the interface.
`(config-if)#no shutdown`	Administratively no shutdown the interface.
`(config-if)#enable-rsvp`	Enable RSVP message exchange on this interface.
`(config-if)#enable-ldp ipv4`	Enable LDP on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe22`	Enter interface mode.
`(config-if)#label-switching`	Enable label switching on interface
`(config-if)#enable-ldp ipv4`	Enable LDP on this interface
`(config-if)#ip address 22.22.22.29/24`	Set an IP address of the interface.
`(config-if)#no shutdown`	Administratively no shutdown the interface.
`(config-if)#enable-rsvp`	Enable RSVP message exchange on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf`	Enter the router configure mode for OSPF.

`(config-router)#router-id 29.29.29.29`	Configure OSPF router-ID same as loopback interface IP address

`(config-router)#network 21.21.21.0/24 area 0`
`(config-router)#network 22.22.22.0/24 area 0`
`(config-router)#network 29.29.29.29/32 area 0`
	Define the network on which OSPF runs and associate the area ID

`(config-router)#exit`	Exit the router configure mode.
`(config)#rsvp-path p21`	Enter the path mode for RSVP pt1.
`(config-path)#21.21.21.43 strict`	Configure this explicit route path as a strict hop.
`(config-path)#38.38.38.42 strict`	Configure this explicit route path as a strict hop.
`(config-path)#69.69.69.30 strict`	Configure this explicit route path as a strict hop.
`(config)#exit`	Exit the path mode.
`(config)#rsvp-trunk to_30 ipv4`	Enter the trunk mode for RSVP.
`(config-trunk)#primary fast-reroute protection one-to-one`	Configure primary fast-reroute protection facility for a trunk.
`(config-trunk)#primary fast-reroute node-protection`	Configure primary fast-reroute node protection for the trunk
`(config-trunk)#primary path p21`	Configure trunk to 30 to use the defined path.
`(config-trunk)#to 30.30.30.30`	Specify the IPv4 egress (destination point) for the LSP.
`(config-trunk)#exit`	Exit from trunk mode.
`(config)#ip vrf vrf1`	Configure VRF instance
`(config-vrf)#rd 100:1`	Configure Router Distinguisher value
`(config-vrf)#route-target both 100:1`	Configure route-target as both
`(config-vrf)#exit`	Exit the path mode.
`(config)#interface xe43`	Enter to the interface mode
`(config-if)#ip vrf forwarding vrf1`	Bind the VRF instance to the interface
`(config-if)#ip address 43.43.43.29/24`	Configure IP address
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Configure BGP router instance
`(config-router)#neighbor 30.30.30.30 remote-as 100`	Configure neighbor with remote-as
`(config-router)#neighbor 30.30.30.30 update-source 29.29.29.29`	Configure update source as loopback address
`(config-router)#address-family vpnv4 unicast`	Configure VPNv4 address family
`(config-router-af)#neighbor 30.30.30.30 activate`	Activate the VPN neighbor
`(config-router-af)#exit-address-family`	Exit the VPN address family
`(config-router)#address-family ipv4 vrf vrf1`	Configure VRF address family
`(config-router-af)redistribute connected`	Redistribute connected route
`(config-router-af)exit-address-family`	Exit VRF address family
`(config-router)#exit`	Exit router mode
`(config)#mpls l2-circuit vlan10 10 30.30.30.30`	Configure Virtual circuit.
`(config-pseudowire)#exit`	Exit pseudowire config mode.
`(config)#service-template st1`	Template configuration

(config-svc)#match outer-vlan 10	Match criteria under template configuration
(config-svc)#exit	Exit service template mode
(config)#service-template st2	Template configuration
(config-svc)#match outer-vlan 30	Match criteria under template configuration
(config-svc)#exit	Exit service template mode
(config)#interface xe44	Enter interface configuration mode
(config-if)#switchport	Configure interface as switch port
(config-if)#mpls-l2-circuit t1 service-template st1	Bind the interface to the VC with service template
(config-if)#exit	Exit interface configuration mode
(config)#mpls vpls vpls30 30	Configure VPLS instance
(config-vpls)#signaling ldp	Configure VPLS signaling as LDP
(config-vpls-sig)#vpls-type vlan	Configure VPLS type as VLAN encapsulation
(config-vpls-sig)#vpls-peer 30.30.30.30	Configure VPLS peer
(config-vpls-sig)#exit-signaling	Exit VPLS configuration mode
(config)#interface xe45	Enter interface configuration mode
(config-if)#switchport	Configure interface as switch port
(config-if)#mpls-vpls vpls30 service-template st2	Bind the VPLS instance to the interface
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#commit	Commit the transaction.

RTR-43

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 43.43.43.43/32 secondary	Set a secondary IP address of the interface
(config-if)#no shutdown	Administratively shutdown the interface.
(config-if)#exit	Exit interface mode.
(config)#router-id 43.43.43.43	Configure the router ID.
(config)#router rsvp	Enter to router RSVP mode.
(config-router)#exit	Exit the router mode
(config)#interface xe5/1	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 11.11.11.43/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe9/1	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface

(config-if)#ip address 21.21.21.43/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe9/2	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 22.22.22.43/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe13/2	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface
(config-if)#ip address 38.38.38.43/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf	Enter the router configure mode for OSPF.
(config-router)#router-id 43.43.43.43	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 11.11.11.0/24 area 0 (config-router)#network 22.22.22.0/24 area 0 (config-router)#network 21.21.21.0/24 area 0 (config-router)#network 38.38.38.0/24 area 0 (config-router)#network 43.43.43.43/32 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#commit	Commit the transaction.

RTR-42

(config)#interface lo	Enter interface mode.
(config-if)#ip address 42.42.42.42/32 secondary	Set a secondary IP address of the interface
(config-if)#no shutdown	Administratively shutdown the interface.
(config-if)#exit	Exit interface mode.
(config)#router-id 42.42.42.42	Configure the router ID.
(config)#router rsvp	Enter to router RSVP mode.
(config-router)#exit	Exit the router mode
(config)#interface xe2	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 5.5.5.42/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe10/1	Enter interface mode.

(config-if)#label-switching	Enable label switching on interface
(config-if)#ip address 25.25.25.42/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 38.38.38.42/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe4	Enter interface mode
(config-if)#label-switching	Enable label switching on interface
(config-if)#ip address 69.69.69.42/24	Specify an IP address for the interface
(config-if)#no shutdown	Administratively no shutdown the interface
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface
(config-if)#exit	Exit interface mode
(config)#router ospf	Enter the router configure mode for OSPF.
(config-router)#router-id 42.42.42.42	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 5.5.5.0/24 area 0 (config-router)#network 25.25.25.0/24 area 0 (config-router)#network 69.69.69.0/24 area 0 (config-router)#network 38.38.38.0/24 area 0 (config-router)#network 42.42.42.42/32 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#commit	Commit the transaction

RTR-41

(config)#interface lo	Enter interface mode.
(config-if)#ip address 44.44.44.44/32 secondary	Set a secondary IP address of the interface
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#exit	Exit interface mode.
(config)#router-id 44.44.44.44	Configure the router ID.
(config)#router rsvp	Enter to router RSVP mode.
(config-router)#exit	Exit the router mode
(config)#interface xe1/1	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 1.1.1.41/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.

(config)#interface xe2	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface
(config-if)#ip address 5.5.5.41/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe5/1	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 11.11.11.41/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf	Enter the router configure mode for OSPF.
(config-router)#router-id 44.44.44.44	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 5.5.5.0/24 area 0 (config-router)#network 1.1.1.0/24 area 0 (config-router)#network 11.11.11.0/24 area 0 (config-router)#network 44.44.44.44/32 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#commit	Commit the transaction.

RTR-31

(config)#interface lo	Enter interface mode.
(config-if)#ip address 31.31.31.31/32 secondary	Set a secondary IP address of the interface
(config-if)#no shutdown	Administratively shutdown the interface.
(config-if)#exit	Exit interface mode.
(config)#router-id 31.31.31.31	Configure the router ID.
(config)#router rsvp	Enter to router RSVP mode.
(config-router)#exit	Exit the router mode
(config)#interface xe1	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 1.1.1.31/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe25	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface
(config-if)#ip address 25.25.25.31/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.

(config-if)#exit	Exit interface mode.
(config)#interface xe41	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 41.41.41.31/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf	Enter the router configure mode for OSPF.
(config-router)#router-id 31.31.31.31	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 1.1.1.0/24 area 0 (config-router)#network 25.25.25.0/24 area 0 (config-router)#network 41.41.41.0/24 area 0 (config-router)#network 31.31.31.31/32 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#commit	Commit the transaction.

RTR-30

(config)#interface lo	Enter interface mode.
(config-if)#ip address 30.30.30.30/32 secondary	Set a secondary IP address of the interface
(config-if)#no shutdown	Administratively shutdown the interface.
(config-if)#exit	Exit interface mode.
(config)#router-id 30.30.30.30	Configure the router ID.
(config)#router rsvp	Enter to router RSVP mode.
(config-router)#exit	Exit the router mode
(config)#router ldp	Enter to router LDP mode.
(config-router)#targeted-peer ipv4 29.29.29.29	Configure targeted peer.
(config-router-targeted-peer)#exit-targeted-peer-mode	Exit-targeted-peer-mode
(config-router)#exit	Exit router mode
(config)#interface xe41	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#ip address 41.41.41.30/24	Set an IP address of the interface.
(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#enable-ldp ipv4	Enable LDP on this interface
(config-if)#exit	Exit interface mode.
(config)#interface xe54/1	Enter interface mode.
(config-if)#label-switching	Enable label switching on interface
(config-if)#enable-ldp ipv4	Enable LDP on this interface
(config-if)#ip address 69.69.69.30/24	Set an IP address of the interface.

(config-if)#no shutdown	Administratively no shutdown the interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf	Enter the router configure mode for OSPF.
(config-router)#router-id 30.30.30.30	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 41.41.41.0/24 area 0 (config-router)#network 69.69.69.0/24 area 0 (config-router)#network 30.30.30.30/32 area 0	Define the network on which OSPF runs and associate the area ID
(config-router)#commit	Commit the transaction.
(config)#rsvp-path p41	Enter the path mode for RSVP pt1.
(config-path)#41.41.41.31 strict	Configure this explicit route path as a strict hop.
(config-path)#1.1.1.41 strict	Configure this explicit route path as a strict hop.
(config-path)#11.11.11.43 strict	Configure this explicit route path as a strict hop.
(config)#exit	Exit the path mode.
(config)#rsvp-trunk to_29 ipv4	Enter the trunk mode for rsvp.
(config-trunk)#primary fast-reroute protection one-to-one	Configure primary fast-reroute protection facility for a trunk.
(config-trunk)#primary fast-reroute node-protection	Configure primary fast-reroute node protection for the trunk
(config-trunk)#primary path p41	Configure trunk to_29 to use the defined path.
(config-trunk)#to 29.29.29.29	Specify the IPv4 egress (destination point) for the LSP.
(config-trunk)#exit	Exit from trunk mode.
(config)#ip vrf vrf1	Configure VRF instance
(config-vrf)#rd 100:1	Configure Router Distinguisher value
(config-vrf)#route-target both 100:1	Configure route-target as both
(config-vrf)#exit	Exit the path mode.
(config)#interface xe23	Enter to the interface mode
(config-if)#ip vrf forwarding vrf1	Bind the VRF instance to the interface
(config-if)#ip address 23.23.23.29/24	Configure IP address
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Configure BGP router instance
(config-router)#neighbor 29.29.29.29 remote-as 100	Configure neighbor with remote-as
(config-router)#neighbor 29.29.29.29 update-source 30.30.30.30	Configure update source as loopback address
(config-router)#address-family vpnv4 unicast	Configure VPNv4 address family
(config-router-af)#neighbor 29.29.29.29 activate	Activate the VPN neighbor
(config-router-af)#exit-address-family	Exit the VPN address family
(config-router)#address-family ipv4 vrf vrf1	Configure VRF address family
(config-router-af)redistribute connected	Redistribute connected route
(config-router-af)exit-address-family	Exit VRF address family

(config-router)#exit	Exit router mode
(config)#mpls l2-circuit vlan10 10 29.29.29.29	Configure Virtual circuit.
(config-pseudowire)#exit	Exit pseudowire config mode.
(config)#service-template st1	Template configuration
(config-svc)#match outer-vlan 10	Match criteria under template configuration
(config-svc)#exit	Exit service template mode
(config)#service-template st2	Template configuration
(config-svc)#match outer-vlan 30	Match criteria under template configuration
(config-svc)#exit	Exit service template mode
(config)#interface xe24	Enter interface configuration mode
(config-if)#switchport	Configure interface as switch port
(config-if)#mpls-l2-circuit vlan10 service-template st1	Bind the interface to the VC with service template
(config-if)#exit	Exit interface configuration mode
(config)#mpls vpls vpls30 30	Configure VPLS instance
(config-vpls)#signaling ldp	Configure VPLS signaling as LDP
(config-vpls-sig)#vpls-type vlan	Configure VPLS type as VLAN encapsulation
(config-vpls-sig)#vpls-peer 29.29.29.29	Configure VPLS peer
(config-vpls-sig)#exit-signaling	Exit VPLS configuration mode
(config)#interface xe25	Enter interface configuration mode
(config-if)#switchport	Configure interface as switch port
(config-if)#mpls-vpls vpls30 service-template st2	Bind the VPLS instance to the interface
(config-if-vpls)#split-horizon group access1	Configure split-horizon group on VPLS
(config-if-vpls)#exit	Exit VPLS attachment-circuit mode
(config-if)#commit	Commit the transaction.

MPLS RSVP Entropy Label Capabilities

To share the load across multiple members of a LAG port in the core of an MPLS network we can use entropy labels

An Entropy Label is always preceded by an Entropy level indicator which is a special Label with value seven, and indicates the next label present is an Entropy label. The trade off is the MPLS stack depth increases by two and it reduces overhead on transit routers.

Note: Load balancing is enabled by default for all the parameters. If you enable load balancing manually, then all the parameters enabled by default are reset and you need to enable the parameters based on which traffic should be load balanced.

Entropy labels will only be added when the remote edge node advertises its capability for Entropy.

The examples below show how entropy can be enabled on a provider edge node as per the setup we need to enable on RTR29 and RTR30 to have entropy enabled in both directions:

```
(config)#router rsvp
(config-router)#entropy-label-capability
```

This enables ELC signaling for RSVP.

For validation, use:

```
#show mpls forwarding-table
Codes: > - installed FTN, * - selected FTN, p - stale FTN, B - BGP FTN, K - CLI FTN, t - 
tunnel

```

MPLS RSVP LSP Re-optimization

Follow these steps to configure RSVP LSP Re-optimization.

`#configure terminal`	Enter configure mode.
`(config)#rsvp-trunk T1`	Create an RSVP trunk T1 and enter the Trunk mode.
`(config-trunk)#reoptimize`	Enable re-optimization of the session.

`#configure terminal`	Enter configure mode.
`(config)#router rsvp`	Enter RSVP mode
`(config-router)#lsp-reoptimization-timer 5`	Sets the re-optimization timer for the session.

Follow these steps to force the LSP to be re-optimized.

`#rsvp-trunk t1 force-reoptimize`	Re-optimize the LSP forcefully

CHAPTER 2 RSVP-TE Facility Backup (Facility Bypass)

RSVP supports multiple path protection mechanisms and facility backup is one of them. With facility backup protection, N number of LSPs sharing the common path can be protected using one bypass tunnel which leads to resource utilization.

Note: Do not configure a facility backup trunk with the same transit node as that of the primary trunk.

Topology

As shown in Figure 2-18, we have four routers R1, R2, R3, and R4.

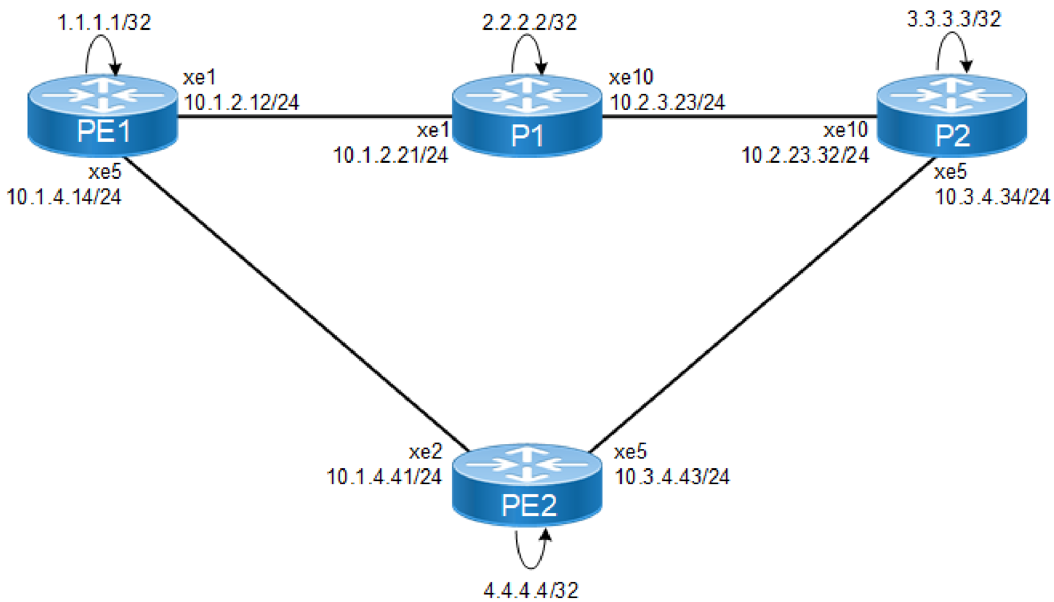

Figure 2-18: RSVP facility backup

Configuration

PE1

#configure terminal	Enter configuration mode
(config)#interface lo	Specify interface loopback for configuration
(config-if)#ip address 1.1.1.1/32 secondary	Configure ip address of loopback
(config-if)#exit	Exit interface configuration mode
(config)#interface xe1	Specify interface xe1 for configuration
(config-if)#ip address 10.1.2.12/24	Configure ip address of interface
(config)#exit	Exit interface configuration mode
(config-if)#int xe5	Specify interface xe1 for configuration
(config-if)#ip address 10.1.4.14/24	Configure ip address of loopback

(config-if)#exit	Exit configuration mode
(config)#router ospf 1	Configure the router OSPF with process id
(config-router)#router-id 1.1.1.1	Configure OSPF router-id
(config-router)#network 1.1.1.1/32 area 1	Define the network of the interface with area 0
(config-router)#network 10.1.2.0/24 area 1	Define the network of the interface with area 0
(config-router)#network 10.1.4.0/24 area 1	Define the network of the interface with area 0
(config-router)#exit	Exit the configure mode
(config)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval
(config)#exit	Exit the configure mode
(config)#router ospf 1	Enter router OSPF mode with process id
(config-router)#bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-router)#exit	Exit the router mode
(config)#router rsvp	Enter router RSVP
(config-router)#exit	Exit the router configuration mode
(config)#interface xe1	Enter the interface mode
(config-if)#enable-rsvp	Enable RSVP
(config-if)#label-switching	Enable label-switching
(config-if)#exit	Exit the interface configuration mode
(config)#interface xe5	Enter the interface mode
(config-if)#enable-rsvp	Enable RSVP
(config-if)#label-switching	Enable label-switching
(config-if)#commit	Commit the transaction.

P1

(config)#interface lo	Specify the interface (lo)
(config-if)#ip address 2.2.2.2/32 secondary	Enter the loopback ip address as secondary
(config-if)#exit	Exit the interface configure mode
(config-if)#int xe1	Specify the interface(xe1)
(config-if)#ip address 10.1.2.21/24	Configure the IP address for the interface
(config-if)#exit	Exit the interface mode
(config-if)#int xe10	Specify the interface(xe1)
(config-if)#ip address 10.2.3.23/24	Configure the IP address for the interface
(config-if)#exit	Exit the configuration mode
(config)#router ospf 1	Configure OSPF router-id
(config-router)#router-id 2.2.2.2	Configure the router id
(config-router)#network 2.2.2.2/32 area 1	Define the network of the interface with area 0
(config-router)#network 10.1.2.0/24 area 1	Define the network of the interface with area 0
(config-router)#network 10.2.3.0/24 area 1	Define the network of the interface with area 0
(config-router)#exit	Exit the configure mode
(config)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval

(config)#exit	Exit the configure mode
(config)#router ospf 1	Enter router OSPF mode with process id
(config-router)#bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-router)#exit	Exit the router mode
(config)#router rsvp	Enter router RSVP
(config-router)#exit	Exit the router configuration mode
(config)#interface xe1	Enter the interface mode
(config-if)#enable-rsvp	Enable RSVP
(config-if)#label-switching	Enable label-switching
(config-if)#exit	Exit the interface configuration mode
(config)#interface xe10	Enter the interface mode
(config-if)#enable-rsvp	Enable RSVP
(config-if)#label-switching	Enable label-switching
(config-if)#commit	Commit the transaction.

P2

(config)#interface lo	Specify the interface (lo)
(config-if)#ip address 3.3.3.3/32 secondary	Enter the loopback ip address as secondary
(config-if)#exit	Exit the interface configuration mode
(config-if)#int xe10	Specify the interface(xe1)
(config-if)#ip address 10.2.3.32/24	Configure the IP address for the interface
(config-if)#exit	Exit the interface mode
(config-if)#interface xe5	Specify the interface(xe1)
(config-if)#ip address 10.3.4.34/24	Configure the IP address for the interface
(config-if)#exit	Exit the configuration mode
(config)#router ospf 1	Configure OSPF router-id
(config-router)#router-id 3.3.3.3	Configure the router id
(config-router)#network 3.3.3.3/32 area 1	Define the network of the interface with area 0
(config-router)#network 10.3.4.0/24 area 1	Define the network of the interface with area 0
(config-router)#network 10.2.3.0/24 area 1	Define the network of the interface with area 0
(config-router)#exit	Exit the configure mode
(config)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval
(config)#exit	Exit the configure mode
(config)#router ospf 1	Enter router OSPF mode with process id
(config-router)#bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-router)#exit	Exit the router mode
(config)#router rsvp	Enter router RSVP
(config-router)#exit	Exit the router configuration mode
(config)#interface xe10	Enter the interface mode
(config-if)#enable-rsvp	Enable RSVP

(config-if)#label-switching	Enable label-switching
(config-if)#exit	Exit the interface configuration mode
(config)#interface xe5	Enter the interface mode
(config-if)#enable-rsvp	Enable RSVP
(config-if)#label-switching	Enable label-switching
(config-if)#commit	Commit the transaction.

PE2

(config)#interface lo	Specify the interface (lo)
(config-if)#ip address 4.4.4.4/32 secondary	Enter the loopback IP address as secondary
(config-if)#exit	Exit the interface configuration mode
(config-if)#interface xe2	Specify the interface(xe1)
(config-if)#ip address 10.1.4.41/24	Configure the ip address for the interface
(config-if)#exit	Exit the interface mode
(config-if)#int xe5	Specify the interface(xe1)
(config-if)#ip address 10.3.4.43/24	Configure the ip address for the interface
(config-if)#exit	Exit the configuration mode
(config)#router ospf 1	Configure ospf router-id
(config-router)#router-id 4.4.4.4	Configure the router id
(config-router)#network 4.4.4.4/32 area 1	Define the network of the interface with area 0
(config-router)#network 10.1.4.0/24 area 1	Define the network of the interface with area 0
(config-router)#network 10.3.4.0/24 area 1	Define the network of the interface with area 0
(config-router)#exit	Exit the configure mode
(config)#bfd interval 3 minrx 3 multiplier 3	Configure BFD interval
(config)#exit	Exit the configuration mode
(config)#router ospf 1	Exit the router OSPF mode with process id
(config-router)#bfd all-interfaces	Enable the OSPF enabled interfaces with bfd
(config-router)#exit	Exit the router mode
(config)#router rsvp	Enter router RSVP
(config-router)#exit	Exit the router configuration mode
(config)#interface xe1	Enter the interface mode
(config-if)#enable-rsvp	Enable RSVP
(config-if)#label-switching	Enable label-switching
(config-if)#exit	Exit the interface configuration mode
(config)#interface xe5	Enter the interface mode
(config-if)#enable-rsvp	Enable RSVP
(config-if)#label-switching	Enable label-switching
(config-if)#commit	Commit the transaction.

RSVP Path on PE1

(config)#rsvp-path primary_1	Enter the rsvp-path configuration mode with name
(config-path)#10.1.2.21 strict	Specify the first next-hop ip address
(config-path)#10.2.3.32 strict	Specify the second next-hop ip address
(config-path)#exit	Exit the rsvp-path configuration mode
#configure terminal	Enter the configuration mode
(config)#rsvp-path bypass_1	Enter the rsvp-path configuration mode with name
(config-path)#10.1.4.41 strict	Specify the first next-hop ip address
(config-path)#10.3.4.34 strict	Specify the second next-hop ip address
(config-path)#exit	Exit the rsvp-path configuration mode
#configure terminal	Enter the configuration mode
(config)#rsvp-trunk R1-R3	Enter the rsvp trunk to be created with name
(config-trunk)#primary path primary_1	Configure primary path for the trunk
(config-trunk)#to 3.3.3.3	Enter the destination ip
(config-trunk)#primary fast-reroute protection facility	Configure facility backup protection for the trunk
(config-trunk)#exit	Exit the configuration mode
(config)#rsvp-bypass B1-B8	Enter the rsvp bypass to be created with name
(config-trunk)#path bypass_1	Configure primary path for the trunk
(config-trunk)#to 3.3.3.3	Enter the destination IP
(config-if)#commit	Commit the transaction.

Limitations

Dedicated Bypass Bandwidth

Refer the topology defined above.

Suppose we have two primary tunnels P1 (100mbps) and P2(20mbps) ingressing from R1 and egressing at R3 (path R1->R2>R3) and asking for BW protection and we have two Bypass tunnels bp1 (120mbps) and bp2(80mbps) type dedicated with same ingress and egress router taking Path R1->R4->R3. Below are the two cases defined in which we can observe different kinds of behavior.

1. Let the primary P1 and P2 come up.

CASE 1:

i) If the bypass bp1 (120mbps) comes up first it will give protection to both the primaries P1 and P2. bp2 should remain idle and will not give protection if there are no other primary tunnels asking for it.

CASE 2:

i) If the bypass bp2 (80mbps) comes up first it will give protection to only the primary P2 (20mbps) that will have satisfied protection which will not be changed until the bypass will go down.

ii) After that if bp1 (120mbps) comes it will provide protection to primary P1 (100mbps).

So in the CASE 1 after the protection has been provided to both the primary tunnels P1 and P2 by bypass bp1 if new primary tunnel P3 comes up with BW protection of 80mbps it would be given by bp2 (80mbps).

But in the CASE 2 as bp2 has only 60mbps left (20mbps is being used by P2) and it would not give protection to P3 tunnel and it will remain unprotected. To get the protection new tunnel has to have setup and hold priorities higher than other tunnels which are already been served with the bypass protection.

Secondary Tunnel

Suppose we have primary tunnel P1 (100mbps) ingressing from R1 and egressing at R3 (path R1->R2>R3) and asking for BW protection and we have Bypass tunnel bp1 (120mbps) type dedicated with same ingress and egress router taking Path R1->R4->R3. Then Bypass will start providing protection to primary P1.

If the primary went down it will start using the local protection.

After that if the secondary tunnel is provisioned, primary LSP, which is in using backup state shall continue to use backup path and will not shift over to secondary path.

Facility Bypass with Ring Topology Configuration

This section contains a complete Facility Bypass with Ring Topology configuration.

During facility bypass integration to OcNOS SP, few issues were reported when upstream and downstream interfaces of a session happens to be same (i.e. protection path is same as upstream path) and also CSPF most likely had some issues where LSP path used to formed by crossing the head node of the path.

Considering the information available in RSVP to impose restriction, bypass tunnel path crossing primary LSP node anywhere in between merge point were not considered for mapping.

Below assumption point was added in ERD and documents were updated on the line.

If protection is requested by primary session, then initial bypass matching criteria will be to ensure egress (merge point) node of bypass will be one of the nodes of primary LSP and bypass never intersect any node of primary LSP until the merge point.

The facility bypass method takes advantage of the MPLS label stack. Instead of creating a separate LSP for every backed-up LSP, a single LSP is created that serves to back up a set of LSPs. We call such an LSP tunnel a bypass tunnel. The bypass tunnel must intersect the path of the original LSP(s) somewhere downstream of the PLR. Naturally, this constrains the set of LSPs being backed up via that bypass tunnel to those that pass through some common downstream node. All LSPs that pass through the point of local repair and through this common node that do not also use the facilities involved in the bypass tunnel are candidates for this set of LSPs.

By multiple facility bypass tunnels, we mean that multiple facility bypass tunnels can be created to the same egress/MP. For a protected LSP there could be multiple candidates available. The mapping of the LSP to one of the backup tunnels has to be efficiently done so that we can extract the maximum benefit out of those backup tunnels available

Topology

Figure 2-19 displays a sample Facility Bypass with Ring topology.

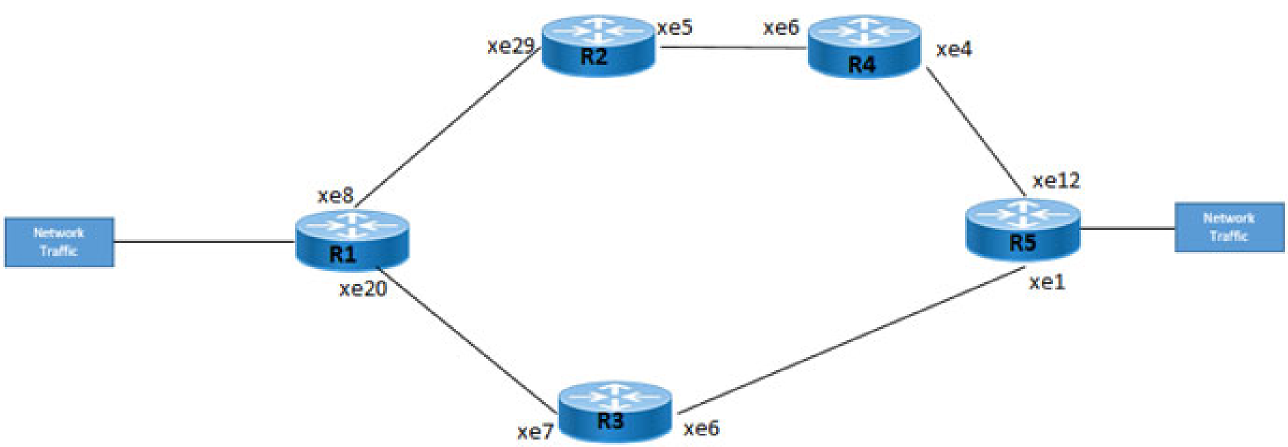

Figure 2-19: Facility Bypass with Ring Topology

Configurations

All configuration commands in the table below should be followed for each router.

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure IP address for the loopback interface.

`(config-if)#ip router isis ISIS-IGP`	Enable IS-IS routing on an interface
`(config-if)#exit`	Exit interface mode.
`(config)#bfd interval 3 minrx 3 multiplier`	Configure BFD interval
`(config)#router-id 1.1.1.1`	Assigning router-id
`(config)#router rsvp`	Enter router mode for RSVP.
`(config-router)#exit`	Exit router configuration mode.
`(config)#interface xe8`	Specify the Interface to be configured.
`(config-if)#ip address 10.1.1.1/24`	Configure IP address for the interface.
`(config-if)#no shutdown`	Administratively bringing up the interface.
`(config-if)#label-switching`	Enable label switching on the interface
`(config-if)#isis network point-to-point`	Configure the ISIS interface network type as point to point
`(config-if)#ip router isis ISIS-IGP`	Enable IS-IS routing on an interface
`(config-if)#enable-rsvp`	Enable rsvp configuration on interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe20`	Specify the Interface to be configured
`(config-if)#ip address 12.1.1.1/24`	Configure IP address for the interface.
`(config-if)#no shutdown`	Administratively bringing up the interface.
`(config-if)#label-switching`	Enable label switching on the interface
`(config-if)#isis network point-to-point`	Configure the ISIS interface network type as point to point
`(config-if)#ip router isis ISIS-IGP`	Enable IS-IS routing on an interface
`(config-if)#enable-rsvp`	Enable rsvp configuration on interface
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ISIS-IGP`	Create an IS-IS routing instance
`(config-router)#is-type level-1`	Configure instance as level-1only routing.
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#mpls traffic-eng router-id 1.1.1.1`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1
`(config-router)#capability cspf`	Enable CSPF feature for ISIS instance.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance
`(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#exit`	Exit router mode.
`(config)#rsvp-path R1-R5-PRI-001`	Create a rsvp path
`(config-path)#10.1.1.2 strict`	Configure this explicit router path as a strict hop
`(config-path)#14.1.1.3 strict`	Configure this explicit router path as a strict hop
`(config-path)#17.1.1.3 strict`	Configure this explicit router path as a strict hop
`(config-path)#exit`	Exit the rsvp-path mode
`(config)#rsvp-path R1-R5-BPS-001`	Create a rsvp path
`(config-path)#12.1.1.2 strict`	Configure this explicit router path as a strict hop

(config-path)#15.1.1.3 strict	Configure this explicit router path as a strict hop
(config-path)#exit	Exit the rsvp-path mode
(config)#rsvp-trunk R1-R5-PRI-001	Enter the trunk mode for RSVP
(config-trunk)#primary fast-reroute protection facility	Configure primary fast-reroute protection facility for a trunk.
(config-trunk)#primary fast-reroute node-protection	Configure primary fast-reroute node protection for a trunk.
(config-trunk)#primary path R1-R5-PRI-001	Configure trunk to use the defined path.
(config-trunk)#to 5.5.5.5	Specify the IPv4 egress (destination point) for the LSP
(config-path)#exit	Exit the rsvp-trunk mode
(config)#rsvp-bypass R1-R5-BPS-001	Enter the bypass mode for RSVP
(config-trunk)#path R1-R5-BPS-001	Configure path for bypass tunnel
(config-trunk)#to 5.5.5.5	Specify the IPv4 egress (destination point) for the LSP
(config-path)#exit	Exit the rsvp-bypass mode
(config)#commit	Commit the transaction.

R2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 2.2.2.2/32 secondary	Configure IP address for the loopback interface.
(config-if)#ip router isis ISIS-IGP	Enable IS-IS routing on an interface
(config-if)#exit	Exit interface mode.
(config)#router-id 2.2.2.2	Assigning router-id
(config)#bfd interval 3 minrx 3 multiplier	Configure BFD interval
(config)#router rsvp	Enter router mode for RSVP.
(config-router)#exit	Exit router configuration mode.
(config)#interface xe29	Specify the Interface to be configured.
(config-if)#ip address 10.1.1.2/24	Configure IP address for the interface.
(config-if)#no shutdown	Administratively bringing up the interface.
(config-if)#label-switching	Enable label switching on the interface
(config-if)#isis network point-to-point	Configure the ISIS interface network type as point to point
(config-if)#ip router isis ISIS-IGP	Enable IS-IS routing on an interface
(config-if)#enable-rsvp	Enable rsvp configuration on interface
(config-if)#exit	Exit interface mode.
(config)#interface xe5	Specify the Interface to be configured
(config-if)#ip address 14.1.1.2/24	Configure IP address for the interface.
(config-if)#no shutdown	Administratively bringing up the interface.
(config-if)#label-switching	Enable label switching on the interface
(config-if)#isis network point-to-point	Configure the ISIS interface network type as point to point
(config-if)#ip router isis ISIS-IGP	Enable IS-IS routing on an interface
(config-if)#enable-rsvp	Enable rsvp configuration on interface

`(config-if)#exit`	Exit interface mode.
`(config)#router isis ISIS-IGP`	Create an IS-IS routing instance
`(config-router)#is-type level-1`	Configure instance as level-1only routing.
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#mpls traffic-eng router-id 2.2.2.2`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1
`(config-router)#capability cspf`	Enable CSPF feature for ISIS instance.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance
`(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the transaction.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Configure IP address for the loopback interface.
`(config-if)#ip router isis ISIS-IGP`	Enable IS-IS routing on an interface
`(config-if)#exit`	Exit interface mode.
`(config)#router-id 3.3.3.3`	Assigning router-id
`(config)#bfd interval 3 minrx 3 multiplier`	Configure BFD interval
`(config)#router rsvp`	Enter router mode for RSVP.
`(config-router)#exit`	Exit router configuration mode.
`(config)#interface xe7`	Specify the Interface to be configured.
`(config-if)#ip address 12.1.1.2/24`	Configure IP address for the interface.
`(config-if)#no shutdown`	Administratively bringing up the interface.
`(config-if)#label-switching`	Enable label switching on the interface
`(config-if)#isis network point-to-point`	Configure the ISIS interface network type as point to point
`(config-if)#ip router isis ISIS-IGP`	Enable IS-IS routing on an interface
`(config-if)#enable-rsvp`	Enable rsvp configuration on interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe6`	Specify the Interface to be configured
`(config-if)#ip address 15.1.1.2/24`	Configure IP address for the interface.
`(config-if)#no shutdown`	Administratively bringing up the interface.
`(config-if)#label-switching`	Enable label switching on the interface
`(config-if)#isis network point-to-point`	Configure the ISIS interface network type as point to point
`(config-if)#ip router isis ISIS-IGP`	Enable IS-IS routing on an interface
`(config-if)#enable-rsvp`	Enable rsvp configuration on interface
`(config-if)#exit`	Exit interface mode.

© 2025 IP Infusion Inc. Proprietary

(config)#router isis ISIS-IGP	Create an IS-IS routing instance
(config-router)#is-type level-1	Configure instance as level-1only routing.
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#mpls traffic-eng router-id 3.3.3.3	Configure MPLS-TE unique router-id TLV.
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1

CHAPTER 3 RSVP-Multipath Configuration

RSVP multipath provides multiple paths to reach the destination. RSVP services (L2 VPN, L3 VPN, LU, mapped route, etc.) can be mapped to RSVP multipath so that traffic is load-balanced. At ingress node the traffic is load-balanced based on the configured hash (L3 src/dest IP/port, L2 src/dst mac, or in-label if intermediate Autonomous segments). Each LSP path within multipath group can provide individual protection for each path (facility, 1-to-1, secondary). Each tunnel path in multipath group cost may vary (can have different hop, with consideration for load-balancing the traffic). Each member can have the backup protection as other multipath member path or outside the multipath member path.

Topology

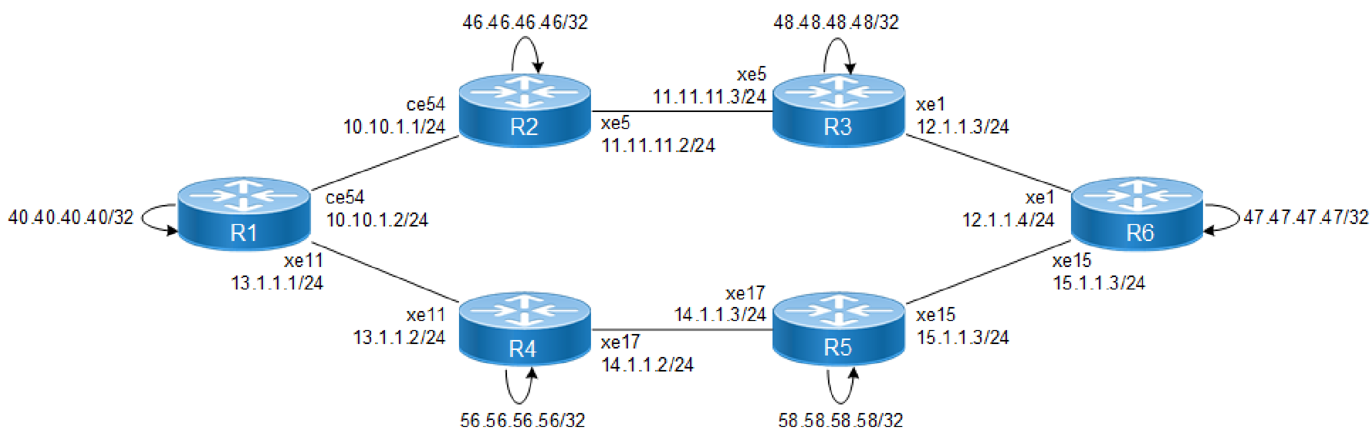

Figure 3-20: RSVP-Multipath Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#hardware-profile statistics tunnel-lif enable`	Configure hardware-profile statistics
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 40.40.40.40/32 secondary`	Set a secondary IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router rsvp`	Enter Configure Router mode.
`(config-router)#router-id 40.40.40.40`	Set the router ID to IP address 40.40.40.40
`(config-router)#exit`	Exit Router mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.1.1/24`	Set the IP address for the interface.
`(config-if)#label-switching`	Enable label switching on interface.
`(config-if)#enable-rsvp`	Enable RSVP message exchange on this interface.

(config-if)#exit	Exit interface mode.
(config)#interface xe11	Enter interface mode.
(config-if)#ip address 13.1.1.1/24	Set the IP address for the interface.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the Routing process and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#router-id 40.40.40.40	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 10.1.1.0/24 area 0	Define the network (10.1.1.0/24) on which OSPF runs and associate the area ID (0).
(config-router)#network 13.1.1.0/24 area 0	Define the network (13.1.1.0/24) on which OSPF runs and associate the area ID (0).
(config-router)#network 40.40.40.40/32 area 0	Set the IP address of the loopback interface to 40.40.40.40/32.
(config-router)#exit	Exit Router mode.
(config)#rsvp-path path1 mpls	Enter the path mode for RSVP path1.
(config-path)#10.1.1.2 strict	Configure this explicit route path as a strict hop.
(config-path)#11.1.1.3 strict	Configure this explicit route path as a strict hop.
(config-path)#12.1.1.4 strict	Configure this explicit route path as a strict hop.
(config)#exit	Exit the path mode.
(config)#rsvp-path path2 mpls	Enter the path mode for RSVP path2.
(config-path)#13.1.1.2 strict	Configure this explicit route path as a strict hop.
(config-path)#14.1.1.3 strict	Configure this explicit route path as a strict hop.
(config-path)#15.1.1.4 strict	Configure this explicit route path as a strict hop.
(config)#exit	Exit the path mode.
(config)#rsvp-trunk t1 ipv4	Enter the trunk mode for rsvp.
(config-trunk)#primary path path1	Configure trunk t1 to use the defined path.
(config-trunk)#from 40.40.40.40	Specify the IPv4 ingress (source point) for the LSP.
(config-trunk)#to 47.47.47.47	Specify the IPv4 egress (destination point) for the LSP.
(config-trunk)#exit	Exit from trunk mode.
(config)#rsvp-trunk t2 ipv4	Enter the trunk mode for rsvp.
(config-trunk)#primary path path2	Configure trunk t2 to use the defined path.
(config-trunk)#from 40.40.40.40	Specify the IPv4 egress (source point) for the LSP.
(config-trunk)#to 47.47.47.47	Specify the IPv4 ingress (destination point) for the LSP.
(config-trunk)#exit	Exit from trunk mode.
(config)#rsvp-multipath test	Configure RSVP Multipath group.
(config-multipath)#to 47.47.47.47	Configure a mandatory destination FEC(egress router).
(config-multipath)#description "my-group"	Configure description to RSVP Multipath group.
(config-multipath)#exit	Exit from RSVP Multipath mode.
(config)#rsvp-trunk t1 ipv4	Enter the trunk mode for rsvp.

(config-trunk)#multipath-group test	Configure RSVP Multipath group to trunk t1.
(config-trunk)#exit	Exit from trunk mode.
(config)#rsvp-trunk t2 ipv4	Enter the trunk mode for rsvp.
(config-trunk)#multipath-group test	Configure RSVP Multipath group to trunk t2.
(config-trunk)#exit	Exit from trunk mode.
(config)#commit	Commit all the configurations.

R2

#configure terminal	Enter configure mode.

CHAPTER 4 RSVP Graceful Restart Configuration

Overview

The RSVP-TE graceful restart enables routers to maintain MPLS forwarding state when a link or node failure occurs. In a link failure, control communication is lost between two nodes, however, the nodes do not lose their control or forwarding state. RSVP Graceful restart (GR) is one of the fault-handling mechanism, that protects the forwarding state of the node during failure and helps to reinstate the previous state when the node has recovered.

Topology

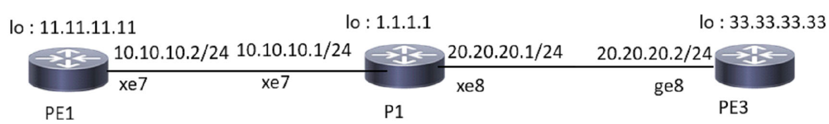

Figure 4-21: RSVP Graceful Restart

Configuration

PE1-NSM

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 11.11.11.11/32 secondary`	Set the IP address for the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe7`	Enter interface mode.
`(config-if)#ip address 10.10.10.2/24`	Set the IP address for the interface.
`(config-if)#label-switching`	Enable label switching on interface `xe7`.
`(config-if)#commit`	Commit the transaction.

PE1-RSVP-TE

`(config)#router rsvp`	Enter `Configure Router` mode.
`(config-router)#exit`	Exit `Router` mode.
`(config)#interface xe7`	Enter interface mode.
`(config-if)#enable-rsvp`	Enable RSVP message exchange on this interface.
`(config-if)#commit`	Commit the transaction.

PE1-OSPF

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#router-id 11.11.11.11`	Configure OSPF router-ID same as loopback interface IP address
`(config-router)#network 10.10.10.0/24 area 0`	Define the network (10.10.10.0/24) on which OSPF runs and associate the area ID (0).
`(config-router)#network 11.11.11.11/32 area 0`	Set the IP address of the loopback interface to 11.11.11.11/32.
`(config-router)#commit`	Commit the transaction.

P - NSM

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 1.1.1.1/32 secondary`	Set the IP address for the interface.
`(config-if)#exit`	Enable label switching on interface lo.
`(config)#interface xe7`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Set the IP address for the interface.
`(config-if)#label-switching`	Enable label switching on interface xe7.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe8`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Set the IP address for the interface.
`(config-if)#label-switching`	Enable label switching on interface xe7.
`(config-if)#commit`	Commit the transaction.

P - RSVP-TE

(config)#router rsvp	Enter Configure Router mode.
(config-router)#exit	Exit Router mode.
(config)#interface xe7	Enter interface mode.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe8	Enter interface mode.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#commit	Commit the transaction.

P - OSPF

#configure terminal	Enter configure mode.
(config)#router ospf 100	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#router-id 1.1.1.1	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 10.10.10.0/24 area 0	Define the first network (10.10.10.0/24) on which OSPF runs and associate the area ID (0).
(config-router)#network 20.20.20.0/24 area 0	Define the second network (20.20.20.0/24) on which OSPF runs and associate the area ID (0).
(config-router)#network 1.1.1.1/32 area 0	Set the IP address of the loopback interface to 1.1.1.1/32.
(config-router)#commit	Commit the transaction.

PE3 - NSM

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 33.33.33.33/32 secondary	Set the IP address for the interface.
(config-if)#exit	Exit interface mode.
(config)#interface ge8	Enter interface mode.
(config-if)#ip address 20.20.20.2/24	Set the IP address for the interface.
(config-if)#label-switching	Enable label switching on interface ge8.
(config-if)#commit	Commit the transaction.

PE3- RSVP-TE

(config)#router rsvp	Enter Configure Router mode.
(config-router)#exit	Exit Router mode.
(config)#interface ge8	Enter interface mode.
(config-if)#enable-rsvp	Enable RSVP message exchange on this interface.
(config-if)#commit	Commit the transaction.

PE3 - OSPF

#configure terminal	Enter configure mode.
(config)#router ospf 100	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#router-id 33.33.33.33	Configure OSPF router-ID same as loopback interface IP address
(config-router)#network 20.20.20.0/24 area 0	Define the network (20.20.20.0/24) on which OSPF runs and associate the area ID (0).
(config-router)#network 33.33.33.33/32 area 0	Set the IP address of the loopback interface to 33.33.33.33/32.
(config-router)#commit	Commit the transaction.

PE1 - RSVP-Path

#configure terminal	Enter configure mode.
(config)#rsvp-path PE1_to_PE3_via_P1 mpls	Create an RSVP Path and enter the Path mode.
(config-path)#10.10.10.1 strict	Configure this explicit route path as a strict hop.
(config-path)#20.20.20.2 strict	Configure this explicit route path as a strict hop.
(config-path)#exit	Exit Path mode.
#configure terminal	Enter configure mode.
(config)#rsvp-trunk PE1_to_PE3 ipv4	Create an RSVP trunk and enter the Trunk mode.
(config-trunk)#primary path PE1_to_PE3_via_P1	Configure the trunk to use defined path.
(config-trunk)#from 11.11.11.11	Specify ipv4 source point for the LSP.
(config-trunk)#to 33.33.33.33	Specify the IPv4 egress (destination point) for the LSP.
(config-trunk)#commit	Commit the transaction.

PE3 - RSVP-Path

#configure terminal	Enter configure mode.
(config)#rsvp-path PE3_to_PE1_via_P1 mpls	Create an RSVP Path and enter the Path mode.
(config-path)#20.20.20.1 strict	Configure this explicit route path as a strict hop.
(config-path)#10.10.10.2 strict	Configure this explicit route path as a strict hop.
(config-path)#exit	Exit Path mode.
#configure terminal	Enter configure mode.
(config)#rsvp-trunk PE3_to_PE1 ipv4	Create an RSVP trunk and enter the Trunk mode.
(config-trunk)#primary path PE3_to_PE1_via_P1	Configure the trunk to use defined path.
(config-trunk)#from 33.33.33.33	Specify the ipv4 source point for LSP
(config-trunk)#to 11.11.11.11	Specify the IPv4 egress (destination point) for the LSP.
(config-trunk)#commit	Commit the transaction.

PE1 – RSVP-GR

#configure terminal	Enter configure mode.
(config)#router rsvp	nter the configuration router mode.
(config-router)#neighbor 10.10.10.1	Configure the neighbor ip address.
(config-router)#graceful-restart	Enable the rsvp-gr.
(config-router)#commit	Commit the transaction.

P1 – RSVP-GR

#configure terminal	Enter configure mode.
(config)#router rsvp	Enter the configuration router mode.
(config-router)#neighbor 10.10.10.2	Configure the neighbor ip address.
(config-router)#neighbor 20.20.20.2	Configure the neighbor ip address.
(config-router)#graceful-restart	Enable the rsvp-gr.
(config-router)#commit	Commit the transaction.

PE3 – RSVP-GR

`#configure terminal`	Enter configure mode.
`(config)#router rsvp`	Enter the router configuration mode.
`(config-router)#neighbor 20.20.20.1`	Configure the neighbor ip address.
`(config-router)#graceful-restart`	Enable the rsvp-gr.
`(config-router)#commit`	Commit the transaction.

Validation

Verify the RSVP graceful restart on PE1.

```
PE1#show rsvp graceful-restart

CHAPTER 5 RSVP Detour Over Ring Topology

Overview

In OcNOS, this feature allows the detour formation in the ring topology to enhance the routing experience. The detour formation is a local protection mechanism to reroute the data traffic when a failure or congestion occurs in the primary Label Switched Path (LSP). In Multiprotocol Label Switching (MPLS), the primary LSP is the default path through which the data travels from the source to the destination node.

Feature Characteristics

This feature allows detour to take the upstream path of protected LSP, allowing a detour based protection in a ring topology. The upstream path of the protected LSP is the section of the network that precedes the PLR node in the network. This feature works for both path and sender-template method of detour formation. For the inter-op solutions that do not support the sender-template method, use the path method of detour formation.

In the below diagram, the data traffic path highlighted in green dots is the primary LSP. The link shown with the red cross is locally protected at the Point of Local Repair (PLR) node. A PLR node is a network device that reacts and takes action when a link fails. For continued data traffic flow, detour occurs through the red dotted line. Detour in MPLS is an alternate path used when the primary LSP encounters disruption or congestion.

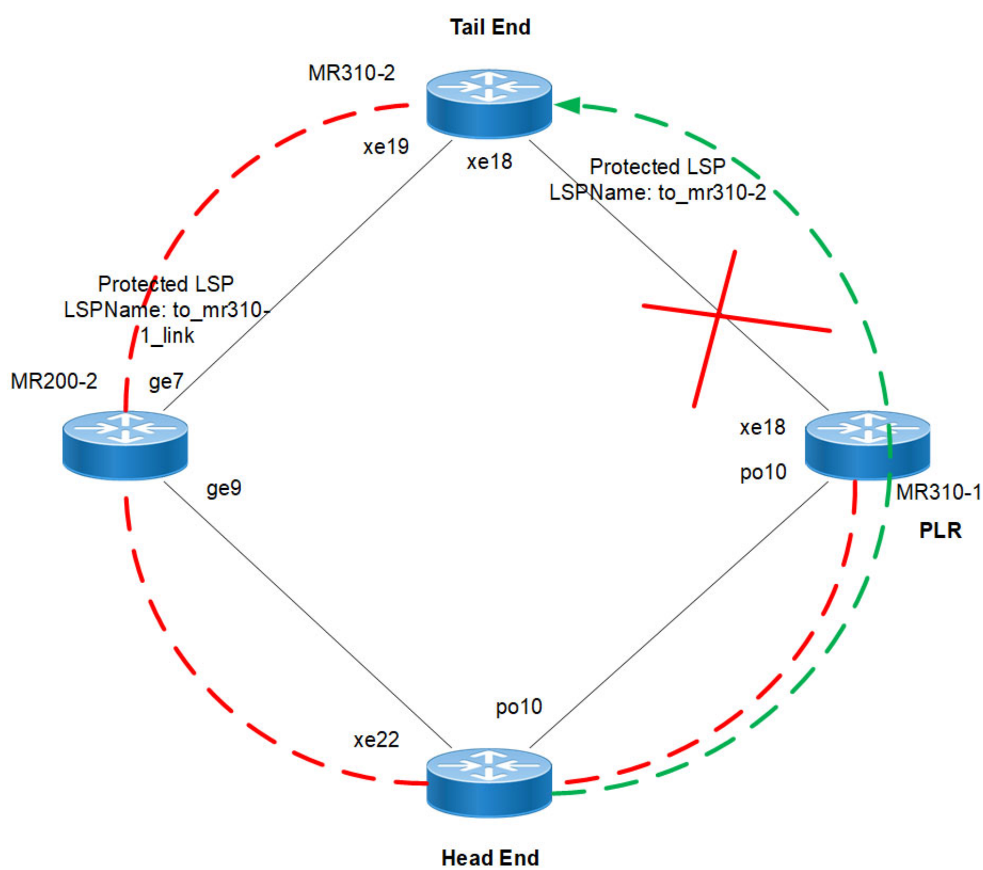

Figure 5-1: RSVP-TE FRR failover ring topology Feature Characteristics

Benefits

This feature helps detour the data traffic when there is a link or node failure, keeping the data traffic loss to a minimum (less than 50ms when BFD negotiated for fastest detection).

Prerequisite

Before the detour configuration in a ring topology, configure the RSVP tunnel with fast reroute protection of the one-to-one method.

For more information, refer to the Fast Reroute Configuration (one-to-one method) section of the RSVP-TE Configuration chapter in the *OcNOS Multi-Protocol Label Switching Guide*.

Configuration

This section shows the configuration procedure to create a detour in the ring topology.

Topology

Configure the primary LSP in the below ring topology from the head end to the tail end.

For example, consider PE1 as the head end and PE2 as the tail end, and the primary LSP is via R1, R2, and R3. In this case, first configure the Fast Reroute Configuration (one-to-one method) on the PE1 and PE2 and then configure the detour-allow-primary-upstream-path command in all the nodes. For example, if the link between R3 and PE2 is down, the detour follows via primary LSP to reach PE2.

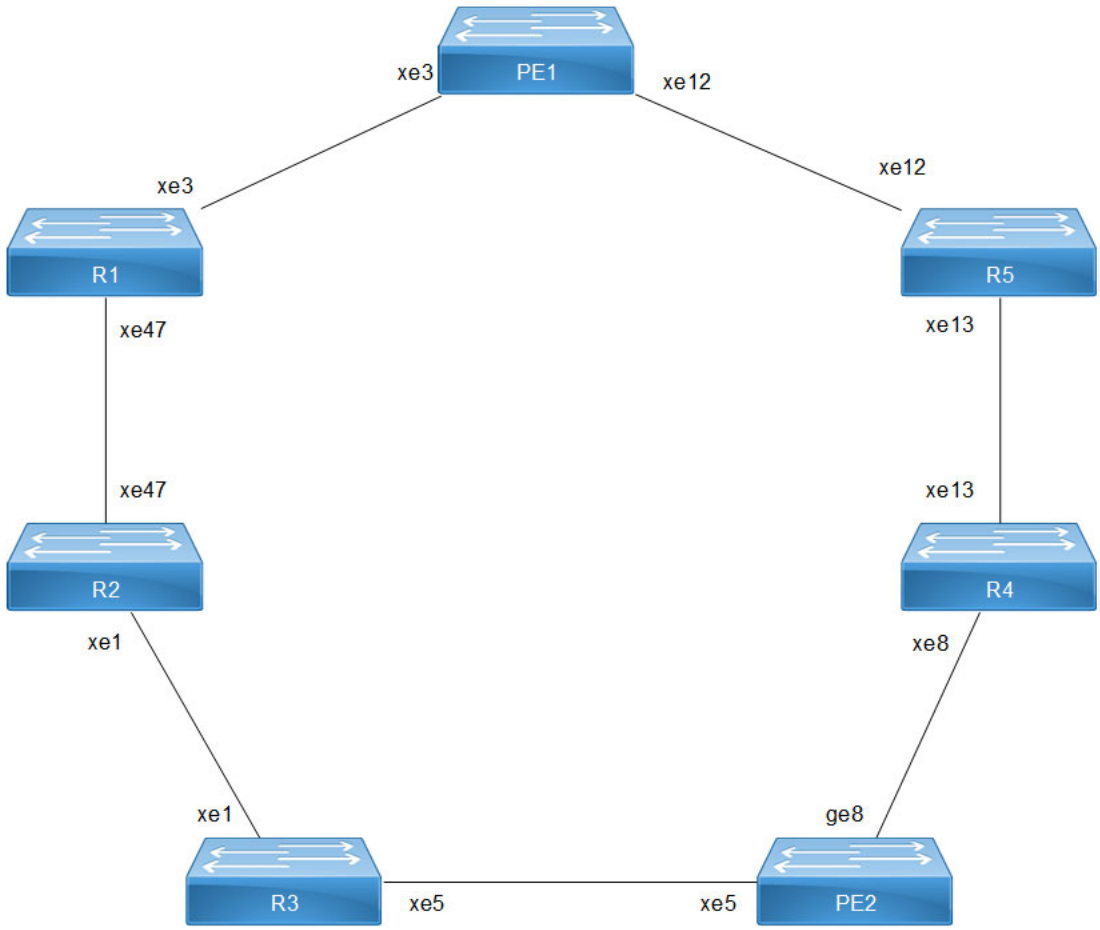

Figure 5-2: RSVP-TE FRR failover ring topology - 1:1 Detour

PE1 - OSPF Configurations

This section shows how to configure the Open Shortest Path First (OSPF) as Interior Gateway Protocol (IGP).

`PE1#configure terminal`	Enter configure mode.
`PE1(config)#interface xe3`	Enter interface mode `xe3`.
`PE1(config-if)#ip address 61.61.61.3/24`	Configure IPv4 address `61.61.61.3.24`.
`PE1(config-if)#label-switching`	Configure label switching on `xe3`.
`PE1(config-if)#enable-rsvp`	Enable RSVP on `xe3`.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config)#interface xe12`	Enter interface mode `xe12`.
`PE1(config-if)#ip address 58.58.58.2/24`	Configure IPv4 address `58.58.58.2/24`.
`PE1(config-if)#label-switching`	Configure label switching on `xe12`.
`PE1(config-if)#enable-rsvp`	Enable RSVP on `xe12`.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config)#interface lo`	Enter loopback interface mode.

`PE1(config-if)#ip address 26.26.26.26/32 secondary`	Configure IPv4 address `26.26.26.26/32`.
`PE1(config-if)#exit`	Exit interface mode.
`PE1(config)#router ospf 100`	Enter OSPF router mode.
`PE1(config-router)#ospf router-id 26.26.26.26`	Assign router ID `26.26.26.26` for OSPF.
`PE1(config-router)#network 26.26.26.26/32 area 0.0.0.0`	Define network `26.26.26.26/32` under router OSPF.
`PE1(config-router)#network 58.58.58.0/24 area 0.0.0.0`	Define network `58.58.58.0/24` under router OSPF.
`PE1(config-router)#network 61.61.61.0/24 area 0.0.0.0`	Define network `61.61.61.0/24` under router OSPF.
`PE1(config-router)#exit`	Exit router OSPF mode.
`PE1(config)#commit`	Commit the transaction.
`PE1(config)#exit`	Exit the configure mode.

PE1 - RSVP Configurations

This section shows:

1. The configuration of detour to take the upstream path of protected LSP.
2. The configuration of the primary LSP and attaching it to the RSVP trunk.
3. The configuration of the FRR.

`PE1#configure terminal`	Enter configure mode.
`PE1(config)#router rsvp`	Enable RSVP globally.
`PE1(config-router)#detour-allow-primary-upstream-path`	Configure this CLI to allow detour to take primary upstream path.
`PE1(config-router)#exit`	Exit router RSVP mode.
`PE1(config)#rsvp-path PE1-PE2-01 mpls`	Configure RSVP path PE1-PE2-01 and enter path mode.
`PE1(config-path)#61.61.61.2 strict`	Configure this explicit route path as a strict hop.
`PE1(config-path)#23.23.23.3 strict`	Configure this explicit route path as a strict hop.
`PE1(config-path)#41.41.41.3 strict`	Configure this explicit route path as a strict hop.
`PE1(config-path)#56.56.56.3 strict`	Configure this explicit route path as a strict hop.
`PE1(config-path)#rsvp-trunk TR-PE1-PE2-MP-01 ipv4`	Create an RSVP trunk TR-PE1-PE2-MP-01 and enter the trunk mode.
`PE1(config-trunk)#primary fast-reroute protection one-to-one`	Configure primary fast reroute protection.
`PE1(config-trunk)#primary fast-reroute node-protection`	Configure node protection.
`PE1(config-trunk)#primary path PE1-PE2-01`	Configure trunk PE1-PE2-01 to use as the primary LSP.
`PE1(config-trunk)#from 26.26.26.26`	Assign the source loopback address `26.26.26.26` to the RSVP trunk.
`PE1(config-trunk)#to 22.22.22.22`	Assign the destination loopback address `22.22.22.22` to the RSVP trunk.
`PE1(config-trunk)#exit`	Exit router RSVP trunk mode.

PE1(config)#commit	Commit the transaction.
PE1(config)#exit	Exit the configure mode.

R1 - OSPF Configurations

This section shows how to configure the Open Shortest Path First (OSPF) as Interior Gateway Protocol (IGP).

R1#configure terminal	Enter configure mode.
R1(config)#interface xe3	Enter interface mode xe3.
R1(config-if)#ip address 61.61.61.2/24	Configure IPv4 address 61.61.61.2/24.
R1(config-if)#label-switching	Configure label switching on xe3.
R1(config-if)#enable-rsvp	Enable RSVP on interface xe3.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface xe47	Enter interface mode xe47.
R1(config-if)#ip address 23.23.23.2/24	Configure IPv4 address 23.23.23.2/24.
R1(config-if)#label-switching	Configure label switching on xe47.
R1(config-if)#enable-rsvp	Enable RSVP on interface xe47.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface lo	Enter loopback interface mode.
R1(config-if)#ip address 24.24.24.24/32 secondary	Configure IPv4 address 24.24.24.24/32.
R1(config-if)#exit	Exit interface mode.
R1(config)#router ospf 100	Enter OSPF router mode.
R1(config-router)#ospf router-id 24.24.24.24	Assign router-id for OSPF.
R1(config-router)#network 23.23.23.0/24 area 0.0.0.0	Define network 23.23.23.0/24 under router OSPF.
R1(config-router)#network 24.24.24.24/32 area 0.0.0.0	Define network 24.24.24.24/32 under router OSPF.
R1(config-router)#network 61.61.61.0/24 area 0.0.0.0	Define network 61.61.61.0/24 under router OSPF.
R1(config-router)#exit	Exit router OSPF mode.
R1(config)#commit	Commit the transaction.
R1(config)#exit	Exit the configure mode.

R1 - RSVP Configurations

This section shows how to configure the detour to take the upstream path of protected LSP.

R1#configure terminal	Enter configure mode.
R1(config)#router rsvp	Enable RSVP globally.
R1(config-router)#detour-allow-primary-upstream-path	Configure this CLI to allow detour to take primary upstream path.
R1(config-router)#exit	Exit router RSVP mode.
R1(config)#commit	Commit the transaction.
R1(config)#exit	Exit the configure mode.

© 2025 IP Infusion Inc. Proprietary

R2 - OSPF Configurations

This section shows how to configure the Open Shortest Path First (OSPF) as Interior Gateway Protocol (IGP).

`R2#configure terminal`	Enter configure mode.
`R2(config)#interface xe1`	Enter interface mode `xe1`.
`R2(config-if)#ip address 41.41.41.2/24`	Configure IPv4 address `41.41.41.2/24`.
`R2(config-if)#label-switching`	Configure label switching on `xe1`.
`R2(config-if)#enable-rsvp`	Enable RSVP on `xe1`.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe47`	Enter interface mode `xe47`.
`R2(config-if)#ip address 23.23.23.3/24`	Configure IPv4 address `23.23.23.3/24`.
`R2(config-if)#label-switching`	Configure label switching on `xe47`.
`R2(config-if)#enable-rsvp`	Enable RSVP on `xe47`.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface lo`	Enter loopback interface mode.
`R2(config-if)#ip address 88.88.88.88/32 secondary`	Configure IPv4 address `88.88.88.88/32`.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#router ospf 100`	Enter OSPF router mode.
`R2(config-router)#ospf router-id 88.88.88.88`	Assign router-id `88.88.88.88` for OSPF.
`R2(config-router)#network 23.23.23.0/24 area 0.0.0.0`	Define network `23.23.23.0/24` under router OSPF.
`R2(config-router)#network 41.41.41.0/24 area 0.0.0.0`	Define network `41.41.41.0/24` under router OSPF.
`R2(config-router)#network 88.88.88.88/32 area 0.0.0.0`	Define network `88.88.88.88/32` under router OSPF.
`R2(config-router)#exit`	Exit router OSPF mode.
`R2(config)#commit`	Commit the transaction.
`R2(config)#exit`	Exit the configure mode.

R2 - RSVP Configurations

This section shows how to configure the detour to take the upstream path of protected LSP.

`R2#configure terminal`	Enter configure mode.
`R2(config)#router rsvp`	Enable RSVP globally.
`R2(config-router)#detour-allow-primary-upstream-path`	Configure this CLI to allow detour to take primary upstream path.
`R2(config-router)#exit`	Exit router RSVP mode.
`R2(config)#commit`	Commit the transaction.
`R2(config)#exit`	Exit the configure mode.

R3 - OSPF Configurations

This section shows how to configure the Open Shortest Path First (OSPF) as Interior Gateway Protocol (IGP).

`R3#configure terminal`	Enter configure mode.
`R3(config)#interface xe1`	Enter interface mode `xe1`.
`R3(config-if)#ip address 41.41.41.3/24`	Configure IPv4 address `41.41.41.3/24`.
`R3(config-if)#label-switching`	Configure label switching on `xe1`.
`R3(config-if)#enable-rsvp`	Enable RSVP on `xe1`.
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#interface xe5`	Enter interface mode `xe5`.
`R3(config-if)#ip address 56.56.56.2/24`	Configure IPv4 address `56.56.56.2/24`.
`R3(config-if)#label-switching`	Configure label switching on `xe5`.
`R3(config-if)#enable-rsvp`	Enable RSVP on `xe5`.
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#interface lo`	Enter loopback interface mode.
`R3(config-if)#ip address 99.99.99.99/32 secondary`	Configure IPv4 address `99.99.99.99/32`.
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#router ospf 100`	Enter OSPF router mode.
`R3(config-router)#ospf router-id 99.99.99.99`	Assign router-id for OSPF.
`R3(config-router)#network 41.41.41.0/24 area 0.0.0.0`	Define network `41.41.41.0/24` under router OSPF.
`R3(config-router)#network 56.56.56.0/24 area 0.0.0.0`	Define network `56.56.56.0/24` under router OSPF.
`R3(config-router)#network 99.99.99.99/32 area 0.0.0.0`	Define network `99.99.99.99/32` under router OSPF.
`R3(config-router)#exit`	Exit router OSPF mode.
`R3(config)#commit`	Commit the transaction.
`R3(config)#exit`	Exit the configure mode.

R3 - RSVP Configurations

This section shows how to configure the detour to take the upstream path of protected LSP.

`R3#configure terminal`	Enter configure mode.
`R3(config)#router rsvp`	Enable RSVP globally.
`R3(config-router)#detour-allow-primary-upstream-path`	Configure this CLI to allow detour to take primary upstream path.
`R3(config-router)#exit`	Exit router RSVP mode.
`R3(config)#commit`	Commit the transaction.
`R3(config)#exit`	Exit the configure mode.

R5 - OSPF Configurations

This section shows how to configure the Open Shortest Path First (OSPF) as Interior Gateway Protocol (IGP).

`R5#configure terminal`	Enter configure mode.
`R5(config)#interface xe1`	Enter interface mode `58.58.58.3/24`.
`R5(config-if)#ip address 58.58.58.3/24`	Configure IPv4 address.
`R5(config-if)#label-switching`	Configure label switching on `xe1`.
`R5(config-if)#enable-rsvp`	Enable RSVP on `xe1`.
`R5(config-if)#exit`	Exit interface mode.
`R5(config)#interface xe13`	Enter interface mode `xe13`.
`R5(config-if)#ip address 54.54.54.4/24`	Configure IPv4 address `54.54.54.4/24`.
`R5(config-if)#label-switching`	Configure label switching on `xe13`.
`R5(config-if)#enable-rsvp`	Enable RSVP on `xe13`.
`R5(config-if)#exit`	Exit interface mode.
`R5(config)#interface lo`	Enter loopback interface mode.
`R5(config-if)#ip address 17.17.17.17/32 secondary`	Configure IPv4 address `17.17.17.17/32`.
`R5(config-if)#exit`	Exit interface mode.
`R5(config)#router ospf 100`	Enter OSPF router mode.
`R5(config-router)#ospf router-id 17.17.17.17`	Assign router-id for OSPF.
`R5(config-router)#network 17.17.17.17/32 area 0.0.0.0`	Define network `17.17.17.17/32` under router OSPF.
`R5(config-router)#network 54.54.54.0/24 area 0.0.0.0`	Define network `54.54.54.0/24` under router OSPF.
`R5(config-router)#network 58.58.58.0/24 area 0.0.0.0`	Define network `58.58.58.0/24` under router OSPF.
`R5(config-router)#exit`	Exit router OSPF mode.
`R5(config)#commit`	Commit the transaction.
`R5(config)#exit`	Exit the configure mode.

R5 - RSVP Configurations

This section shows how to configure the detour to take the upstream path of protected LSP.

`R5#configure terminal`	Enter configure mode.
`R5(config)#router rsvp`	Enable RSVP globally.
`R5(config-router)#detour-allow-primary-upstream-path`	Configure this CLI to allow detour to take primary upstream path
`R5(config-router)#exit`	Exit router RSVP mode
`R5(config)#commit`	Commit the transaction.
`R5(config)#exit`	Exit the configure mode.

R4 - OSPF Configurations

This section shows how to configure the Open Shortest Path First (OSPF) as Interior Gateway Protocol (IGP).

`R4#configure terminal`	Enter configure mode.
`R4(config)#interface xe13`	Enter interface mode `xe13`.
`R4(config-if)#ip address 54.54.54.3/24`	Configure IPv4 address `54.54.54.3/24`.
`R4(config-if)#label-switching`	Configure label switching on `xe13`.
`R4(config-if)#enable-rsvp`	Enable RSVP on interface `xe13`.
`R4(config-if)#exit`	Exit interface mode.
`R4(config)#interface xe8`	Enter interface mode `xe8`.
`R4(config-if)#ip address 62.62.62.3/24`	Configure IPv4 address `62.62.62.3/24`.
`R4(config-if)#label-switching`	Configure label switching on `xe8`.
`R4(config-if)#enable-rsvp`	Enable RSVP on `xe8`.
`R4(config-if)#exit`	Exit interface mode.
`R4(config)#interface lo`	Enter loopback interface mode.
`R4(config-if)#ip address 48.48.48.48/32 secondary`	Configure IPv4 address `48.48.48.48/32`.
`R4(config-if)#exit`	Exit interface mode.
`R4(config)#router ospf 100`	Enter OSPF router mode.
`R4(config-router)#ospf router-id 48.48.48.48`	Assign router-id for OSPF.
`R4(config-router)#network 48.48.48.48/32 area 0.0.0.0`	Define network `48.48.48.48/32` under router OSPF.
`R4(config-router)#network 54.54.54.0/24 area 0.0.0.0`	Define network `54.54.54.0/24` under router OSPF.
`R4(config-router)#network 62.62.62.0/24 area 0.0.0.0`	Define network 62.62.62.0/24 under router OSPF.
`R4(config-router)#exit`	Exit router OSPF mode.
`R4(config)#commit`	Commit the transaction.
`R4(config)#exit`	Exit the configure mode.

R4 - RSVP Configurations

This section shows how to configure the detour to take the upstream path of protected LSP.

`R4#configure terminal`	Enter configure mode.
`R4(config)#router rsvp`	Enable RSVP globally.
`R4(config-router)#detour-allow-primary-upstream-path`	Configure this CLI to allow detour to take primary upstream path.
`R4(config-router)#exit`	Exit router RSVP mode.
`R4(config)#commit`	Commit the transaction.
`R4(config)#exit`	Exit the configure mode.

PE2 - OSPF Configurations

This section shows how to configure the Open Shortest Path First (OSPF) as Interior Gateway Protocol (IGP).

PE2#configure terminal	Enter configure mode.
PE2(config)#interface xe5	Enter interface mode xe5.
PE2(config-if)#ip address 56.56.56.3/24	Configure IPv4 address 56.56.56.3/24.
PE2(config-if)#label-switching	Configure label switching on xe5.
PE2(config-if)#enable-rsvp	Enable RSVP on xe5.
PE2(config-if)#exit	Exit interface mode.
PE2(config)#interface ge8	Enter interface mode ge8.
PE2(config-if)#ip address 62.62.62.2/24	Configure IPv4 address 62.62.62.2/24.
PE2(config-if)#label-switching	Configure label switching on ge8.
PE2(config-if)#enable-rsvp	Enable RSVP on ge8.
PE2(config-if)#exit	Exit interface mode.
PE2(config)#interface lo	Enter loopback interface mode.
PE2(config-if)#ip address 22.22.22.22/32 secondary	Configure IPv4 address 22.22.22.22/32.
PE2(config-if)#exit	Exit interface mode.
PE2(config)#router ospf 100	Enter OSPF router mode.
PE2(config-router)#ospf router-id 22.22.22.22	Assign router-id for OSPF.
PE2(config-router)#network 22.22.22.22/32 area 0.0.0.0	Define network 22.22.22.22/32 under router OSPF.
PE2(config-router)#network 56.56.56.0/24 area 0.0.0.0	Define network 56.56.56.0/24 under router OSPF.
PE2(config-router)#network 62.62.62.0/24 area 0.0.0.0	Define network 62.62.62.0/24 under router OSPF.
PE2(config-router)#exit	Exit router OSPF mode.
PE2(config)#commit	Commit the transaction.
PE2(config)#exit	Exit the configure mode.

PE2 - RSVP Configurations

This section shows:

1. The configuration of detour to take the upstream path of protected LSP.
2. The configuration of the primary LSP and attaching it to the RSVP trunk.
3. The configuration of the FRR.

PE2#configure terminal	Enter configure mode.
PE2(config)#router rsvp	Enable RSVP globally.
PE2(config-router)#detour-allow-primary-upstream-path	Configure this CLI to allow detour to take primary upstream path.
PE2(config-router)#exit	Exit router RSVP mode.
PE2(config)#rsvp-path PE2-PE1-01 mpls	Configure RSVP path PE2-PE1-01 and enter path mode.
PE2(config-path)#56.56.56.2 strict	Configure this explicit route path as a strict hop.
PE2(config-path)#41.41.41.2 strict	Configure this explicit route path as a strict hop.

© 2025 IP Infusion Inc. Proprietary

PE2(config-path)#23.23.23.2 strict	Configure this explicit route path as a strict hop.
PE2(config-path)#61.61.61.3 strict	Configure this explicit route path as a strict hop.
PE2(config-router)#exit	Exit path mode.
PE2(config-path)#rsvp-trunk TR-PE2-PE1-MP-01 ipv4	Create an RSVP trunk TR-PE2-PE1-MP-01 and enter the Trunk mode.
PE2(config-trunk)#primary fast-reroute protection one-to-one	Configure primary fast-reroute protection.
PE2(config-trunk)#primary fast-reroute node-protection	Configure node protection.
PE2(config-trunk)#primary path PE2-PE1-01	Configure trunk PE2-PE1-01 to use as the primary LSP.
PE2(config-trunk)#from 22.22.22.22	Assign the source loopback address 22.22.22.22 to the RSVP trunk.
PE2(config-trunk)#to 26.26.26.26	Assign the destination loopback address 26.26.26.26 to the RSVP trunk.
PE2(config-trunk)#exit	Exit router RSVP trunk mode.
PE2(config)#commit	Commit the transaction.
PE2(config)#exit	Exit the configure mode.

Validation

PE1

Below is the validation output of RSVP LSPs from PE1 to PE2 via R1>R2>R3:

```
#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to Secondary
* indicates the session is active with local repair at one or more nodes
(P) indicates the secondary-priority session is acting as primary

Ingress RSVP:

Now, shutting down one of the interfaces on Primary LSP path and check RSVP tunnel outputs on PE1 and PE2

Shutdown interface xe47 connected between R1 and R2:

`#configure terminal`	Enter Configure mode.
`(config)#interface xe47`	Enter interface mode.
`(config-router)#shutdown`	Administratively bring the interface down.
`(config-router)#exit`	Exit router RSVP mode

Below is the validation output of RSVP LSPs from PE1 to PE2 after admin shutting one of the interfaces on primary LSP path:

```
#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to Secondary
* indicates the session is active with local repair at one or more nodes
(P) indicates the secondary-priority session is acting as primary

Ingress RSVP:

Implementation Examples

To implement detour based protection in a ring topology, use the command detour-allow-primary-upstream-path that allows the detour formation to consider the upstream path of protected LSP. This is only applicable in ring topology.

New CLI Commands

detour-allow-primary-upstream-path

Use this command to ensure detour formation to consider the upstream path of protected LSPs. This is a deviation to RFC 4090 section 6.2 recommendation (https://datatracker.ietf.org/doc/html/rfc4090). This command is intended to be used in special cases where detour protection is required on ring topology if no alternate path is available.

Use the no parameter with this command to bypass the upstream path to the protected LSP when choosing a detour path.

Note: This command is intended to be used in ring topology if detour support is required at the cost of resource and link bandwidth. This command is not recommended to be configured otherwise.

Command Syntax

```
detour-allow-primary-upstream-path
no detour-allow-primary-upstream-path
```

Parameters

None

Default

By default, detour formation excludes the protected LSP upstream path as per RFC 4090 section 6.2 recommendations.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#detour-allow-primary-upstream-path
(config-router)#commit
(config-router)#no detour-allow-primary-upstream-path
(config-router)#commit
```

Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

Acronym	Description
FRR	Fast Reroute
LSP	Label Switched Path
OSPF	Open Shortest Path First
PLR	Point of Local Repair

Glossary

The following provides definitions for key terms used throughout this document:

Detour formation in the ring topology	The detour formation in the ring topology is a mechanism to reroute the data traffic over the backup path when a failure or congestion occurs in the primary Label Switched Path (LSP).
PLR node	A PLR node is a network device that reacts and takes action when a link fails.
Primary LSP	The primary LSP is the default path of the forwarding data packets from the source device to the destination device.
Protected LSP	A protected LSP is a primary LSP with a backup path in an MPLS network. When there is an issue or a failure in the primary LSP, the traffic is rerouted through the backup path, protecting the primary LSP.

© 2025 IP Infusion Inc. Proprietary

RSVP Tunnel	RSVP tunnels are logical paths through which data traffic traverses in an IP network.
Upstream path of the protected LSP	The upstream path of the protected LSP is the section of the network that precedes the PLR node in the network.

CHAPTER 6 RSVP-TE Dynamic Facility Backup LSP (RSVP Auto Bypass)

Overview

Resource Reservation Protocol (RSVP) auto bypass is a subset of the Facility Backup feature, designed to enhance fast-reroute protection. The facility backup feature operates by establishing bypass tunnels for protected sessions at each PLR node, serving as a local safeguard for sessions on every Point of Local Repair (PLR). Configuring bypass tunnels manually on each PLR, particularly in larger topologies, presented challenges in configuration management. The RSVP auto bypass functionality ensures to dynamically create bypass tunnels when feature enabled in PLR nodes and the sessions come up in PLR requesting facility backup protection.

Feature Characteristics

The RSVP auto bypass operates in conjunction with manual bypass tunnels, and if both manual and auto bypass offer the same level of protection as requested, the manual bypass takes precedence. Auto bypass tunnels, which do not serve any session, have a finite lifetime and are deleted if they remain unused.

Benefits

RSVP auto bypass contributes to a more automated, efficient, and manageable facility backup protection mechanism in RSVP-enabled networks.

Prerequisites

Ensure the following prerequisites are met before configuring RSVP Auto Bypass functionality:

Define Interfaces and Loopback Addresses

Configure Layer 2 interfaces, such as port channel interfaces (e.g., po1), and assign specific IP addresses for proper identification, and routing. Additionally, assign loopback IP addresses to establish essential points of connectivity. These configurations establish the efficient network routing and communication.

```
!
interface lo
 ip address 127.0.0.1/8
 ip address 135.1.1.27/32 secondary
 ipv6 address ::1/128
!
interface po6
 ip address 1.1.2.2/30
!
interface xe6
 channel-group 6 mode active
!
```

Configure IGP for Dynamic Routing

Enable ISIS to facilitate dynamic routing on all nodes within the network. Define ISIS router instances to match loopback IP addresses and add network segments to ISIS areas for proper route distribution. Set up neighbor relationships using loopback IP addresses, ensuring efficient route advertisement and convergence for optimal network performance.

ISIS Configuration

```
!
router isis 1
 is-type level-2-only
 metric-style wide
 mpls traffic-eng router-id 135.1.1.27
 mpls traffic-eng level-2
 capability cspf
 dynamic-hostname
 fast-reroute ti-lfa level-2 proto ipv4
 net 49.0000.0000.0027.00
 passive-interface lo
!
interface po6
 isis network point-to-point
 ip router isis 1
!
```

OSPF Configuration

```
!
router ospf 100
 ospf router-id 135.1.1.27
 network 135.1.1.27/32 area 0.0.0.0
 network 1.1.5.1/24 area 0.0.0.0
 network 1.1.1.1/24 area 0.0.0.0
!
```

Configure RSVP for Efficient Network Operation

Enable Resource Reservation Protocol (RSVP) on all nodes to optimize traffic routing and quality of service. RSVP reserves network resources along specified paths to enhance network performance and reliability.

```
!
router rsvp
!
interface xe1
 label-switching
 enable-rsvp
!
```

Configure the RSVP Primary Path and Trunk

Establish a trunk on edge routers participating in label-switching using defined path.

```
!
rsvp-path PE1-PE4-1 mpls
```

```
  1.1.1.2 strict
  1.1.2.1 strict
  1.1.6.1 strict
 !
 rsvp-trunk PE1-PE4-1 ipv4
  primary fast-reroute protection facility
  primary fast-reroute node-protection
  primary path PE1-PE4-1
  from 135.1.1.27
  to 135.1.1.44
 !
```

Configuration for RSVP Auto Bypass

This section shows the configuration of the various nodes within the topology to set up a RSVP-Auto bypass tunnels.

Topology

The sample topology includes Edge Nodes (PE1, PE2) and core Nodes (P1, P3 and P4). As per sample configurations, Primary path is defined via PE1-P1-P3-PE2 using strict hops and auto bypass tunnel creation is formed on PE1.

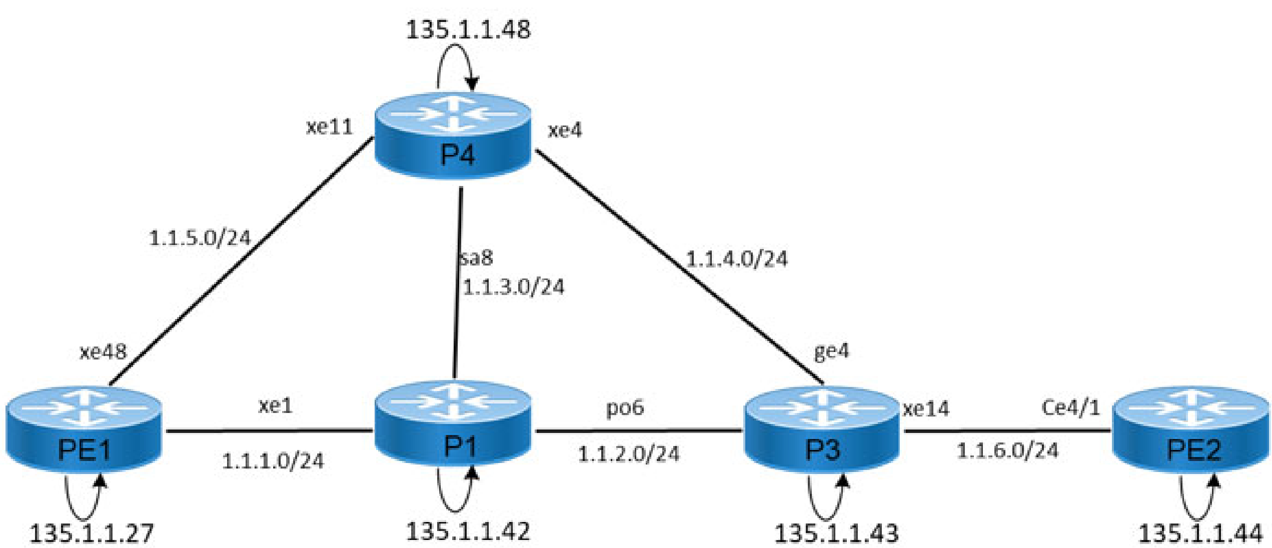

Figure 6-3: RSVP-Auto Bypass Configuration

Before configuring RSVP-Auto bypass tunnles, meet all Prerequisites for the following nodes:

- Edge nodes: PE1 and PE2
- Core nodes: P1, P3, and P4

Auto bypass feature helps in automatically forming bypass tunnels and protecting the facility backup protection requested tunnels.

Configuring RSVP Auto Bypass

Configure RSVP Auto bypass tunnels on PE1 router as follows:

1. Configure auto-bypass under router rsvp.
```
(config)#router rsvp
(config-router)# auto-bypass
```
2. Enable Auto bypass globally.
```
(config-auto-bypass)#  enable
```
3. Modify protection capability attribute for best-effort type bypasses.
```
(config-auto-bypass)# attributes best-effort
(config-auto-bypass-attr)#protection-capability node
```
4. Modify other auto bypass attributes for best-effort type bypasses.

   Note: Auto bypass re-optimization uses the global command to set the re-optimization timer.
```
(config-auto-bypass-attr)#   reoptimize
```
5. Configure inactivity timer globally for automatically created bypass tunnels.

   Note: The default value for the inactivity-timer is 60 minutes. The minimum timer is 1 and maximum timer is 240.
```
(config-auto-bypass)#  inactivity-timer 5
```

Configure RSVP Auto bypass tunnels on P1, P3, P4, PE2 router as follows:

1. Configure auto-bypass under router rsvp.
```
(config)#router rsvp
(config-router)# auto-bypass
```
2. Enable Auto bypass globally.
```
(config-auto-bypass)#  enable
```
3. Modify protection capability attribute for best-effort type bypasses.
```
(config-auto-bypass)# attributes best-effort
(config-auto-bypass-attr)#protection-capability link
```
4. Modify other auto bypass attributes for best-effort type bypasses.

   Note: Auto bypass re-optimization shall use the global command to set the re-optimization timer.
```
(config-auto-bypass-attr)#   reoptimize
```
5. Configure inactivity timer globally for automatically created bypass tunnels.

   Note: The default value for the inactivity-timer is 60 minutes. The minimum timer is 1 and maximum timer is 240.
```
(config-auto-bypass)#  inactivity-timer 5
```

Snippet configuration on PE1 router is as follows:

```
!
router rsvp
 auto-bypass
  attributes best-effort
   protection-capability node
   reoptimize
   exit
  inactivity-timer 5
  enable
  exit
!
```

Snippet configuration on P1, P3, and P4 router is as follows:

```
#show running-config
!
router rsvp
  auto-bypass
  attributes best-effort
   protection-capability link
   reoptimize
   exit
  enable
  exit
!
```

Validation

Verify all sessions including auto bypass sessions summary information:

Bypass name will have a character B or D. BL for Link protection and BN is for Node protection.

```

Auto Bypass and Manual Bypass Co-exists with Perfect Protection

Manual bypass and auto bypass coexist and when manual bypass already providing perfect protection, then manual bypass preferred over auto bypass. auto bypass won't be triggered.

Auto bypass is created when Manual bypass is provided with perfect protection as link

Snippet configuration on PE1 router for Auto-bypass is as follows:

```
#show running-config
!
router rsvp
 auto-bypass
  attributes best-effort
   protection-capability link
   reoptimize
   exit
  inactivity-timer 5
  enable
  exit
!
```

Snippet configuration on PE1 router for Manual-bypass is as follows:

```
 !
rsvp-path backup-PE1-P4-P1 mpls
 1.1.5.2 strict
 1.1.3.2 strict
!
rsvp-bypass backup-to-p1
 path backup-PE1-P4-P1
 to 135.1.1.44
!
```

Validation

Verify all sessions including auto bypass sessions summary information:

Manual bypass and auto bypass coexist and when manual bypass already providing perfect protection, auto bypass session goes down when manual bypass exists.

Verify all RSVP sessions information: The output shows only manual bypass session information when Manual bypass and auto bypass coexist and when manual bypass already providing perfect protection.

```
PE1#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to

Auto Bypass with Node Protection and Manual Bypass with Link Protection

Snippet configuration on PE1 router for Auto-bypass is as follows:

```
!
router rsvp
 auto-bypass
  attributes best-effort
   protection-capability node
   reoptimize
   exit
  inactivity-timer 5
  enable
  exit
!
```

Snippet configuration on PE1 router for Manual-bypass is as follows:

```
 !
rsvp-path backup-PE1-P4-P1 mpls
 1.1.5.2 strict
 1.1.3.2 strict
!
rsvp-bypass backup-to-p1
 path backup-PE1-P4-P1
 to 135.1.1.44
!
```

Validation

Verify all sessions including auto bypass sessions summary information: The output shows that

Manual bypass for link protection is UP and auto bypass for node protection is UP and running.

```
PE1#show rsvp session
Type  : PRI - Primary, SEC - Secondary, DTR - Detour, BPS - Bypass
State : UP - Up, DN - Down, BU - Backup in Use, SU - Secondary in Use, FS - Forced to
Secondary
* indicates the session is active with local repair at one or more nodes
(P) indicates the secondary-priority session is acting as primary

RSVP Auto Bypass Commands

The RSVP auto bypass introduces the following configuration commands within the Facility Backup commands.

auto-bypass

Use this command to enter a new mode of auto-bypass to configure auto bypass specific commands and enable auto bypass feature.

Use the `no` parameter to auto bypass configurations. When configuration removed at global level, all auto bypass configuration will be removed and all dynamically created bypass tunnels will be deleted.

Command Syntax

```
auto-bypass
no auto-bypass
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

This example is for configuring auto bypass:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#exit
(config-router)#no auto-bypass
```

auto-bypass enable

Use this command to enable or disable auto bypass functionality. When this functionality is enabled, sessions requesting facility backup protection will attempt creation of bypass tunnels dynamically, if no satisfying bypass protection is available. If topology supports the formation of dynamically created bypass session, then the sessions will be protected by dynamically created bypass tunnels.

When manual bypass created, which satisfies protection requirement similar to auto bypass tunnels, then manual bypass tunnel gets preference over auto bypass tunnels. However, if auto bypass tunnels provide better protection (based on session request) than manual bypass, then auto bypass tunnels considered for protection over manual bypass tunnels.

Use the `disable` parameter to disable the auto bypass functionality. When this functionality is disabled, all dynamically created bypass tunnels will be deleted.

Command Syntax

```
enable
disable
```

Parameters

None

Default

Disabled

Command Mode

Auto bypass mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

This example is for enabling the auto bypass:

```
#configure terminal
(config)#router rsvp
```

```
(config-router)#auto-bypass
(config-auto-bypass)#enable
(config-auto-bypass)#commit
(config-auto-bypass)#exit
```

This example is for disabling the auto bypass:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#disable
(config-auto-bypass)#commit
(config-auto-bypass)#exit
```

inactivity-timer

Use this command to configure inactivity timer for auto bypass tunnels. When auto bypass tunnels do not protect any session, inactivity timer will decide how long to retain the auto bypass tunnels before deleting them. If auto bypass tunnel starts protecting any session, then inactivity timer will be stopped.

Use the `no` parameter to reset auto bypass inactivity timer to default value.

Command Syntax

```
inactivity-timer <1-240>

no inactivity-timer
```

Parameters

`inactivity-timer <1-240>`	Specifies the RSVP auto bypass inactivity timer in minutes. This timer determines the maximum time that dynamically created auto bypass tunnels can remain inactive before being deleted. The default value is 60 minutes.

Default

None

Command Mode

Auto bypass mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

This example is for setting the inactivity timer to 5 minutes:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#inactivity-timer 5
(config-auto-bypass)#commit
(config-auto-bypass)#exit
```

attributes

Use this command to configure auto bypass attributes. Currently only best-effort type auto bypass tunnels supported and hence user can modify the attributes of best-effort type auto bypass. This command takes to new mode in which several parameters can be configured. The parameters configured in this mode are applicable to auto bypass sessions of attribute type.

Use the `no` parameter to reset auto bypass attributes of matching type to default values.

Command Syntax

```
attributes best-effort
no attributes best-effort
```

Parameters

`best-effort`	Specifies the auto bypass attribute configuration for the best-effort type in auto bypass.

Default

The initial configuration for best-effort auto bypass attributes is not set, and the internal entities have their default settings.

Command Mode

Auto bypass mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

This example is for configuring auto bypass attributes:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

This example is to reset auto bypass attributes of matching type to default values:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
(config-auto-bypass)#no attributes best-effort
(config-auto-bypass)#commit
(config-auto-bypass)#exit
```

protection-capability

Use this command to set the protection capability attribute for auto bypass. Capability setting decides the types of auto bypass tunnels allowed to be attempted. When capability configured as link, only exclude link type of bypass creation will be attempted and provides protection against only link failure. When capability node is configured, if session requests for node protection, then exclude node type bypass will also be created along with exclude link type bypass and provides the best protection possible. Even when capability configured as node, if session doesn't request for node protection, then node protecting bypass formation will not be attempted.

Use the `no` parameter to reset the attribute to default value which is capability type node.

Command Syntax

```
protection-capability (link | node)
no protection-capability
```

Parameters

`link`	Specifies the capability for link protection only.
`node`	Specifies the capability for link and node protection.

Default

The value for protection capability is `node`.

Command Mode

Auto bypass attribute mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for setting up the protection capability attribute to `link`:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#protection-capability link
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Example to reset the protection capability attribute to default value:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#no protection-capability
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

bandwidth

Use this command to set the bandwidth attribute for auto bypass. Auto bypass sessions of matching attribute type will inherit this bandwidth constraint while requesting for an LSP to CSPF.

Use the `no` parameter to remove bandwidth attribute and auto bypass sessions will not request any bandwidth constraint to form LSP.

Command Syntax

```
bandwidth BANDWIDTH
no bandwidth
```

Parameters

`BANDWIDTH`	Specifies the bandwidth attribute for auto bypass within the range of 1k to 100g. The default value is zero.

Default

None

Command Mode

Auto bypass attribute mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for setting up the bandwidth attribute to `100g`:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#bandwidth 100g
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Example to reset the bandwidth attribute to default value:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#no bandwidth
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

setup-priority

Use this command to set the setup priority attribute for auto bypass. Auto bypass sessions of matching attribute type will inherit this setup priority constraint while requesting for an LSP to CSPF.

Use the `no` parameter to reset setup priority attribute to default value.

Command Syntax

```
setup-priority <0-7>
no setup-priority
```

Parameters

`setup-priority <0-7>`	Specifies the attribute for Auto bypass setup priority. The default value for attribute for setup priority is 7.

Default

None

Command Mode

Auto bypass attribute mode

Applicability

Introduced in OcNOS version 6.5.0.

Example

Example for setting up the setup priority attribute to `5`.

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass attributes best-effort
(config-auto-bypass-attr)#setup-priority 5
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Example to reset the setup priority attribute to default value.

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass attributes best-effort
(config-auto-bypass-attr)#no setup-priority
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

hold-priority

Use this command to set the hold priority attribute for auto bypass. Auto bypass sessions of matching attribute type will inherit this hold priority constraint while requesting for an LSP to CSPF.

Use the `no` parameter to reset hold priority attribute to default value.

Command Syntax

```
hold-priority <0-7>
no hold-priority
```

Parameters

`hold-priority <0-7>`	Specifies the attribute for Auto bypass hold priority. The default value is 0.

Default

None

Command Mode

Auto bypass attribute mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for setting up the hold priority attribute to `2`:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#hold-priority 2
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Example to reset the hold priority attribute to default value:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#no hold-priority
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

hop-limit

Use this command to set the hop limit attribute for auto bypass. Auto bypass sessions of matching attribute type will inherit this hop limit constraint while requesting for an LSP to CSPF.

Use the `no` parameter to reset hop limit attribute to default value.

Command Syntax

```
hop-limit <1-255>
no hop-limit
```

Parameters

`hop-limit <1-255>`	Specifies the attribute for Auto bypass hop limit. The default value is 255.

Default

None

Command Mode

Auto bypass attribute mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for setting up the hop limit attribute to 5:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#hop-limit 5
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Example to reset the hop limit attribute to default value:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#no hop-limit
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

reoptimize

Use this command to set the re-optimization attribute for auto bypass. Auto bypass sessions of matching attribute type will be enabled for re-optimization when the attribute is configured.

Use the `no` parameter to disable re-optimization for auto bypass.

Command Syntax

```
reoptimize

no reoptimize
```

Parameters

None

Default

The auto bypass re-optimization is disabled.

Command Mode

Auto bypass attribute mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for enabling the re-optimization attribute:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#reoptimize
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Example for disabling the re-optimization attribute:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#no reoptimize
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

exclude-address

Use this command to configure exclude address attribute for auto bypass. Auto bypass sessions of matching attribute type will inherit this explicit exclude address constraint while requesting for an LSP to CSPF. CSPF will provide the auto bypass path excluding the implicit exclude address and the configured exclude addresses.

Note: When link address added for exclusion, next-hop address on the link must be configured to exclude the link in forward direction and also if the link must be excluded in both direction, then both link address and the next-hop address must be added to exclude address list. For node address exclusion, it is recommended to configure the loopback address which is part of routing.

Use the `no` parameter to remove the exclude address constraint.

Command Syntax

```
exclude-address (link | node) A.B.C.D
no exclude-address (link | node) A.B.C.D
```

Parameters

`link A.B.C.D`	Specifies the exclude address of type link.
`node A.B.C.D`	Specifies the exclude address of node link.

Default

Auto bypass will only have an implicit exclude address, which is the immediate link or node of the protected session. No additional exclude address constraints are applied.

Command Mode

Auto bypass attribute mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for configuring exclude address attribute to `link 10.1.1.2`:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#exclude-address link 10.1.1.2
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Example for configuring exclude address attribute to `node 2.2.2.2`:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#exclude-address node 2.2.2.2
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Example to remove the exclude address constraint from `link 10.1.1.2`:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bypass
(config-auto-bypass)#attributes best-effort
(config-auto-bypass-attr)#no exclude-address link 10.1.1.2
(config-auto-bypass-attr)#commit
(config-auto-bypass-attr)#exit
```

Show Commands - RSVP Auto Bypass

show rsvp router-id-table

Use this command to display the mapping of link addresses to router IDs maintained by the RSVP module to reduce the number of CSPF query.

Note: This command can display no information even when auto bypass sessions are active but that is just an indication that RSVP module doesn't hold the CSPF data locally and will collect data from CSPF when required.

Command Syntax

```
show rsvp router-id-table
```

Parameters

None

Command Mode

Exec and Privileged exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for viewing RSVP router ID table:

```
#show rsvp router-id-table
Link Address     Router ID        Query Status     CSPF Client    Refcnt
----------------+----------------+----------------+--------------+---------
23.1.1.3         3.3.3.3          COMPLETE         ISIS           3
```

show rsvp srlg-group

This command displays mapping of unique ID value used in auto bypass name to the SRLG group when srlg-disjoint is configured.

Note that, only OSPF CSPF provides SRLG protection. SRLG configuration not recommended to be configured when CSPF is ISIS.

Command Syntax

```
show rsvp srlg-group
```

Parameters

None

Command Mode

Exec and Privileged exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for viewing SRLG group:

```
#show rsvp srlg-group
Group-ID   Refcnt     SRLG Values
----------+----------+----------------------------------------------------
100        3          10
```

show rsvp srlg-group parameters output details

Field	Description
Group-ID	A unique ID generated for a set of SRLG values. This ID is used in tunnel name to maintain SRLG uniqueness.
Refcnt	Number of auto bypass tunnels using the group ID in their name.
SRLG Values	A set of SRLG values for which a unique ID is generated.

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
CSPF	**Constrained Shortest Path First**. An extension of shortest path first (SPF). The path computed using CSPF is the shortest path that fulfills a set of constraints. After running the shortest path algorithm, the paths are pruned, removing those links that violate a given set of constraints.
LSP	**Label Switched Path**. A sequence of routers that cooperatively perform Multi-Protocol Label Switching (MPLS) operations for a packet stream. An LSP is a unidirectional, point-to-point, half-duplex connection carrying information downstream from the ingress (first) router to the egress (last) router. The ingress and egress routers cannot be the same device.
OSPF	**Open Shortest Path First.** An Interior Gateway Protocol (IGP) based on link-state routing. OSPF is widely deployed in large networks because of its efficient use of network bandwidth and its rapid convergence after changes in topology.
PLR	**Point of Local Repair**. It refers to a router's capability within a network to quickly reroute traffic around a failed link or node.
RSVP	**Resource Reservation Protocol**. A signalling protocol for reserving resources across a network. RSVP is rarely used by itself, but Resource Reservation Protocol—Traffic Engineering (RSVP-TE) is widely used.
SRLG	**Shared Risk Link**. Group. It refers to a group of links that share a common risk of failure due to factors such as physical proximity, geographic location, or shared resources.

CHAPTER 7 Auto-Bandwidth with RSVP-TE

Overview

Automatic bandwidth allows to dynamically adjust bandwidth reservation based on the measured traffic. RSVP automatic bandwidth monitors the traffic rate on a Label Switched Path (LSP) and resizes the bandwidth to align it closely with the traffic in the tunnel. RSVP automatic bandwidth is configured on individual LSPs at every headend router.

Auto bandwidth can be added to an operational LSP at any time, but no bandwidth change occurs until a future trigger event or auto bandwidth profile configured with initial bandwidth or minimum bandwidth. Auto bandwidth may also be removed from an operational LSP at any time and this would re-signal the LSP with no bandwidth reservation.

Feature Characteristics

The characteristics of the RSVP auto-bandwidth are:

- RSVP-TE auto bandwidth provides the means to automatically adjust the bandwidth allocation for traffic engineering tunnels based on their measured traffic load.
- This feature samples the average output rate for each tunnel marked for automatic bandwidth adjustment. For each marked tunnel, this feature periodically adjusts the tunnel's allocated bandwidth to the largest eligible sample for the tunnel since the last adjustment.
- The frequency with which tunnel bandwidth is adjusted and the allowable range of adjustments should be configurable on a per-auto-bandwidth profile basis.
- In addition, the sampling interval and the interval over which to average tunnel traffic to obtain the average output rate is user-configurable on a per-auto-bandwidth profile basis.

Note:

- Convergence on redundancy may require bidirectional traffic or MAC aging.
- The feature relies on stat_id allocation to tunnel entities, and there is a limit on the maximum number of stat_ids (which varies based on the chip variant). If a tunnel is not associated with a stat entity, traffic rate samples cannot be fetched for those tunnels.
- RSVP Graceful Restart is not supported for automatic bandwidth. When a GR is performed, RSVP will not store the current bandwidth for the reservation. It will use either the initial bandwidth (if configured), the minimum bandwidth, or the highest bandwidth of the on-boot sample (if auto-bandwidth-on-boot is configured).
- The auto bandwidth feature relies on the hardware's ability to collect tunnel traffic counters. In Qumran1 devices, the “hardware-profile statistics tunnel-lif enable” command must be enabled, and the system must be reloaded for the change to take effect. Without the tunnel statistics profile, auto bandwidth will not process traffic rates and will be ineffective. Note that, only 2 statistics profiles shall be configured as this is the hardware limitation.
- Auto bandwidth and manual bandwidth configurations are mutually exclusive. Auto bandwidth allows for configuring an initial bandwidth, which will be used as the session's initial bandwidth when auto bandwidth is associated with a trunk. If the initial bandwidth is not configured, the minimum bandwidth will be used to initialize the session bandwidth.
- For tunnels with only one hop, the no PHP (default config) must be set for the rate to be computed correctly.

Benefits

In large MPLS transport networks in service provider settings with this capability:

© 2025 IP Infusion Inc. Proprietary

- The network can react faster to sudden bursts of traffic in near real-time and not rely on manual intervention.
- Effective use of bandwidth resources by minimizing the over-subscription/padding of LSP bandwidth.
- Maximizes the usage of available bandwidth and optimizes the network effectively to use preferred, shorter latency, paths first.

Prerequisites

Define Interfaces and Loopback Addresses

Configure Layer 3 interfaces, like port channel interfaces (e.g., po1), and assign specific IP addresses for proper identification and routing. Additionally, assign loopback IP addresses to establish essential points of connectivity. These configurations establish the efficient network routing and communication.

```
!
interface lo
 ip address 127.0.0.1/8
 ip address 100.1.1.1/32 secondary
 ipv6 address ::1/128
!
interface xe1
 ip address 1.1.1.1/24
!
```

Configure IGP for Dynamic Routing

Configure IGP for dynamic routing by following the steps mentioned. This setup includes enabling ISIS for dynamic routing and configuring OSPF for the network.

ISIS Configuration

1. **Enable ISIS on all nodes**: Ensure that ISIS is running across the network to facilitate dynamic routing.
2. **Define ISIS Router Instances**: Set up instances to match loopback IP addresses.
3. **Add Network Segments to ISIS Areas**: This ensures proper route distribution.
4. **Set up Neighbor Relationships**: Use loopback IP addresses to establish these relationships for efficient route advertisement and convergence.

```
!
router isis 1
 is-type level-2-only
 metric-style wide
 mpls traffic-eng router-id 100.1.1.1
 mpls traffic-eng level-2
 capability cspf
 dynamic-hostname
 fast-reroute ti-lfa level-2 proto ipv4
 net 49.0000.0000.0001.00
 passive-interface lo
!
interface xe1
 isis network point-to-point
```

```
 ip router isis 1
!
```

OSPF Configuration

1. **Configure OSPF Router ID**: Assign a unique router ID for OSPF operations.
2. **Define OSPF Networks**: Include the loopback IP and other network segments in the OSPF area for route distribution.

```
!
router ospf 100
 ospf router-id 100.1.1.1
 network 100.1.1.1/32 area 0.0.0.0
 network 1.1.1.1/24 area 0.0.0.0
!
```

Configure RSVP for Efficient Network Operation

Enable Resource Reservation Protocol (RSVP) on all nodes to optimize traffic routing and quality of service. RSVP reserves network resources along specified paths to enhance network performance and reliability.

```
!
router rsvp
!
interface xe1
 label-switching
 enable-rsvp
!
```

Configure the RSVP Primary Path and Trunk

Establish a trunk is required on edge routers participating in label-switching using defined path. Configuring the RSVP path is optional.

```
!
rsvp-path PE1-PE2-1 mpls
 1.1.1.2 strict
 1.1.2.1 strict
!
rsvp-trunk PE1-PE2 ipv4
 reoptimize
 primary fast-reroute protection facility
 primary fast-reroute node-protection
 primary path PE1-PE2-1
 from 100.1.1.1
 to 100.1.1.3
!
```

Configuration for RSVP Auto-Bandwidth

Configure various nodes within the topology to set up a RSVP-Auto bypass tunnels.

Topology

The sample topology includes Edge Nodes (PE1 and PE2) and core Nodes (P1).

Primary path is defined via PE1-P1-PE2.

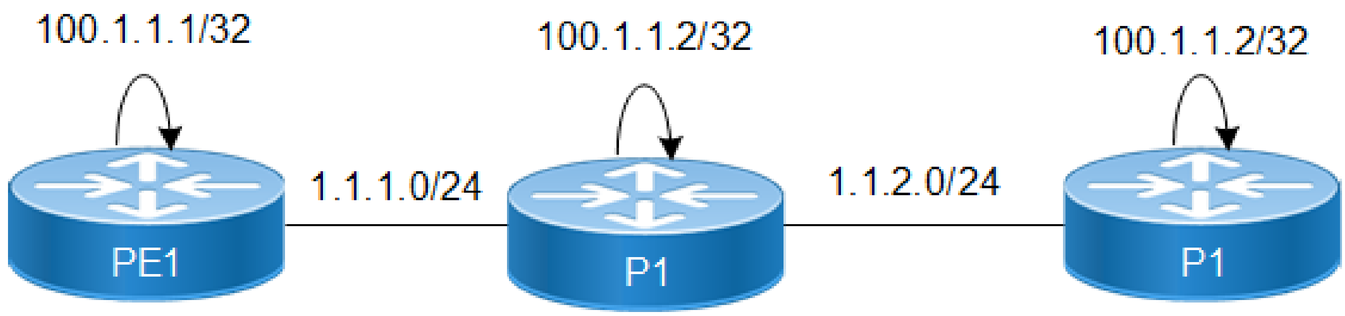

Figure 7-4: RSVP-Auto Bypass Tunnel Setup

Configure RSVP Auto Bandwidth on PE1 Router

1. Create auto-bandwidth Profile.

```
(config)# rsvp-auto-bandwidth AUTO-BW
(config-auto-bandwidth)# commit
```

2. Set the Sample interval & adjust interval.

```
(config-auto-bandwidth)# sample-interval 1
(config-auto-bandwidth)# adjust-interval 5
```

3. Set the minimum & maximum bandwidth rate.

```
(config-auto-bandwidth)# minimum-bandwidth 200m
(config-auto-bandwidth)# maximum-bandwidth 500m
```

4. Set the overflow-threshold & underflow-threshold.

```
(config-auto-bandwidth)# overflow-threshold absolute 100m
(config-auto-bandwidth)# underflow-threshold absolute 50m
```

5. Set the overflow & underflow limit.

```
(config-auto-bandwidth)# overflow-limit 2
(config-auto-bandwidth)# underflow-limit 2
```

6. Set the maximum number of consecutive times the average bandwidth can exceed the maximum threshold bandwidth before the exceed action is applied.

```
(config-auto-bandwidth)# maximum-bandwidth-exceed-limit 2
(config-auto-bandwidth)#maximum-bandwidth-exceed-action teardown
(config-auto-bandwidth)#commit
```

Running configuration on PE1 router is as follows:

```
#show running-config rsvp
!
router rsvp
!
!
interface xe1
 enable-rsvp
!
interface xe2
 enable-rsvp
!
```

Validation

Verify auto bandwidth adjustments information as below:

```
Send the sample rate with 200MBPS and verify the auto bandwidth adjustments as below:

Overflow:

Current bandwidth is adjusted to 290.4MBPS. Then, send the sample rate which is more than overflow threshold i.e, 340.1MBPS , 377.2MBPS.

As per the below output current bandwidth is more than overflow threshold bandwidth and consecutively two samples are received and it is more than the overflow limit.

So current BW is adjusted to 377.2mbps after 2 consecutive samples collected as per the Maximum Average Bandwidth.

Samples collected in the current adjustment cycle:
=======================================
Underflow:
```

Scenario 1 :

Current bandwidth is adjusted to 377.2 mbps. Then, send the sample rate which is less than underflow threshold i.e, 317.3 mbps , 310 mbps.

As per the below output current bandwidth is more than underflow threshold bandwidth and consecutively two samples are received and it is more than the underflow limit.

So current BW is adjusted to 317.3 mbps after 2 consecutive samples collected as per the Minimum Average Bandwidth.

-----------------------------------------------------------------------------------------
Samples collected in the current adjustment cycle:
```

Scenario 2 :

Configure the Auto bandwidth Profile without configuring any underflow-limit. When all the samples in adjustment cycle receive with the underflow rate, then only underflow bandwidth adjustment will happen.

Below Example shows underflow limit as a Zero and current bandwidth is set to 8.5g and all the samples are received less then underflow-limit. So, the Bandwidth adjustment happens only after adjustment cycle.

```

Configure RSVP Auto Bandwidth on Boot on PE1 Router

1. Create auto-bandwidth Profile.

```
(config)#router rsvp
```

2. Configure Auto bandwidth on boot and set the values for sample interval, Adjust interval and Adjust interval count.

```
(config-router)#auto-bandwidth-on-boot 1 5 1
(config-router)#commit
```

Validation

Verify auto bandwidth on boot adjustments information as below:

```
#show running-config rsvp
!
router rsvp
 auto-bandwidth-on-boot 1 5 1
!
!
!
!
!
!
!
#
#show rsvp trunk auto-bandwidth

*** On boot auto bandwidth is in progress for 2 minutes, 3 seconds ***

Commands for RSVP Auto-Bandwidth

The RSVP auto-bandwidth uses the following configuration commands.

rsvp-auto-bandwidth

Use this command to configure an auto bandwidth profile. The profile will have default settings if any parameter not configured explicitly. User can configure parameters to their need within auto bandwidth profile.

Use `no` parameter of this command to delete auto bandwidth profile.

Command Syntax

```
rsvp-auto-bandwidth PROFILENAME
no rsvp-auto-bandwidth PROFILENAME
```

Parameters

`<PROFILE_NAME>`	Specifies the name assigned to the auto-bandwidth profile during configuration. The profile name can be a maximum of 64 characters in length.

Default

None

Command Mode

Config mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure an auto-bandwidth profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#commit
(config-auto-bandwidth)#exit
(config)#
```

The following example describes how to delete the auto bandwidth profile:

```
#configure terminal
(config)#no rsvp-auto-bandwidth bwp
(config)#commit
```

sample-interval

Use this command to configure a sample interval value in minutes on the auto bandwidth profile. Sample interval determines the frequency at which rate samples collected from associated trunks. Sample interval must not be configured more than adjust interval as no samples can be collected within an adjustment cycle in such case.

Note: Sample interval timers run per auto bandwidth profile and not per associated trunks. So, in case of bandwidth adjustments on trunks before adjustment cycle completion will leave the newly formed session with less number of samples in the remaining part of adjustment cycle. In order to avoid very few samples being processed, minimum-samples command shall be configured in absolute or percentage format.

Use the `no` parameter to remove the sample interval configuration.

Command Syntax

```
sample-interval <1 - 10080>
no sample-interval
```

Parameters

<1-10080>	Specifies the sample interval value in minutes.

Default

5 minutes

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure sample interval in the auto bandwidth profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#sample-interval 2
(config-auto-bandwidth)#commit
```

The following example describes how to remove configured sample interval in the auto bandwidth profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no sample-interval
(config-auto-bandwidth)#commit
```

adjust-interval

Use this command to configure a adjust interval value in minutes on the auto bandwidth profile. Adjust interval determines the duration of the adjustment cycle. Bandwidth update decisions for active session of associated trunks are taken after every adjustment cycle. Adjust interval must not be configured less than sample interval as no samples can be collected within an adjustment cycle in such case.

Note: Adjust interval timers run per auto bandwidth profile and not per associated trunks. So, in case of bandwidth adjustments on trunks before adjustment cycle completion will leave the newly formed session with less number of samples in the remaining part of adjustment cycle. In order to avoid very few samples being processed, minimum-samples command shall be configured in absolute or percentage format.

Use the `no` parameter to remove the adjust interval configuration.

Command Syntax

```
adjust-interval <5 - 10080>
no adjust-interval
```

Parameters

`<5-10080>`	Specifies the adjust interval value in minutes.

Default

30 minutes

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure adjust interval in the auto bandwidth profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#adjust-interval 60
(config-auto-bandwidth)#commit
```

The following example describes how to remove configured adjust interval in the auto bandwidth profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no adjust-interval
(config-auto-bandwidth)#commit
```

minimum-bandwidth

Use this command to configure minimum bandwidth on the auto bandwidth profile. Even when traffic flow is much lesser than minimum bandwidth, LSP will be reserved with the configured minimum bandwidth during bandwidth adjustment process. When auto bandwidth profile associated with trunk, LSP will be signaled with minimum bandwidth when initial bandwidth is not configured in the profile.

Use the `no` parameter to remove the minimum bandwidth configuration from the profile.

Command Syntax

```
minimum-bandwidth BANDWIDTH
no minimum-bandwidth
```

Parameters

BANDWIDTH	Specifies the bandwidth value in the range of 1k to 999g.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure minimum bandwidth in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#minimum-bandwidth 100m
(config-auto-bandwidth)#commit
```

The following example describes how to remove the minimum bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no minimum-bandwidth
(config-auto-bandwidth)#commit
```

maximum-bandwidth

Use this command to configure maximum bandwidth on the auto bandwidth profile. Even when traffic flow is much higher than maximum bandwidth, LSP will be reserved with the configured maximum bandwidth during bandwidth adjustment process. Operator notification is generated if the traffic rate samples collected are higher than the maximum bandwidth but the reservation is limited to maximum bandwidth.

Note: When maximum bandwidth is configured, even a single traffic rate sample crossing the maximum bandwidth will trigger an MBB with maximum bandwidth reserved. If user doesn't wish to trigger an MBB for single sample of maximum bandwidth exceed, maximum-bandwidth-exceed-limit shall be configured with a value to mention the number of consecutive samples to cross maximum bandwidth to take further action.

Use the `no` parameter to remove the maximum bandwidth configuration from the profile.

Command Syntax

```
maximum-bandwidth BANDWIDTH
no maximum-bandwidth
```

Parameters

`BANDWIDTH`	Specifies the bandwidth value in the range of 1k to 999g.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure maximum bandwidth in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#maximum-bandwidth 900m
(config-auto-bandwidth)#commit
```

The following example describes how to remove the maximum bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no maximum-bandwidth
(config-auto-bandwidth)#commit
```

initial-bandwidth

Use this command to configure initial bandwidth on the auto bandwidth profile. When auto bandwidth profile associated with trunk, LSP will be signalled with initial bandwidth when initial bandwidth is configured in the profile. For trunks which are already associated with auto bandwidth profile and the system going through reload, initial bandwidth will not be applicable as on boot computation will trigger to update active sessions with bandwidth as per the on boot period traffic rate sample computation.

Use the `no` parameter to remove the initial bandwidth configuration from the profile.

Command Syntax

```
initial-bandwidth BANDWIDTH
no initial-bandwidth
```

Parameters

BANDWIDTH	Specifies the bandwidth value in the range of 1k to 999g.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure initial bandwidth in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#initial-bandwidth 500m
(config-auto-bandwidth)#commit
```

The following example describes how to remove the initial bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no initial-bandwidth
(config-auto-bandwidth)#commit
```

underflow-threshold

Use this command to configure underflow threshold in percentage or absolute value format on the auto bandwidth profile. Underflow threshold sets the amount of reduction in traffic rate sample to detect an eligible underflow. As an example, absolute underflow threshold 10m when current bandwidth is 200m means, a traffic rate sample of 190.1m will not be considered eligible underflow sample and a sample of 189.9m will be considered eligible underflow sample.

When all the traffic rate samples collected for an auto bandwidth profile associated trunk cross underflow threshold in an adjustment cycle, then the highest eligible traffic rate sample will be considered to re-signal the session with new bandwidth at the end of an adjustment cycle.

Constraints like underflow-limit and underflow-threshold-activate-bandwidth will add additional logic on how bandwidth update action is taken. This will be discussed in respective sections.

If underflow threshold is not configured, then minor reduction in traffic rate sample also will be considered as eligible underflow bandwidth sample. So, underflow and overflow threshold is a recommended configuration even though it is not mandatory.

When underflow threshold is configured in percentage, the threshold will be computed based on the current bandwidth and the percentage value. Example, underflow threshold 10% for a current bandwidth of 100m means a sample of 90m or lesser will be considered eligible underflow sample. Underflow threshold can be configured either as absolute value or in percentage but not both.

Use the `no` parameter to remove the underflow bandwidth configuration from the profile.

Command Syntax

```
underflow-threshold (percent <1-100>) | (absolute BANDWIDTH)
no underflow-threshold (percent | absolute)
```

Parameters

`<1-100>`	Specifies the underflow threshold value in percentage.
`BANDWIDTH`	Specifies the bandwidth value in the range of 1k to 999g.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure underflow bandwidth in percentage format in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#underflow-threshold percent 10
(config-auto-bandwidth)#commit
```

The following example describes how to remove the underflow bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no underflow-threshold percent
(config-auto-bandwidth)#commit
```

overflow-threshold

Use this command to configure overflow threshold in percentage or absolute value format on the auto bandwidth profile. Overflow threshold sets the amount of increase in traffic rate sample required to detect an eligible overflow. As an example, absolute overflow threshold 10m when current bandwidth is 200m means, a traffic rate sample of 209.9m will not be considered eligible overflow sample and a sample of 210.1m will be considered eligible overflow sample.

When a traffic rate sample collected for an auto bandwidth profile associated trunk crosses overflow threshold in an adjustment cycle, then the highest eligible traffic rate sample will be considered to re-signal the session with new bandwidth at the end of adjustment cycle.

Constraints like overflow-limit and overflow-threshold-activate-bandwidth will add additional logic on how bandwidth update action is taken. This will be discussed in respective sections.

© 2025 IP Infusion Inc. Proprietary

If overflow threshold is not configured, then minor increase in traffic rate sample also will be considered as eligible overflow bandwidth sample. So, underflow and overflow threshold is a recommended configuration even though it is not mandatory.

When overflow threshold is configured in percentage, the threshold will be computed based on the current bandwidth and the percentage value. Example, overflow threshold 10% for a current bandwidth of 100m means a sample of 110m or more will be considered eligible overflow sample. Overflow threshold can be configured either as absolute value or in percentage but not both.

Use the `no` parameter to remove the underflow bandwidth configuration from the profile.

Command Syntax

```
overflow-threshold (percent <1-100>) | (absolute BANDWIDTH)
no overflow-threshold (percent | absolute)
```

Parameters

<1-100>	Specifies the overflow threshold value in percentage.
BANDWIDTH	Specifies the bandwidth value in the range of 1k to 999g.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure underflow bandwidth in absolute format in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#overflow-threshold absolute 10m
(config-auto-bandwidth)#commit
```

The following example describes how to remove the underflow bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no overflow-threshold absolute
(config-auto-bandwidth)#commit
```

underflow-threshold-activate-bandwidth

Use this command to configure absolute bandwidth range to allow bandwidth re-signalling when underflow threshold and underflow limit criteria matched. This configuration helps to limit the underflow bandwidth reservation update for certain range of bandwidth.

As an example, if the current bandwidth is 500m and the underflow threshold is 10%. So, normally, if all traffic rate samples collected are in the range of 400m to 450m, session will be re-signalled to reserve new bandwidth. However, if underflow-threshold-activate-bandwidth is configured as 300m, then the traffic rate samples in the range of 400m to

450m will not trigger bandwidth update. Only when the traffic rate samples are less than 300m, then it will be considered as eligible sample.

The configuration creates an absolute bandwidth range for underflow samples to be eligible. The bandwidth range for underflow eligibility will be minimum bandwidth (or zero when minimum bandwidth is not configured) to underflow-threshold-activate-bandwidth value. When this command is not configured, there won't be any such absolute range and only underflow-threshold and underflow-limit will be considered for computation, if configured.

Use the `no` parameter to remove the underflow threshold activate bandwidth configuration from the profile.

Command Syntax

```
underflow-threshold-activate-bandwidth BANDWIDTH
no underflow-threshold-activate-bandwidth
```

Parameters

`BANDWIDTH`	Specifies the bandwidth value in the range of 1k to 999g.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure underflow threshold activate bandwidth in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#underflow-threshold-activate-bandwidth 500m
(config-auto-bandwidth)#commit
```

The following example describes how to remove the underflow threshold activate bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no underflow-threshold-activate-bandwidth
(config-auto-bandwidth)#commit
```

overflow-threshold-activate-bandwidth

Use this command to configure absolute bandwidth range to allow bandwidth re-signalling when overflow threshold and overflow limit criteria matched. This configuration helps to limit the overflow bandwidth reservation update for certain range of bandwidth.

As an example, if the current bandwidth is 100m and the overflow threshold is 10%. Normally, if a traffic rate sample collected is in the range of 110m to 150m, session will be re-signalled to reserve new bandwidth. However, if overflow-threshold-activate-bandwidth is configured as 300m, then the traffic rate samples in the range of 110m to 150m will not trigger bandwidth update. Only when the traffic rate samples are more than 300m, then it will be considered as eligible sample.

The configuration creates an absolute bandwidth range for overflow samples to be eligible. The bandwidth range for overflow eligibility will be overflow-threshold-activate-bandwidth value to a practical infinity. When this command is not configured, there won't be any such absolute range and only overflow-threshold and overflow-limit will be considered for computation, if configured.

Use the `no` parameter to remove the overflow threshold activate bandwidth configuration from the profile.

Command Syntax

```
overflow-threshold-activate-bandwidth BANDWIDTH
no overflow-threshold-activate-bandwidth
```

Parameters

`BANDWIDTH`	Specifies the bandwidth value in the range of 1k to 999g.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure overflow threshold activate bandwidth in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#overflow-threshold-activate-bandwidth 500m
(config-auto-bandwidth)#commit
```

The following example describes how to remove the overflow threshold activate bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no overflow-threshold-activate-bandwidth
(config-auto-bandwidth)#commit
```

underflow-limit

Use this command to configure underflow limit on the auto bandwidth profile. When underflow limit is configured, if the traffic rate samples collected on the associated session consecutively crosses underflow threshold for underflow limit times, then the bandwidth adjustment will be triggered immediately without waiting for adjustment cycle completion. When underflow-threshold-activate-bandwidth is configured, even this criteria is considered to mark a sample as eligible underflow sample.

Only when underflow limit is configured, underflow adjustment may happen before the completion of adjustment cycle. Otherwise, underflow adjustment considered only at the completion of adjustment cycle when all samples found to be eligible underflow sample.

Use the `no` parameter to remove the underflow limit configuration from the profile.

Command Syntax

```
underflow-limit <1-10080>
no underflow-limit
```

Parameters

<1-10080>	Specifies the underflow limit value for consecutive eligible samples.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure underflow limit in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#underflow-limit 3
(config-auto-bandwidth)#commit
```

The following example describes how to remove the underflow limit configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no underflow-limit
(config-auto-bandwidth)#commit
```

overflow-limit

Use this command to configure overflow limit on the auto bandwidth profile. When overflow limit is configured, if the traffic rate samples collected on the associated session consecutively crosses overflow threshold for overflow limit times, then the bandwidth adjustment will be triggered immediately without waiting for adjustment cycle completion. When overflow-threshold-activate-bandwidth is configured, even this criteria is considered to mark a sample as eligible underflow sample.

Only when overflow limit is configured, overflow adjustment may happen before the completion of adjustment cycle. Otherwise, overflow adjustment considered only at the completion of adjustment cycle when a sample found to be eligible overflow sample.

If the traffic rate sample crosses maximum bandwidth, then maximum-bandwidth-exceed-limit configuration comes into picture and by default, a single sample crossing maximum bandwidth triggers bandwidth update. This situation is different from overflow scenario.

Use the `no` parameter to remove the overflow limit configuration from the profile.

Command Syntax

```
overflow-limit <1-10080>
no overflow-limit
```

Parameters

`<1-10080>`	Specifies the overflow limit value for consecutive eligible samples.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure overflow limit in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#overflow-limit 3
(config-auto-bandwidth)#commit
```

The following example describes how to remove the overflow limit configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no overflow-limit
(config-auto-bandwidth)#commit
```

maximum-bandwidth-exceed-limit

Use this command to configure maximum bandwidth exceed limit on the auto bandwidth profile. When maximum bandwidth exceed limit is configured, if the traffic rate samples collected on the associated session consecutively crosses maximum bandwidth for maximum-bandwidth-exceed-limit times, then the action will be triggered immediately without waiting for adjustment cycle completion. When maximum-bandwidth-exceed-limit is not configured, a single sample exceeding maximum bandwidth will trigger an action which is re-signal with updated bandwidth or restart the session with initial or minimum bandwidth based on the action configured.

When maximum bandwidth is not configured, maximum bandwidth exceed limit configuration doesn't have any significance. Overflow limit and maximum bandwidth exceed limits are independent commands with different significance with latter associated with maximum bandwidth.

Use the `no` parameter to remove the maximum bandwidth exceed limit configuration from the profile.

Command Syntax

```
maximum-bandwidth-exceed-limit <1-10080>
no maximum-bandwidth-exceed-limit
```

Parameters

`<1-10080>`	Specifies the maximum bandwidth exceed limit value for consecutive eligible samples.

Default

1

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure maximum bandwidth exceed limit in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#maximum-bandwidth-exceed-limit 2
(config-auto-bandwidth)#commit
```

The following example describes how to remove the maximum bandwidth exceed limit configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no maximum-bandwidth-exceed-limit
(config-auto-bandwidth)#commit
```

maximum-bandwidth-exceed-action

Use this command to configure maximum bandwidth exceed action on the auto bandwidth profile. When the traffic rate samples collected on the associated session consecutively crosses maximum bandwidth for maximum-bandwidth-exceed-limit times (or one time if limit is not configured), then the action to be triggered will be decided by this configuration. If not configured, default action is to re-signal the session with maximum bandwidth or ignore if session is already signalled with maximum bandwidth. In any case, user will be notified about the maximum bandwidth being exceeded. However, with exceed action configured as teardown, session will be released and restarted with initial bandwidth or minimum bandwidth if initial bandwidth is not configured.

This action will lead to service interruption if there are no alternate transport. So, this configuration is recommended to be used with full awareness of the impact.

Use the `no` parameter to remove the maximum bandwidth exceed action configuration from the profile.

Command Syntax

```
maximum-bandwidth-exceed-action (teardown)
no maximum-bandwidth-exceed-action
```

Parameters

`teardown`	Teardown the session exceeding maximum bandwidth.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure maximum bandwidth exceed action in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#maximum-bandwidth-exceed-action teardown
(config-auto-bandwidth)#commit
```

The following example describes how to remove the maximum bandwidth exceed action configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no maximum-bandwidth-exceed-action
(config-auto-bandwidth)#commit
```

resignal-failure-action

Use this command to configure an action on the auto bandwidth profile when the bandwidth update re-signalling fails on the associated session. By default, if re-signalling fails (3 attempts) for the updated bandwidth, it will be noted down as re-signalling failure and session will continue with its current bandwidth reservation. If severe actions to be taken on such re-signal failure, then teardown action can be configured which will release the current session and restart freshly with initial bandwidth or minimum bandwidth when initial bandwidth is not configured.

This action will lead to service interruption if there are no alternate transport. So, this configuration is recommended to be used with full awareness of the impact.

Use the `no` parameter to remove the re-signal failure action configuration from the profile.

Command Syntax

```
resignal-failure-action (teardown)
no resignal-failure-action
```

Parameters

`teardown`	Specifies the teardown the session when re-signalling with new bandwidth fails.

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure re-signal failure action in a profile:

```
#configure terminal
```

```
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#resignal-failure-action teardown
(config-auto-bandwidth)#commit
```

The following example describes how to remove the re-signal failure action configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no resignal-failure-action
(config-auto-bandwidth)#commit
```

sync-bandwidth

Use this command to configure bandwidth synchronization for primary and secondary sessions of an auto bandwidth profile associated trunk. With this configuration, in case the associated trunk is configured with primary and secondary sessions, every time primary session goes through a bandwidth update, secondary session also will be re-signalled with primary session's bandwidth. Thus, secondary path is determined with proper reservation constraints to ensure it is in the correct bandwidth reserved state when traffic switches to secondary.

Use the `no` parameter to remove synchronise bandwidth configuration from the profile.

Command Syntax

```
sync-bandwidth
no sync-bandwidth
```

Parameters

None

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure synchronize bandwidth in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#sync-bandwidth
(config-auto-bandwidth)#commit
```

The following example describes how to remove the synchronise bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no sync-bandwidth
(config-auto-bandwidth)#commit
```

monitor-bandwidth

Use this command to configure only monitor the traffic rate samples and computation without taking any action. This command can be used to monitor the traffic behaviour without updating the active sessions. With this configuration, in case of overflow, underflow, adjustment cycle completion time computation results, maximum bandwidth exceed, etc., notification is provided without taking any action.

Use the `no` parameter to remove monitor bandwidth configuration from the profile.

Command Syntax

```
monitor-bandwidth
no monitor-bandwidth
```

Parameters

None

Default

None

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure monitor bandwidth in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#monitor-bandwidth
(config-auto-bandwidth)#commit
```

The following example describes how to remove the monitor bandwidth configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no monitor-bandwidth
(config-auto-bandwidth)#commit
```

minimum-samples

Use this command to configure the minimum samples required in an adjustment cycle for bandwidth processing. Sample timers and Adjust timers are executed per auto bandwidth profile and not per associated trunk. Thus, there are scenarios of a trunk going through a bandwidth update few minutes ago and again ends up with adjustment cycle completion processing with very few samples collected. In order to avoid such scenarios, minimum samples required in an adjustment cycle to process the bandwidth shall be configured.

Configuration is accepted in both absolute and in percentage format. This gives user the flexibility to choose the format that suites their need. If sample interval and adjust interval expected to be fixed, then absolute configuration helps providing the requirement of exact number of minimum samples required to process. If exact number isn't important and there are chances of changing adjust interval or sample interval in future, then percentage format can be chosen. However, only one of the formats can be configured.

By default, even if there is one traffic rate sample during adjustment cycle completion, bandwidth will be processed. So, it will be recommended to have this configuration if users are keen on minimum of certain samples to be considered for bandwidth computation.

Use the `no` parameter to remove the minimum sample configuration from the profile.

Command Syntax

```
minimum-samples (percent <1-100>) | (absolute <1-10080>)
no underflow-limit (percent | absolute)
```

Parameters

<1-10080>	Specifies the absolute value for minimum samples required in an adjustment cycle.
<1-100>	Specifies the minimum sample percentage required in an adjustment cycle.

Default

1 sample

Command Mode

Auto bandwidth mode

Applicability

Introduced in OcNOS version 6.5.2.

Example

The following example describes how to configure minimum samples in percentage format in a profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#minimum-samples percent 70
(config-auto-bandwidth)#commit
```

The following example describes how to remove the minimum samples configuration from the profile:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#no minimum-samples percent
(config-auto-bandwidth)#commit
```

auto-bandwidth

Use this command to attach an auto bandwidth profile to a trunk. When the auto bandwidth profile is attached to the trunk, active session will be re-signalled with initial bandwidth configured in the auto bandwidth profile or minimum bandwidth configured if initial bandwidth is not configured. Bandwidth update will be triggered only if there is variation in the bandwidth to be initialized. Attaching or detaching an auto bandwidth profile doesn't trigger any session flap and doesn't cause traffic impact.

When an auto bandwidth profile is associated with first trunk, sample interval and adjust interval timers will start and are stopped when the profile is removed from the last trunk.

Manual bandwidth configuration for the sessions and auto bandwidth profile attach are mutually exclusive and the configuring both of them on a trunk is not allowed.

Use the `no` parameter to remove the auto bandwidth profile from the trunk.

Command Syntax

```
auto-bandwidth PROFILENAME
no auto-bandwidth PROFILENAME
```

Parameters

PROFILENAME	Specifies the name of the auto bandwidth profile.

Default

None

Command Mode

Trunk mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to associate an auto bandwidth profile to a trunk:

```
#configure terminal
(config)#rsvp-auto-bandwidth bwp
(config-auto-bandwidth)#exit
(config)#rsvp-trunk t1
(config-trunk)#auto-bandwidth bwp
(config-trunk)#commit
```

The following example describes how to remove the auto bandwidth profile from the trunk:

```
#configure terminal
(config)#rsvp-trunk t1
(config-trunk)#no auto-bandwidth bwp
(config-trunk)#commit
```

auto-bandwidth-on-boot

Use this command to configure on boot sample interval, adjust interval and number of adjustment cycles. When the system is reloaded and comes up, all active sessions of trunks associated with auto bandwidth profiles run a relatively faster adjustment cycle with quicker sample collection to settle the sessions with accurate bandwidth reservation.

By default, sample interval is 1 minute, adjust interval is 5 minutes and the adjustment cycle runs one time. After the adjustment cycle completion, samples of each associated trunks computed to re-signal the sessions with updated bandwidth. Then the auto bandwidth profile based adjustment cycle starts. If user wishes to run the boot up time rigorous sample computation for longer duration or multiple rounds, then it shall be configured. The configurations will apply from system reload if the configuration is saved. Properties of auto bandwidth profiles will not be applied during boot up time computation.

Use the `no` parameter to remove the auto bandwidth profile from the trunk.

Command Syntax

```
auto-bandwidth-on-boot <1-10080> <1-10080> <1-10>
no auto-bandwidth-on-boot
```

Parameters

<1-10080>	On boot sample interval value in minutes.
<1-10080>	On boot adjustment interval value in minutes.
<1-10>	Specifies the number of adjustment cycles to run on boot.

Default

Sample interval 1 minute, adjust interval 5 minutes and 1 adjustment cycle.

Command Mode

Router mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to configure on boot auto bandwidth parameters:

```
#configure terminal
(config)#router rsvp
(config-router)#auto-bandwidth-on-boot 1 10 3
(config-router)#commit
```

The following example describes how to reset on boot auto bandwidth parameters:

```
#configure terminal
(config)#router rsvp
(config-router)#no auto-bandwidth-on-boot
(config-router)#commit
```

force-auto-bandwidth-adjustment

Use this command to force a bandwidth adjustment on a trunk associated with auto bandwidth profile. When the command is executed without bandwidth value mentioned, traffic rate samples collected till the time are used to compute the bandwidth to be adjusted. In case of bandwidth value mentioned in the command, the bandwidth is verified for eligibility and bandwidth update will be triggered.

Command Syntax

```
rsvp-trunk TRUNKNAME force-auto-bandwidth-adjustment (BANDWIDTH|)
```

Parameters

TRUNKNAME	Specifies the name of the trunk to go through forced bandwidth adjustment.
BANDWIDTH	Specifies the bandwidth value in the range of 1k to 999g.

Default

None

Command Mode

Privileged Exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how you can force a bandwidth adjustment for a trunk with an auto bandwidth profile:

```
#rsvp-trunk t1 force-auto-bandwidth-adjustment
```

clear rsvp auto-bandwidth

Use this command to reset the auto bandwidth adjustment cycle by clearing all the traffic samples collected by the associated trunks and by restarting sample and adjust timers. If auto bandwidth profile name is not mentioned, then all trunks associated with any auto bandwidth profile will be reset and computation will start freshly.

Command Syntax

```
clear rsvp auto-bandwidth (PROFILENAME|)
```

Parameters

PROFILENAME	Specifies the name of the auto bandwidth profile.

Default

None

Command Mode

Privileged Exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to restart processing of an auto bandwidth profile:

```
#clear rsvp auto-bandwidth bwp
```

clear rsvp trunk auto-bandwidth-statistics

Use this command to clear the statistics maintained on a trunk associated with auto bandwidth profile. Statistics will be mainly the highest watermarked bandwidth, last adjusted bandwidth, how many times adjustment triggered, status of the adjustment trigger, etc. This command will only clear the auto bandwidth statistics for the trunk and doesn't impact the operation of auto bandwidth including the traffic rate samples collected for the current adjustment cycle.

Command Syntax

```
clear rsvp trunk TRUNKNAME auto-bandwidth-statistics
```

Parameters

TRUNKNAME	Specifies the name of the trunk associated with auto bandwidth profile.

Default

None

Command Mode

Privileged Exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example describes how to clear the auto bandwidth statistics on a trunk which is associated with the auto bandwidth profile:

```
#clear rsvp trunk t1 auto-bandwidth-statistics
```

Show Commands for RSVP

show rsvp auto-bandwidth

Use this command to display auto bandwidth profile specific information.

Command Syntax

```
show rsvp auto-bandwidth
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for viewing all the auto bandwidth profiles:

```
 #show rsvp auto-bandwidth

Profile Name : bwp
-----------------------------------------------------------------------------
Sample Interval                               : 5 minutes (due in 4 minutes)
Adjust Interval                               : 30 minutes (due in 29 minutes)
Minimum Samples required for processing      : 1
Initial Bandwidth                             : 0
Minimum bandwidth                             : 0
Maximum bandwidth                             : 100m
Underflow Threshold Bandwidth                 : 5m
```

```
Overflow Threshold Bandwidth                  : 5m
Underflow Threshold Activate Bandwidth        : 0
Overflow Threshold Activate Bandwidth         : 0
Overflow Limit                                : 3

Maximum Bandwidth Exceed Limit                : 1
Maximum Bandwidth Exceed Action               : notify
Re-signal Failure Action                      : notify
Sync Bandwidth                                : No
Monitor Bandwidth                             : No
No. of trunks associated                      : 1
```

show rsvp auto-bandwidth detail

Use this command to display a specific auto bandwidth profile information or all auto bandwidth profile information along with associated trunk details.

Command Syntax

```
show rsvp auto-bandwidth (PROFILENAME | detail)
```

Parameters

PROFILENAME	Specifies the name of the auto bandwidth profile.
detail	Specifies detailed information of all the auto bandwidth profiles.

Command Mode

Exec mode and Privileged Exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following example is for viewing all the auto bandwidth profiles along with associated trunks:

```
#show rsvp auto-bandwidth detail

Profile Name : bwp
-----------------------------------------------------------------------------
Sample Interval                           : 5 minutes (due in 4 minutes)
Adjust Interval                           : 30 minutes (due in 29 minutes)
Minimum Samples required for processing   : 1
Initial Bandwidth                         : 0
Minimum bandwidth                         : 0
Maximum bandwidth                         : 100m
Underflow Threshold Bandwidth             : 5m
Overflow Threshold Bandwidth              : 5m
Underflow Threshold Activate Bandwidth    : 0
Overflow Threshold Activate Bandwidth     : 0
Overflow Limit                            : 3
Underflow Limit                           : 3
Maximum Bandwidth Exceed Limit            : 1
Maximum Bandwidth Exceed Action           : notify
Re-signal Failure Action                  : notify
Sync Bandwidth                            : No
Monitor Bandwidth                         : No
```

```
No. of trunks associated                 : 1
------------+--------+--------+--------+----------+----------+----------+----------+-----------
Trunk-Name   Trunk    LSP      Last     Requested  Signaled   Current    Highest    LastAdjust
            ID       ID       BW       BW         BW         BW         Time                  -
-----------+--------+--------+--------+----------+----------+----------+----------+-----------
t1           5001     2201     10.1m    22.5m      22.5m      22.5m      35.5m      2024 Jul 23
```

show rsvp trunk auto-bandwidth

Use this command to display the information of all the trunks associated with the auto bandwidth profile. This show command will display high level information like what is the last bandwidth, current bandwidth, last adjustment time, time left in adjustment cycle in seconds, etc.

Command Syntax

```
show rsvp trunk auto-bandwidth
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for viewing an auto bandwidth summary of all the trunks associated with auto bandwidth profile:

```
      #show rsvp trunk auto-bandwidth
-----------+------+-----+------+----------+---------+--------+--------+------------+-----------
Trunk-Name  Trunk  LSP   Last   Requested  Signaled  Current  Highest  Adjust-Time  Last-Adjust
           ID     ID    BW     BW         BW        BW       BW       Left(sec)    Time
-----------+------+-----+------+----------+---------+--------+--------+------------+-----------
t1          5001   2201  10.1m  22.5m      22.5m     22.5m    35.5m    1142         2024 Jul 23
```

show rsvp trunk auto-bandwidth detail

Use this command to display the information of a trunk or all the trunks associated with the auto bandwidth profile. This command will provide detailed information of the auto bandwidth related statistics on the trunk as well as details of traffic rate samples collected in an adjust cycle and the time left for next sample collection, etc.

Command Syntax

```
show rsvp trunk auto-bandwidth (TRUNKNAME | detail)
```

Parameters

`TRUNKNAME`	Specifies the name of the particular trunk to display auto-bandwidth details for.

Command Mode

Exec mode and Privileged Exec mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

Example for viewing the auto bandwidth details of all the trunks associated with auto bandwidth profile

```
#show rsvp trunk auto-bandwidth detail
:Session: t1-Primary, Tunnel-id: 5001, LSP-ID: 2201, Egress: 2.2.2.2
-----------------------------------------------------------------------------

A.B.C.D

Use this command to configure an explicit IPv4 route sub-object as either loose or strict. A list of sub-objects specifies an explicit route to the egress router for an LSP.

- For the strict type of route addresses, the route taken from the previous router to the current router must be a directly connected path and a message exchanged between the two routers should not pass any intermediate routers. This ensures that routing is enforced on the basis of each link. For configuring path-option as “strict” path, we need to configure interface ip address (ip address of next-hop interface). strict with loopback ip shall not be configured.
- For the loose type of route addresses, the route taken form the previous router to the current router need not be a direct path and a message exchanged between the two routers can pass other routers.For configuring path-option as “loose” path, we can configure either loopback interface ip address or next-hop interface ip address. It will expand the explicit path accordingly since the next hop need not to be a connected one.

Use the `no` parameter with this command to disable the configuration.

Command Syntax

```
A.B.C.D
A.B.C.D (loose|strict)
no A.B.C.D
no A.B.C.D (loose|strict)
```

Parameters

`loose`	Make this node loose
`strict`	Make this node strict

Default

By default, A.B.C.D is disabled

Command Mode

Path mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-path mypath
(config-path)#10.10.0.5 strict
```

ack-wait-timeout

Use this command to set the acknowledgement wait timeout for the RSVP daemon. This command can be invoked from config-router mode.

Use the `no` parameter with this command to revert to the default settings.

Command Syntax

```
ack-wait-timeout <1-65535>
no ack-wait-timeout
```

Parameters

`<1-65535>`	Configure acknowledgement wait timeout.

Default

By default, `no ack-wait-timeout`.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 4.2.

Examples

```
#configure terminal
(config)router rsvp
(config-router)# ack-wait-timeout 30

#configure terminal
(config)router rsvp
(config-router)# no ack-wait-timeout
```

clear rsvp session

Use this command to reset either all or specified sessions originating from a specific ingress and terminating on the specific egress.

Note: If the affected session originates from the router where the command is issued, it is stopped and started. If the affected session does not originate from the router where the command is issued, it is stopped and deleted.

Command Syntax

```
clear rsvp session TUNNEL-ID LSP-ID INGRESS EGRESS
```

Parameters

`TUNNELID`	Clear tunnel ID sessions
`LSP-ID`	Clear LSP ID sessions
`INGRESS`	Clear ingress sessions
`EGRESS`	Clear egress sessions

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear rsvp session 1 1 1.2.3.4 192.168.1.1
```

clear rsvp trunk

Use this command to clear an RSVP trunk or to clear all RSVP trunks.

Clearing a trunk also kills any session associated with the trunk. This command is useful when a trunk is missing required data such as routing information. When data is missing, the trunk is in an incomplete state, and clearing it correctly re-initializes the session.

Note: If this command is given in the session on the ingress router, the session stops and restarts. If this command is given in the session on the egress router, the session is not cleared.

Command Syntax

Note: Use the following commands to clear standard RSVP Trunks:

```
clear rsvp trunk *
clear rsvp trunk ingress (TRUNKNAME|*)
clear rsvp trunk non-ingress (TRUNKNAME|*)
clear rsvp trunk (TRUNKNAME|*)
clear rsvp trunk (TRUNKNAME|*) primary
clear rsvp trunk (TRUNKNAME|*) secondary
```

Parameters

`*`	Clear all RSVP trunks configured
`TRUNKNAME`	Name of a specific trunk to be cleared
`ingress`	Clear an RSVP ingress trunk
`non-ingress`	Clear an RSVP non-Ingress trunk
`primary`	Clear all primary sessions configured for this trunk
`secondary`	Clear all secondary sessions configured for this trunk

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear rsvp trunk mytrunk
#clear rsvp trunk *
#clear rsvp trunk ingress mytrunk
#clear rsvp trunk ingress *
#clear rsvp trunk non-ingress mytrunk
#clear rsvp trunk non-ingress *
#clear rsvp trunk mytrunk primary
#clear rsvp trunk * primary
#clear rsvp trunk mytrunk secondary
#clear rsvp trunk * secondary
```

© 2025 IP Infusion Inc. Proprietary

cspf

Use this command to enable the use of Constrained Shortest Path First (CSPF) server for all RSVP sessions. If CSPF is turned off globally, it cannot be enabled for any LSP.

The CSPF server computes paths for LSPs that are subject to various constraints such as bandwidth, hop count, administrative groups, priority, and explicit routes. When computing paths for LSPs, CSPF considers not only the topology of the network and the attributes defined for the LSP but also the links. It attempts to minimize congestion by intelligently balancing the network load.

Use the no cspf command to disable this configuration.

Note: CSPF server information is not signaled across session and hence sessions in transit and egress nodes will not be aware of the CSPF server. So, in multi CSPF scenarios, neighbor down event from a CSPF server restart all sessions irrespective of which CSPF server sessions were using.

Note: The CSPF server is unaware of whether an interface is label-switching and RSVP enabled. So, the LSP calculation may include non-RSVP interfaces too, and may lead to tunnel sessions not coming up. To avoid links that are not label-switching and RSVP enabled, “te-metric” with the highest value shall be configured on those interfaces to de-prioritize those links in the TE database.

Command Syntax

```
cspf
```

Parameters

None

Default

By default, CSPF server is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows using the `no cspf` command in Router mode to disable CSPF for all RSVP sessions.

```
#configure terminal
(config)#router rsvp
(config-router)#cspf
```

debug rsvp all

Use this command to enable all debugging options for an RSVP daemon.

Use the `no` parameter with this command to stop logging all debugging information.

Command Syntax

```
debug rsvp (all|)
no debug rsvp (all|)
```

Parameters

None

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug rsvp all
```

© 2025 IP Infusion Inc. Proprietary

debug rsvp cspf

Use this command to enable the exchange of debugging messages between the RSVP module and the CSPF module.

Use the `no` parameter with this command to stop logging CSPF debugging information.

Command Syntax

```
debug rsvp cspf
no debug rsvp cspf
```

Parameters

None

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug rsvp cspf
```

debug rsvp events

Use this command to enable debugging of events that were generated from an RSVP daemon.

Use the `no` parameter with this command to stop logging RSVP debugging information.

Command Syntax

```
debug rsvp events
no debug rsvp events
```

Parameters

None

Command Mode

Privileged Exec and Configure modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug rsvp events
```

debug rsvp fsm

Use these commands to enable debugging of events related to RSVP finite state machines (FSM). Commands are available to log debugging information for the egress FSM, the ingress FSM, the transit FSM, the transit upstream FSM, or the transit downstream FSM.

Use the `no` parameter with these commands to stop logging FSM debugging information.

Command Syntax

```
debug rsvp fsm
debug rsvp fsm egress
debug rsvp fsm ingress
debug rsvp fsm transit
debug rsvp fsm transit upstream
debug rsvp fsm transit downstream
no debug rsvp fsm
no debug rsvp fsm egress
no debug rsvp fsm ingress
no debug rsvp fsm transit
no debug rsvp fsm transit upstream
no debug rsvp fsm transit downstream
```

Parameters

None

Command Mode

Privileged Exec and Configure modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#debug rsvp fsm transit upstream
```

debug rsvp hexdump

Use this command to enable the hexdump debugging option for an RSVP daemon.

Use the `no` parameter with this command to stop logging hexdump debugging information.

Command Syntax

```
debug rsvp hexdump
no debug rsvp hexdump
```

Parameters

None

Command Mode

Privileged Exec and Configure modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug rsvp hexdump
```

debug rsvp nsm

Use this command to enable the NSM debugging option for an RSVP daemon.

Use the `no` parameter with this command to stop logging NSM debugging information.

Command Syntax

```
debug rsvp nsm
no debug rsvp nsm
```

Parameters

None

Command Mode

Privileged Exec and Configure modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug rsvp nsm
```

debug rsvp packet

Use this command to enable packet debugging options for an RSVP daemon. Using the `in` option command enables debugging for incoming packets. Using the `out` option command enables debugging for outgoing packets.

Use the `no` parameter with these commands to stop logging debugging information.

Command Syntax

```
debug rsvp packet
debug rsvp packet in
debug rsvp packet out
no debug rsvp packet
no debug rsvp packet in
no debug rsvp packet out
```

Parameters

None

Command Mode

Privileged Exec and Configure modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug rsvp packet in
#debug rsvp packet out
```

description (rsvp-bypass)

Use this command to add a description to the rsvp-bypass or update an existing description.

Use the `no` parameter with this command to disable the configuration.

Command Syntax

```
description LINE
no description
```

Parameters

`LINE`	Line describing the RSVP tunnel

Default

By default, rsvp bypass description is empty.

Command Mode

Rsvp-bypass mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#description this_is_the_description
(config-bypass)#no description
```

description (rsvp-path)

Use this command to add a description to the rsvp-path or update an existing description.

Use the `no` parameter with this command to disable the configuration.

Command Syntax

```
description LINE
no description
```

Parameters

`LINE`	Line describing the RSVP path

Default

By default, rsvp path description is empty.

Command Mode

Rsvp-path mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
#configure terminal
(config)#rsvp-path mypath
(config-path)#description this_is_the_description
(config-path)#no description
```

description (rsvp-trunk)

Use this command to add a description to the rsvp-trunk or update an existing description.

Use the `no` parameter with this command to disable the configuration.

Command Syntax

```
description LINE
no description
```

Parameters

`LINE`	Line describing the RSVP tunnel

Default

By default, rsvp trunk description is empty.

Command Mode

Rsvp-trunk mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#description this_is_the_description
(config-trunk)#no description
```

disable-rsvp

Use this command to disable RSVP message exchange on an interface.

RSVP can be enabled using the enable-rsvp command.

Command Syntax

```
disable-rsvp
```

Parameters

None

Default

By default, RSVP message exchange is disabled on an interface.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#disable-rsvp
```

enable-rsvp

Use this command to enable RSVP message exchange on an interface.

Note: To use this command, the corresponding interface needs to be enabled for label-switching using the label-switching command.

See disable-rsvp to undo the effects of this command.

Command Syntax

```
enable-rsvp
```

Parameters

None

Default

By default, RSVP message exchange is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#enable-rsvp
```

entropy-label-capability

Use this command to share the load across multiple members of a LAG port in the core of an MPLS network by using entropy labels.

Note: Use the `no` form of the command to disable the use of entropy labels

Command Syntax

```
entropy-label-capability
no entropy-label-capability
```

Parameters

None

Default

By default, entropy labels are not used.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#configure terminal
(config)router rsvp
(config-router)#entropy-label-capability
```

explicit-null

Use this command to send explicit-null labels to upstream router, instead of implicit-null labels.

If php is enabled then implicit-null label is advertised, then the penultimate hop removes the label and sends the packet as a plain IP packet to the egress router. The explicit-null command advertises label 0 and retains the label so the egress router can pop it. For details about usage of explicit-null, please refer to *RFC 3032*.

Use the `no` parameter with this command to stop sending explicit-null labels for directly-connected FECs to upstream router and resume sending non reserved labels.

Command Syntax

```
explicit-null
no explicit-null
```

Parameters

None

Default

By default, no php is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#explicit-null
```

ext-tunnel-id A.B.C.D

Use this command to configure an extended-tunnel identifier as an IPv4 address. These identifiers are used in RSVP messages. If no extended-tunnel ID is specified, the LSR-ID for the router is used as the extended-tunnel ID for all LSPs. The extended-tunnel ID is a simple way of identifying all LSPs belonging to the same trunk.

Use the `no` parameter with this command to remove a configured extended-tunnel ID.

Command Syntax

```
ext-tunnel-id A.B.C.D
no ext-tunnel-id
```

Parameters

`A.B.C.D`	Extended tunnel identifier for this trunk in IPv4 address format

Default

By default, the LSR-ID of the router is used as the extended-tunnel ID for all sessions.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk t1
(config-trunk)#ext-tunnel-id 10.10.10.30

(config)#rsvp-trunk t1
(config-trunk)#no ext-tunnel-id
```

from A.B.C.D

Use this command to specify a “from” IPv4 address for the RSVP daemon. This command can be invoked from either the router rsvp mode or from the rsvp-trunk mode. In the RSVP router mode, this command defines the source address as an IPv4 packet sent out by the RSVP daemon. In the RSVP trunk mode, this command indicates a sender’s address in the sender template object that is used in path messages.

Use the `no` parameter with this command to revert to the default settings.

Command Syntax

```
from A.B.C.D
no from
```

Parameters

`A.B.C.D`	When in trunk mode, this is the IPv4 address of a tunnel ingress node
`A.B.C.D`	When in router mode, this is the loopback IPv4 address

Default

By default, from A.B.C.D is enabled

Command Mode

Router or Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#from 10.10.0.5

#configure terminal
(config)#router rsvp
(config-router)#from 10.10.0.5
```

graceful-restart

Use this command to enable RSVP-TE graceful restart capability on a router. This is a global parameter. RSVP-TE determines whether or not to send the graceful restart capability object in its hello message. However, this capability also depends on support for graceful restart on the neighbor router.

The following conditions must be met in order to activate RSVP-TE graceful restart:

- This command is used on the local router.
- The neighbor router is explicitly set with either the entropy-label-capability or neighbor X:X::X:X command.
- The neighbor router supports graceful restart, and it is activated.

Command Syntax

```
graceful-restart
no graceful-restart
```

Parameters

None

Default

Graceful restart is disabled by default.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 5.0.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#graceful-restart
(config-router)#no graceful-restart
```

graceful-restart recovery-time

Use this command to set a recovery time for an RSVP-TE graceful restart configuration.

Use the `no` parameter with this command to reset the recovery time.

Command Syntax

```
graceful-restart recovery-time <60000-3600000>
no graceful-restart recovery-time
```

Parameters

`<60000-3600000>`Recovery time value in milliseconds

Default

Default value is 360000 ms.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 5.0.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#graceful-restart recovery-time 600000
```

graceful-restart restart-time

Use this command to set a restart time for an RSVP-TE graceful restart configuration.

Use the `no` parameter with this command to reset the restart time.

Command Syntax

```
graceful-restart restart-time <10000-600000>
no graceful-restart restart-time
```

Parameters

`<10000-600000>`	Restart time value in milliseconds

Default

Default value is 180000 ms.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 5.0.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#graceful-restart restart-time 100000
```

hello-interval

Use this command to set an interval between Hello packets.

Used as a global command, this value is over-ridden by the hello-interval set on the interface (see rsvp hello-interval). For optimum performance, set this value no more than one-third of the hello-timeout value.

Use the `no` parameter with this command to return to the default hello interval value.

Command Syntax

```
hello-interval <1-65535>
no hello-interval
```

Parameter

`<1-65535>`	The time in seconds after which hello packets are sent

Default

By default, hello interval is 2 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#hello-interval 5

(config)#router rsvp
(config-router)#no hello-interval
```

hello-receipt

Use this command to enable the receipt of Hello messages from peers.

Use the `no` parameter with this command to disable the exchange of Hello messages.

Command Syntax

```
hello-receipt
no hello-receipt
```

Parameters

None

Default

By default, hello receipt is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#hello-receipt
```

hello-timeout

Use this command to set the RSVP hello timeout. If an LSR has not received a hello message from a peer within the number of seconds set with this command, all sessions shared with this peer are reset. The hello-timeout determines how long an RSVP node waits for a hello message before declaring a neighbor to be down.

Use the `no` parameter with this command to set the default hello timeout value.

Command Syntax

```
hello-timeout <1-65535>
```

```
no hello-timeout
```

Parameter

`<1-65535>`	Time in seconds to receive a hello message.

Default

By default, hello-timeout value is 7 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#hello-timeout 12

(config)#router rsvp
(config-router)#no hello-timeout
```

keep-multiplier

Use this command to configure the constant to be used to calculate a valid reservation lifetime for a Labeled Switched Path (LSP).

The refresh time and keep multiplier are two interrelated timing parameters used to calculate the valid reservation lifetime for an LSP. Use the following formula to calculate the reservation lifetime for an LSP:

```
L >= (K + 0.5)* 1.5 * R
```

`K` = keep-multiplier

`R` = refresh timer

The router sends refresh messages periodically so that the neighbors do not timeout.

Use the `no` parameter with this command to return to the default keep-multiplier setting.

Command Syntax

```
keep-multiplier <1-255>
no keep-multiplier <1-255>
```

Parameters

`<1-255>`	The keep-multiplier value

Default

By default, keep-multiplier value is 3

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#keep-multiplier 2
```

loop-detection

Use this command to turn on loop detection for Path and Reservation messages exchanged between LSRs.

Use the no loop-detection command to return to default settings.

Command Syntax

```
loop-detection
```

Parameters

None

Default

By default, loop detection is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#loop-detection
```

© 2025 IP Infusion Inc. Proprietary

lsp-metric

Use this command to set LSP absolute metric or relative metric for IGP Shortcut use

Use the `no` parameter along with this command to unset the LSP metirc for IGP shortcut.

Command Syntax

```
lsp-metric absolute <1-65535>
lsp-metric relative (<-65535-0>|<1-65535>)
no lsp-metric absolute (<1-65535>|)
no lsp-metric relative (<-65535-0>|<1-65535>|)
```

Parameters

absolute	Absolute metric
relative	Relative metric
<1-65535>	Metric value
<-65535-0>	The keep-multiplier value

Command Mode

RSVP Trunk mode

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#exit
(config)#rsvp-trunk T1
(config-trunk)#lsp-metric absolute 10
(config-trunk)#lsp-metric relative 10
```

lsp-reoptimization-timer

Use this command to set the re-optimization interval timer.

Use the no parameter with this command to set the default re-optimization interval (5 minutes).

Command Syntax

```
lsp-reoptimization-timer <1-240>
```

Parameter

`<1-240>`	The interval in minutes after which LSP re-optimization will take place.

Default

By default, the re-optimization timer interval is 5 minutes.

Command Mode

RSVP router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#router rsvp
(config-router)#lsp-reoptimization-timer 10
(config)#router rsvp
(config-router)#no lsp-reoptimization-timer
```

map-route A.B.C.D

Use this command to map a route using an IPv4 to an RSVP trunk. If the primary LSP for a trunk goes down, all mapped routes are sent automatically to a secondary LSP configured as backup for a primary LSP.

Use the `no` parameter with this command to unmap routes from specified trunks.

Command Syntax

```
map-route A.B.C.D/M
map-route A.B.C.D/M CLASS
map-route A.B.C.D A.B.C.D
map-route A.B.C.D A.B.C.D CLASS
no map-route A.B.C.D/M
no map-route A.B.C.D/M CLASS
no map-route A.B.C.D A.B.C.D
no map-route A.B.C.D A.B.C.D CLASS
```

Parameters

`A.B.C.D/M`	Prefix to map, plus mask
`A.B.C.D`	Prefix to be mapped
`A.B.C.D`	Prefix mask
`CLASS`	Incoming DiffServ Class (for example, be, ef, etc.) to map to the RSVP trunk

Default

By default, map route A.B.C.D/M is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#map-route 2.2.2.2/16
```

neighbor A.B.C.D

Use this command to designate a neighbor IPv4 address to use when exchanging hello messages. Any neighbor hello message that is not explicitly identified is rejected.

Use the `no` parameter with this command to remove an IP neighbor from the system.

Command Syntax

```
neighbor A.B.C.D
no neighbor A.B.C.D
```

Parameters

None

Default

By default, neighbor A.B.C.D is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#neighbor 10.10.0.5
```

neighbor X:X::X:X

Use this command to designate a neighbor IPv6 address to use when exchanging hello messages. Any neighbor hello message that is not explicitly identified is rejected.

Use the `no` parameter with this command to remove an IP neighbor from the system.

Command Syntax

```
neighbor X:X::X:X

no neighbor X:X::X:X
```

Parameters

None

Default

By default, neighbor X:X::X:X is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#neighbor 3ffe::3:34
```

no cspf

Use this command to disable the use of the Constrained Shortest Path First (CSPF) server for all RSVP sessions. Disable CSPF when no nodes support the required traffic engineering extensions.

When this command is executed in Router mode, CSPF is disabled for all configured RSVP sessions, and all RSVP sessions configured from this point forward. If the default CSPF per RSVP session is enabled, it will be disabled. The CSPF status for RSVP sessions can be verified using the show rsvp session command with the detail option.

Use the cspf command to revert to the default settings.

Note: When CSPF is disabled, path is not calculated taking constraints into consideration. Path message is sent to the next hop based on IGP best route. In this case, ERO is not included in path message and all constraints are included.

Command Syntax

```
no cspf
```

Parameters

None

Default

By default, no cspf is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows using the `no cspf` command in Router mode to disable CSPF for all RSVP sessions.

```
#configure terminal
(config)#router rsvp
(config-router)#no cspf
```

no igp-shortcut

Use this command to disable Interior Gateway Protocol (IGP) shortcut.

Command Syntax

```
no igp-shortcut
```

Parameters

None

Command Mode

Trunk mode

Example

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#no igp-shortcut
```

no loop-detection

Use this command to turn off loop detection for Path and Reservation messages exchanged between LSRs. When a Path or Resv message is received, the primary IP address of the incoming interface is compared with the received route record list.

Use the loop-detection command to revert to default settings.

Command Syntax

```
no loop-detection
```

Parameters

None

Default

By default, no loop detection is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#no loop-detection
```

no php

Use this command to disable Penultimate-Hop-Popping (PHP) for the router. An egress router sends neither implicit null label nor explicit null for LSPs. When `no php` command is used, the egress router sends non-reserved labels (those labels in the label pool range allotted to RSVP) to the upstream router and retains the labels till the egress router.

Note: Use the show rsvp command to display the status of Penultimate-Hop-Popping.

Command Syntax

```
no php
```

Parameters

None

Default

By default, no php is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#no php
```

no record

Use this command to disable recording of the route taken by Path and Reservation Request (Resv) messages that confirm establishment of reservations and are used to identify errors. The routes are recorded by means of the Route Record Object (RRO) in RSVP messages.

Command Syntax

```
no record
```

Parameters

None

Default

Routes are recorded by default.

Command Mode

RSVP Bypass mode

Examples

```
#configure terminal
(config)#rsvp-bypass bypassname
(config-bypass)#no record
```

no refresh-path-parsing

Use this command to disable parsing of Refresh PATH messages received from upstream nodes. Enable this command to minimize message processing by RSVP, if you are sure that a particular router does not need to parse Refresh-PATH messages to check for changes because LSPs passing through this router are not required to be updated, simultaneously.

Use the refresh-path-parsing command to revert to the default settings.

Command Syntax

```
no refresh-path-parsing
```

Parameters

None

Default

By default, refresh-path-parsing is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
Router#configure terminal
Router(config)#router rsvp
Router(config-router)#no refresh-path-parsing
```

no refresh-resv-parsing

Use this command to disable parsing of Refresh RESV messages received from upstream nodes. Enable this command to minimize message processing by RSVP, if you are sure that a particular router does not need to parse Refresh RESV messages to check for changes because LSPs passing through this router are not required to be updated simultaneously.

Command Syntax

```
no refresh-resv-parsing
```

Parameters

None

Default

By default, refresh reservation parsing is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
Router#configure terminal
Router(config)#router rsvp
Router(config-router)#no refresh-resv-parsing
```

path-option dynamic pce

Use this command to indicate that a tunnel must query PCE for path computation.

Command Syntax

```
path-option dynamic pce
```

Parameters

None

Command Mode

RSVP trunk mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)#rsvp-trunk mytrunk ipv4
(config-trunk)#path-option dynamic pce
(config-trunk)#pce entity 1
```

php

Use this command to enable Penultimate-Hop-Popping for the router. An egress router send an implicit-null label (3) to the upstream router.

Note: Use the show rsvp command to display the status of Penultimate-Hop-Popping.

Use the no php command to revert to the default setting.

Note: On Qumran1 (QAX, QMX, and QUX) platforms, when a primary session has non-implicit-null out label and a backup session has implicit-null out label, then L3 services do not work when the session is at backup state. i.e., mpls ping, L3 ping, and map route traffic will fail as label popped packets cannot select the next header ethertype properly.

Command Syntax

```
php
```

Parameters

None

Default

By default, no php is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#php
```

primary ADMIN-GROUP-NAME

Use this command to configure primary administrative groups. Administrative groups are manually assigned attributes that describe the color of links, so that links with the same color are in one class. These groups are used to implement different policy-based LSP setups. Administrative group attributes can be included or excluded for an LSP or for a path's primary and secondary paths.

Note: A link can be added to a specific Administrative Group via the Network Services Module. Refer to the *Network Services Module Command Reference* for details.

Use the `no` parameter to remove a previously configured group from an administrative group list.

Command Syntax

```
primary (include-any|include-all|exclude-any) ADMIN-GROUP-NAME
primary (include-any|exclude-any) ADMIN-GROUP-NAME
primary (include-any|include-all|exclude-any) ADMIN-GROUP-NAME
primary (include-any|exclude-any) ADMIN-GROUP-NAME
```

Parameters

`include-any`	Include any attributes
`include-all`	Include all attributes
`exclude-any`	Exclude any attribute
`ADMIN-GROUP-NAME`	Administrative group name

Default

By default, primary admin group name is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary exclude-any myadmingroup

#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary include-all admingrp2

#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary include-any admingrp2
```

primary affinity

Use this command to enable sending of session attribute objects with resource affinity data.

Use the no primary affinity command to disable sending of session attribute objects.

Command Syntax

```
primary affinity
```

Parameters

None

Default

By default, primary affinity is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary affinity
```

primary bandwidth

Use this command to reserve the primary bandwidth in bits per second for the current trunk.

Each LSP has an associated bandwidth attribute. The bandwidth value is included in the sender's RSVP Path message and specifies the bandwidth to be reserved for the LSP. It is specified in bits per second, with a higher value indicating a greater user traffic volume. A zero bandwidth reserves no resources, although exchanges labels.

Use the `no` parameter to remove configured bandwidth information.

Command Syntax

```
primary bandwidth BANDWIDTH
no primary bandwidth BANDWIDTH
```

Parameter

BANDWIDTH	<1-999>k for 1 to 999 kilobits/s
	<1-999>m for 1 to 999 megabits/s
	<1-100>g for 1 to 100 gigabits/s

Default

The default bandwidth is 0 bits per second, which allows data to flow through but does not reserve bandwidth.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary bandwidth 100m
```

primary cspf

Use this command to enable the use of Constrained Shortest Path First (CSPF) server for an explicit route to the egress, or all RSVP sessions. When CSPF is turned off globally, it cannot be enabled for any LSP.

The CSPF server computes paths for LSPs that are subject to constraints such as bandwidth, hop count, administrative groups, priority, and explicit routes. When computing paths for LSPs, CSPF considers not only the topology of the network and the attributes defined for the LSP, but also the links. It attempts to minimize congestion by intelligently balancing the network load.

Use the no primary affinity command to revert to the default settings.

Note: CSPF server information is not signaled across session and hence sessions in transit and egress nodes will not be aware of the CSPF server. So, in multi CSPF scenarios, neighbor down event from a CSPF server restart all sessions irrespective of which CSPF server sessions were using.

Command Syntax

```
primary cspf
```

Parameters

None

Default

By default, primary cspf is enabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary cspf
```

primary cspf-retry-limit

Use this command to specify the number of retries that CSPF should carry out for a request received from RSVP.

Use the `no` parameter with this command to disable this configuration.

Command Syntax

```
primary cspf-retry-limit <1-65535>
no primary cspf-retry-limit
```

Parameter

`<1-65535>`	Set the number of times CSPF should retry for this LSP

Default

By default, retry-limit is 0.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary cspf-retry-limit 535

(config)#rsvp-trunk T1
(config-trunk)#no primary cspf-retry-limit
```

primary cspf-retry-timer

Use this command to specify the time between each retry that CSPF might carry out for a request received from RSVP.

Use the `no` parameter with this command to disable this configuration.

Command Syntax

```
primary cspf-retry-timer <1-600>
no primary cspf-retry-timer
```

Parameter

`<1-600>`	Timeout between successive retries, in seconds

Default

By default, retry-timer is 0

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary cspf-retry-timer 45

(config)#rsvp-trunk T1
(config-trunk)#no primary cspf-retry-timer
```

primary filter

Use this command to set the filter to the fixed or shared style for an LSP.

- The shared filter style identifies a shared reservation environment. It creates a single reservation into which flows from all senders are mixed.
- The fixed filter style designates a distinct reservation. A distinct reservation request is created for data packets from a particular sender. The fixed filter style is also used style to prevent rerouting of an LSP and to prevent another LSP from using this bandwidth.

Use the `no` parameter to reset the configured filter to the default.

Command Syntax

```
primary filter fixed
no primary filter
```

Parameters

`fixed`	Use a fixed filter for this LSP

Default

By default, primary filter is shared-explicit.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary filter fixed
```

primary hold-priority

Use this command to configure the hold priority value for the selected trunk. In case of insufficient bandwidth, remove less important existing LSPs to free up a portion of the bandwidth. This can be done by preempting one or more of the signaled LSPs. Hold priority determines the degree to which an LSP holds onto its reservation for a session after the LSP has been configured successfully. When the hold priority is high, the existing LSP is less likely to give up its reservation.

Use the `no` parameter to reset the trunk to the default hold-priority value.

Command Syntax

```
primary hold-priority <0-7>
no primary hold-priority
```

Parameter

`<0-7>`	Set a hold priority for the LSP

Default

The default hold-priority value is 0, which is the highest. Once a session is configured with a hold priority of 0, no other session can preempt it.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary hold-priority 2
```

primary hop-limit

Use this command to specify a limit of hops for an RSVP trunk. Hop-limit data is sent to the CSPF server if CSPF is used.

Upon configuration of an arbitrary hop-limit, the hop-limit is compared with the number of hops configured in the primary path, if a primary path has been configured. If the number of hops in the primary path exceeds the hop-limit configured, no `Path` messages are sent, and any existing session is torn down. If no primary path is configured, the trunk is processed normally and Path messages are sent.

Use the `no` parameter to reset the trunk to the default hop-limit value.

Command Syntax

```
primary hop-limit <1-255>
no primary hop-limit <1-255>
no primary hop-limit
```

Parameters

`<1-255>`	Set the number of acceptable hops for the LSP

Default

By default, primary hop limit is 255

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary hop-limit 23
```

primary label-record

Use this command to record all labels exchanged between RSVP-enabled routers during the reservation setup process.

Use the `no` parameter with this command to turn off recording.

Command Syntax

```
primary label-record
no primary label-record
```

Parameters

None

Default

By default, primary label record is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary label-record
```

primary local-protection

Use this command to enable the local repair of explicit routes for which this router is a transit node.

Use the `no` parameter with this command to disable local repair of explicit routes.

Command Syntax

```
primary local-protection
no primary local-protection
```

Parameters

None

Default

By default, primary local protection is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary local-protection
```

no primary affinity

Use this command to disable the use of sending out session attribute objects with resource affinity data.

Use the primary affinity command to return to the default settings.

Command Syntax

```
no primary affinity
```

Parameters

None

Default

By default, primary no affinity is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#no primary affinity
```

no primary cspf

Use this command to disable the use of Constrained Shortest Path First (CSPF) server for an explicit route to the egress, or all RSVP sessions. When CSPF is turned off globally it cannot be enabled for any LSP. If used per LSP, it can be used to turn off CSPF computation for a specific LSP.

Disable CSPF when all nodes do not support the required traffic engineering extensions, and configure LSPs manually to use an explicit path. The LSP is then established only along the path specified by the operator.

Use the primary cspf command to enable this setting.

Command Syntax

```
no primary cspf
```

Parameters

None

Default

By default, no primary cspf is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows using the `no cspf` command in Trunk mode to disable CSPF for the primary LSP.

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#no primary cspf
```

no primary record

Use this command to disable recording of the route taken by Path and Reservation Request (Resv) messages to confirm establishment of reservations and identify errors. Routes are recorded by means of the Route Record Object (RRO) in RSVP messages.

Use the primary record command to return to the default settings.

Command Syntax

```
no primary record
```

Parameters

None

Default

By default, routes are recorded

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#no primary record
```

primary path

Use this command to specify an RSVP path to be used. The `PATHNAME` in this command is the string (name) used to identify an RSVP path defined for the node (refer to `rsvp-path` command).

Use the `no` parameter with this command to remove a configured RSVP path.

Command Syntax

```
primary path PATHNAME
no primary path
```

Parameters

PATHNAME	The name of the path to use

Default

By default, primary path is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary path mypath
```

primary record

Use this command to enable recording of the route taken by Path and Reservation Request (Resv) messages to confirm establishment of reservations and identify errors. Routes are recorded by means or the Route Record Object (RRO) in RSVP messages.

Use the no primary record command to disable recording of routes.

Command Syntax

```
primary record
```

Parameters

None

Default

By default, routes are recorded

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary record
```

primary retry-limit

Use this command to specify a retry count this RSVP Trunk.

If a session is in a `nonexistent` state due to a path error message, the system tries to recreate the LSP for the number of times specified by the `retry-limit` command.

Although the same retry command controls both the trunk and the session, the retry-limit value affects only the session and not the trunk. If the trunk is in an `incomplete` state, the code keeps trying forever to bring it to a `complete` state regardless of the retry-limit value.

Use the `no` parameter with this command to revert to the default retry-limit value.

Command Syntax

```
primary retry-limit <1-65535>
no primary retry-limit
```

Parameter

<1-65535>	The set number of times the system should try setting up the LSP

Default

By default, the retry-limit value is 0, and the trunk and session try to create the LSP indefinitely.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary retry-limit 256
```

primary retry-timer

Use this command to specify a retry interval for an RSVP Trunk. When an ingress node tries to configure an LSP and the setup fails due to the receipt of a Path Error message, the system waits for the time configured with this command, before retrying the LSP setup process.

Use the `no` parameter with this command to revert to the default retry-time value.

Command Syntax

```
primary retry-timer <1-600>
no primary retry-timer
```

Parameter

`<1-600>`	Time in seconds after which the system should retry setting up the LSP

Default

By default, retry-timer value is 30 seconds.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary retry-timer 12
```

primary reuse-route-record

Use this command to use the updated Route Record List as an Explicit Route (with all strict nodes) when a path message is sent out at the next refresh.

The ERO list contains the hops to be taken to reach the egress from the current LSR. If CSPF is not available, to place an ERO with all strict routes, use this command to modify the ERO after receiving the Resv message. The future Path messages have the ERO with all strict nodes, identifying each and every node to be traversed.

Use the `no` parameter with this command to disable the use of the Route Record List as the explicit route.

Command Syntax

```
primary reuse-route-record
no primary reuse-route-record
```

Parameters

None

Default

By default, primary reuse route record is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary reuse-route-record
```

primary setup-priority

Use this command to configure a setup priority value for a trunk. In case of insufficient bandwidth, users must remove less important LSPs to free up the bandwidth. This can be done by preempting one or more of the existing LSPs. The primary setup priority determines if a new LSP can preempt an existing LSP.

The setup priority of the new LSP must be higher than the hold priority of an existing LSP for the existing LSP to be preempted. Note that for a trunk, the setup priority should not be higher than the hold priority.

Use the `no` parameter with this command to revert to the default primary setup priority value.

Command Syntax

```
primary setup-priority <0-7>
no primary setup-priority
```

Parameters

`<0-7>`	Set the priority value

Default

By default, setup priority is 7, which is the lowest.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary setup-priority 2
```

primary traffic

Use this command to specify the traffic type for this RSVP Trunk.

Use the `no` parameter with this command to reset the configured traffic type.

Command Syntax

```
primary traffic (guaranteed|controlled-load)
no primary traffic
```

Parameters

`controlled-load`	Controlled loaded traffic
`guaranteed`	Guaranteed traffic

Default

By default, primary traffic type is controlled-load

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#primary traffic guaranteed
```

refresh-time

Use this command to configure RSVP refresh interval timer. The timer specifies the interval after which Path and/ or Reservation Request (Resv) messages will be sent out.

The refresh time and keep multiplier are two interrelated timing parameters used to calculate the valid Reservation Lifetime for an LSP. Refresh time regulates the interval between Refresh messages which include Path and Reservation Request (Resv) messages. Refresh messages are sent periodically so that reservation does not timeout in the neighboring nodes. Each sender and receiver host sends Path and Resv messages, downstream and upstream respectively, along the paths.

Use the `no` parameter with this command to return to the default refresh-time interval.

Command Syntax

```
refresh-time <1-65535>
no refresh-time <1-65535>
no refresh-time
```

Parameter

`<1-65535>`	The duration for which messages are sent, in seconds

Default

By default, refresh-time interval is 30 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#refresh-time 20
```

refresh-path-parsing

Use this command to disable parsing of Refresh PATH messages received from upstream nodes. Use this command to minimize message processing by RSVP when you are sure that a particular router does not need to parse Refresh-PATH messages to check for changes, because LSPs passing through this router are not required to be updated simultaneously.

Use the no refresh-path-parsing command to disable this setting.

Command Syntax

```
refresh-path-parsing
```

Parameters

None

Default

By default, refresh-path-parsing is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
Router#configure terminal
Router(config)#router rsvp
Router(config-router)#refresh-path-parsing
```

refresh-resv-parsing

Use this command to disable parsing of Refresh RESV messages received from upstream nodes. Use this command to minimize message processing by RSVP when you are sure that a particular router does not need to parse Refresh RESV messages to check for changes because LSPs passing through this router are not required to be updated simultaneously.

Use the no refresh-resv-parsing command to disable this setting.

Command Syntax

```
refresh-resv-parsing
```

Parameters

None

Default

By default, refresh reservation parsing is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
Router#configure terminal
Router(config)#router rsvp
Router(config-router)#refresh-resv-parsing
```

reoptimize

Use this command to enable re-optimization of the RSVP primary LSP with the rsvp-trunk force-reoptimize command.

Use the no parameter with this command to disable re-optimization of the RSVP primary LSP.

Command Syntax

```
reoptimize
```

Parameters

None

Command Mode

Trunk mode

Applicability

This command was introduced in OcNOS version 1.3.4.

Examples

```
(config)#rsvp-trunk t1
(config-trunk)#reoptimize
(config)#rsvp-trunk t1
(config-trunk)#no reoptimize
```

restart rsvp graceful

Use this command to restart RSVP gracefully.

To restart RSVP gracefully, you must give the graceful-restart command to enable graceful restart capability on the device in RSVP router mode.

Command Syntax

```
restart rsvp graceful
```

Parameter

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#restart rsvp graceful
    #restart rsvp graceful
    % Warning : RSVP process will stop and needs to restart manually,
    You may loose ospf configuration, if not saved
    Proceed for graceful restart? (y/n):y
```

revert-timer

Use this command to specify a "revert-timer" for the RSVP daemon. This command can be invoked from either the router rsvp mode or from the rsvp-trunk mode. In the RSVP router mode, this command defines the revert timer from secondary session to primary session for the RSVP daemon.

Use the `no` parameter with this command to revert to the default settings.

Command Syntax

```
revert-timer <1-65535>
no revert-timer (<1-65535>|)
```

Parameters

`<1-65535>`	Hold-on timer before revert back to primary session

Default

By default, `no rever-timer` is configured

Command Mode

Router or Trunk mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#revert-timer 30

#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#no revert-timer

#configure terminal
(config)#router rsvp
(config-router)#revert-timer 40
#configure terminal
(config)#router rsvp
(config-router)#no revert-timer
```

router rsvp

Use this command to enter router mode from configure mode and to enable the RSVP daemon, if it is not already enabled.

Use the `no` parameter with this command to disable RSVP on the node.

Command Syntax

```
router rsvp
no router rsvp
```

Parameters

None

Default

RSVP is started only if this command is executed.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The command prompt changes from config to config-router, as illustrated below:

```
#configure terminal
(config)#router rsvp
(config-router)#

(config-router)#exit
(config)#no router rsvp
```

rsvp hello-interval

Use this command to enable the sending of Hello packets on the interface and to set the interval value between successive Hello packets to neighbor. For optimum performance, set this value to less than one-third the value of the configured RSVP hello-timeout. See the rsvp hello-timeout command for more information.

Note: This is an interface-specific command and when not used, the global hello-interval state applies.

Use the `no` parameter with this command to return to the default hello interval value.

Command Syntax

```
rsvp hello-interval <1-65535>
no rsvp hello-interval
```

Parameter

`<1-65535>`	RSVP hello interval in seconds

Default

By default, RSVP hello interval is 2 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#rsvp hello-interval 110

(config)#interface eth0
(config-if)#no rsvp hello-interval
```

rsvp hello-receipt

Use this command to enable the receipt of hello messages from peers connected through this interface. This is an interface-specific command and when not used, the global hello-receipt command applies.

Use the `no` parameter with this command to disable the exchange of hello messages for this interface.

Command Syntax

```
rsvp hello-receipt
no rsvp hello-receipt
```

Parameters

None

Default

By default, rsvp hello receipt is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#rsvp hello-receipt
```

rsvp hello-timeout

This command determines how long an RSVP node should wait for a hello message before declaring a neighbor to be down. If an LSR does not received a hello message from a peer connected to an interface within the specified duration, the LSR resets all sessions that are shared with this particular peer. This is an interface-specific command and when not used, the global hello-timeout command applies.

Use the `no` parameter to revert to the default hello timeout value.

Command Syntax

```
rsvp hello-timeout <1-65535>
no rsvp hello-timeout
```

Parameters

`<1-65535>`	Time to receive a hello message, in seconds

Default

By default, hello-timeout value is 7 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#rsvp hello-timeout 550

(config)#interface eth0
(config-if)#no rsvp hello-timeout
```

rsvp keep-multiplier

This command sets the constant for calculating a valid reservation lifetime for an LSP, which allows messages to be exchanged through this interface. This is an interface-specific command and when not specified, the global keep-multiplier command applies.

Reservation lifetime is the duration of bandwidth reservation for the LSP. The refresh time and keep multiplier are two interrelated timing parameters used to calculate the valid reservation lifetime for an LSP. Use the following formula to calculate the reservation lifetime for an LSP:

```
L >= (K + 0.5)* 1.5 * R
```

`K` = keep-multiplier

`R` = refresh timer

Refresh messages are sent periodically so that neighbors do not timeout.

Use the `no` parameter with this command to return to the global keep-multiplier value.

Command Syntax

```
rsvp keep-multiplier <1-255>
no rsvp keep-multiplier <1-255>
```

Parameter

`<1-255>`	Set a value for the lifetime constant

Default

By default RSVP keep-multiplier value is 3

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#rsvp keep-multiplier 3

(config)#interface eth0
(config-if)#no rsvp keep-multiplier
```

rsvp refresh-time

Use this command to configure RSVP refresh interval timer for the current interface. This is an interface-specific command and when not used, the global refresh-time command applies.

The refresh time and keep multiplier are two interrelated timing parameters used to calculate the valid reservation lifetime for an LSP. Refresh time regulates the interval between refresh messages that include path and reservation request (Resv) messages. Refresh messages are sent periodically so that the reservation does not timeout in the neighboring nodes. Each sender and receiver host sends path and resv messages, downstream and upstream respectively, along the paths.

Use the `no` parameter with this command to revert to the refresh-time value set in RSVP mode.

Command Syntax

```
rsvp refresh-time <1-65535>
no rsvp refresh-time <1-65535>
```

Parameter

`<1-65535>`	The duration for which messages are sent, in seconds

Default

By default, refresh interval is 30 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#rsvp refresh-time 5055

(config)#interface eth0
(config-if)#no rsvp refresh-time
```

rsvp-path

Use this command to create a new RSVP path or to enter the `Path` command mode. In this mode, you can add or delete paths and also specify the path to be loose or strict.

Use the `no` parameter with this command to delete the path and its specified hops.

Command Syntax

```
rsvp-path PATHNAME
no rsvp-path PATHNAME
```

Parameter

PATHNAME	Name of the path

Default

By default, rsvp path is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-path mypath
(config-path)#
```

rsvp-trunk

Use this command to create a new RSVP trunk. When the trunk is created, the attributes required to configure an explicitly-routed or traditionally-routed LSP are set. Once a trunk is configured with the required attributes, an RSVP session (and PSB) is created for this trunk, which enables the exchange of messages and completes the LSP setup.

This command also modifies an existing RSVP path to configure an explicitly-routed or traditionally-routed LSP. In addition, this command can be used to set the address family (IPv4) of an RSVP trunk. If no address family is assigned, the default value is used. If the address family is already set, a check is made to see whether the address family configured and the one already in the database are the same. An error message is returned if the two do not match.

Use the `no` parameter with this command to remove an RSVP trunk and all configured attributes, except the primary path.

Note: The RSVP trunk's name (`TRUNKNAME`) is limited to 32 characters.

Command Syntax

```
rsvp-trunk TRUNKNAME ipv4
no rsvp-trunk TRUNKNAME
```

Parameters

`TRUNKNAME`	Name to use for the trunk
`ipv4`	IPv4 address family trunk

Default

By default, rsvp trunk is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The command prompt changes from `config` to `config-trunk` as illustrated below:

```
#configure terminal
(config)#rsvp-trunk mytrunk ipv4
(config-trunk)#
```

rsvp-trunk force-reoptimize

Use this command to force re-optimize a particular primary LSP. Re-optimization of the LSP must have been enabled with the reoptimize command.

Command Syntax

```
rsvp-trunk TRUNKNAME force-reoptimize
```

Parameters

TRUNKNAME	Name of the trunk

Default

NA.

Command Mode

Execute mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#rsvp-trunk t1 force-reoptimize
```

rsvp-trunk force-switchover-secondary

Use this command to force switchover a secondary LSP. This command is recommended for limited use on a stable system when there is a need for software upgrade without traffic impact.

Note: This command is supported on secondary configured tunnels and not on multiple secondary configured tunnels.

Command Syntax

```
rsvp-trunk TRUNKNAME force-switchover-secondary (off|on)
```

Parameters

`TRUNKNAME` Name of the trunk

`force-switchover-secondary` (off|on)

Force switchover to secondary

Default

NA.

Command Mode

Execute mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#rsvp-trunk <Trunk-Name> force-switchover-secondary off
```

rsvp-trunk-restart

Use this command to restart the RSVP trunk. This command “kills” an existing LSP and restarts the LSP setup process.

Command Syntax

```
rsvp-trunk-restart
```

Parameters

None

Default

By default, rsvp trunk restart is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#rsvp-trunk-restart
```

secondary ADMIN-GROUP-NAME

Use this command to configure secondary administrative groups. Administrative groups are manually assigned attributes that describe the color of links, so that links with the same color are in one class. These groups are used to implement different policy-based LSP setups. Administrative group attributes can be included or excluded for an LSP or for a path's primary and secondary paths.

Note: A link can be added to a specific Administrative Group via NSM. Refer to the *Network Services Module Command Reference* for details.

Use the `no` parameter to remove a previously set group from an administrative group list.

Command Syntax

```
secondary (include-any|include-all|exclude-any) ADMIN-GROUP-NAME
secondary (include-any|exclude-any) ADMIN-GROUP-NAME
no secondary (include-any|include-all|exclude-any) ADMIN-GROUP-NAME
no secondary (include-any|exclude-any) ADMIN-GROUP-NAME
```

Parameters

`include-any`	Include any attribute
`include-all`	Include all attribute
`exclude-any`	Exclude any attribute
`ADMIN-GROUP-NAME`	Administrative group name

Default

By default, secondary admin group name is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary exclude-any myadmingroup

#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary include-any myadmingroup

#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary include-all myadmingroup
```

secondary bandwidth

Use this command to reserve the bandwidth in bits per second for the current trunk.

Each LSP has an associated bandwidth attribute. The bandwidth value is included in the sender's RSVP Path message and specifies the bandwidth to be reserved for the LSP. It is set in bits per second, with a higher value indicating a greater user traffic volume. A zero bandwidth reserves no resources, although label exchanges are possible.

Use the `no` parameter with this command to unset the configured bandwidth information.

Command Syntax

```
secondary bandwidth BANDWIDTH
no secondary bandwidth BANDWIDTH
no secondary bandwidth
```

Parameter

`BANDWIDTH`	<1-999>k for 1 to 999 kilobits/s
	<1-999>m for 1 to 999 megabits/s
	<1-100>g for 1 to 100 gigabits/s

Default

By default, bandwidth is 0 bits per second, which allows data to flow through but does not reserve bandwidth.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary bandwidth 100m
```

secondary cspf

Use this command to enable the use of Constrained Shortest Path First (CSPF) server for an explicit route to the egress, or all RSVP sessions.

The CSPF server computes paths for LSPs that are subject to constraints such as bandwidth, hop count, administrative groups, priority, and explicit routes. When computing paths for LSPs, CSPF considers not only the topology of the network and the attributes defined for the LSP, but also the links. It attempts to minimize congestion by intelligently balancing the network load.

Use the no secondary cspf command to revert to the default settings.

Note: CSPF server information is not signaled across session and hence sessions in transit and egress nodes will not be aware of the CSPF server. So, in multi CSPF scenarios, neighbor down event from a CSPF server restart all sessions irrespective of which CSPF server sessions were using.

Command Syntax

```
secondary cspf
```

Parameters

None

Default

By default, secondary cspf is enabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows using the `no cspf` command in Trunk mode to disable CSPF for the primary LSP.

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary cspf
```

secondary cspf-retry-limit

Use this command to specify the number of retries that CSPF should carry out for a request received from RSVP.

Use the `no` parameter with this command to remove this configuration.

Command Syntax

```
secondary cspf-retry-limit <1-65535>
no secondary cspf-retry-limit
```

Parameter

`<1-65535>`	The number of times CSPF should retry for this LSP

Default

By default, no retry limit for CSPF route calculations is configured, so the value is 0.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary cspf-retry-limit 535
```

secondary cspf-retry-timer

Use this command to specify the time between each retry that CSPF might carry out for a request received from RSVP.

Use the `no` parameter with this command to remove this configuration.

Command Syntax

```
secondary cspf-retry-timer <1-600>
no secondary cspf-retry-timer
```

Parameters

`<1-600>`	Timeout between successive retries, in seconds

Default

By default, no retry-timer configuration is defined for CSPF calculations, so the value is set to 0.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary cspf-retry-timer 45
```

secondary filter

Use this command to set the filter to fixed or shared filter style for RSVP trunk.

- The shared filter style identifies a shared reservation environment. It creates a single reservation into which flows from all senders are mixed.
- The fixed filter style designates a distinct reservation. A distinct reservation request is created for data packets from a particular sender. The fixed filter style is also used style to prevent rerouting of an LSP and to prevent another LSP from using this bandwidth.

Use the `no` parameter to reset the configured filter to the default style.

Command Syntax

```
secondary filter fixed
no secondary filter
```

Parameters

`fixed`	Use a Fixed Filter for this RSVP Trunk.

Default

By default, secondary filter is shared-explicit.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Usage

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary filter fixed
```

secondary hold-priority

Use this command to configure the hold priority value for the selected trunk.

In case of insufficient bandwidth, the user must remove any less important existing LSP to free up the bandwidth. This can be done by preempting one or more of the signaled LSPs. Hold priority determines the degree to which an LSP holds onto its reservation for a session after the LSP has been configured successfully. When the hold priority is high, the existing LSP is less likely to give up its reservation.

Use the `no` parameter to revert to the default hold-priority value.

Command Syntax

```
secondary hold-priority <0-7>
```

```
no secondary hold-priority
```

Parameter

`<0-7>`	Specify a value for hold priority

Default

The default hold-priority is 0, the highest value. Once a session is configured with a 0 hold priority value, no other session can preempt it.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary hold-priority 2
```

secondary hop-limit

Use this command to specify a limit of hops for an RSVP trunk.

Upon configuration of an arbitrary hop-limit, the hop-limit is compared with the number of hops configured in the primary path, if a primary path has been configured. If the number of hops in the primary path exceed the hop-limit configured, no path messages are sent out and any existing session is torn down. If no primary path is configured, the trunk is processed normally and the path messages are sent out. The hop-limit data is sent to the CSPF server, if CSPF is being used.

Use the `no` parameter to revert to the default hop-limit value.

Command Syntax

```
secondary hop-limit <1-255>
no secondary hop-limit <1-255>
no secondary hop-limit
```

Parameter

`<1-255>`	The number of acceptable hops

Default

By default, secondary hop limit is 255

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary hop-limit 23
```

secondary label-record

Use this command to record all labels exchanged between RSVP enabled routers during the reservation setup process. This command records all labels exchanged for an LSP from the ingress to the egress, and helps with debugging.

Use the `no` parameter to turn off recording.

Command Syntax

```
secondary label-record

no secondary label-record
```

Default

By default, secondary label record is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary label-record
```

secondary local-protection

Use this command to enable the local repair of explicit routes for which this router is a transit node.

Use the no parameter with this command to disable local repair of explicit routes.

Command Syntax

```
secondary local-protection
no secondary local-protection
```

Parameters

None

Default

By default, secondary local protection is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary local-protection
```

no secondary affinity

Use this command to disable the use of sending out session attribute objects with resource affinity data.

Use the secondary bandwidth command to revert to the default settings.

Command Syntax

```
no secondary affinity
```

Parameters

None

Default

By default, no secondary affinity is disabled.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#no secondary affinity
```

no secondary cspf

Use this command to disable the use of Constrained Shortest Path First (CSPF) server for an explicit route to the egress, or all RSVP sessions.

If CSPF is turned off globally, it cannot be enabled for any LSP. If used per LSP, it can be used to turn off CSPF computation for a specific LSP. The CSPF server computes paths for LSPs that are subject to various constraints such as bandwidth, hop count, administrative groups, priority, and explicit routes. When computing paths for LSPs, CSPF considers not only the topology of the network and the attributes defined for the LSP, but, also the links. It attempts to minimize congestion by intelligently balancing the network load.

Disable CSPF when all nodes do not support the required traffic engineering extensions and configure LSPs manually to use an explicit path. The LSP is then established only along the path specified by the operator.

Use the secondary cspf command to revert to the default settings.

Command Syntax

```
no secondary cspf
```

Parameters

None

Default

By default, secondary no cspf is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows using the `no cspf` command in Trunk mode to disable CSPF for the primary LSP.

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#no secondary cspf
```

no secondary record

This command is used to disable recording of the route taken by path and resv messages and confirms the establishment of reservations and to identify errors. Routes are recorded by means of the route record object (RRO) in an RSVP message.

Use the secondary record command to revert to the default settings.

Command Syntax

```
no secondary record
```

Parameters

None

Default

By default, routes are recorded

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#no secondary record
```

© 2025 IP Infusion Inc. Proprietary

secondary path

Use this command to specify an RSVP path to be used.

Use the `no` parameter with this command to remove a configured RSVP path.

Command Syntax

```
secondary path PATHNAME
no secondary path
```

Parameters

PATHNAME	The name of the path to be used. PATHNAME is a string (name) used to identify an RSVP path defined for the node (refer to the rsvp-path command).

Default

By default, secondary path is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary path mypath
```

secondary-priority path

Use this command to specify a RSVP path to be used for a specific priority secondary.

Use the no parameter with this command to remove a configured secondary-priority.

Command Syntax

```
secondary-priority <1-5> path PATHNAME
no secondary-priority <1-5>
```

Parameters

`<1-5>`	Secondary Priority value.
`PATHNAME`	The name of the path to be used. `PATHNAME` is a string (name) used to identify an RSVP path defined for the node (refer to the rsvp-path command).

Default

Secondary-priority can only be configured along with a path. Other attributes can only be associated post this command.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk t1
(config-trunk)#secondary-priority 1 path sp1
(config)# rsvp-trunk t1
(config-trunk)#no secondary-priority 1
```

secondary-priority hold-priority

Use this command to configure the hold priority value for the secondary-priority lsp.

In case of insufficient bandwidth, the user must remove any less important existing LSP to free up the bandwidth. This can be done by preempting one or more of the signaled LSPs. Hold priority determines the degree to which an LSP holds onto its reservation for a session after the LSP has been configured successfully. When the hold priority is high, the existing LSP is less likely to give up its reservation.

Use the no parameter to revert to the default hold-priority value.

Command Syntax

```
secondary-priority <1-5> hold-priority <0-7>
no secondary-priority <1-5> hold-priority <0-7>
no secondary-priority <1-5> hold-priority
```

Parameters

<1-5>	Secondary Priority value.
<0-7>	Specify a value for hold priority.

Default

The default hold-priority is 0, the highest value. Once a session is configured with a 0 hold priority value, no other session can preempt it.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)# rsvp-trunk t1
(config-trunk)#secondary-priority 1 hold-priority 4
(config)# rsvp-trunk t1
(config-trunk)# no secondary-priority 1 hold-priority
```

secondary-priority setup-priority

Use this command to configure a setup priority value for the secondary-priority lsp.

In case of insufficient bandwidth, the user must remove any less important LSPs to free up bandwidth. This can be done by preempting one or more of the existing LSPs. The setup priority determines whether a new LSP that preempts an existing LSP may be established. The setup priority of the new LSP must be higher than the hold priority of an existing LSP for the existing LSP to be preempted. Note that for a trunk, the setup priority should not be higher than the hold priority.

Use the no parameter with this command to revert to the default setup priority value.

Command Syntax

```
secondary-priority <1-5> setup-priority <0-7>
no secondary-priority <1-5> setup-priority <0-7>
```

Parameters

`<1-5>`	Secondary Priority value.
`<0-7>`	Specify a value for hold priority.

Default

By default, setup value is 7 (the lowest).

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)# rsvp-trunk t1
(config-trunk)#secondary-priority 1 setup-priority 4
(config)# rsvp-trunk t1
(config-trunk)# no secondary-priority 1 setup-priority 4
```

secondary-priority label-record

Use this command to record all labels exchanged between RSVP enabled routers during the reservation setup process. This command records all labels exchanged for an LSP from the ingress to the egress, and helps with debugging.

Use the no parameter to turn off recording.

Command Syntax

```
secondary-priority <1-5> label-record
no secondary-priority <1-5> label-record
```

Parameters

`<1-5>`	Secondary Priority value.

Default

By default, label record is disabled for secondary-priority.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)# rsvp-trunk t1
(config-trunk)#secondary-priority 1 label-record
(config)# rsvp-trunk t1
(config-trunk)# no secondary-priority 1 label-record
```

secondary-priority hop-limit

Use this command to specify a limit of hops for a secondary-priority lsp.

Upon configuration of an arbitrary hop-limit, the hop-limit is compared with the number of hops configured in the path, if a path has been configured. If the number of hops in the path exceed the hop-limit configured, no path messages are sent out and any existing session is torn down.

Use the no parameter to revert to the default hop-limit value.

Command Syntax

```
secondary-priority <1-5> hop-limit <1-255>
no secondary-priority <1-5> hop-limit <1-255>
```

Parameters

`<1-5>`	Secondary Priority value.
`<1-255>`	The number of acceptable hops.

Default

By default, hop limit is 255.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)# rsvp-trunk t1
(config-trunk)#secondary-priority 1 hop-limit 123
(config)# rsvp-trunk t1
(config-trunk)# no secondary-priority 1 hop-limit 123
```

secondary-priority bandwidth

Use this command to reserve the bandwidth in bits per second for the current trunk.

Each LSP has an associated bandwidth attribute. The bandwidth value is included in the sender's RSVP Path message and specifies the bandwidth to be reserved for the LSP. It is set in bits per second, with a higher value indicating a greater user traffic volume. A zero bandwidth reserves no resources, although label exchanges are possible.

Use the no parameter with this command to unset the configured bandwidth information.

Command Syntax

```
secondary-priority <1-5> bandwidth BANDWIDTH
no secondary-priority <1-5> bandwidth BANDWIDTH
```

Parameters

`<1-5>`	Secondary Priority value.
`BANDWIDTH`	<1-999>k for 1 to 999 kilobits/s <1-999>m for 1 to 999 megabits/s <1-100>g for 1 to 100 gigabits/s

Default

By default, bandwidth is 0 bits per second, which allows data to flow through but does not reserve bandwidth.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)# rsvp-trunk t1
(config-trunk)#secondary-priority 1 bandwidth 100m
(config)# rsvp-trunk t1
(config-trunk)# no secondary-priority 1 bandwidth 100m
```

secondary record

This command is used to enable recording of the route taken by path and resv messages to confirm the establishment of reservations and to identify errors. Routes are recorded by means of the route record object (RRO) in RSVP messages.

Use the no secondary record command to revert to the default settings.

Command Syntax

```
secondary record
```

Parameters

None

Default

By default, routes are recorded

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary record
```

secondary retry-limit

Use this command to specify a retry count this RSVP Trunk.

If a session is in a nonexistent state due to the receipt of a path error message, it tries to recreate the LSP for the number of times specified by primary retry-limit. Although the same retry command controls both the trunk and the session, the retry-limit value affects only the session and not the trunk. If the trunk is in an incomplete state, the code keeps trying to bring it to a complete state, irrespective of the retry-limit value.

Use the `no` parameter to revert to the default retry-limit value.

Command Syntax

```
secondary retry-limit <1-65535>
no secondary retry-limit
```

Parameter

`<1-65535>`	The set number of times the system should try setting up the LSP

Default

By default, the retry-limit value is 0 so the trunk and session try to create the LSP indefinitely.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary retry-limit 256
```

secondary retry-timer

Use this command to specify a retry interval for an RSVP Trunk. When the ingress tries to configure an LSP and the setup fails due to the receipt of a path error message, the system waits for the time configure by this command before retrying the LSP setup process.

Use the `no` parameter to revert to the default.

Command Syntax

```
secondary retry-timer <1-600>
no secondary retry-timer
```

Parameter

`<1-600>`	Interval after which the system should retry setting up the LSP, in seconds

Default

By default, retry time is 30 seconds

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary retry-timer 12
```

secondary reuse-route-record

Use this command to use the updated route record list as an explicit route (with all strict nodes) when a path message is sent out at the next refresh.

An explicit route object (ERO) list contains the hops to be taken to reach the egress from the current LSR. If CSPF can not place an ERO with all strict routes, then this command helps modify the ERO after receiving resv messages. Future path messages have the ERO with all strict nodes, which identify each and every node to be traversed.

Use the `no` parameter to disable the use of the route record list as the explicit route.

Command Syntax

```
secondary reuse-route-record
no secondary reuse-route-record
```

Parameters

None

Default

By default, secondary reuse route record is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary reuse-route-record
```

secondary setup-priority

Use this command to configure a setup priority value for this trunk.

In case of insufficient bandwidth, the user must remove any less important LSPs to free up bandwidth. This can be done by preempting one or more of the existing LSPs. The setup priority determines whether a new LSP that preempts an existing LSP may be established. The setup priority of the new LSP must be higher than the hold priority of an existing LSP for the existing LSP to be preempted. Note that for a trunk, the setup priority should not be higher than the hold priority.

Use the `no` parameter with this command to revert to the default setup priority value.

Command Syntax

```
secondary setup-priority <0-7>
no secondary setup-priority
```

Parameters

`<0-7>`	The priority value

Default

By default, setup value is 7 (the lowest).

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary setup-priority 2
```

secondary traffic

Use this command to identify the traffic type for this RSVP Trunk.

Use the `no` parameter with this command to unset the configured traffic type.

Command Syntax

```
secondary traffic (guaranteed|controlled-load)
no secondary traffic
```

Parameters

`guaranteed` Guaranteed traffic

`controlled-load` Controlled load traffic

Default

Controlled load is the default traffic type.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#secondary traffic guaranteed
```

shutdown

Use this command to administratively disable a trunk. Execute this command to release the sessions of this trunk, and it only comes up once it is administratively enabled.

Use the `no` parameter to enable the trunk.

Command Syntax

```
shutdown
```

```
no shutdown
```

Parameters

None

Default

None

Command Mode

Trunk mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below example disable the trunk administratively:

```
#configure terminal
(config)#rsvp-trunk t1
(config-trunk)#shutdown
(config-trunk)#commit
```

The below example enable the trunk administratively:

```
#configure terminal
(config)#rsvp-trunk t1
(config-trunk)#no shutdown
(config-trunk)#commit
```

snmp restart rsvp

Use this command to restart SNMP in Resource Reservation Protocol -Traffic Engineering (RSVP-TE)

Command Syntax

```
snmp restart rsvp
```

Parameters

None

Default

By default, snmp restart rsvp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#snmp restart rsvp
```

to A.B.C.D

Use this command to specify an IPv4 egress for an LSP. When configuring an LSP, you must specify the address of the egress router by using this command in the trunk node. An egress definition is a mandatory attribute; no RSVP session is created when an egress is not defined.

Use the `no` parameter with this command to unset the configured egress address.

Command Syntax

```
to A.B.C.D
no to
```

Parameters

None

Default

The operator must specify an egress for LSP initialization to begin.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk mytrunk
(config-trunk)#to 10.10.0.5
```

update-type

Use this command to change the method of updating attributes for sessions (primary/ secondary) for this trunk.

- If make-before-break is configured (default type), a new LSP is created for each attribute update. When the new LSP becomes operational, the original LSP is torn down.
- If break-before-make is configured, the existing LSP is torn down and restarted for each attribute update.

Use the `no` parameter with this command to remove an update type.

Command Syntax

```
update-type (make-before-break|break-before-make)
no update-type
```

Parameters

`make-before-break`
Make before break update

`break-before-make`
Break before make update

Default

By default, make-before-break types of updates are carried out.

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#update-type break-before-make

#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#update-type make-before-break
```

© 2025 IP Infusion Inc. Proprietary

CHAPTER 2 Fast Reroute Commands

This chapter describes the RSVP-TE Fast Reroute commands.

Note: Constrained Shortest Path First (CSPF) is mandatory for FRR to work.

default-frr-protection

Use this command to configure the default method of fast reroute protection when sender has not specified a method via FRR object but asked for local protection. This command is particularly useful with interop with Cisco as Cisco doesn't send FRR object in path message. By default, default FRR protection considered to be one-to-one in OcNOS and in case of interop with Cisco where default protection needed is facility, this command shall be configured on all OcNOS devices in the network.

Note: Having this command configured in one OcNOS device and not configured in other OcNOS device in the network will cause unpredictable behavior as RFC recommendation for merge node behavior of facility and one-to-one are different.

Note: This command is applicable only when path message contains local protection flag set but doesn't contain FRR object. When FRR object mentions protection type explicitly, this command is not applicable and also, if path message doesn't request local protection, then also this command is not applicable.

Command Syntax

```
default-frr-protection (one-to-one | facility)
no default-frr-protection
```

Parameters

`facility`	Facility Backup (Bypass) protection
`one-to-one`	One-to-One protection mechanism

Default

By default, if local protection requested but FRR object not available, one-to-one protection is considered.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.1.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)# default-frr-protection facility
(config-router)# commit
(config-router)# no default-frr-protection
(config-router)# commit
```

detour-identification

Use this command to set a path-specific detour LSP identification method, using the detour object.

Use the no parameter with this command to unset the detour LSP identification method.

Note: This command helps identify the backup LSP identification method for one-to-one protection only.

Command Syntax

```
detour-identification (path|sender-template)
no detour-identification
```

Parameters

`path`	Set a path-specific detour identification method
`sender-template`	Set a sender template-specific detour identification method

Default

By default, detour identification is sender template

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#detour-identification path

#configure terminal
(config)#router rsvp
(config-router)#detour-identification sender-template

#configure terminal
(config)#router rsvp
(config-router)#no detour-identification
```

© 2025 IP Infusion Inc. Proprietary

primary fast-reroute bandwidth

Use this command to set the detour LSP bandwidth.

Note: This command helps identify attributes of the FRR backup LSP for the one-to-one protection method.

Use the `no` parameter with this command to unset fast-reroute LSP bandwidth.

Command Syntax

```
primary fast-reroute bandwidth BANDWIDTH
no primary fast-reroute bandwidth BANDWIDTH
no primary fast-reroute BANDWIDTH
```

Parameter

BANDWIDTH	<1-999>k for 1 to 999 kilobits/s
	<1-999>m for 1 to 999 megabits/s
	<1-100>g for 1 to 100 gigabits/s

Default

By default, primary fast reroute bandwidth is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary fast-reroute bandwidth 10000000
```

primary fast-reroute hold-priority

Use this command to set the hold-priority for a detour LSP.

Note: This command helps identify attributes of the FRR backup LSP for the one-to-one protection method.

Use the `no` parameter with this command to unset the detour LSP hold-priority.

Command Syntax

```
primary fast-reroute hold-priority <0-7>
no primary fast-reroute hold-priority (<0-7>|)
```

Parameter

`<0-7>`	Set the value for hold-priority

Default

By default, primary fast reroute hold priority is 0

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary fast-reroute hold-priority 3
```

primary fast-reroute hop-limit

Use this command to set the hop-limit for a detour LSP.

Note: This command helps identify attributes of the FRR backup LSP for the one-to-one protection method.

Use the `no` parameter with this command to unset the detour LSP hop-limit.

Command Syntax

```
primary fast-reroute hop-limit <1-255>
no primary fast-reroute hop-limit (<1-255>|)
```

Parameter

`<1-255>`	Set the number of hops

Default

By default, primary fast reroute hop limit is 255

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary fast-reroute hop-limit 25
```

primary fast-reroute node-protection

Use this command to set node protection.

Note: This command helps identify attributes of the FRR backup LSP for the one-to-one protection method.

Use the `no` parameter with this command to remove node protection.

Command Syntax

```
primary fast-reroute node-protection
no primary fast-reroute node-protection
```

Parameters

None

Default

By default, primary fast reroute node protection is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary fast-reroute node-protection
```

primary fast-reroute protection

Use this command to create an Fast Reroute backup and to set an LSP one-to-one protection or facility backup mechanism.

Note: Traffic switching of less than 50ms is not applicable for unknown unicast traffic received on edge nodes for VPLS services.

Use the `no` parameter with this command to remove LSP protection mechanism.

Parameters

None

Command Syntax

```
primary fast-reroute protection (one-to-one|facility)
no primary fast-reroute protection (one-to-one|facility)
```

Parameters

`one-to-one`	One-to-one protection
`facility`	Facility backup (bypass) protection"

Default

By default, primary fast reroute protection is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary fast-reroute protection one-to-one
```

primary fast-reroute setup-priority

Use this command to configure a setup-priority for the detour LSP.

Note: This command helps identify attributes of the FRR backup LSP for the one-to-one protection method.

Use the `no` parameter with this command to remove the detour LSP setup-priority.

Command Syntax

```
primary fast-reroute setup-priority <0-7>
no primary fast-reroute setup-priority (<0-7>|)
```

Parameter

<0-7>	Set a value for setup priority

Default

By default, primary fast reroute setup priority is 0

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary fast-reroute setup-priority 2
```

CHAPTER 3 Refresh Reduction Commands

This chapter describes the RSVP-TE Refresh Reduction commands:

- ack-send-timer
- ack-wait-timeout
- message-ack
- refresh-reduction
- rsvp ack-wait-timeout
- rsvp message-ack
- rsvp refresh-reduction

ack-send-timer

Use this command to configure the timer to send an acknowledgement message. Timer configuration increases the chances of piggy backing multiple acknowledgement messages but also adds delay in acknowledgment received by neighbor node. So, use this command with exact knowledge of optimum time.

Note: Configure this command with a value within the limit of ack-wait-timeout to avoid frequent timeout.

Command Syntax

```
ack-send-timer <1-5>
no ack-send-timer
```

Parameter

`<1-5>`	Value in seconds for acknowledgement send timer.

Default

By default, acknowledgement message is transmitted immediately without piggy-backing.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 6.4.1.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)# ack-send-timer 1
(config-router)# commit
(config-router)# no ack-send-timer
(config-router)# commit
```

ack-wait-timeout

Use this command to configure the acknowledgement wait timeout for all RSVP-TE neighbors.

Use the `no` parameter with this command to revert to the default acknowledgement wait timeout.

Command Syntax

```
ack-wait-timeout <1-65535>
no ack-wait-timeout
```

Parameter

<1-65535>	Specify a value for the acknowledgement wait timeout in seconds. The default timeout value is 10 seconds.

Default

By default, ack wait timeout is 10 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#ack-wait-timeout 5

(config)#router rsvp
(config-router)#no ack-wait-timeout
```

message-ack

Use this command to enable message acknowledgment for all messages being sent to neighbors that are known to support refresh reduction.

Use the `no` parameter with this command to disable message acknowledgment for all messages being sent to neighbors.

Command Syntax

```
message-ack
no message-ack
```

Parameters

None

Default

By default, Message Acknowledgment is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#message-ack

(config)#router rsvp
(config-router)#no message-ack
```

refresh-reduction

Use this command to enable refresh reduction capability advertisement for all interfaces.

Use the no parameter with this command disable refresh reduction capability advertisement for all interfaces.

Command Syntax

```
refresh-reduction
no refresh-reduction
```

Parameters

None

Default

By default, Refresh reduction mechanism is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#refresh-reduction

(config)#router rsvp
(config-router)#no refresh-reduction
```

rsvp ack-wait-timeout

Use this command to configure the acknowledgment wait timeout for all neighbors detected via the specific interface.

Use the `no` parameter with this command to revert to the default acknowledgment wait timeout for the specified interface.

Command Syntax

```
rsvp ack-wait-timeout <1-65535>
no rsvp ack-wait-timeout
```

Parameters

`<1-65535>`	Specify a value for the acknowledgment wait timeout in seconds. The default timeout value is 10 seconds.

Default

By default, rsvp ack wait timeout is 10 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#rsvp ack-wait-timeout 5

(config)#interface eth0
(config-if)#no rsvp ack-wait-timeout
```

rsvp message-ack

Use this command to enable message acknowledgment for all messages being sent to the neighbors that have been detected via the specific interface.

Use the `no` parameter with this command to disable message acknowledgment for all messages being sent to the neighbors that have been detected via the specified interface.

Command Syntax

```
rsvp message-ack
no rsvp message-ack
```

Parameters

None

Default

By default, Message Acknowledgment is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#rsvp message-ack

(config)#interface eth0
(config-if)#no rsvp message-ack
```

rsvp refresh-reduction

Use this command to enable Refresh Reduction capability advertisement for a specific interface.

Use the `no` parameter with this command disable Refresh Reduction capability advertisement for the specified interface.

Command Syntax

```
rsvp refresh-reduction
no rsvp refresh-reduction
```

Parameters

None

Default

Refresh Reduction mechanism is enabled by default for all interfaces.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#rsvp refresh-reduction

(config)#interface eth0
(config-if)#no rsvp refresh-reduction
```

CHAPTER 4 Facility Backup Commands

This chapter describes the RSVP-TE bypass commands for facility backup protection

- RSVP Auto Bypass Commands
- backup-bw-type
- bandwidth
- bypass-lsp-addr-query-interval
- cspf-retry-limit
- cspf-retry-timer
- filter
- hold-priority
- hop-limit
- label-record
- no record
- path
- preemption-type
- record
- retry-limit
- retry-timer
- reuse-route-record
- rsvp-bypass
- setup-priority
- shutdown
- to A.B.C.D
- traffic

backup-bw-type

Use this command to select the bypass trunk bandwidth support type.

Bypass trunks of dedicated bandwidth type will serve only bandwidth protections requested LSPs. The total bandwidth requirement of served LSPs will be less than or equal to the bandwidth configured on the bypass trunk. If an LSP with bandwidth protection and higher setup priority requests protection and bypass doesn't have sufficient bandwidth available, then LSPs with lower hold priority will be preempted to serve the LSP with higher setup priority.

Use the `no` parameter to remove configured backup bandwidth type.

Command Syntax

```
backup-bw-type (dedicated | best-effort)
no backup-bw-type
```

Parameters

`dedicated`	Dedicated backup bandwidth support
`best-effort`	Best effort backup bandwidth support

Default

best-effort

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#backup-bw-type dedicated
```

bandwidth

Use this command to reserve the bypass bandwidth in bits per second for the current trunk.

Each LSP has an associated bandwidth attribute. The bandwidth value is included in the sender's RSVP Path message and specifies the bandwidth to be reserved for the LSP. It is specified in bits per second, with a higher value indicating a greater user traffic volume. A zero bandwidth reserves no resources, although exchanges labels.

Use the `no` parameter to remove configured bandwidth information.

Command Syntax

```
bandwidth BANDWIDTH
no bandwidth BANDWIDTH
no bandwidth
```

Parameter

`BANDWIDTH`	<1-999>k for 1 to 999 kilobits/s
	<1-999>m for 1 to 999 megabits/s
	<1-100>g for 1 to 100 gigabits/s

Default

The default bandwidth is 0 bits per second, which allows data to flow through but does not reserve bandwidth.

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#bandwidth 100m
(config-bypass)#no bandwidth
```

bypass-lsp-addr-query-interval

Use this command to set the interval at which bypass trunk must query CSPF for LSP address. This mechanism ensures to update bypass trunk LSP addresses regularly so that, it can verify regularly if it can protect any LSP requesting protection.

Use the `no` parameter with this command to reset the interval to default value.

Note: Reducing interval to lower values may impact performance.

Command Syntax

```
bypass-lsp-addr-query-interval <10-60>
no bypass-lsp-addr-query-interval
```

Parameter

`<10-60>`	Set interval of bypass trunk querying LSP address

Default

By default, interval is set to 60 seconds.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)# bypass-lsp-addr-query-interval 50
```

cspf-retry-limit

Use this command to specify the number of retries that CSPF should carry out for a request received from RSVP.

Use the `no` parameter with this command to disable this configuration.

Command Syntax

```
cspf-retry-limit <1-65535>
no cspf-retry-limit
```

Parameter

`<1-65535>`	Set the number of times CSPF should retry for this LSP

Default

By default, retry-limit is 0 which means infinite retry.

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#cspf-retry-limit 535

(config)#rsvp-bypass bp1
(config-bypass)#no cspf-retry-limit
```

cspf-retry-timer

Use this command to specify the time between each retry that CSPF might carry out for a request received from RSVP. Use the no parameter with this command to disable this configuration.

Command Syntax

```
primary cspf-retry-timer <1-600>
no primary cspf-retry-timer
```

Parameter

`<1-600>`	Timeout between successive retries, in seconds

Default

By default, retry-timer is 0

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#cspf-retry-timer 45

(config)#rsvp-bypass bp1
(config-bypass)#no cspf-retry-timer
```

filter

Use this command to set the filter to the fixed or shared style for an LSP.

- The shared filter style identifies a shared reservation environment. It creates a single reservation into which flows from all senders are mixed.
- The fixed filter style designates a distinct reservation. A distinct reservation request is created for data packets from a particular sender. The fixed filter style is also used style to prevent rerouting of an LSP and to prevent another LSP from using this bandwidth.

Use the `no` parameter to reset the configured filter to the default.

Command Syntax

```
filter fixed
no filter
```

Parameters

`fixed`	Use a fixed filter for this LSP

Default

By default, bypass filter is shared-explicit.

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#filter fixed
```

hold-priority

Use this command to configure the hold priority value for the selected bypass trunk. In case of insufficient bandwidth, remove less important existing LSPs to free up a portion of the bandwidth. This can be done by preempting one or more of the signaled LSPs. Hold priority determines the degree to which an LSP holds onto its reservation for a session after the LSP has been configured successfully. When the hold priority is high, the existing LSP is less likely to give up its reservation.

Use the `no` parameter to reset the trunk to the default hold-priority value.

Command Syntax

```
hold-priority <0-7>
no hold-priority
```

Parameters

`<0-7>`	Set a hold priority for the bypass LSP

Default

The default hold-priority value is 0, which is the highest. Once a session is configured with a hold priority of 0, no other session can preempt it.

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#hold-priority 2
```

hop-limit

Use this command to specify a limit of hops for an RSVP bypass trunk. Hop-limit data is sent to the CSPF server if CSPF is used.

Upon configuration of an arbitrary hop-limit, the hop-limit is compared with the number of hops configured in the bypass path, if a bypass path has been configured. If the number of hops in the bypass path exceeds the hop-limit configured, no Path messages are sent, and any existing session is torn down. If no bypass path is configured, the bypass trunk is processed normally and Path messages are sent.

Use the `no` parameter to reset the bypass trunk to the default hop-limit value.

Command Syntax

```
hop-limit <1-255>
no hop-limit
```

Parameters

`<1-255>`	Set the number of acceptable hops for the LSP

Default

By default, bypass hop limit is 255

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#hop-limit 23
```

© 2025 IP Infusion Inc. Proprietary

label-record

Use this command to record all labels exchanged between RSVP-enabled routers during the reservation setup process.

Use the `no` parameter with this command to turn off recording.

Command Syntax

```
label-record
no label-record
```

Parameters

None

Default

By default, bypass label record is disabled

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#label-record
```

no record

Use this command to disable recording of the route taken by Path and Reservation Request (Resv) messages to confirm establishment of reservations and identify errors. Routes are recorded by means of the Route Record Object (RRO) in RSVP messages.

Use the `record` command to return to the default settings.

Command Syntax

```
no record
```

Parameters

None

Default

By default, routes are recorded

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#no record
```

path

Use this command to specify an RSVP path to be used. The PATHNAME in this command is the string (name) used to identify an RSVP path defined for the node (refer to rsvp-path command).

Use the `no` parameter with this command to remove a configured RSVP path.

Command Syntax

```
path PATHNAME
no path
```

Parameters

PATHNAME	The name of the path to use

Default

By default, bypass path is disabled

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#path mypath
```

© 2025 IP Infusion Inc. Proprietary

preemption-type

Use this command to configure preemption type which decides the criteria to be considered in case of preemption.

Use the `no` parameter to remove configured preemption type.

Command Syntax

```
preemption-type (less-lsp-preempted | less-unused-bandwidth)
no preemption-type
```

Parameters

`less-lsp-preempted`	Set preemption type to minimize number of LSPs preempted
`less-unused-bandwidth`	Set preemption type to ensure less bypass bandwidth unused

Default

By default, preemption type is set to less-lsp-preempted.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#router rsvp
(config-router)#preemption-type less-unused-bandwidth
```

record

Use this command to enable recording of the route taken by Path and Reservation Request (Resv) messages to confirm establishment of reservations and identify errors. Routes are recorded by means or the Route Record Object (RRO) in RSVP messages.

Use the `no record` command to disable recording of routes.

Command Syntax

```
record
```

Parameters

None

Default

By default, routes are recorded

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#record
```

retry-limit

Use this command to specify a retry count this RSVP bypass Trunk.

If a session is in a nonexistent state due to a path error message, the system tries to recreate the LSP for the number of times specified by the retry-limit command.

Although the same retry command controls both the trunk and the session, the retry-limit value affects only the session and not the trunk. If the trunk is in an incomplete state, the code keeps trying forever to bring it to a complete state regardless of the retry-limit value.

Use the `no` parameter with this command to revert to the default retry-limit value.

Command Syntax

```
retry-limit <1-65535>
no retry-limit
```

Parameter

`<1-65535>`	The set number of times the system should try setting up the LSP

Default

By default, the retry-limit value is 0, and the trunk and session try to create the LSP indefinitely.

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#retry-limit 256
```

retry-timer

Use this command to specify a retry interval for an RSVP bypass Trunk. When an ingress node tries to configure an LSP and the setup fails due to the receipt of a Path Error message, the system waits for the time configured with this command, before retrying the LSP setup process.

Use the `no` parameter with this command to revert to the default retry-time value.

Command Syntax

```
retry-timer <1-600>
no retry-timer
```

Parameters

`<1-600>`	Time in seconds after which the system should retry setting up the LSP

Default

By default, retry-timer value is 30 seconds.

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#retry-timer 12
```

reuse-route-record

Use this command to use the updated Route Record List as an Explicit Route (with all strict nodes) when a path message is sent out at the next refresh.

The ERO list contains the hops to be taken to reach the egress from the current LSR. If CSPF is not available, to place an ERO with all strict routes, use this command to modify the ERO after receiving the Resv message. The future Path messages have the ERO with all strict nodes, identifying each and every node to be traversed.

Use the `no` parameter with this command to disable the use of the Route Record List as the explicit route.

Command Syntax

```
reuse-route-record
no reuse-route-record
```

Parameters

None

Default

By default, reuse route record is disabled

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#reuse-route-record
```

rsvp-bypass

Use this command to create a new RSVP bypass trunk. When the bypass trunk is created, the attributes required to configure an explicitly-routed or traditionally-routed LSP are set. Once a trunk is configured with the required attributes, an RSVP bypass session (and PSB) is created for this trunk, which enables the exchange of messages and completes the LSP setup.

This command also modifies an existing RSVP path to configure an explicitly-routed or traditionally-routed LSP.

Use the `no` parameter with this command to remove an RSVP bypass trunk and all configured attributes.

Note: The RSVP bypass' name (BYPASSNAME) is limited to 32 characters.

Command Syntax

```
rsvp-bypass BYPASSNAME
no rsvp-bypass BYPASSNAME
```

Parameters

`BYPASSNAME`	Name to use for the bypass trunk

Default

By default, `rsvp bypass trunk` is disabled

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

The command prompt changes from `config` to `config-bypass` as illustrated below:

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#
```

setup-priority

Use this command to configure a setup priority value for a trunk. In case of insufficient bandwidth, users must remove less important LSPs to free up the bandwidth. This can be done by preempting one or more of the existing LSPs. The primary setup priority determines if a new LSP can preempt an existing LSP.

The setup priority of the new LSP must be higher than the hold priority of an existing LSP for the existing LSP to be preempted. Note that for a trunk, the setup priority should not be higher than the hold priority.

Use the `no` parameter with this command to revert to the default primary setup priority value.

Command Syntax

```
setup-priority <0-7>
no setup-priority
```

Parameters

`<0-7>`	Set the priority value

Default

By default, setup priority is 7, which is the lowest.

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#setup-priority 2
```

© 2025 IP Infusion Inc. Proprietary

shutdown

Use this command to administratively disable a bypass trunk. Execute this command to release the bypass session of this trunk, and it only comes up once it is administratively enabled.

Use the `no` parameter to enable the trunk.

Command Syntax

```
shutdown
no shutdown
```

Parameters

None

Default

None

Command Mode

Bypass mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below example disable the trunk administratively:

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#shutdown
(config-bypass)#commit
```

The below example enable the trunk administratively:

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#no shutdown
(config-bypass)#commit
```

to A.B.C.D

Use this command to specify an IPv4 egress for a bypass LSP. When configuring an LSP, you must specify the address of the egress router by using this command in the bypass node. An egress definition is a mandatory attribute; no RSVP session is created when an egress is not defined.

Use the `no` parameter with this command to unset the configured egress address.

Command Syntax

```
to A.B.C.D
no to
```

Parameters

None

Default

The operator must specify an egress for LSP initialization to begin.

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#to 10.10.0.5
```

© 2025 IP Infusion Inc. Proprietary

traffic

Use this command to specify the traffic type for this RSVP bypass Trunk.

Use the `no` parameter with this command to reset the configured traffic type.

Command Syntax

```
traffic (guaranteed|controlled-load)
no traffic
```

Parameters

`controlled-load`	Controlled loaded traffic
`guaranteed`	Guaranteed traffic

Default

By default, primary traffic type is controlled-load

Command Mode

Bypass mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#rsvp-bypass bp1
(config-bypass)#traffic guaranteed
```

CHAPTER 5 Differentiated Services Commands

This chapter describes the RSVP Differentiated Services (DiffServ) commands.

map-route A.B.C.D

Use this command to map a IPv4 prefix route onto a trunk. This route is to be used for packets that are mapped to a specific RSVP trunk.

Use the `no` parameter with this command for unmapping routes from specified trunks.

Note: Do not configure the local address as a map route, as explicit validation is not done. The wrong configuration may impact traffic.

Command Syntax

```
map-route A.B.C.D A.B.C.D
map-route A.B.C.D A.B.C.D CLASS
map-route A.B.C.D/M
map-route A.B.C.D/M CLASS
no map-route A.B.C.D A.B.C.D
no map-route A.B.C.D A.B.C.D CLASS
no map-route A.B.C.D/M
no map-route A.B.C.D/M CLASS
```

Parameters

`A.B.C.D`	Specify the IPV4 address to be mapped.
`A.B.C.D`	Specify a mask to be applied to the address being mapped.
`A.B.C.D/M`	Specify the IPV4 address to be mapped, with mask.
`CLASS`	Specify the DiffServ Class Name (for example, `be`, `ef` etc.) used for selecting incoming IP packets to be mapped to a specified RSVP trunk.

Default

By default, map route A.B.C.D is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#map-route 1.1.2.2/24 be
```

map-route X:X::X:X

Use this command to map a IPv6 prefix route onto a trunk. This route is to be used for packets that are mapped to a specific RSVP trunk.

Use the `no` parameter with this command for unmapping routes from specified trunks.

Command Syntax

```
map-route X:X::X:X X:X::X:X
map-route X:X::X:X X:X::X:X CLASS
map-route X:X::X:X/M
map-route X:X::X:X/M CLASS
no map-route X:X::X:X X:X::X:X
no map-route X:X::X:X X:X::X:X CLASS
no map-route X:X::X:X/M
no map-route X:X::X:X/M CLASS
```

Parameters

`X:X::X:X`	Specify the IPV6 address to be mapped.
`X:X::X:X`	Specify a mask to be applied to the address being mapped.
`X:X::X:X/M`	Specify the IPV6 address to be mapped, with mask.
`CLASS`	Specify the DiffServ Class Name (for example, `be`, `ef` etc.) used for selecting incoming IP packets to be mapped to a specified RSVP trunk.

Default

By default, map route X:X::X:X is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#map-route 1.1.2.2/24 be
```

override-diffserv

Use this command to enable the Differentiated Services (Diff-Serv) override configuration.

If a Path message is received without a Diff-Serv object by a Diff-Serv enabled node, it can be interpreted either as a request for an E-LSP (EXP-Inferred-PSC LSP) or as a request for Non-Diff-Serv LSP. This command supports the override option and when configured, the LSR interprets a path message without a Diff-Serv object as a request for Non-Diff-Serv LSP.

Use the `no` parameter with this command disable this feature.

Command Syntax

```
override-diffserv
no override-diffserv
```

Parameters

None

Default

By default, override diffserv is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router rsvp
(config-router)#override-diffserv
```

primary class-to-exp-bit

Use this command to configure a primary PHB-EXP (Per-Hop Behavior-Experimental) mapping to be used by an E-LSP (EXP-Inferred-PSC LSP). This mapping is different from the node level PHB-EXP mapping.

Use the `no` parameter with this command to remove a PHB-EXP mapping configuration from current E-LSP PHB-EXP mapping.

Command Syntax

```
primary class-to-exp-bit CLASS <0-7>
no primary class-to-exp-bit CLASS <0-7>
```

Parameters

`CLASS`	Specify the DiffServ Class Name (for example, be, ef etc.) used for selecting incoming IP packets to be mapped to a specified RSVP trunk.
`<0-7>`	Exp bit which is to be mapped to this PHB.

Default

By default, primary map class is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary class-to-exp-bit af12 3

(config)#rsvp-trunk T1
(config-trunk)#no primary class-to-exp-bit af12 3
```

© 2025 IP Infusion Inc. Proprietary

primary elsp-signaled

Use this command to configure a primary Diff-Serv (Differentiated Services) explicitly signaled E-LSP (EXP-Inferred-PSC LSP) interface.

The classes 1 to 7 are optional parameters that can be selected from node level PHB-EXP (Per-Hop Behavior) mapping as PHBs, which will then be used for an E-LSP. If you do not specify a class with this command, all classes will be selected for the E-LSP.

Use the no parameter with this command to remove the configuration.

Command Syntax

```
primary elsp-signaled
primary elsp-signaled CLASS1
primary elsp-signaled CLASS1 CLASS2
primary elsp-signaled CLASS1  CLASS2 CLASS3
primary elsp-signaled CLASS1  CLASS2 CLASS3 CLASS4
primary elsp-signaled CLASS1  CLASS2 CLASS3 CLASS4 CLASS5
primary elsp-signaled CLASS1  CLASS2 CLASS3 CLASS4 CLASS5 CLASS6
primary elsp-signaled CLASS1  CLASS2 CLASS3 CLASS4 CLASS5 CLASS6 CLASS7
no primary elsp-signaled
```

Parameter

`CLASS<0-7>`	Diffserv class alias. e.g.: be, ef, af11, etc.

Default

By default, primary elsp signaled is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary elsp-signaled cs2 cs5 cs6

(config)#rsvp-trunk T1
(config-trunk)#no primary elsp-signaled
```

primary llsp

Use this command to configure a primary Differentiated Services Label-Only-Inferred-PSC (Diff-Serv L-LSP) interface, which will use Diff-Serv Class as its PHB Scheduling Class (PSC).

Use the no parameter with this command to remove the Diff-Serv L-LSP configuration.

Command Syntax

```
primary llsp CLASS
no primary llsp
```

Parameters

CLASS<0-7>	Diffserv class alias. e.g: be, ef, af11, etc.

Default

By default, primary llsp is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is not available on QUMRAN devices.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#primary llsp cs4

(config)#rsvp-trunk T1
(config-trunk)#no primary llsp
```

secondary map class

Use this command to configure a secondary PHB-EXP (Per-Hop Behavior-Experimental) mapping to be used by an E-LSP (EXP-Inferred-PSC LSP). This mapping is different from the node level PHB-EXP mapping.

Use the no parameter with this command to remove a PHB-EXP mapping configuration from current E-LSP PHB-EXP mapping.

Command Syntax

```
secondary map class-to-exp-bit CLASS  <0-7>
no secondary map class-to-exp-bit CLASS  <0-7>
```

Parameters

`CLASS`	Diff-Serv class (queue) mapped to the particular PHB.
	Diffserv class alias e.g: be, ef, af11, etc.
`<0-7>`	Exp bit that is to be mapped to this PHB.

Default

By default, secondary map class is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary class-to-exp-bit cs4 3

(config)#rsvp-trunk T1
(config-trunk)#no secondary class-to-exp-bit cs4 3
```

secondary elsp-signaled

Use this command to configure a secondary Diff-Serv (Differentiated Services) explicitly signaled E-LSP (EXP-Inferred-PSC LSP) interface. The classes 1 to 7 are optional parameters can be selected from the node level PHB-EXP (Per-Hop Behavior) mapping as PHBs. They will then be used for an E-LSP. If you do not specify a class with this command, all classes will be selected for the E-LSP.

Use the no parameter with this command to remove the configuration.

Command Syntax

```
secondary elsp-signaled
secondary elsp-signaled CLASS1
secondary elsp-signaled CLASS1 CLASS2
secondary elsp-signaled CLASS1 CLASS2 CLASS3
secondary elsp-signaled  CLASS1 CLASS2 CLASS3 CLASS4
secondary elsp-signaled  CLASS1 CLASS2 CLASS3 CLASS4 CLASS5
secondary elsp-signaled CLASS1 CLASS2 CLASS3 CLASS4 CLASS5 CLASS6
secondary elsp-signaled CLASS1 CLASS2 CLASS3 CLASS4 CLASS5 CLASS6 CLASS7
no secondary elsp-signaled
```

Parameters

`CLASS<0-7>`	Diffserv class alias. e.g: be, ef, af11, etc.

Default

By default, secondary elsp signaled is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary elsp-signaled class cs3 cs6 cs2 cs5

(config)#rsvp-trunk T1
(config-trunk)#no secondary elsp-signaled
```

secondary llsp

Use this command to configure a secondary Differentiated Services Label-Only-Inferred-PSC (Diff-Serv L-LSP) interface, which will use Diff-Serv Class as its PHB Scheduling Class (PSC).

Use the no parameter with this command to remove the Diff-Serv L-LSP configuration.

Command Syntax

```
secondary llsp CLASS
no secondary llsp
```

Parameters

`CLASS<0-7>`	Diffserv class alias. e.g: be, ef, af11, etc.

Default

By default, secondary llsp is disabled

Command Mode

Trunk mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is not available on QUMRAN devices.

Example

```
#configure terminal
(config)#rsvp-trunk T1
(config-trunk)#secondary llsp class cs5

(config)#rsvp-trunk T1
(config-trunk)#no secondary llsp
```

show rsvp diffserv-info

Use this command to display node level Differentiated Services (Diff-Serv) configuration information. This information includes the node level PHB-EXP mapping configured for ELSP-signaled LSP.

Command Syntax

```
show rsvp diffserv-info
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Following is a sample output of the `show rsvp diffserv-info` command.

```
#show rsvp diffserv-info
CLASS-EXP mapping:
CLASS    DSCP_value
 c5  101000 0
 be  000000 1
 cs1 001000 2
 cs3 011000 3
 cs2 010000 4
 cs4 100000 5
 cs6 110000 6
 cs7 111000 7
Table 5-1 explains the show command output fields.
```

Table 5-1: show rsvp diffserv-info output fields

Field	Description
CLASS	MPLS class type that corresponds to the DiffServ traffic engineering class.
EXP_value	Exp value is initialized at the ingress routing device only and overrides the rewrite configuration established for that forwarding class.

CHAPTER 6 RSVP Multipath Commands

This chapter is a reference for RSVP Multipath commands:

description

Use this command to add a description to the multipath group or update an existing description.

Use the `no` parameter to remove the description.

Command Syntax

```
description LINE
no description
```

Parameter

`LINE`	Line describing the purpose of RSVP multipath Group

Default

By default, description is empty.

Command Mode

Multipath mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#rsvp-multipath mygroup
(config-multipath)# description "For example purpose"
(config-multipath)# no description
```

multipath-group

Use this command to configure a multipath group on the RSVP trunk. When multipath group is configured on the trunk, trunk will become member of multipath group.

Use the `no` parameter to remove multipath group from RSVP trunk.

Command Syntax

```
multipath-group GROUPNAME
no multipath-group
```

Parameter

GROUPNAME	Name of the multipath group

Default

By default, parameter is not configured.

Command Mode

Trunk mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#rsvp-trunk to_dest1
(config-trunk)# multipath-group mygroup
(config-trunk)# no multipath-group
```

rsvp-multipath

Use this command to create a new multipath group or enter the existing group to update any group parameter.

Use the `no` parameter with this command to remove an RSVP multipath group.

Command Syntax

```
rsvp-multipath GROUPNAME
no rsvp-multipath GROUPNAME
```

Parameter

GROUPNAME	Name of the multipath group

Default

By default, rsvp multipath is not configured.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

The command prompt changes from config to config-multipath as illustrated below:

```
#configure terminal
#(config)#rsvp-multipath mygroup
#(config-multipath)#exit
#(config)#no rsvp-multipath mygroup
```

to A.B.C.D

Use this command to specify an IPv4 egress to a multipath group. When configuring a multipath group, you must specify the address of the egress router by using this command. An egress definition is a mandatory attribute; multipath group is not allowed to be configured on RSVP trunks when an egress is not defined.

Use the no parameter to remove the IPv4 egress address from multipath group.

Command Syntax

```
to A.B.C.D
no to
```

Parameter

A.B.C.D	IPv4 address of multipath group destination

Default

By default, parameter is not configured.

Command Mode

Multipath mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#rsvp-multipath mygroup
(config-multipath)# to 3.3.3.3
(config-multipath)# no to
```

show mpls counters rsvp multipath-name

Use this command to get traffic statistics over member trunks of multipath group.

Note: Qumran devices require hardware statistics profiles to be enabled explicitly for traffic statistics to be active. For tunnel statistics 'tunnel-lif' statistics profiles need to be enabled and system needs to be reloaded to take effect. Please see the `hardware-profile statistics` command in the *OcNOS Configuration Guide* for details.

Note: This statistic is not an explicit count of traffic over a multipath group. This statistic is collected over multipath members individually and any traffic individually carried by multipath members also counted under this output.

Command Syntax

```
show mpls counters rsvp multipath-name (NAME|)
```

Parameter

`NAME`	RSVP multipath group name

Command Mode

Exec mode and Privilege Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#show  mpls counters rsvp multipath-name test
Tunnel-id 5001 Extended Tunnel-ID 1.1.1.1 Egress 2.2.2.2
 lsp-name : t1-Primary                                  [Ingress]
 lsp-ingress : 1.1.1.1          lsp-id : 2201
 Rx pkts : n/a                  Rx bytes : n/a
 Tx pkts : 3776248              Tx bytes : 5671925998

Tunnel-id 5002 Extended Tunnel-ID 1.1.1.1 Egress 2.2.2.2
 lsp-name : t2-Primary                                  [Ingress]
 lsp-ingress : 1.1.1.1          lsp-id : 2202
 Rx pkts : n/a                  Rx bytes : n/a
 Tx pkts : 3776250              Tx bytes : 5671927500
```

show mpls rsvp-multipath

Use this command to display forwarder level information for a multipath group or all multipath groups.

Command Syntax

```
show mpls rsvp-multipath (NAME|)
```

Parameter

NAME	RSVP multipath group name

Command Mode

Exec mode and Privilege Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
# show mpls rsvp-multipath
Codes: > - installed FTN, * - selected FTN, t - tunnel, R - RSVP-TE FTN

Multipath Name : mp1,  ID : 101,  Nhlfe Ix : 2
  Active member count : 2,  FEC : 2.2.2.2/32
  Active member details :
  -----------------------
Index  Code    FTN-ID  Nhlfe-ID  Tunnel-id  Pri  LSP-Type     Out-Label  Out-Intf  ELC  Nexthop
1      R(t)>   1       1         5002       Yes  LSP_DEFAULT  24320      xe31      No   31.1.1.2
2      R(t)>   2       3         5001       Yes  LSP_DEFAULT  24321      xe11      No   11.1.1.2
```

show rsvp multipath

Use this command to display information for a multipath group or all multipath groups.

Command Syntax

```
show rsvp multipath (NAME|)
```

Parameter

`NAME`	RSVP multipath group name

Command Mode

Exec mode and Privilege Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#show rsvp multipath

RSVP-multipath Name : mp1,  ID : 101
  Description : "multipath group from R1 to R2"
  Member count : 3,  Egress : 2.2.2.2/32
  Member details :
  ----------------
  Trunk-ID   Trunk-name                    Status
  5001       to_R2_1                       active
  5002       to_R2_2                       active
  5003       to_R2_3                       inactive

RSVP-multipath Name : mp2,  ID : 102
  Member count : 0,  Egress : 3.3.3.3/32

RSVP-multipath Name : mp3,  ID : 103
  Member count : 0,  Egress : N/A
```

show running-config rsvp-multipath

Use this command to check configuration details of multipath groups.

Command Syntax

```
show running-config rsvp-multipath (NAME|)
```

Parameter

NAME	Name of the multipath group

Command Mode

Exec mode and Privilege Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#show running-config rsvp-multipath
!
rsvp-multipath mp1
 description "multipath group from R1 to R2"
 to 2.2.2.2
!
rsvp-multipath mp2
 to 3.3.3.3
!
rsvp-multipath mp3
!
!
```

CHAPTER 7 Show Commands

This chapter describes the RSVP-TE show commands.

show debugging rsvp

This command displays the status of the options selected by the `debug RSVP` command.

Command Syntax

```
show debugging rsvp
```

Parameters

None

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging rsvp
NSM debugging status:
  RSVP event debugging is on
  RSVP packet debugging is on
  RSVP incoming packet debugging is on
  RSVP outgoing packet debugging is on
  RSVP hexadecimal dump debugging is on
#
```

Table 7-2 explains the show command output fields.

Table 7-2: show debugging rsvp output fields

Field	Description
NSM debugging status	Debugging is enabled or disabled on a per-interface basis, using the commands.

show rsvp

Use this command to display data about the RSVP daemon.

Command Syntax

```
show rsvp
```

Parameters

None

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp
RSVP Version                    : 1
Process uptime                  : 8 minutes
RSVP Refresh Reduction          : Enabled
RSVP Message Acknowledgement    : Disabled
Bundle Send                     : Disabled
NSM Connection                  : Up
CSPF Connection                 : Up
CSPF usage                      : Enabled
RSVP Refresh Timer              : 5
Keep Multiplier                 : 3
Acknowledgement Await Timeout   : 10
Explicit-Null For Direct Conn   : Disabled
Local Protection                : Disabled
Hello Receipt                   : Disabled
Hello Interval                  : 2
Hello Timeout                   : 10
Loop detection                  : Enabled (all interface)
Override Diffserv               : Disabled
Ingress                         : 1.1.1.1
Penultimate Hop Popping         : Enabled
Refresh PATH msg parsing        : Enabled
Refresh RESV msg parsing        : Enabled
Detour identification           : Sender-Template

#
```

Table 7-3 explains the show command output fields.

Table 7-3: show rsvp output fields

Field	Description
RSVP Version	Version number associated with the RSVP ingress route.
Process uptime	Duration of the process running time.
RSVP Refresh Reduction	Measure of processing over head requests of refresh messages. Refresh reduction detail extensions improve routing device performance by reducing the process overhead, thus increasing the number of LSPs a routing device can support.
RSVP Message Acknowledgement	Acknowledge message for refresh reductions.
Bundle Send	Disables sending of Bundle Messages for a system.
NSM Connection	The Network Services Module (NSM) sends unsolicited messages to, or receives unsolicited messages from, the QoS (quality of service) module.
CSPF Connection	NSM passes the information to CSPF.
CSPF usage	CSPF finds the shortest path toward the LSP’s egress router, taking into account explicit-path constraints.
RSVP Refresh Timer	Time interval used to generate periodic RSVP messages.
Keep Multiplier	Number of RSVP messages that can be lost before an RSVP state is declared stale.
Acknowledgment Await Timeout	The router that initiates the acknowledgment messages for an RSVP session waits for the timeout.
Explicit-Null For Direct Conn	Advertise label 0 to the egress routing device of an LSP. Explicit null: enabled or disabled.
Local Protection	A local repair mechanism is in use to maintain this tunnel.
Hello Receipt	To exchange Hello messages among neighbors.
Hello Interval	Frequency at which RSVP hellos are sent on this interface (in seconds).
Hello Timeout	RSVP Hello State Timer feature detects when a neighbor is down and triggers faster state timeout.
Loop detection	Loop back Detection (LBD) provides protection against loops by transmitting loop protocol packets out of ports where loop protection has been enabled.
Override Diffserv	Diffserv helps to carry the EXP-to-PHB mapping for signaled E-LSP or the PSC value for L-LSP.
Ingress	Information about ingress RSVP sessions.
Penultimate Hop Popping	Removes the label one hop before its destination.
Refresh PATH msg parsing	Refresh message supports the refreshing of RSVP state without the transmission of conventional Path messages.
Refresh RESV msg parsing	Refresh message supports the refreshing of RSVP state without the transmission of conventional Resv messages.
Detour identification	Detours are calculated to avoid the immediate downstream link and node.

show rsvp admin-groups

Use this command to display all known administrative groups configured through the NSM for the system.

Command Syntax

```
show rsvp admin-groups
```

Parameters

None

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output showing four administrative groups configured through NSM.

```
#show rsvp admin-groups
 Admin group detail:
  Value of 0 associated with admin group 'a'
  Value of 1 associated with admin group 'b'
  Value of 2 associated with admin group 'c'
  Value of 3 associated with admin group 'd'
#
```

Table 7-4 explains the show command output fields.

Table 7-4: show rsvp admin-groups output field

Field	Description
Admin group detail	Administrative groups details which implements the link coloring of resource classes.

show rsvp bypass

Use this command to display bypass session related information for configured bypass LSPs.

Command Syntax

```
show rsvp bypass
```

Parameters

None

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp bypass
Ingress RSVP:
To              From            Tun-ID   LSP-ID   LSPName                         State Uptime    Rt  Style  Labelin  Labelout
172.31.54.4      172.31.54.1     5001     2201     BYPASS2-172.31.222.19-Bypass    UP    02d15h11m 1 1 SE     -        52516
172.31.54.2      172.31.54.1     5002     2202     BYPASS3-172.31.222.9-Bypass     UP    02d15h11m 1 1 SE     -        0
172.31.54.2      172.31.54.1     5003     2203     BYPASS4-172.31.222.7-Bypass     UP    02d15h11m 1 1 SE     -        0
172.31.53.18   172.31.54.1      5004      2204     BYPASS5-172.31.189.179-Bypass  UP    02d15h11m 1 1 SE     -        52501
```

show rsvp bypass detail

Use this command to display bypass session related information in detail for all configured bypass LSPs or the bypass session with specified bypass tunnel name.

Command Syntax

```
show rsvp bypass (BYPASSNAME | detail)
```

Parameters

`BYPASSNAME`	Bypass tunnel name
`detail`	Detailed information of all configured bypass sessions

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp bypass BYPASS2-172.31.222.19
Ingress (Bypass)
172.31.54.4
  From: 172.31.54.1, LSPstate: Up, LSPname: BYPASS2-172.31.222.19-Bypass

```

show rsvp bypass lsp-address-list

Use this command to display address details of every node of a bypass session shown as merge node detail for egress node of bypass session and transit node detail for transit node details of bypass session.

Command Syntax

```
show rsvp bypass (BYPASSNAME|) lsp-address-list
```

Parameters

BYPASSNAME	(Optional) Bypass tunnel name

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp bypass BYPASS2-172.31.222.19 lsp-address-list
Bypass trunk: BYPASS2-172.31.222.19

Merge Point Router ID: 172.31.54.4

Number of Merge Point IP addresses: 6
IP address:
  172.31.222.22    172.31.180.4     172.31.222.19    172.31.222.27
  172.31.222.31    172.31.186.4

Number of Transit Point IP addresses: 9
IP address:
  172.31.54.3      172.31.222.23    172.31.222.30    172.31.180.2
  172.31.222.25    172.31.186.20    172.31.33.120    172.31.180.3
  172.31.180.5

LSP address query interval: 60 seconds, next retry in: 27 seconds
```

show rsvp bypass protected-lsp-list

Use this command to display the list of sessions protected by a bypass session and match code provides the details bypass is a perfect match or any constraint compromised.

Note: Match code 0 is an indication of perfect match i.e. all constraint of protected session matched. i.e. If protected session asked for node protection, then bypass provides perfect node protection by merging exactly at next to next hop node. If protected session asked for bandwidth protection, bypass provides bandwidth protection. In case of PHP node, even when node protection is requested by protected session, it is not applicable and node protection request is not applicable on PHP node. Thus, a bypass providing link protection with other criteria matching is considered as perfect match.

Note: If a bypass protected session requested for link protection but it is mapped to a bypass node protection, then it is not a perfect match. Match code will be 4 in that case.

Note: When bandwidth protection is requested, highest importance of bypass mapping given to bandwidth protection. When bandwidth protection cannot be provided, then the remaining constraints given importance.

Command Syntax

```
show rsvp bypass (BYPASSNAME|) protected-lsp-list
```

Parameters

BYPASSNAME	Bypass tunnel name

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp bypass protected-lsp-list
Match Code: 0 - Perfect match (all criteria matching), 1 - Bandwidth protection miss, 2 - Node protection miss,
            3 - SRLG protection miss, 4 - Merge point not ideal, 255 - Invalid

```

show rsvp control-adjacency

Use this command to display RSVP specific information for control adjacency.

Command Syntax

```
show rsvp control-adjacency
show rsvp control-adjacency CANAME
```

Parameters

CANAME	Use this parameter to display the name of a control-adjacency

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#"show rsvp control-adjacency" without parameters:
Control Adj    Admin status   Oper Status    Peer-address   Gifindex
Control Channel

#"show rsvp control-adjacency" with parameters:
Admin Status"Enabled" : "Disabled"
Oper Status"Up" : "Down"
Peer-address
Gifindex
Control-Channel in usecc->name : "N/A"
Control-Channel Gifindex
Control-Channel Local-address
Control-Channel Peer-address
Control-Channel ID
Control-Channel Binding Ifindex
Refresh Reduction usage"Disabled" : "Enabled"
Message Acknowledgement"Enabled" : "Disabled"
Bundle Buffer size
Current Epoch Value
Primary IPv4 addressIPv4_address : "N/A"
Primary IPv6 addressIPv6_address : "N/A"
Configured refresh time
Configured keep multiplier
Acknowledgement Await Timeout
Hello Receipt"Enabled" : "Disabled"
Hello Interval
Hello Timeout
Non IANA Hello exchange"Enabled" : "Disabled"
```

Table 7-5 explains the show command output fields.

Table 7-5: show rsvp control-adjacency output field

Field	Description
Control Adj	Control Adjacency status and configuration.
Admin status	Indicates whether the user can administratively disable a peer while still preserving its configuration. Up = Yes, Down = No.
Oper Status	Displays the current status of the cross-connect segment – Up or Down.
Peer-address	Peer address in aa IPv4 and IPv6 format.
Gifindex	Number of gif index on which RSVP is active.
Control Channel	Control Channel status and configuration.
Refresh Reduction usage	Measure of processing over head requests of refresh messages.
Message Acknowledgment	The router that initiates the acknowledgment messages for an RSVP session.
Bundle Buffer size	Number of bundle buffer size.
Current Epoch Value	Value of the database epoch and number of entries in the epoch.
Primary IPv4 address	Primary IPv4 address of the neighbor interface.
Primary IPv6 address	Primary IPv6 address of the neighbor interface.
Configured Refresh Time	Time refresher which takes to generate periodic RSVP messages.
Configured Keep Multiplier	Number of RSVP messages that can be lost before an RSVP state is declared stale.
Acknowledgment Await Timeout	The router that initiates the acknowledgment messages for an RSVP session waits for the timeout.
Hello Receipt	To exchange Hello messages among neighbors.
Hello Interval	Frequency at which RSVP hellos are sent on this interface (in seconds).
Hello Timeout	RSVP Hello State Timer feature detects when a neighbor is down and triggers faster state timeout.
Non IANA Hello exchange	Hello exchange state in the interface.

© 2025 IP Infusion Inc. Proprietary

show rsvp data-link

Use this command to display RSVP specific information for data links.

Command Syntax

```
show rsvp data-link
show rsvp data-link DLNAME
```

Parameters

DLNAME	Data link name

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh rsvp data-link
```

show rsvp graceful-restart

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Command Syntax

```
show rsvp graceful-restart
show rsvp graceful-restart A.B.C.D
```

Parameters

A.B.C.D	IPv4 address of a specific neighbor (optional).

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#show rsvp graceful-restart
Graceful Restart: Enabled
Advertised Restart Time: 180000 msec
Advertised Recovery Time: 360000 msec
Sending Recovery Time: Yes
Remote addr: 172.16.10.2 Local addr: 172.16.10.1
Nbr State: Normal Type: Reroute
Nbr Hello State: Up
LSPs protecting: 0
Restart Time: 0 msec, Recovery Time: 0 msec
Rest of Restart Time: 0 msec, Rest of Recovery Time: 0 msec
```

show rsvp interface

Use this command to display data about RSVP-specific information for interfaces, or about a specific interface.

Command Syntax

```
show rsvp interface
show rsvp interface IFNAME
```

Parameter

IFNAME	The name of the interface to display data.

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp interface eth0
Status                          : Enabled
Interface Index                 : 2
Refresh Reduction usage         : Enabled
Message Acknowledgement         : Disabled
Bundle Buffer size              : 65535
Current Epoch Value             : 208043005
Primary IPv4 address            : 10.10.23.1
Primary IPv6 address            : N/A
Interface Type                  : Ethernet
Administrative Group            : a
                                : d
Configured refresh time         : 5
Configured keep multiplier      : 3
Acknowledgement Await Timeout : 10
Hello Receipt                   : Disabled
Hello Interval                  : 2
Hello Timeout                   : 10
Non IANA Hello exchange         : Disabled
#
```

Table 7-6 explains the show command output fields.

Table 7-6: show rsvp interface output field

Field	Description
Status	Display the status of Resource Reservation Protocol (RSVP).
Interface Index	Number of interface index on which RSVP is active.
Refresh Reduction usage	Measure of processing over head requests of refresh messages.

Table 7-6: show rsvp interface output field

Field	**Description**
Message Acknowledgement	The router that initiates the acknowledgment messages for an RSVP session.
Bundle Buffer size	Number of bundle buffer size.
Current Epoch Value	Value of the database epoch and number of entries in the epoch.
Primary IPv4 address	Primary IPv4 address of the neighbor interface.
Primary IPv6 address	Primary IPv6 address of the neighbor interface.
Interface Type	Type of interface.
Administrative Group	The administrators who belong to the same administrative group.
Configured Refresh Time	Time refresher which takes to generate periodic RSVP messages.
Configured Keep Multiplier	Number of RSVP messages that can be lost before an RSVP state is declared stale.
Acknowledgment Await Timeout	The router that initiates the acknowledgment messages for an RSVP session waits for the timeout.
Hello Receipt	To exchange Hello messages among neighbors.
Hello Interval	Frequency at which RSVP hellos are sent on this interface (in seconds).
Hello Timeout	RSVP Hello State Timer feature detects when a neighbor is down and triggers faster state timeout.
Non IANA Hello exchange	Hello exchange state in the interface.

show rsvp l2-info

Use this command to display MAC and out interface details of a bypass tunnel which is used to send control messages of protected sessions over bypass tunnel when protected session is using backup.

Command Syntax

```
show rsvp l2-info
```

Parameters

None

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp l2-info
============================================================
## Bypass ftn l2 info ##
Ftn IX: 1
Out label: 52521 Out if 100022
src addr:(34ef.b63d.57a9)
Dst addr:(34ef.b694.3e08)
============================================================
============================================================
## Bypass ftn l2 info ##
Ftn IX: 2
Out label: 3 Out if 100022
src addr:(34ef.b63d.57a9)
Dst addr:(34ef.b694.3e08)
============================================================
```

show rsvp local-addresses

Use this command to display data about any configured RSVP local address, including either IPv4 or IPv6 addresses.

Command Syntax

```
show rsvp local-addresses
show rsvp local-addresses ipv4
show rsvp local-addresses ipv6
```

Parameters

ipv4	Use this parameter to display IPv4 local addresses.
ipv6	Use this parameter to display IPv6 local addresses.

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp local-addresses
IPv4 Addresses:
 Address                      Interface
 4.4.4.40                     lo
 10.1.2.40                    eth0
 14.14.14.8                   eth4
 34.0.0.40                    eth2
 80.0.0.40                    eth2
 127.0.0.1                    lo
IPv6 Addresses:
 Address                      Interface
 ::1                          lo
 fe80::202:b3ff:fed5:8dbb     eth4
 fe80::202:b3ff:fed5:9842     eth2
 fe80::20e:cff:fe83:3727      eth0
#
```

Table 7-7 explains the show command output fields.

Table 7-7: show rsvp local-addresses output field

Field	Description
IPv4 Addresses	IPv4 address for the interface.
IPv6 Addresses	IPv6 address for the interface.
Address	Address for the interface.
Interface	Name of the interface.

© 2025 IP Infusion Inc. Proprietary

show rsvp neighbor

Use this command to display a list of IPv4 RSVP neighbors or just a single IPv4 RSVP neighbor.

Command Syntax

```
show rsvp neighbor
show rsvp neighbor A.B.C.D
```

Parameters

`A.B.C.D`	Use this parameter to display the IP address of the IPv4 RSVP neighbor.

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp neighbor
IP Address          UpStrm LSP DnStrm LSP RefreshReduc Srefresh In  Type
10.10.20.4          0          1          Enabled      5s           Implicit
10.10.23.2          0          1          Enabled      8s           Implicit
#
```

Table 7-8 explains the show command output fields.

Table 7-8: show rsvp neighbor output field

Field	Description
IP Address	Address for the interface.
UpStrm LSP	Specify the upstream label for the bidirectional label-switched path (LSP).
DnStrm LSP	Specify the dnstream label for the bidirectional label-switched path (LSP).
Refresh Reduc	Refresh reduction improves the scalability, latency, and reliability of Resource Reservation Protocol (RSVP) signaling to enhance network performance and message delivery.
Srefresh In	Remaining seconds for srefresh timer expiry.
Type	Type of neighbor interface.

show rsvp nexthop-cache

Use this command to display the current nexthops being cached by RSVP.

Command Syntax

```
show rsvp nexthop-cache
```

Parameters

None

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp nexthop-cache
Prefix              Nexthop          Outgoing Intf  Valid For   Num Sessions
10.10.20.80/32      0.0.0.0          eth1           12 seconds  1
10.10.23.60/32      0.0.0.0          eth0           17 seconds  1
#
```

Table 7-9 explains the show command output fields.

Table 7-9: show rsvp nexthop-cache output field

Field	Description
Prefix	It is an ordered list and entries are evaluated in order of increasing sequence number.
Nexthop	IP address of the next hop.
Outgoing Intf	Short name of the physical interface through which traffic goes to the protected link.
Valid For	Frequency at which RSVP hellos are sent next hop on this interface (in seconds).
Num Sessions	Number of session in the interface.

show rsvp path

Use this command to display the configured rsvp paths and their configured hops. Specify the pathname to show hops related to a specific path. If no pathname is specified all the rsvp paths are displayed.

Command Syntax

```
show rsvp path
show rsvp path PATHNAME
```

Parameter

PATHNAME	The name of a specific path.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Following are sample outputs from this command, with and without a PATHNAME (PRI) specified.

```
#show rsvp path
Path name: PRI, id: 1
 10.10.11.51 strict
 10.10.12.50 strict
 10.10.13.51 strict

Path name: SEC, id: 2
 10.10.10.51 strict

Path name: loop, id: 3
 10.10.11.51 strict
 10.10.12.50 strict
 10.10.13.51 strict
 10.10.14.50 strict
#

#show rsvp path PRI
Path name: PRI, id: 1
 10.10.11.51 strict

#
```

Table 7-10 explains the show command output fields.

Table 7-10: show rsvp path output field

Field	Description
Path name	Name of the path.
id	Address of the rsvp path.

show rsvp protected-lsp-reop-list

Use this command to display list of facility protected sessions which didn't get any bypass protection or didn't get a perfect bypass protection. These sessions are checked for better protection whenever a new bypass session comes up.

Command Syntax

```
show rsvp protected-lst-reop-list
```

Parameters

None

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp protected-lsp-reop-list
Tunnel-id  Lsp-Id     Lsp-Name                            Role       Ext_tnl_id       Ingress          Egress           Protected
222       169        LHR_t222                            Transit    172.31.53.18     172.31.53.18     172.31.2.52      Yes
204       1522       LHR_t204                            Transit    172.31.53.18     172.31.53.18     172.31.33.120    Yes
17         52608      GGN_NDLS_2ND_LOOSE::to_CISCO_2ND_LOOSE
                                                            Transit    172.31.33.120    172.31.33.120    172.31.53.18     Yes
```

show rsvp session

Use this command to display session-related information for configured LSPs.

Command Syntax

```
show rsvp session
show rsvp session up
show rsvp session up detail
show rsvp session down
show rsvp session down detail
```

Parameters

up	Use this parameter to display sessions that are currently operational.
down	Use this parameter to display sessions that are currently not operational.
detail	Use this parameter to display detailed session-related information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Following is a sample output from the command using the detail parameter.

```
#show rsvp session detail
Ingress (Primary)
10.10.21.3
  From: 1.1.1.1, LSPstate: Up, LSPname: t1

Table 7-11 explains the show command output fields.

Table 7-11: show rsvp session output field

Field	Description
Ingress (Primary)	Information about ingress RSVP sessions. Each session has one line of output.
From	Source (ingress switch) of the session.
LSP state	State of the LSP that is being handled by this RSVP session. It can be either Up, Dn (down), or Admin Dn. Admin Dn indicates that the LSP is being taken down gracefully.
LSPname	Name of the LSP.
Setup priority	Value of the setup priority.
Hold priority	Determines the degree to which an LSP holds onto its session reservation after the LSP has been set up successfully.
CSPF usage	CSPF usage state in the rsvp session.
LSP Protection	Protects the traffic failures.
Label in	Incoming label for this LSP.
Label out	Outgoing label for this LSP.
Tspec rate	Sender's traffic specification, which describes the sender's traffic parameters.
Fspec rate	Fspec peak rate values.
Tunnel id	Tunnel address (destination port) for the session.
LSP id	Address of the LSP in the interface.
Ext-Tunnel Id	Session address for the ext-tunnel.
Down stream	Specify the dnstream label for the bidirectional label-switched path (LSP).
Path refresh	Path messages are sent periodically to refresh path states. The refresh interval is controlled by a variable called the refresh time.
Resv lifetime	Number of seconds remaining in the lifetime of the reservation.
Retry count	Number of times sanity polling periodically checks for an error condition in the FPC.
intrvl	Interval sets the time for the messages in order to control the session.
LSP Type	Type of ELSP signal.

show rsvp session count

Use this command to display session-related information for configured LSPs.

Command Syntax

```
show rsvp session count
show rsvp session count egress
show rsvp session count ingress
show rsvp session count transit
```

Parameters

`egress`	Use this parameter to display the number of configured egress sessions.
`ingress`	Use this parameter to display the number of configured ingress sessions.
`transit`	Use this parameter to display the number of configured transmit sessions.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp session count
Total configured: 1520, Up 1520, Down 0
#
```

Table 7-12 explains the show command output fields.

Table 7-12: show rsvp session count output field

Field	Description
Total configured	Number of configured rsvp session in the interface.

show rsvp session egress

Use this command to display session-related information for an egress router.

Command Syntax

```
show rsvp session egress
show rsvp session egress A.B.C.D
show rsvp session egress X:X::X:X
show rsvp session egress detail
show rsvp session egress down
show rsvp session egress down detail
show rsvp session egress up
show rsvp session egress up detail
```

Parameters

A.B.C.D	Use this parameter to display an IPv4 address of an egress router
X:X::X:X	Use this parameter to display an IPv6 address of an egress router
down	Use this parameter to display sessions that are currently not operational
up	Use this parameter to display sessions that are currently operational
detail	Use this parameter to display detailed session-related information

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show rsvp session egress without parameters or with "up" or "down":

Table 7-13 explains the show command output fields.

Table 7-13: show rsvp session egress output field

Field	Description
LSP state	State of the LSP that is being handled by this RSVP session. It can be either Up, Dn (down), or Admin Dn. Admin Dn indicates that the LSP is being taken down gracefully.
LSP name	Name of the LSP.
CSPF usage	CSPF usage state in the rsvp session.
CSPF Retry Count	Number of times CSPF tried to find the path.
CSPF Retry Interval	The interval at which CSPF retry to find the path.
IGP-Shortcut	Status of IGP shortcut for the RSVP trunk.
LSP metric	Relative/Absolute metric value of the LSP.
LSP Protection	LSP Protection configured for the RSVP trunk.
Bypass trunk	Name for the configured Bypass trunk.
Tspec rate	Sender's traffic specification, which describes the sender's traffic parameters.
Fspec rate	Fspec peak rate values.
Policer	QoS Policy configured for the RSVP trunk.
Tunnel Id	Tunnel identifier (destination port) for the RSVP session.
LSP Id	Address of the LSP in the interface.
Ext-Tunnel Id	Ext Tunnel identifier (destination port) for the RSVP session.
Down stream	Specify the dn stream label for the bidirectional label-switched path (LSP).
Upstream	Address of the previous hop for the egress session.
Path refresh	Path messages are sent periodically to refresh path states. The refresh interval is controlled by a variable called the refresh time.
Path lifetime	Number of seconds remaining in the lifetime of the reservation.
Resv refresh	Remaining time in seconds for the next Resv refresh.
Resv lifetime	Number of seconds remaining in the lifetime of the reservation.
Retry count	Number of times sanity polling periodically checks for an error condition in the FPC.
intrvl	Interval sets the time for the messages in order to control the session.
next retry in	Remaining time in seconds for the next retry.
RRO re-use as ERO	Enabling to re-use Record route as Explicit route for rsvp session.
Label Recording	Enabling to record the labels exchanged by all the peers.
FRR Admin Groups/Admin Groups	Resource affinities associated with the rsvp session.

Table 7-13: show rsvp session egress output field

Field	Description
Exclude path detail	Detailed List of the link addresses to be excluded for RSVP Bypass session.
Exclude Link	Address of the Link to be excluded for RSVP Bypass session.
Configured Path	Configured path name associated with the rsvp session.
Record route	Established rsvp path with each hop information.
Style	Reservation style associated with the rsvp session.
Traffic type	Traffic type associated with the rsvp session.
Minimum Path MTU	Path maximum transmission unit (MTU) discovery in the interface.
LSP Type	Type of ELSP signal.
CLASS	Name of the class which is associated with rsvp session.
DSCP_value	DSCP value of diff-serv class which is associated with rsvp session.
EXP_value	EXP value of diff-serv class which is associated with rsvp sess
DSTE Class Type Number	Diff-serv class type number associated with rsvp session.
Class Type name	Diff-serv class type name associated with rsvp session.
Last Recorded Error Code	The last recorded error code for the RSVP session.
Last Recorded Error Value	The last recorded error for the RSVP session.
Node where Last Recorded Error originated	Error originated node in the rsvp session.
Trunk Type	Trunk type in the rsvp session.
Tesid	Traffic Engineering Service Instance Identifier
Merge Point Adderss	Address of the node where the Bypass LSP joins with the protected LSP.

show rsvp session ingress

Use this command to display session-related information for an ingress router.

Command Syntax

```
show rsvp session ingress
show rsvp session ingress A.B.C.D
show rsvp session ingress X:X::X:X
show rsvp session ingress detail
show rsvp session ingress down
show rsvp session ingress down detail
show rsvp session ingress up
show rsvp session ingress up detail
```

Parameters

`A.B.C.D`	Use this parameter to display an IPv4 address of an ingress router
`X:X::X:X`	Use this parameter to display an IPv6 address of an ingress router.
`down`	Use this parameter to display sessions that are currently not operational
`up`	Use this parameter to display sessions that are currently operational
`detail`	Use this parameter to display detailed session-related information

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

`#show rsvp session ingress` (without parameters or with `up` or `down`:)

```
%s RSVP:

Table 7-14 explains the show command output fields.

Table 7-14: show rsvp session ingress output field

Field	Description
LSP state	State of the LSP that is being handled by this RSVP session. It can be either Up, Dn (down), or Admin Dn. Admin Dn indicates that the LSP is being taken down gracefully.
LSP name	Name of the LSP.
CSPF usage	CSPF usage state in the rsvp session.
CSPF Retry Count	Number of times CSPF tried to find the path.
CSPF Retry Interval	The interval at which CSPF retry to find the path.
IGP-Shortcut	Status of IGP shortcut for the RSVP trunk.
LSP metric	Relative/Absolute metric value of the LSP.
LSP Protection	LSP Protection configured for the RSVP trunk.
Bypass trunk	Name for the configured Bypass trunk.
Tspec rate	Sender's traffic specification, which describes the sender's traffic parameters.
Fspec rate	Fspec peak rate values.
Policer	QoS Policy configured for the RSVP trunk.
Tunnel Id	Tunnel identifier (destination port) for the RSVP session.
LSP Id	Address of the LSP in the interface.
Ext-Tunnel Id	Ext Tunnel identifier (destination port) for the RSVP session.
Down stream	Specify the dn stream label for the bidirectional label-switched path (LSP).

Table 7-14: show rsvp session ingress output field

Field	Description
Upstream	Address of the previous hop for the egress session.
Path refresh	Path messages are sent periodically to refresh path states. The refresh interval is controlled by a variable called the refresh time.
Path lifetime	Number of seconds remaining in the lifetime of the reservation.
Resv refresh	Remaining time in seconds for the next Resv refresh.
Resv lifetime	Number of seconds remaining in the lifetime of the reservation.
Retry count	Number of times sanity polling periodically checks for an error condition in the FPC.
intrvl	Interval sets the time for the messages in order to control the session.
next retry in	Remaining time in seconds for the next retry.
RRO re-use as ERO	Enabling to re-use Record route as Explicit route for rsvp session.
Label Recording	Enabling to record the labels exchanged by all the peers.
FRR Admin Groups/Admin Groups	Resource affinities associated with the rsvp session.
Exclude path detail	Detailed List of the link addresses to be excluded for RSVP Bypass session.
Exclude Link	Address of the Link to be excluded for RSVP Bypass session.
Configured Path	Configured path name associated with the rsvp session.
Record route	Established rsvp path with each hop information.
Style	Reservation style associated with the rsvp session.
Traffic type	Traffic type associated with the rsvp session.
Minimum Path MTU	Path maximum transmission unit (MTU) discovery in the interface.
LSP Type	Type of ELSP signal.
CLASS	Name of the class which is associated with rsvp session.
DSCP_value	DSCP value of diff-serv class which is associated with rsvp session.
EXP_value	EXP value of diff-serv class which is associated with rsvp sess
DSTE Class Type Number	Diff-serv class type number associated with rsvp session.
Class Type name	Diff-serv class type name associated with rsvp session.
Last Recorded Error Code	The last recorded error code for the RSVP session.
Last Recorded Error Value	The last recorded error for the RSVP session.
Node where Last Recorded Error originated	Error originated node in the rsvp session.

Table 7-14: show rsvp session ingress output field

Field	Description
Trunk Type	Trunk type in the rsvp session.
Tesid	Traffic Engineering Service Instance Identifier.
Merge Point Adderss	Address of the node where the Bypass LSP joins with the protected LSP.

show rsvp session LSP-NAME

Use this command to display information only for sessions with a specified name.

Note: This command doesn't work for sessions with tunnel name larger than 32 characters or sessions originated from non-OcNOS solutions.

Command Syntax

```
show rsvp session LSP-NAME
show rsvp session LSP-NAME primary
show rsvp session LSP-NAME secondary
```

Parameters

`primary`	Use this parameter to display any primary LSP sessions
`secondary`	Use this parameter to display any secondary LSP sessions

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Usage

Following is a sample output from the command displaying session information about the LSP named `t1`.

```
#show rsvp session t1
Ingress (Primary)
192.168.0.90
  From: 192.168.0.63, LSPstate: Up, LSPname: t1
  Setup priority: 7, Hold priority: 0
  CSPF usage: Disabled, CSPF Retry Count: 0, CSPF Retry Interval: 30 seconds
  Label in: -,  Label out: 17,
  Tspec rate: 0
  Tunnel Id: 1, LSP Id: 1, Ext-Tunnel Id: 192.168.0.63
  Downstream: 10.10.23.60, eth0
  Path refresh: 30 seconds (due in 34 seconds)
  Resv lifetime 157 seconds (due in 155 seconds)
  Retry Count: 0, Retry Interval: 30 seconds
  RRO re-use as ERO: Enabled
  Labels Recording: Disabled
  Admin Groups: include-any -->  0(a)
  Configured Path: p1 (in use)
  Configured Explicit Route Detail :
   10.10.23.60/32 loose
  Session Explicit Route Detail :
   10.10.23.60/32 loose
   10.10.21.90/32 loose
  Record route: <self> 10.10.23.60 10.10.21.90
  Style: Shared Explicit Filter
  Traffic type: controlled-load
  Minimum Path MTU: 1500
  Last Recorded Error Code: None
```

```
    Last Recorded Error Value: None
#
```

Table 7-15 explains the show command output fields.

Table 7-15: show rsvp session LSP-NAME output field

Field	Description
Ingress (Primary)	Information about ingress RSVP sessions. Each session has one line of output.
From	Source (ingress switch) of the session.
LSP state	State of the LSP that is being handled by this RSVP session. It can be either Up, Dn (down), or Admin Dn. Admin Dn indicates that the LSP is being taken down gracefully.
LSPname	Name of the LSP.
Setup priority	Value of the setup priority.
Hold priority	Determines the degree to which an LSP holds onto its session reservation after the LSP has been set up successfully.

show rsvp session transit

Use this command to display session-related information for the transit or intermediate router.

Command Syntax

```
show rsvp session transit
show rsvp session transit detail
show rsvp session transit up
show rsvp session transit down
show rsvp session transit up detail
show rsvp session transit down detail
```

Parameters

`up`	Use this parameter to display sessions that are operational
`down`	Use this parameter to display sessions that are not operational
`detail`	Use this parameter to display detailed session-related information

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Following are sample outputs from the command displaying detailed session information for the transit router.

```
#show rsvp session transit detail
Transit (Primary)
10.10.21.3
  From: 1.1.1.1, LSPstate: Up, LSPname: t1
  Setup priority: 5, Hold priority: 5
  LSP Protection: None
  Label in: 16,  Label out: 3,
  Tspec rate: 10m, Fspec rate: 10m
  Tunnel Id: 1, LSP Id: 2, Ext-Tunnel Id: 1.1.1.1
  Downstream: 10.10.21.3, eth1   Upstream: 10.10.23.1, eth3
  Path refresh: 5 seconds (due in 6155 seconds)
  Path lifetime: 26 seconds (due in 25 seconds)
  Resv refresh: 5 seconds (due in 2533 seconds)
  Resv lifetime: 26 seconds (due in 25 seconds)
  RRO re-use as ERO: Disabled
  Label Recording: Disabled
  Admin Groups:   Received Explicit Route Detail :
   10.10.23.2/32 strict
  Record route: 10.10.23.1 <self> 10.10.21.3
  Style: Shared Explicit Filter
  Traffic type: controlled-load
  Minimum Path MTU: 1500
  LSP Type:  ELSP_SIGNAL
  CLASS    DSCP_value     EXP_value
```

```
    af43      100110          7
    DSTE Class Type Number: 0, Class Type name: default
  #
```

Table 7-16 explains the show command output fields.

Table 7-16: show rsvp session transit output field

Field	Description
Transit (Primary)	Transit RSVP sessions information in the interface.
From	Source (ingress switch) of the session.
LSP state	State of the LSP that is being handled by this RSVP session. It can be either Up, Dn (down), or Admin Dn. Admin Dn indicates that the LSP is being taken down gracefully.
LSP name	Name of the LSP.
Setup priority	Value of the setup priority.
Hold priority	Determines the degree to which an LSP holds onto its session reservation after the LSP has been set up successfully.
LSP Protection	Protects the traffic failures.
Label in	Incoming label for this LSP.
Label out	Outgoing label for this LSP.
Tspec rate	Sender's traffic specification, which describes the sender's traffic parameters.
Fspec rate	Fspec peak rate values.
Tunnel id	Tunnel address (destination port) for the session.
LSP id	Address of the LSP in the interface.
Ext-Tunnel Id	Session address for the ext-tunnel.
Down stream	Specify the dnstream label for the bidirectional label-switched path (LSP).
Path refresh	Path messages are sent periodically to refresh path states. The refresh interval is controlled by a variable called the refresh time.
Resv lifetime	Number of seconds remaining in the lifetime of the reservation.
RRO re-use as ERO	Enabling to re-use Record route as Explicit route for rsvp session.
Label Recording	Enabling to record the labels exchanged by all the peers.
Admin Groups	Resource affinities associated with the rsvp session.
Configured Explicit Route Detail	Configured path name associated with the rsvp session.

Table 7-16: show rsvp session transit output field

Field	Description
Record route	Recorded route for the session, taken from the record route object. Normally this value will be the same as that of explct route. Differences indicate that path rerouting has occurred, typically during fast reroute.
Style	Reservation style associated with the rsvp session.
Traffic type	Traffic type associated with the rsvp session.
Minimum Path MTU	Path maximum transmission unit (MTU) discovery in the interface.
LSP Type	Type of LSP for Diffserv services(E-LSP or L-LSP).
CLASS	Name of the class which is associated with rsvp session.
DSCP_value	DSCP value of diff-serv class which is associated with rsvp session.
EXP_value	EXP value of diff-serv class which is associated with rsvp session.
DSTE Class Type Number	Diff-serv class type number associated with rsvp session.
Class Type name	Diff-serv class type name associated with rsvp session.

show rsvp statistics

Use this command to display overall statistics of different type of RSVP control messages sent and received in a node.

Command Syntax

```
show rsvp statistics
```

Parameters

None

Command Mode

```
Exec and Privileged Exec modes
```

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp statistics
  PacketType              Total
                 Sent       Received
  Path            627          501
  PathErr           0           24
  PathTear          1           27
  Resv FF          30            9
  Resv WF           0            0
  Resv SE         646          583
  Resv Err          0            0
  ResvTear          0            0
  ResvConf          0            0
  Hello        330604       334461
  Bundle         1006          866
  Ack              50           14
  SRefresh      34348        32424
  Notify            0            0
```

show rsvp summary-refresh

Use this command to display RSVP summary refresh data.

Command Syntax

```
show rsvp summary-refresh
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp summary-refresh:
Neighbor Addr       Tunnel ID  LSP ID     Ingress              Egress
```

Table 7-17 explains the show command output fields.

Table 7-17: show rsvp trunk output field

Field	Description
Neighbor Addr	Neighbor address on the primary address of the interface.
Tunnel ID	Tunnel identifier (destination port) for the RSVP session.
LSP ID	Address of the LSP in the interface.
Ingress	Information about ingress RSVP sessions.
Egress	Information about egress RSVP sessions.

show rsvp trunk

Use this command to display information for a specific trunk or for all trunks.

Command Syntax

```
show rsvp trunk
show rsvp trunk NAME
show rsvp trunk detail
```

Parameters

NAME	Enter the name of a trunk
detail	Use this parameter to display detailed information for all trunks

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp trunk
Trunk Name       Trunk ID  Type        # Sess        Egress Address(es)
T1               101       P2P              1        4.4.4.4
T2               102       P2P              2        5.5.5.5
Total trunks configured: 3.
#
```

Following is a sample output from the command using the detail parameter.

```
#show rsvp trunk detail
Trunk name: T1, tunnel-id: 101
 Type: P2P
 Ext-tunnel-id: 1.1.1.1/32
 Egress: 4.4.4.4/32
 # of LSPs in trunk: 1
 Mapped-routes: none

Trunk name: T2, tunnel-id: 102
 Type: P2P
 Ext-tunnel-id: 1.1.1.1/32
 Egress: 5.5.5.5/32
 # of LSPs in trunk: 2
 Mapped-routes: none
```

Table 7-18 explains the show command output fields.

Table 7-18: show rsvp trunk output field

Field	Description
Trunk Name	Name of the trunk.
Trunk ID	Session address for the trunk.
Type	Trunk type in the rsvp session.
Sess	Number of sessions associated with rsvp trunk.
Egress	Information about egress RSVP sessions.
Total trunks configured	Number of configured trunk in the rsvp session.
Ext-tunnel-id	Extended Tunnel identifier (destination port) for the RSVP session.
Mapped-routes	Map the route of the interface.

show rsvp trunk multi-sec-detail

Use this command to display secondary priority details specific to a trunk or for all trunks

Command Syntax

```
show rsvp trunk multi-sec-detail
show rsvp trunk NAME multi-sec-detail
```

Parameters

NAME	Enter the name of a trunk

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
# show rsvp trunk multi-sec-detail
Ingress (Secondary-Priority1)
5.5.5.5
  From: 6.6.6.6, LSPstate: Dn, LSPname: t2-Secondary-Priority-1
  Ingress FSM state: Idle
  Setup priority: 7, Hold priority: 0
  CSPF usage: Enabled, CSPF Retry Count: 0, CSPF Retry Interval: 30 seconds
  LSP Re-Optimization: Disabled, Re-Optimization Timer: NA
  IGP-Shortcut: Disabled, LSP metric: 65
  LSP Protection: None
  Label in: -,  Label out: -,
  Tspec rate: 0, Fspec rate: 0
  Policer: Not Configured
  Tunnel Id: 5001, LSP Id: 2206, Ext-Tunnel Id: 6.6.6.6
  Last Recorded Error Code: Routing Problem (24)
  Last Recorded Error Value: No route available toward destination (5)
  Node where Last Recorded Error originated: None
  Trunk Type: mpls
Ingress (Secondary-Priority3)
5.5.5.5
  From: 6.6.6.6, LSPstate: Dn, LSPname: t2-Secondary-Priority-3
  Ingress FSM state: Idle
  Setup priority: 7, Hold priority: 0
  CSPF usage: Enabled, CSPF Retry Count: 0, CSPF Retry Interval: 30 seconds
  LSP Re-Optimization: Disabled, Re-Optimization Timer: NA
  IGP-Shortcut: Disabled, LSP metric: 65
  LSP Protection: None
  Label in: -,  Label out: -,
  Tspec rate: 0, Fspec rate: 0
  Policer: Not Configured
  Tunnel Id: 5001, LSP Id: 2206, Ext-Tunnel Id: 6.6.6.6
  Last Recorded Error Code: Routing Problem (24)
  Last Recorded Error Value: No route available toward destination (5)
  Node where Last Recorded Error originated: None
  Trunk Type: mpls
```

show rsvp version

Use this command to display the version of the RSVP daemon. Current RSVP version is 1.

Command Syntax

```
show rsvp version
```

Parameters

None

Command Mode

Exec and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
   RSVP protocol       = Enabled
   R(refresh timer)    = 30 seconds
   K(keep multiplier) = 3
   Preemption          = Normal
#
```

Table 7-19 explains the show command output fields.

Table 7-19: show rsvp version output field

Field	Description
Resource Reservation Protocol	RSVP software version.
RSVP protocol	Status of RSVP.
R (refresh timer)	Configured time interval used to generate periodic RSVP messages.
K (keep multiplier)	Number of RSVP messages that can be lost before an RSVP state is declared stale.
Preemption	Currently configured preemption capability.
