CONTENTS

PREFACE

About this Guide

This guide describes how to configure System Management in OcNOS.

IP Maestro Support

Monitor devices running OcNOS Release 6.3.4-70 and above using IP Maestro software.

Audience

This guide is intended for network administrators and other engineering professionals who configure OcNOS.

Conventions

The Table 1 table shows the conventions used in this guide.

Table 1. Conventions

Convention	Description
Italics	Emphasized terms; titles of books
 **Note:**	Special instructions, suggestions, or warnings
`monospaced type`	Code elements such as commands, parameters, files, and directories

Chapter Organization

The chapters in command references are organized as described in Command Description Format (page 139).

The chapters in configuration guides are organized into these major sections:

- An overview that explains a configuration in words
- Topology with a diagram that shows the devices and connections used in the configuration
- Configuration steps in a table for each device where the left-hand side shows the commands you enter and the right-hand side explains the actions that the commands perform
- Validation which shows commands and their output that verify the configuration

Related Documentation

For information about installing OcNOS, see the *Installation Guide* for your platform.

Feature Availability

The features described in this document that are available depend upon the OcNOS SKU that you purchased. See the *Feature Matrix* for a description of the OcNOS SKUs.

Migration Guide

Check the *Migration Guide* for configuration changes to make when migrating from one version of OcNOS to another.

Support

For support-related questions, contact support@ipinfusion.com.

Comments

If you have comments, or need to report a problem with the content, contact techpubs@ipinfusion.com.

Command Line Interface

This chapter introduces the OcNOS Command Line Interface (CLI) and how to use its features.

Command Line Interface Help

You access the CLI help by entering a full or partial command string and a question mark “?”. The CLI displays the command keywords or parameters along with a short description. For example, at the CLI command prompt, type:

```
> show ?
```

The CLI displays this keyword list with short descriptions for each keyword:

```
show ?
  application-priority            Application Priority
  arp                             Internet Protocol (IP)
  bfd                             Bidirectional Forwarding Detection (BFD)
  bgp                             Border Gateway Protocol (BGP)
  bi-lsp                          Bi-directional lsp status and configuration
  bridge                          Bridge group commands
  ce-vlan                         COS Preservation for Customer Edge VLAN
  class-map                       Class map entry
  cli                             Show CLI tree of current mode
  clns                            Connectionless-Mode Network Service (CLNS)
  control-adjacency               Control Adjacency status and configuration
  control-channel                 Control Channel status and configuration
  cspf                            CSPF Information
  customer                        Display Customer spanning-tree
  cvlan                           Display CVLAN information
  debugging                       Debugging functions
  etherchannel                    LACP etherchannel
  ethernet                        Layer-2
...
```

If you type the ? in the middle of a keyword, the CLI displays help for that keyword only.

```
> show de?
debugging  Debugging functions
```

If you type the ? in the middle of a keyword, but the incomplete keyword matches several other keywords, OcNOS displays help for all matching keywords.

```
> show i? (CLI does not display the question mark).
interface  Interface status and configuration
ip         IP information
isis       ISIS information
```

Command Completion

The CLI can complete the spelling of a command or a parameter. Begin typing the command or parameter and then press the tab key. For example, at the CLI command prompt type **sh**:

```
> sh
```

Press the tab key. The CLI displays:

```
> show
```

If the spelling of a command or parameter is ambiguous, the CLI displays the choices that match the abbreviation. Type **show i** and press the tab key. The CLI displays:

```
> show i
  interface  ip         ipv6       isis
> show i
```

The CLI displays the **interface** and **ip** keywords. Type **n** to select **interface** and press the tab key. The CLI displays:

```
> show in
> show interface
```

Type ? and the CLI displays the list of parameters for the **show interface** command.

```
> show interface
  IFNAME  Interface name
  |       Output modifiers
  >       Output redirection
  <cr>
```

The CLI displays the only parameter associated with this command, the **IFNAME** parameter.

Command Abbreviations

The CLI accepts abbreviations that uniquely identify a keyword in commands. For example:

```
> sh int xe0
```

is an abbreviation for:

```
> show interface xe0
```

Command Line Errors

Any unknown spelling causes the CLI to display the error **Unrecognized command** in response to the ?. The CLI displays the command again as last entered.

```
> show dd?
```

```
% Unrecognized command
> show dd
```

When you press the Enter key after typing an invalid command, the CLI displays:

```
(config)#router ospf here
                        ^
% Invalid input detected at '^' marker.
```

where the ^ points to the first character in error in the command.

If a command is incomplete, the CLI displays the following message:

```
> show
% Incomplete command.
```

Some commands are too long for the display line and can wrap mid-parameter or mid-keyword, as shown below. This does *not* cause an error and the command performs as expected:

```
area 10.10.0.18 virtual-link 10.10.0.19 authentication-key 57393
```

Command Negation

Many commands have a **no** form that resets a feature to its default value or disables the feature. For example:

- The **ip address** command assigns an IPv4 address to an interface
- The **no ip address** command removes an IPv4 address from an interface

Syntax Conventions

Table 2 describes the conventions used to represent command syntax in this reference.

Table 2. Syntax conventions

Convention	Description	Example
monospaced font	Command strings entered on a command line	**show ip ospf**
lowercase	Keywords that you enter exactly as shown in the command syntax.	show ip ospf
UPPERCASE	See Variable Placeholders (page 138)	IFNAME
()	Optional parameters, from which you must select one. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	(A.B.C.D|<0-4294967295>)
()	Optional parameters, from which you select one or none. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	(A.B.C.D|<0-4294967295>|)
()	Optional parameter which you can specify or omit. Do not enter the parentheses or vertical bar as part of the command.	(IFNAME|)

Table 2. Syntax conventions (continued)

Convention	Description	Example
`{}`	Optional parameters, from which you must select one or more. Vertical bars delimit the selections. Do not enter the braces or vertical bars as part of the command.	`{intra-area <1-255>|inter-area <1-255>|external <1-255>}`
`[]`	Optional parameters, from which you select zero or more. Vertical bars delimit the selections. Do not enter the brackets or vertical bars as part of the command.	`[<1-65535>|AA:NN|internet|local-AS| no-advertise|no-export]`
`?`	Nonrepeatable parameter. The parameter that follows a question mark can only appear once in a command string. Do not enter the question mark as part of the command.	`?route-map WORD`
`.`	Repeatable parameter. The parameter that follows a period can be repeated more than once. Do not enter the period as part of the command.	`set as-path prepend .<1-65535>`

Variable Placeholders

Table 3 shows the tokens used in command syntax use to represent variables for which you supply a value.

Table 3. Variable placeholders

Token	Description
`WORD`	A contiguous text string (excluding spaces)
`LINE`	A text string, including spaces; no other parameters can follow this parameter
`IFNAME`	Interface name whose format varies depending on the platform; examples are: **`eth0`**, **`Ethernet0`**, **`ethernet0`**, **`xe0`**
`A.B.C.D`	IPv4 address
`A.B.C.D/M`	IPv4 address and mask/prefix
`X:X::X:X`	IPv6 address
`X:X::X:X/M`	IPv6 address and mask/prefix
`HH:MM:SS`	Time format
`AA:NN`	BGP community value
`XX:XX:XX:XX:XX:XX`	MAC address

`<1-5>`
`<1-65535>`
`<0-2147483647>`
`<0-4294967295>`
	Numeric range

Command Description Format

The Table 4 table explains the sections used to describe each command in this reference.

Table 4. Command descriptions

Section	Description
Command Name	The name of the command, followed by what the command does and when should it be used
Command Syntax	The syntax of the command
Parameters	Parameters and options for the command
Default	The state before the command is executed
Command Mode	The mode in which the command runs; see Command Modes (page 142)
Example	An example of the command being executed

Keyboard Operations

The Table 5 table lists the operations you can perform from the keyboard.

Table 5. Keyboard operations

Key combination	Operation
Left arrow or Ctrl+b	Moves one character to the left. When a command extends beyond a single line, you can press left arrow or Ctrl+b repeatedly to scroll toward the beginning of the line, or you can press Ctrl+a to go directly to the beginning of the line.
Right arrow or Ctrl-f	Moves one character to the right. When a command extends beyond a single line, you can press right arrow or Ctrl+f repeatedly to scroll toward the end of the line, or you can press Ctrl+e to go directly to the end of the line.
Esc, b	Moves back one word
Esc, f	Moves forward one word
Ctrl+e	Moves to end of the line
Ctrl+a	Moves to the beginning of the line
Ctrl+u	Deletes the line
Ctrl+w	Deletes from the cursor to the previous whitespace
Alt+d	Deletes the current word
Ctrl+k	Deletes from the cursor to the end of line
Ctrl+y	Pastes text previously deleted with Ctrl+k, Alt+d, Ctrl+w, or Ctrl+u at the cursor
Ctrl+t	Transposes the current character with the previous character
Ctrl+c	Ignores the current line and redisplays the command prompt
Ctrl+z	Ends configuration mode and returns to exec mode
Ctrl+l	Clears the screen

Table 5. Keyboard operations (continued)

Key combination	Operation
Up Arrow or Ctrl+p	Scroll backward through command history
Down Arrow or Ctrl+n	Scroll forward through command history

Show Command Modifiers

You can use two tokens to modify the output of a **show** command. Enter a question mark to display these tokens:

```
# show users ?
  | Output modifiers
  > Output redirection
```

You can type the | (vertical bar character) to use output modifiers. For example:

```
> show rsvp | ?
  begin     Begin with the line that matches
  exclude   Exclude lines that match
  include   Include lines that match
  last      Last few lines
  redirect  Redirect output
```

Begin Modifier

The **begin** modifier displays the output beginning with the first line that contains the input string (everything typed after the **begin** keyword). For example:

```
# show running-config | begin xe1
...skipping
interface xe1
ipv6 address fe80::204:75ff:fee6:5393/64
!
interface xe2
ipv6 address fe80::20d:56ff:fe96:725a/64
!
line con 0
login
!
end
```

You can specify a regular expression after the **begin** keyword, This example begins the output at a line with either “xe2” or “xe4”:

```
# show running-config | begin xe[2-4]

...skipping
interface xe2
 shutdown
!
interface xe4
 shutdown
!
interface svlan0.1
 no shutdown
!
route-map myroute permit 2
!
route-map mymap1 permit 10
!
route-map rmap1 permit 2
```

```
!
line con 0
 login
line vty 0 4
 login
!
end
```

Include Modifier

The **include** modifier includes only those lines of output that contain the input string. In the output below, all lines containing the word “input” are included:

```
# show interface xe1 | include input
    input packets 80434552, bytes 2147483647, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1, missed 0
```

You can specify a regular expression after the **include** keyword. This examples includes all lines with “input” or “output”:

```
#show interface xe0 | include (in|out)put
    input packets 597058, bytes 338081476, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
    output packets 613147, bytes 126055987, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
```

Exclude Modifier

The **exclude** modifier excludes all lines of output that contain the input string. In the following output example, all lines containing the word “input” are excluded:

```
# show interface xe1 | exclude input
Interface xe1
  Scope: both
  Hardware is Ethernet, address is 0004.75e6.5393
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
  inet6 fe80::204:75ff:fee6:5393/64
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0
```

You can specify a regular expression after the **exclude** keyword. This example excludes lines with “output” or “input”:

```
show interface xe0 | exclude (in|out)put
Interface xe0
  Scope: both
  Hardware is Ethernet  Current HW addr: 001b.2139.6c4a
  Physical:001b.2139.6c4a  Logical:(not set)
  index 2 metric 1 mtu 1500 duplex-full arp ageing timeout 3000
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Bandwidth 100m
  DHCP client is disabled.
  inet 10.1.2.173/24 broadcast 10.1.2.255
  VRRP Master of :  VRRP is not configured on this interface.
  inet6 fe80::21b:21ff:fe39:6c4a/64
    collisions 0
```

Redirect Modifier

The **redirect** modifier writes the output into a file. The output is not displayed.

```
# show cli history | redirect /var/frame.txt
```

The output redirection token (>) does the same thing:

```
# show cli history >/var/frame.txt
```

Last Modifier

The **last** modifier displays the output of last few number of lines (As per the user input). The last number ranges from 1 to 9999.

For example:

```
#show running-config | last 10
```

String Parameters

The restrictions in Table 6 apply for all string parameters used in OcNOS commands, unless some other restrictions are noted for a particular command.

Table 6. String parameter restrictions

Restriction	Description
Input length	1965 characters or less
Restricted special characters	“?”, “,”, “>”, “|”, and “=” The “|” character is allowed only for the **description** command in interface mode.

Command Modes

Commands are grouped into modes arranged in a hierarchy. Each mode has its own set of commands. The table below lists the command modes common to all protocols.

Table 7. Common Command Modes

Name	Description
Execution mode	Also called *view* mode, this is the first mode to appear after you start the CLI. It is a base mode from where you can perform basic commands such as show, exit, quit, help, and enable.
Privileged execution mode	Also called *enable* mode, in this mode you can run additional basic commands such as debug, write, and show.
Configure mode	Also called *configure terminal* mode, in this mode you can run configuration commands and go into other modes such as interface, router, route map, key chain, and address family. Configure mode is single user. Only one user at a time can be in configure mode.

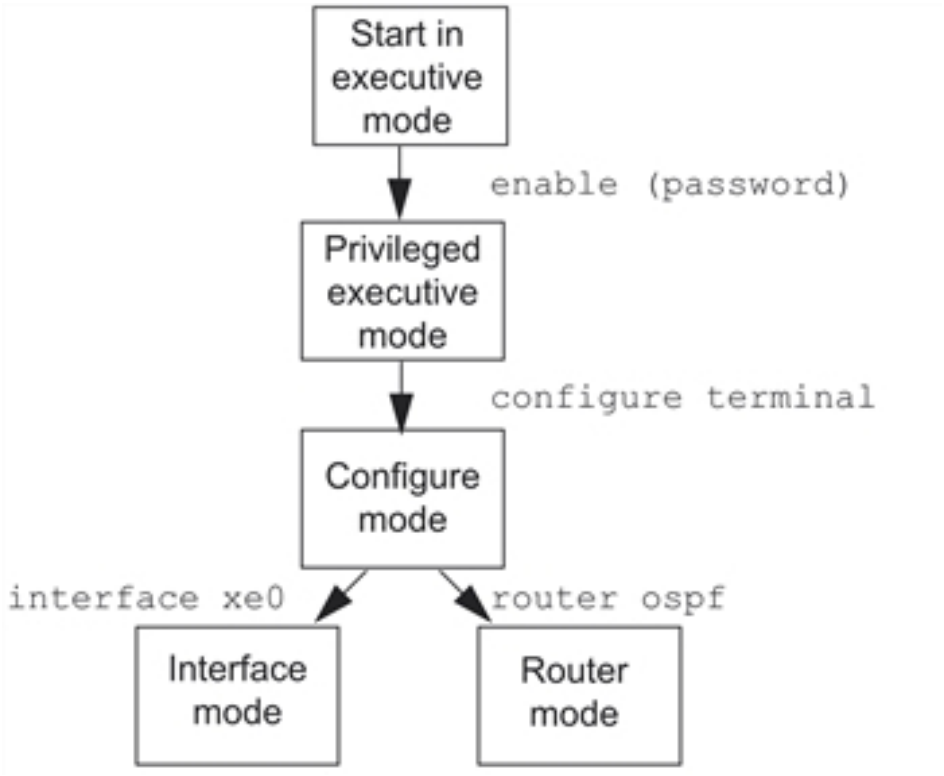
Table 7. Common Command Modes (continued)

Name	Description
Interface mode	In this mode you can configure protocol-specific settings for a particular interface. Any setting you configure in this mode overrides a setting configured in router mode.
Router mode	This mode is used to configure router-specific settings for a protocol such as BGP or OSPF.

Command Mode Tree

The diagram below shows the common command mode hierarchy.

Figure 1. Common command modes



To change modes:

1. Enter privileged executive mode by entering **`enable`** in Executive mode.
2. Enter configure mode by entering **`configure terminal`** in Privileged Executive mode.

The example below shows moving from executive mode to privileged executive mode to configure mode and finally to router mode:

```
> enable mypassword
# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)# router ospf
(config-router)#
```

Note: Each protocol can have modes in addition to the common command modes. See the command reference for the respective protocol for details.

Transaction-based Command-line Interface

The OcNOS command line interface is transaction based:

- Any changes done in configure mode are stored in a separate *candidate* configuration that you can view with the command.
- When a configuration is complete, apply the candidate configuration to the running configuration with the command.
- If a fails, no configuration is applied as the entire transaction is considered failed. You can continue to change the candidate configuration and then retry the .
- Discard the candidate configuration with the `abort transaction` command.
- Check the last aborted transaction with the `show transaction last-aborted` command.
- Multiple configurations cannot be removed with a single . You must remove each configuration followed by a commit.

Note: All commands MUST be executed only in the default CML shell (**`cmlsh`**). If you log in as root and start **`imish`**, then the system configurations will go out of sync. The **`imish`** shell is not supported and should not be started manually.

AUTHENTICATION MANAGEMENT CONFIGURATION

AAA Configuration for Console Connection

Overview

OcNOS uses the Accounting, Authentication, Authorization (AAA) protocol to authenticate the user through **RADIUS**[1] or **TACACS**[2]+ remote servers or Local authentication server to gives access to the device. The console port of the OcNOS is accessible (ssh or Telnet) only through the default **VRF**[3] or VRF management port only. If the user attempts to access the device using the non VRF interface the access is denied.

The AAA authentication from console port via default VRF or VRF management is enhanced to reach the remote authentication servers through the non VRF interface.

Feature Characteristics

TACACS/RADIUS client can reach the OcNOS in both default and management VRF or non VRF interface for authentication.

Following are the features supported:

- Default VRF to reach the remote authentication (TACACS/RADIUS) server in Management VRF
- Management VRF to reach the loopback interface in Default VRF
- The AAA using servers are defined in default and management VRF
- When AAA server is not reachable, the authentication, authorization and accounting is performed via the local authentication server.
- AAA solution is performed based on the configuration only, not on the source of VRF.

Configuration

The following configuration uses the TACACS+ remote server for authentication. The same configurations are holds good for RADIUS authentication server.

Perform the following configurations on host.

1. Configure TACACS client using the configuration provided in TACACS Client Configuration (page 169) or RADIUS Client Configuration (page 154) section.
2. In the above configuration, configure the TACACS or RADIUS server in both management and default VRF. A sample configuration is provided below:

```
feature tacacs+ vrf management
tacacs-server login host 10.12.97.208 vrf management seq-num 1 key 7
0x67efdb4ad9d771c3ed8312b2bc74cedb
feature tacacs+
tacacs-server login host 40.40.40.1 seq-num 1 key 7 0x67efdb4ad9d771c3ed8312b2bc74cedb
tacacs-server login host 30.30.30.1 seq-num 2 key 7 0x67efdb4ad9d771c3ed8312b2bc74cedb
```

[1]Remote Authentication Dial-In User Service

[2]Terminal Access Controller Access Control System

[3]Virtual Routing and Forwarding

3. Create server group for management VRF using the following CLI. This command changes the configure mode to server group (config-tacacs)#.

```
aaa group server tacacs+ TACACS_VRF_MGMT vrf management
```

> **Note:** An AAA server group name configured in a VRF cannot be used to configure another VRF. For example, if the **TACACS_VRF_MGMT** server group is configured in the VRF management, you cannot configure an AAA server with the same name in any other VRFs.

4. Make the TACAC+S server 10.12.30.86 part of the group TACACS_VRF_MGMT for default VRF.

```
 server 10.12.30.86
```

5. Configure the authentication behavior for TACACS+ server with default VRF management, non VRF and fall-back to local authentication server if none configured for management VRF.

```
aaa authentication login default vrf management group TACACS_VRF_MGMT TACACS_NON_VRF_MGMT local
```

6. Configure AAA behavior for management VRF using the following CLIs.

```
aaa accounting default vrf management group TACACS_VRF_MGMT TACACS_NON_VRF_MGMT local
aaa authorization default vrf management group TACACS_VRF_MGMT TACACS_NON_VRF_MGMT local
aaa authentication login default fallback error local non-existent-user vrf management
```

7. Create a server group for non VRF management using the following CLI. This command changes the configure mode to server group (config-tacacs)#.

```
aaa group server tacacs+ TACACS_NON_VRF_MGMT
 server 40.40.40.1
 server 30.30.30.1
```

8. Configure the authentication behavior for TACACS+ server with console VRF management, non VRF and fall-back to local authentication server if none configured for management VRF.
9. Configure AAA behavior for non management VRF using the following CLIs.

```
aaa authentication login console group TACACS_VRF_MGMT TACACS_NON_VRF_MGMT local
aaa accounting console group TACACS_VRF_MGMT TACACS_NON_VRF_MGMT local
aaa authorization console group TACACS_VRF_MGMT TACACS_NON_VRF_MGMT local
aaa authentication login console fallback error local non-existent-user
```

> **Note:** If both management and default VRF is configured, then the default VRF is used to reach the TACACS/RADIUS server. If it is not reachable, then the management VRF is used.

Validation

Following is the sample validation show output for TACACS server with default management VRF and non VRF interface.

Following output shows the interface configured for server group.

```
OcNOS# sh tacacs-server groups
        VRF: default
        group tacacs+:
                server: all configured tacacs servers

       group TACACS_NON_VRF_MGMT:
                server 40.40.40.1
                seq-num 1
```

```
                port is 49
                key is ********

                server 30.30.30.1
                seq-num 2
                port is 49
                key is ********

Following output shows the TACACS+ server configurations:

OcNOS#sh tacacs-server vrf management
 VRF: management

total number of servers:1

Tacacs+ Server                 : 10.12.97.208/49
           Sequence Number     : 1
      Failed Auth Attempts     : 0
     Success Auth Attempts     : 0
   Failed Connect Attempts     : 0
 Last Successful authentication:

(*) indicates last active.

OcNOS#sh tacacs-server
VRF: default

total number of servers:2

Tacacs+ Server                 : 40.40.40.1/49
           Sequence Number     : 1
      Failed Auth Attempts     : 0
     Success Auth Attempts     : 0
   Failed Connect Attempts     : 0
 Last Successful authentication:

Tacacs+ Server                 : 30.30.30.1/49
           Sequence Number     : 2
      Failed Auth Attempts     : 0
     Success Auth Attempts     : 0
   Failed Connect Attempts     : 0
 Last Successful authentication:

(*) indicates last active.

aaa authentication login console fallback error local non-existent-user
```

Glossary

Key Terms/Acronym	Description
TACACS	Terminal Access Controller Access Control System

Restricted Access to Privilege Mode based on User Role

Overview

The Remote Authentication server is enhanced to provide access to execute mode or privilege level execute mode based on the network user's role. The authentication server can be Remote Authentication Dial-In User Service (**RADIUS**[1]) or the Terminal Access Controller Access Control System (**TACACS**[2]) server.

This authorization behavior is enhanced to enable privilege level mode based on the user role specified in the RADIUS/TACACS server. A new CLI **`disable default auto-enable`** is introduced to implement it. Executing this CLI removes the default access to the privilege execute mode to any user.

Feature Characteristics

Removed the default login behavior of network-admin role and authenticate the user based on difference privilege level defined in the remote authentication

The authentications assumes the following:.

- If no privilege-level is specified in the authentication server, the default user role is "network-user".
- All the user logged into the privilege exec mode by default.
- Executing the **`disable default auto-enable`** CLI decides the execution mode only for "network-user" role based on the privilege level.
- The user role is deter

Prerequisites

The following is mandatory before issuing the **`disable default auto-enable`** CLI:

- Specify the RADIUS/TACACS server to authenticate the remote user login and enable the RADIUS/TACACS authentication.

```
radius-server login host 1.2.7.4 vrf management seq-num 1 key 7
0x67efdb4ad9d771c3ed8312b2bc74cedb
aaa authentication login default vrf management group radius
```

Configuration

Perform the following configurations on host to disable the privilege execute mode based the user role.

1. Configure **RADIUS**[3]/**TACACS**[4] server using the configuration provided in RADIUS Authorization Configuration (page 154) or TACACS Server Authentication (page 169) section.

[1]Remote Authentication Dial-In User Service

[2]Terminal Access Controller Access Control System

[3]Remote Authentication Dial-In User Service

[4]Terminal Access Controller Access Control System

2. In the above configuration after enabling the authentication, execute **`disable default auto-enable`** CLI to get into network user executive mode based on user role.

```
(config)#radius-server login host 10.12.97.42 vrf management seq-num 1 key 0 testing123
OcNOS(config)#aaa authentication login default vrf management group radius
OcNOS(config)#disable default auto-enable
```

Note: By default this command is disabled.

Validation

Without configuring the disable default auto-enable CLI, if you login as remote user, user will be entered into privileged exec-mode.

```
radius-server login host 10.12.97.42 vrf management seq-num 1 key 7 0x67efdb4ad9
d771c3ed8312b2bc74cedb

root@instance-00000759:/home/ZebOS8NG# ssh ipi1@10.12.159.128

RADIUS	Remote Authentication Dial-In User Service
TACACS	Terminal Access Controller Access Control System server

RADIUS Client Configuration

Overview

Remote Authentication Dial In User Service (**RADIUS**[1]) is a remote authentication protocol that is used to communicate with an authentication server. A RADIUS server is responsible for receiving user connection requests, authenticating the user, and then returning all configuration information necessary for the client to deliver service to the user.

The OcNOS device, acting as a RADIUS client, sends the user's credentials to the RADIUS server requesting authentication. The RADIUS server validates the received user's credentials and authenticates it. After the authentication, it authorizes the user's privilege level and shares it with the OcNOS. Thus, the user role is decided based on the received privilege level.

The key points for RADIUS authentication are:

- Transactions between client and server are authenticated through the use of a shared key and this key is never sent over the network.
- The password is encrypted before sending it over the network.
- A maximum of eight RADIUS servers can be configured.

Limitation

- If the privilege level is not specified in the radius server's user config file, the default role is considered "network-user."
- By default, the Privileged Exec mode is given to all the users

In OcNOS version 6.4.1, the RADIUS is not present on radius server or authentication fails from RADIUS server

To implement the above requirements, the existing CLI Authentication, Authorization and Accounting (page 198) is used to enable fallback to local authentication server. This is disabled by default.

By default, the fallback to local authentication is applied when the Radius server is unreachable. For other scenarios, enable the fallback using the CLI.

Note: For invalid secret key there is no fallback local authentication. Console authentication is not supported for Radius.

In OcNOS version 6.4.2, the RADIUS Authorization is supported.

RADIUS Authorization Configuration

Benefits

Based on the privilege level received from the **RADIUS**[2] server user role is determined.

[1]Remote Authentication Dial-In User Service

[2]Remote Authentication Dial-In User Service

Prerequisites

RADIUS server process must be up and running.

Configuration

Topology

Following is the RADIUS client and server network topology.

Figure 2. RADIUS Server Client Configuration

IPv4 Address

RADIUS server address is configured in IPv4 address format.

RADIUS Client (Host)

`(config)#radius-server login host 10.12.33.211 vrf management seq-num 1 key 0 testing123`	Specify the radius server ipv4 address to be configured with shared local key for management vrf. The same key should be present on the server config file.
`(config)#radius-server login host 1.1.1.2 seq-num 1 key 0 testing123`	Specify the radius server ipv4 address to be configured with shared local key for default vrf. The same key should be present on the server config file.
`(config)#aaa authentication login default vrf management group radius`	Enable authentication for radius server configured for management **VRF**[1]. Authorization is also enabled by default.
`(config)#aaa authentication login console group radius`	Enable authentication for radius server . Authorization is also enabled by console
`(config)#aaa authentication login default vrf management group radius local`	Enable authentication for radius server and fallback to local configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login console group radius local`	Enable authentication for radius server and fallback to local configured for default vrf. Authorization is also enabled by default

[1]Virtual Routing and Forwarding

Specifies privilege level in **`radius server`** configuration file. The RADIUS client fetch the network operator privilege level from this file. The Privilege level range is between 0-15.

Table 8. Role/privilege level mapping

Role	Privilege level
Network-admin	15
Network engineer	14
RBAC-customized-role	13
Network operator	1 to 12
Network user	0 or any other values (>15 or negative values or any character)

Validation

To verify the RADIUS authorization process, login from the host machine to Host IP with the authenticating user credentials and provide a RADIUS server password.

Execute following show commands to verify the Radius authorization status.

```
OcNOS#sh running-config aaa
aaa authentication login default vrf management group radius
aaa authentication login console group radius
aaa authentication login default vrf management group radius local
aaa authentication login console group radius local

OcNOS#sh running-config radius
radius-server login host 10.12.33.211 vrf management seq-num 1 key 7
0x67efdb4ad9d771c3ed8312b2bc74cedb

radius-server login host 1.1.1.1  seq-num 1 key 7 0x67efdb4ad9d771c3ed8312b2bc74cedb

```

IPv6 Address

RADIUS server address is configured in IPv6 address.

RADIUS Client (Host)

OcNOS(config)#radius-server login host 2001:db8:100::2 vrf management seq-num 1 key 0 testing123	Configure radius server with IPv6 address
OcNOS(config)#aaa authentication login default vrf management group radius local	Configure AAA authentication
(config)#interface eth0	Navigate to the interface mode
(config-if)#ipv6 address 2001:db8:100::5/64	Configure IPv6 address on the eth0 interface
(config-if)#exit	Exit interface configure mode
(config)#commit	Commit the configuration
(config)#exit	Exit configure mode

Validation

To verify the RADIUS authorization process, login from the host machine to Host IP with the authenticating user credentials and provide a RADIUS server password.

Execute following show commands to verify the Radius authorization status.

```
#show running-config radius
radius-server login host 2001:db8:100::2 vrf management seq-num 1 key 7
0x67efdb4ad9d771c3ed8312b2bc74cedb

#show running-config aaa
aaa authentication login default vrf management group radius

#show ipv6 interface eth0 brief
Interface        IPv6-Address                              Admin-Status
eth0             2001:db8:100::5fe80::218:23ff:fe30:e6ba   [up/up]
```

Implementation Examples

Following is an example for **`radius-server`** configuration file:

```
ipi Cleartext-Password := "ipi123"
     Management-Privilege-Level := 12
ocnos Cleartext-Password := "ocnos"
     Management-Privilege-Level := 0
abc Cleartext-password :="AC123"
     Management-Privilege-Level := 14
```

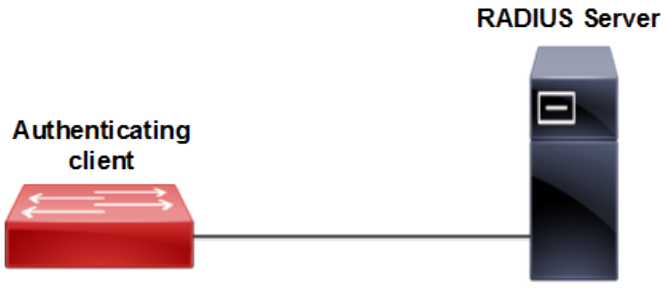
RADIUS Server Authentication Configuration

IPv4 Address

Radius server address is configured as IPv4 address.

Topology

Figure 3. RADIUS[1] Server Host Configuration



Host

`#configure terminal`	Enter configure mode.
`(config)#radius-server login key testing101 vrf management`	Specify the global key for radius servers that are not configured with their respective keys for management vrf. This key should match the one present in the config file of tacacs server.
`(config)#radius-server login key testing101`	Specify the global key for radius servers that are not configured with their respective keys for default vrf. This key should match the one present in the config file of tacacs server
`(config)#radius-server login host 10.12.17.13 vrf management seq-num 1 key testing123`	Specify the radius server ipv4 address to be configured with shared local key for management vrf. The same key should be present on the server config file.
`(config)#radius-server login host 10.12.17.13 seq-num 2 key testing123`	Specify the radius server ipv4 address to be configured with shared local key for default vrf. The same key should be present on the server config file.
`(config)#radius-server login host 10.12.17.11 vrf management seq-num 1 auth-port 1045`	Specify the radius server ipv4 address to be configured with port number for management vrf. The

[1]Remote Authentication Dial-In User Service

	radius server should be started with same port number.
`(config)#radius-server login host 10.12.17.11 seq-num 1 auth-port 1045`	Specify the radius server ipv4 address to be configured with port number for default vrf. The radius server should be started with same port number
`(config)#radius-server login host 10.12.17.11 vrf management seq-num 1 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for management vrf. The radius server should be started with same port number.
`(config)#radius-server login host 10.12.17.11 seq-num 1 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for default vrf. The radius server should be started with same port number. The radius server should be started with same port number
`(config)#radius-server login host Radius-Server-1 vrf management seq-num 2 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 2`	Specify the radius server configured with hostname, key authentication port number, accounting port number, for management **VRF**[1]. The radius server should be started with same port number
`(config)#radius-server login host Radius-Server-1 seq-num 2 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 2`	Specify the radius server configured with hostname sequence number, key and port number for default VRF. The radius server should be started with same port number.
`(config)#aaa authentication login default vrf management group radius`	Enable authentication for radius server configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login default group radius`	Enable authentication for radius server configured for default vrf. Authorization is also enabled by default.
`(config)#aaa authentication login default vrf management group radius local`	Enable authentication for radius server and fallback to local configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login default group radius local`	Enable authentication for radius server and fallback to local configured for default vrf. Authorization is also enabled by default
`(config)#aaa authentication login default vrf management group radius local none`	Enable authentication for radius server, fallback to local followed by fallback to none, configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login default radius local none`	Enable authentication for radius server, fallback to local followed by fallback to none, configured for default vrf. Authorization is also enabled by default

[1]Virtual Routing and Forwarding

`(config)#aaa authentication login default vrf management group radius none`	Enable authentication for radius, fallback to none, configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login default group radius none`	Enable authentication for radius, fallback to none, configured for default VRF. Authorization is also enabled by default
`(config)#aaa group server radius G1 vrf management`	Create aaa radius group G1 for management vrf
`(config)#aaa group server radius G1`	Create AAA radius group G1 for default VRF
`(config-radius)#server 10.12.17.11`	Make the radius server 10.12.30.86 a part of this group G1 for default VRF
`(config-radius)#server Radius-Server-1`	Make Radius-Server-1 a part of this group G1
`(config-radius)#exit`	Exit radius mode
`(config)#commit`	Commit the configuration
`(config)#aaa group server radius G1`	Enter radius mode
`(config-radius)#server 10.12.17.11`	Make the radius server 10.12.30.86 a part of this group G1 for default vrf
`(config-radius)#server Radius-Server-1`	Make Radius-Server-1 a part of this group G1
`(config-radius)#exit`	Exit radius mode.
`(config)#commit`	Commit the configuration
`(config)#aaa authentication login default vrf management group G1`	Authenticate the tacacs+ group G1 with aaa authentication for management vrf
`(config)#aaa authentication login default group G1`	Authenticate the tacacs+ group G1 with aaa authentication for default vrf
`(config)#commit`	Commit the configuration

Validation

To verify the RADIUS authentication process, use SSH or Telnet from the host machine to Host IP with the authenticating user created, and provide a RADIUS server password and check whether the client validates the user with the corresponding username and password.

```
#show radius-server vrf management
        VRF: management
timeout value: 5

Total number of servers:2

IPv6 Address

Radius server address is configured as IPv6 address. Authentication messages are transmitted to radius server from the Router using IPv6 address.

Topology

Figure 4. RADIUS topology (page 164) shows the sample configuration of Radius server.

Figure 4. RADIUS[1] topology

R1

`#configure terminal`	Enter configure mode.
`(config)#radius-server login host 2001:db8:100::2 vrf management seq-num 1 key 0 testing123`	Configure radius server with IPv6 address
`(config)#aaa authentication login default vrf management group radius`	Configure AAA authentication
`(config)#aaa authentication login error-enable vrf management`	Configure AAA authentication login error-enable
`(config)#interface eth0`	Navigate to the interface mode
`(config-if)#ipv6 address 2001:db8:100::5/64`	Configure IPv6 address on the eth0 interface
`(config-if)#exit`	Exit interface configure mode
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit configure mode

Validation

Perform TELNET to the Router R1. Provide the username mentioned in the radius server "users" file as telnet username. Check that R1 sends radius request to the radius server using IPv6 address.

```
#show running-config radius
radius-server login host 2001:db8:100::2 vrf management seq-num 1 key 7 0x67efdb
4ad9d771c3ed8312b2bc74cedb
```

[1]Remote Authentication Dial-In User Service

```
#show running-config aaa
aaa authentication login default vrf management group radius
aaa authentication login error-enable vrf management

#show ipv6 interface eth0 brief

```

RADIUS Server Accounting

You can configure accounting to measure the resources that another user consumes during access.

User

`#configure terminal`	Enter configure mode.
`(config)#radius-server login host 10.12.17.11 vrf management key 7 seq-num 1 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for management vrf. The radius server should be started with same port number.
`(config)#radius-server login host 10.12.17.11 seq-num 2 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with port number for default vrf.The radius server should be started with same port number
`(config)#aaa accounting default vrf management group radius`	Enable accounting for radius server configured for vrf management
`(config)#aaa accounting default group radius`	Enable accounting for radius server configured for default vrf
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation

```
#show aaa accounting vrf management

```

Sample Radius Clients.conf File

```
client 10.12.58.20 {
  secret    = testing123
  shortname = localhost
}
client 192.168.1.2 {
  secret    = testing123
  shortname = localhost
}
client 10.12.37.196 {
  secret    = testing123
}
client 100.0.0.2 {
  secret    = testing123
  shortname = localhost
}

# IPv6 Client
#client ::1 {
#       secret          = testing123
#       shortname       = localhost
#}
#
# All IPv6 Site-local clients
#client fe80::/16 {
#       secret          = testing123
#       shortname       = localhost
```

Sample Radius Users Configuration File

```
#
#DEFAULT
#       Service-Type = Login-User,
#       Login-Service = Rlogin,
#       Login-IP-Host = shellbox.ispdomain.com

# #
# # Last default: shell on the local terminal server.
# #
# DEFAULT
#       Service-Type = Administrative-User

# On no match, the user is denied access.

selftest Cleartext-Password := "password"
testuser1 Cleartext-Password := "user1@101"
testuser2 Cleartext-Password := "user2@202"
testuser3 Cleartext-Password := "user3@303"
```

Fall Back Option for RADIUS Authentication

Overview

Currently, the Remote Authentication Dial-In User Service (**RADIUS**[1]) server authentication fallback to the local authentication server only when the RADIUS server is not reachable.

This behavior is modified to forward the authentication request to the local authentication server when the RADIUS authentication is failed or not reachable.

Feature Characteristics

The RADIUS authentication mechanism is enhanced to fallback to local authentication server when the user

- is not present on RADIUS server or
- authentication fails from RADIUS server

To implement the above requirements, the existing CLI aaa authentication login default fallback error local non-existent-user vrf management is used to enable fallback to local authentication server. This is disabled by default.

Note: For invalid secret key there is no fallback local authentication. Console authentication is not supported for RADIUS.

Benefits

By default, the fallback to local authentication is applied when the RADIUS server is unreachable. For other scenarios, enable the fallback using the CLI.

Configuration

Below is the existing CLI used to enable the fallback local authentication server.

```
aaa authentication login default fallback error local non-existent-user vrf management
```

Refer to Authentication, Authorization and Accounting (page 198) section in the OcNOS System Management Configuration Guide.

Validation

Configure **`aaa authentication`** console and verify console authentication:

```
OcNOS#con t
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#radius-server login host 1.1.1.2 seq-num 1 key 0 kumar
OcNOS(config)#commit
OcNOS(config)#aaa authentication login console group radius
OcNOS(config)#commit
OcNOS(config)#exit
OcNOS#exit

OcNOS#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
```

[1]Remote Authentication Dial-In User Service

```
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

Line        User           Idle         Location/Session PID    TYPE   Role
(*) 0 con 0 [C]ocnos       0d00h00m     ttyS0            5531   Remote network-admin
```

Enabled RADIUS local fallback and verify the authentication:

```
OcNOS(config)#aaa authentication login console group radius local
OcNOS(config)#commit
OcNOS(config)#exit
OcNOS#exit
OcNOS>exit

OcNOS>enable
OcNOS#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

Line         User          Idle         Location/Session PID   TYPE   Role
(*) 0 con 0  [C]test        0d00h00m     ttyS0            5713  Local  network-engineer
130 vty 0    [C]test        0d00h01m     pts/0            5688  Local  network-engineer
OcNOS#
```

TACACS Client Configuration

Overview

Terminal Access Controller Access Control System (**TACACS**[1]) is a remote authentication protocol that is used to communicate with an authentication server. With TACACS, a network device communicates to an authentication server to determine whether a particular user should be allowed access to the device. TACACS+ listens at port 49.

TACACS Server Authentication

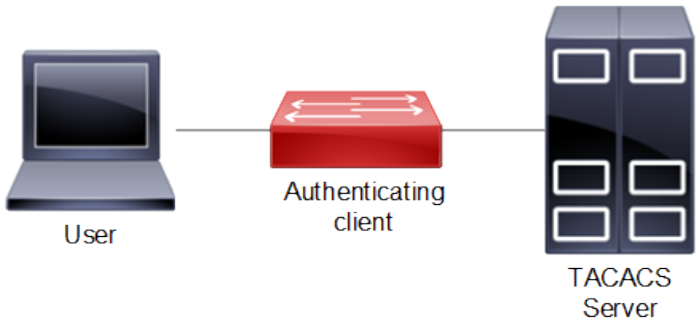
IPv4 Address Configuration

This section shows a **TACACS**[2]+ server is configured with an IPv4 address. Authentication messages are transmitted to TACACS+ server from the device using an IPv4 address.

Topology

Figure 5 shows the sample configuration of TACACS+ server.

Figure 5. TACACS Server Host Configuration



Authenticating Client

`#configure terminal`	Enter configure mode.
`(config)#feature tacacs+ vrf management`	Enable the feature TACACS+ for management vrf
`(config)#feature tacacs+`	Enable the feature TACACS+. for default vrf
`(config)#tacacs-server login key 0 testing101 vrf management`	Specify the global key for tacacs servers that are not configured with their respective keys for management vrf This key should match the one present in the config file of tacacs server
`(config)#tacacs-server login key 0 testing101`	Specify the global key for tacacs servers that are not configured with their respective keys for default vrf This

[1]Terminal Access Controller Access Control System

[2]Terminal Access Controller Access Control System

	key should match the one present in the config file of tacacs server
`(config)#tacacs-server login host 10.16.19.2 vrf management seq-num 1 key 0 testing123`	Specify the tacacs server ipv4 address to be configured with shared key. The same key should be present on the server config file
`(config)#tacacs-server login host 10.16.19.2 seq-num 3 key 0 testing123`	Specify the tacacs server ipv4 address to be configured with shared local key for default vrf The same key should be present on the server config file.
`(config)#tacacs-server login host 10.12.30.86 vrf management seq-num 4 port 1045`	Specify the tacacs server ipv4 address to be configured with the sequence and port number.The tacacs server should be started with same port number
`config)#tacacs-server login host 10.12.30.86 seq-num 2 port 1045`	Specify the tacacs server ipv4 address to be configured with the sequence and port number for default vrf. The tacacs server should be started with same port number
`(config)#tacacs-server login host 10.12.17.11 vrf management seq-num 8 key 7 65535 port 65535`	Specify the tacacs server ipv4 address to be configured with the sequence, key and port number for management vrf. The tacacs server should be started with same port number.
`(config)#tacacs-server login host 10.12.17.11 seq-num 8 key 7 65535 port 65535`	Specify the tacacs server ipv4 address to be configured with the sequence, key and port number for default vrf. The tacacs server should be started with same port number.
`(config)#tacacs-server login host Tacacs-Server-1 vrf management seq-num 7 key 7 65535 port 65535`	Specify the tacacs server configured with host-name sequence number key and port number for management vrf. The tacacs server should be started with same port number
`(config)#tacacs-server login host Tacacs-Server-1 seq-num 7 key 7 65535 port 65535`	Specify the tacacs server configured with host-name sequence number key and port number for default vrf. The tacacs server should be started with same port number
`(config)#aaa authentication login default vrf management group tacacs+`	Enable authentication for TACACS+ server configured for management vrf. Authorization is also enabled by default
`(config)#aaa authentication login default group tacacs+`	Enable authentication for TACACS+ server configured for default vrf. Authorization is also enabled by default.
`(config)#aaa authentication login default vrf management group tacacs+ local`	Enable authentication for TACACS+ and fall-back to local configured for management vrf. Authorization is also enabled by default
`(config)#aaa authentication login default vrf management group tacacs+ local none`	Enable authentication for TACACS+ fall-back to local followed by fall-back to none configured for management vrf. Authorization is also enabled by default
`(config)#aaa authentication login default vrf management group tacacs+ none`	Enable authentication for TACACS+ fall-back to none configured for management vrf. Authorization is also enabled by default

`(config)#aaa authentication login default group tacacs+ none`	Enable authentication for TACACS+ fall-back to none , configured for default vrf. Authorization is also enabled by default
`(config)#aaa group server tacacs+ G1 vrf management`	Create aaa group G1 for management vrf
`(config-tacacs)#server 10.12.30.86 vrf management`	Make the tacacs-server 10.12.30.86 a part of this group G1 for default vrf
`(config-tacacs)#server Tacacs-Server-1`	Make the tacacs-server Tacacs-Server-1 a part of this group G1 for management vrf
`(config-tacas)#exit`	Exit the tacacs-config
`(config)#commit`	Commit the configuration
`(config)#aaa group server tacacs+ G1`	Create aaa group G1 for default vrf
`(config-tacacs)server 10.12.30.86`	Make the tacacs-server 10.12.30.86 a part of this group G1 for default vrf
`(config-tacacs)#server Tacacs-Server-1`	Make the tacacs-server Tacacs-Server-1 a part of this group G1 for management vrf
`(config-tacacs)#exit`	Exit the tacacs-config mode
`(config)#commit`	Commit the configuration
`(config)#aaa authentication login default vrf management group G1`	Authenticate the tacacs+ group G1 with aaa authentication for management vrf
`(config)#aaa authentication login default group G1`	Authenticate the tacacs+ group G1 with aaa authentication for default vrf
`(config)#commit`	Commit the configuration

Users are mapped as shown in Table 9:

Table 9. Role/privilege level mapping

Role	Privilege level
Network administrator	15
Network engineer	14
Network operator	1 to 12
RBAC-customized-role	13
Network user	0 or any other values (>15 or negative values or any character)

TACACS Server Accounting

After authentication, the user can configure accounting to measure the resources that the user consumes during access.

Authenticating Device

`#configure terminal`	Enter configure mode.
`(config)#feature tacacs+ vrf management`	Enable the feature **TACACS**[1]+ for vrf management
`(config)#feature tacacs+`	Enable the feature TACACS+ for default vrf
`(config)#tacacs-server login host 10.16.19.2 vrf management seq-num 1 key 0 testing123`	Specify the TACACS server IPv4 address to be configured with shared key for vrf management. The same key should be present in the server configuration file.
`(config)#tacacs-server login host 10.16.19.2 seq-num 3 key 0 testing123`	Specify the TACACS server IPv4 address to be configured with shared key default vrf. The same key should be present in the server configuration file.
`(config)#aaa accounting default vrf management group tacacs+`	Enable accounting for TACACS server configured for vrf management.
`(config)#aaa accounting default group tacacs+`	Enable accounting for TACACS server configured for default vrf
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit configure mode
`#clear tacacs-server counters vrf management`	Clear tacacs server counters for management vrf
`#clear tacacs-server counters vrf all`	Clear tacacs server counters for management and default vrf
`#clear tacacs-server counters`	Clear tacacs server counters for default vrf

To verify the TACACS accounting process, connect using SSH or Telnet from the host to the client with the user created and provided TACACS server password, and check whether the client validates the user with corresponding username and password.

Validation Commands

show tacacs-server, show aaa accounting, show aaa accounting

[1]Terminal Access Controller Access Control System

```
#show aaa accounting vrf management
                VRF: management
      default: group tacacs+
#

#show aaa accounting vrf all
                VRF: management
      default: group tacacs+

                VRF: default
      default: group tacacs+

#show aaa accounting
                VRF: default
      default: group tacacs+
      #

#show running-config aaa
aaa authentication login default vrf management group G1
aaa accounting default vrf management group tacacs+
aaa group server tacacs+ G1 vrf management
    server Tacacs-Server-1 vrf management
    server 10.12.17.11 vrf management

aaa authentication login default group tacacs+
aaa accounting default group tacacs+
aaa group server tacacs+ G1
    server Tacacs-Server-1
    server 100.0.0.1
```

Sample TACACS Config File Contents

```
#tacacs configuration file
#set the key

key = "testing123"
accounting file = /var/log/tac_acc.log

user = test1 {
        default service = permit
        login = cleartext "12345"
}

group = netadmin {
        service = ppp protocol = ip {
        priv-lvl = 1
        }
}

user = test2 {
        default service = permit
        login = cleartext "12345"
        member = netadmin
}

user = test3 {
        default service = permit
        login = cleartext "12345"
        service = ppp protocol = ip {
        priv-lvl = 15
}
}
```

TACACS Server Authorization

Authorization is realized by mapping the authenticated users to one of the existing predefined roles as shown in Table 9.

The privilege information from the **TACACS**[1]+ server is retrieved for the authenticated users and is mapped onto one of the roles as shown in Table 9.

Each authenticated user is mapped to one of the pre-defined privilege level.

Users with priv-level <=0 and priv-level > 15 are treated as read-only user mapped onto the pre-defined network-user role.

There is no command to enable authorization. Authorization functionality is enabled by default when remote authentication is enabled with TACACS+.

Authorization is “auto-enabled”. After successful authentication, a user can enter into privilege exec mode, irrespective of its privilege level and such user is not prompted with enable mode password, if configured. However based on their role, commands are rejected if not allowed to perform certain operations.

Example

A network-user has read-only access and can only execute show commands. A network-user cannot enter configure mode. An error message is displayed upon executing any command which is not allowed.

```
#write
% Access restricted for user %
#configure terminal
% Access restricted for user %
```

The following attribute value pair in TACACS+ server is used to fetch user privilege information.

```
service = ppp protocol = ip {
        priv-lvl = <0…15>
}
```

Sample TACACS+ Configuration File

```
#tacacs configuration file from “tac_plus version F4.0.3.alpha “
#set the key

key = "testing123"
accounting file = /var/log/tac_acc.log

#Read only user “test1”, without any priv-lvl, mapped to role “network-user”
user = test1 {
default service = permit
login = cleartext "12345"
}

#We can create a group of users mapped to a privilege
group = netadmin {
service = ppp protocol = ip {
priv-lvl = 15
}
}

#User “test2” with highest priv-lvl=15, mapped to role “network-admin”
user = test2 {
```

[1]Terminal Access Controller Access Control System

```
default service = permit
login = cleartext "12345"
member = netadmin
}

#User “test3” with priv-lvl= 1…13, mapped to role “network-operator”
user = test3 {
default service = permit
login = cleartext "12345"
service = ppp protocol = ip {
priv-lvl = 10
}
}
#User “test4” with priv-lvl=14, mapped to role “network-engineer” user = test4 {
default service = permit
login = cleartext "12345"
service = ppp protocol = ip {
priv-lvl = 14
}
}
```

Role-Based Access Control

Overview

The **Role-Based Access Control (RBAC)**[1] feature in OcNOS allows the creation of custom user roles locally. This provides administrators with the flexibility to define specific groups of commands that can be allowed or denied for each role. Users can then be assigned to these user roles on a per-switch basis or by utilizing a **TACACS**[2]+ server.

Feature Characteristics

RBAC offers the capability to restrict or permit users from executing CLI commands in OcNOS and command authorization is entirely handled within OcNOS. With Role-Based Command Authorization, administrators can create the following entities:

- **Policy**[3]
- **User Role**[4]
- User Name

Policy

A policy is a collection of rules that determine which commands are permitted or denied. The maximum number of policies that can be configured is 20.

User Role

User roles group users together, allowing restrictions to be applied based on the policies associated with the role. When creating a User Role, a default policy should be specified. This default policy determines whether all commands are permitted or denied by default. One or more policies can be attached to a User Role. The maximum number of roles that can be configured is 14.

User Name

Users can be assigned to predefined user roles or customized roles. Some predefined roles include:

- Network-Administrator
- Network-Operator
- Network-Engineer
- Network-User

Multiple users can be assigned the same User Role.

RBAC user accounts will not be deleted when a corresponding RBAC-role is deleted or when the dynamic-RBAC feature is disabled. If an RBAC-user is authenticated but the associated role is not present, the user privilege will

[1] A security paradigm that restricts system access based on roles assigned to users.

[2] Terminal Access Controller Access Control System

[3] A set of rules determining which actions are permitted or denied for a specific user role.

[4] A predefined or customized grouping of permissions assigned to users.

default to network-user privilege, and the role will be displayed as RBAC-customized-role in the **show users** command.

Benefits

RBAC ensures secure and controlled access to CLI commands, streamlining network management.

Prerequisites

Ensure there is a supported OcNOS router with management interface access.

RBAC Configuration

Here is the example configurations for the RBAC feature. For TACACS+ configurations, see the TACACS Client Configuration chapter in the System Management guide.

Note: When implemented, users will have visibility into the imposed restrictions through the **show running-config** command. Additionally, both the configured policy and role specifics can be observed using the **show running-config** command.

Example 1

In the provided example, RBAC is employed to define user roles and policies that restrict command access for enhanced security and control. Here is the configuration steps:

```
OcNOS#show running-config rbac
feature dynamic-rbac
policy p1
 permit "enable"
 permit "configure terminal"
 Permit "snmp-server .*"
role custom
 default deny-all
 add policy p1
```

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#username test password Test@123
OcNOS(config)#username test role custom
OcNOS(config)#commit
```

```
OcNOS#sh user-account
User:ocnos
               roles: network-admin
User:test
roles: custom
```

- The RBAC feature is enabled with the **feature dynamic-rbac** command.
- A policy named **p1** is created, allowing specific commands such as **enable**, **configure terminal**, and **SNMP-related** commands.

- A custom role called **`custom`** is established, with a default action to deny all commands (**`default deny-all`**). The previously defined policy **`p1`** is added to this role.
- A new user account named **`test`** is created with the password **`Test@123`**, and the role custom is assigned to this user.
- The configuration changes are committed using the **`commit`** command.The output indicates that the user **`test`** has the custom role, granting specific permissions.

```
root@debian:~# ssh test@10.12.29.130
test@10.12.29.130's password:
Last login: Tue Aug 23 01:06:31 2022 from 10.12.17.153

OcNOS version DELL_S3048-ON-OcNOS-1.3.9.364-ENT_IPBASE-S0-P0  01/21/2022 15:03:56
OcNOS>en
OcNOS#conf t
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#snmp-server community test vrf management -->Allowed
OcNOS(config)#ntp server 1.1.1.1 vrf management      -->Not Allowed
% Access restricted for user %
```

- The user test logs into the system via SSH and demonstrates RBAC enforcement by successfully executing permitted SNMP-related commands but encountering an access restriction when attempting an unauthorized command (**`ntp server`**).
- This example showcases RBAC in action, illustrating how user roles and policies can control command access based on predefined configurations.

Example 2

In the below example, the user **`test1`** establishes an SSH connection and demonstrates the RBAC setup. As the default action **`permits all`** commands except SNMP-related ones, the user is able to execute various configurations, except for **`snmp-server`** configurations:

```
OcNOS#show running-config rbac
feature dynamic-rbac
policy p1
 permit "enable"
 permit "configure terminal"
 permit "snmp-server .*" mode config
policy p2
 permit "enable"
 permit "configure terminal"
 deny "snmp-server .*"
role custom-snmp
 default permit-all
 add policy p2
```

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#username test1 password Test@1234
OcNOS(config)#username test1 role custom-snmp
OcNOS(config)#commit
OcNOS#show user-account
User:ocnos
                roles: network-admin
User:test1
                roles: custom-snmp
```

```
root@debian:~# ssh test1@10.12.29.130
test1@10.12.29.130's password:
```

```
OcNOS version DELL_S3048-ON-OcNOS-1.3.9.364-ENT_IPBASE-S0-P0  01/21/2022 15:03:56
OcNOS>enable
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#ntp server 1.1.1.1 vrf management          --> Allowed
OcNOS(config)#snmp-server community test vrf management  -->Not Allowed
% Access restricted for user %
```

Implementation Examples

RBAC provides a structured and efficient approach to managing and controlling user access to various resources and functionalities within a system. RBAC is particularly beneficial in scenarios with multiple users with varying levels of permissions and responsibilities. Some common use cases for RBAC include:

Network Security: RBAC enhances network security by restricting users to only the resources and commands they need for their roles, reducing the risk of unauthorized access and potential breaches.

Administrative Efficiency: RBAC simplifies user management by categorizing users into predefined roles and streamlining tasks such as provisioning, access updates, and permissions adjustments.

Regulatory Compliance: RBAC ensures compliance with regulations by enforcing proper access controls and maintaining audit trails, helping organizations meet required standards for data security and privacy.

Reduced Human Error: RBAC minimizes the chance of human errors that could lead to network disruptions or security incidents, as users are limited to the specific commands relevant to their roles.

Access Segmentation: In multi-tenant or multi-customer environments, RBAC facilitates access segmentation, ensuring that different groups can only interact with their designated resources, enhancing isolation and privacy.

RBAC Commands

Here is the compilation of the new commands for configuring RBAC feature. For **TACACS**[1]+ commands, see the TACACS+ Commands chapter in the System Management guide.

[1]Terminal Access Controller Access Control System

add policy

Use this command to add a policy to a **TACACS**[1]+ role-based authorization (RBAC) role.

Use the **no** form of this command to remove a policy from an RBAC role.

Command Syntax

```
add policy POLICY-NAME
no add policy POLICY-NAME
```

Parameters

POLICY-NAME
Name of the policy

Default

None

Command Mode

RBAC role mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples demonstrate the configuration of a role named '**myRole**,' defining its default permissions, adding '**myPolicy1**' to the role, and subsequently removing '**myPolicy2**' from it.

```
OcNOS(config)#role myRole
OcNOS(config-role)#default permit-all
OcNOS(config-role)#add policy myPolicy1
OcNOS(config-role)#no add policy myPolicy2
OcNOS(config-role)#exit
```

[1]Terminal Access Controller Access Control System

default

Use this command to set the default rule for a **TACACS**[1]+ role-based authorization (RBAC) role.

Use the **no** parameter with this command to remove the default rule for a TACACS+ role-based authorization (RBAC) role.

Command Syntax

```
default (permit-all | deny-all)
no default
```

Parameters

permit-all
Permit all commands

deny-all
Deny all commands

Default

Unless this command is explicitly configured, the default rule for a role is **deny-all**.

Command Mode

RBAC role mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example illustrates the configuration of a role named '**myRole**' in OcNOS, and specifying its default permission.

```
OcNOS(config)#role myRole
OcNOS(config-role)#default permit-all
OcNOS(config-role)#exit
```

[1]Terminal Access Controller Access Control System

deny

Use this command to add a deny rule to a **TACACS**[1]+ role-based authorization (RBAC) policy.

Use the **no** form of this command to remove a deny rule from an RBAC policy.

Command Syntax

```
deny RULE-STRING (mode MODE-NAME |)
no deny RULE-STRING (mode MODE-NAME |)
```

Parameters

RULE-STRING
Command string

MODE-NAME
Command prompt string such as `config-router` or `config-if`. Deny access to the command only in this mode.

Default

None

Command Mode

RBAC policy mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The example below illustrates the configuration of a policy named **myPolicy** in OcNOS. It includes a deny rule that restricts access to the **ip address** command, specifically within the configuration interface mode (**config-if**).

```
OcNOS#configure terminal
OcNOS(config)#policy myPolicy
OcNOS(config-policy)#deny “ip address” mode config-if
OcNOS(config-policy)#end
```

[1]Terminal Access Controller Access Control System

feature dynamic-rbac

Use this command to enable the **TACACS**[1]+ role-based authorization (RBAC) feature.

Use the **no** form of this command to disable the RBAC feature.

Command Syntax

```
feature dynamic-rbac
no feature dynamic-rbac
```

Parameters

None

Default

By default, feature TACACS+ RBAC is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The example below illustrates the configuration of enabling the TACACS+ RBAC feature.

```
OcNOS#configure terminal
OcNOS(config)#feature dynamic-rbac
```

[1]Terminal Access Controller Access Control System

permit

Use this command to add a permit rule to a **TACACS**[1]+ role-based authorization (RBAC) policy.

Use the **no** form of this command to remove a permit rule in an RBAC policy.

Command Syntax

```
permit RULE-STRING (mode MODE-NAME |)
no permit RULE-STRING (mode MODE-NAME |)
```

Parameters

RULE-STRING
Command string

MODE-NAME
Command prompt string such as `config-router` or `config-if`. Permit access to the command only in this mode.

Default

None

Command Mode

RBAC policy mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples demonstrate the configuration of a policy named **myPolicy**, permitting access to the **ip address** command specifically in the configuration interface mode.

```
OcNOS#configure terminal
OcNOS(config)#policy myPolicy
OcNOS(config-policy)#permit “ip address” mode config-if
```

[1]Terminal Access Controller Access Control System

policy

Use this command to create a **TACACS**[1]+ role-based authorization (RBAC) policy and enter RBAC policy mode.

Use the **no** form of this command to remove an RBAC policy.

Command Syntax

```
policy POLICY-NAME
no policy POLICY-NAME
```

Parameters

POLICY-NAME
Policy[2] name

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples demonstrate the configuration of creating the RBAC policy named **myPolicy**, and the command prompt enters the policy configuration mode.

```
OcNOS#configure terminal
OcNOS(config)#policy myPolicy
OcNOS(config-policy)#exit
```

[1]Terminal Access Controller Access Control System

[2]A set of rules determining which actions are permitted or denied for a specific user role.

role

Use this command to create a **TACACS**[1]+ role-based authorization (RBAC) role and enter RBAC role mode.

Use the **no** form of this command to remove an RBAC role.

Command Syntax

```
role ROLE-NAME
no role ROLE-NAME
```

Parameters

ROLE-NAME

Role name. User cannot specify one of these roles already defined in OcNOS:

`network-admin`
`network-user`
`network-operator`
`network-engineer`

For more about these built-in roles, see username (page 371) command.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples demonstrate the configuration of creating the RBAC role named **myRole**, with the command prompt entering the role configuration mode.

```
OcNOS#configure terminal
OcNOS(config)#role myRole
OcNOS(config-role)#exit
```

[1]Terminal Access Controller Access Control System

show rbac-policy

Use this command to display **TACACS**[1]+ role-based authorization (RBAC) policies.

Command Syntax

```
show rbac-policy (POLICY-NAME |)
```

Parameters

POLICY-NAME
Policy[2] name

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples display the show output of the RBAC policy named **myPolicy** and its associated configurations.

```
OcNOS#show rbac-policy myPolicy
------------------------------------------------------------------------
Policy Name     : myPolicy
permit "ip address" mode config-if
```

[1]Terminal Access Controller Access Control System

[2]A set of rules determining which actions are permitted or denied for a specific user role.

show rbac-role

Use this command to display information about **TACACS**[1]+ role-based authorization (RBAC) roles.

Command Syntax

```
show rbac-role (ROLE-NAME |)
```

Parameters

ROLE-NAME
Role name

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples display the show output of the RBAC role named **myRole** and its associated configurations.

```
OcNOS#show rbac-role myRole
------------------------------------------------------------------------
Role Name          : myRole
Default rule       : permit-all
Attached Policies  : myPolicy1
                   : myPolicy2

------------------------------------------------------------------------
```

Table 10. show rbac-role fields

Entry	Description
Role Name	Displays the name of the role, in this case, **myRole**.
Default rule	Indicates the default rule associated with the role, which can be **permit-all** or **deny-all**.
Attached Policies	Lists the names of policies that are attached to this role. In the example, **myPolicy1** and **myPolicy2** are attached to **myRole**.

[1]Terminal Access Controller Access Control System

Troubleshooting

For smooth operation, verify accurate sensor path configuration, check encoding method compatibility, and ensure proper router-management system connectivity.

Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

Acronym	Description
RBAC	Role Based Access Control
TACACS[1]	Terminal Access Controller Access Control System
TACACS+	Enhanced version of TACACS

Glossary

The following provides definitions for key terms used throughout this document.

Key Terms	Description
Role-Based Access Control (RBAC)[2]	A security paradigm that restricts system access based on roles assigned to users.
User Role[3]	A predefined or customized grouping of permissions assigned to users.
Policy[4]	A set of rules determining which actions are permitted or denied for a specific user role.
Dynamic-RBAC[5]	Dynamic Role-Based Access Control, allowing role assignment during user authentication.

[1]Terminal Access Controller Access Control System

[2]A security paradigm that restricts system access based on roles assigned to users.

[3]A predefined or customized grouping of permissions assigned to users.

[4]A set of rules determining which actions are permitted or denied for a specific user role.

[5]Dynamic Role-Based Access Control, allowing role assignment during user authentication.

AUTHENTICATION MANAGEMENT COMMAND REFERENCE

Authentication, Authorization and Accounting

This chapter is a reference for the authentication:

- Authentication identifies users by challenging them to provide a user name and password. This information can be encrypted if required, depending on the underlying protocol.
- Authorization provides a method of authorizing commands and services on a per user profile basis.

Note: Authorization will be auto-enabled if user enables the Authentication.

- Accounting collects detailed system and command information and stores it on a central server where it can be used for security and quality assurance purposes.

The authentication feature allows you to verify the identity and, grant access to managing devices. The authentication feature works with the access control protocols as described in these chapters:

- RADIUS Commands (page 237)
- TACACS+ Commands (page 219)

Notes: Only network administrators can execute these commands. For more, see the username (page 371) command.

The commands below are supported only on the “management” **VRF**[1].

Per-command authorization needs to be enabled explicitly by the user whereas Session based authorization will be implicitly enabled when user enables authentication.

This chapter describes these commands:

[1]Virtual Routing and Forwarding

aaa authentication login

Use this command to set login authentication behavior.

Use the **no** form of this command to disable either authentication behavior.

Command Syntax

```
aaa authentication login error-enable (vrf (NAME|management)|)
no aaa authentication login error-enable (vrf (NAME|management)|)
```

Parameters

error-enable
Display login failure messages.

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, aaa authentication login is local

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#aaa authentication login error-enable vrf management
```

[1]Virtual Routing and Forwarding

aaa accounting default

Use this command to set a list of server groups to which to redirect accounting logs.

Use the **no** form of this command to only log locally.

Command Syntax

```
aaa accounting default (vrf (NAME|management)|) ((group LINE)|local)
no aaa accounting default (vrf (NAME|management)|) ((group)|local)
```

Parameters

group
Server group list for authentication

LINE
A space-separated list of up to 8 configured **RADIUS**[1] or **TACACS**[2]+ server group names

local
Use local authentication

vrf management
Defines the management **VRF**[3] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

Default AAA method is local

Default groups: RADIUS or TACACS+

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#aaa accounting default vrf management group radius
```

[1]Remote Authentication Dial-In User Service

[2]Terminal Access Controller Access Control System

[3]Virtual Routing and Forwarding

aaa authentication login default

Use this command to set the AAA authentication methods.

Use the **no** form of this command to set the default AAA authentication method (local).

Command Syntax

```
aaa authentication login default (vrf (NAME|management)|) ((group LINE) | (local (|none)) | (none))
no aaa authentication login default (vrf (NAME|management)|)((group) | (local (|none)) | (none))
```

Parameters

group
Use a server group list for authentication

LINE
A space-separated list of up to 8 configured **RADIUS**[1] or **TACACS**[2]+, server group names followed by **local** or **none** or both **local** and **none**. The list can also include:

radius
All configured RADIUS servers

tacacs+
All configured TACACS+ servers

local
Use local authentication

none
No authentication

vrf management
Defines the management **VRF**[3] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, AAA authentication method is local

By default, groups: RADIUS or TACACS+

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

[1]Remote Authentication Dial-In User Service

[2]Terminal Access Controller Access Control System

[3]Virtual Routing and Forwarding

Examples

```
#configure terminal
(config)#aaa authentication login default vrf management group radius
```

aaa authorization default

Use this command to enable per-command authorization. By enabling this user should be able to authorize every command executed via configured server.

This authorization will work only when authentication is successful.

Use the no form of this command to disable authorization.

Command Syntax

```
aaa authorization default (vrf (NAME|management)|) ((group LINE)|local)
no aaa authorization default (vrf (NAME|management)|) ((group LINE)|local)
```

Parameters

group
Server group list for authentication

LINE
Space-separated list of up to 8 configured **TACACS**[1]+ server group names

local
Use local authentication

vrf management
Defines the management **VRF**[2] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

Default AAA method is local

Default groups: TACACS+

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 6.1.0. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#aaa authorization default vrf management group tacacs+
```

[1]Terminal Access Controller Access Control System

[2]Virtual Routing and Forwarding

aaa authentication login console fallback error

Use this command to enable fallback to local authentication for the console login if remote authentication is configured and all AAA servers are unreachable.

Use the **no** form of this command to disable fallback to local authentication for the console login.

Command Syntax

```
aaa authentication login console fallback error local (vrf (NAME|management)|)
no aaa authentication login console fallback error local (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

AAA authentication is local.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#aaa authentication login console fallback error local
```

[1]Virtual Routing and Forwarding

aaa authentication login default fallback error

Use this command to enable fallback to local authentication for the default login if remote authentication is configured and all AAA servers are unreachable.

Use the **no** form of this command to disable fallback to local authentication.

Command Syntax

```
aaa authentication login default fallback error local (vrf (NAME|management)|)
no aaa authentication login default fallback error local (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, AAA authentication is local.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#aaa authentication login default fallback error local vrf management
```

[1]Virtual Routing and Forwarding

aaa group server

Use this command to create a server group and enter server group configure mode.

Use the **no** form of this command to remove a server group.

Command Syntax

```
aaa group server (radius|tacacs+) WORD (vrf (NAME|management)|)
no aaa group server (radius|tacacs+) WORD (vrf (NAME|management)|)
```

Parameters

radius
RADIUS[1] server group

tacacs+
TACACS[2]+ server group

WORD
Server group name; maximum 127 characters

vrf management
Defines the management **VRF**[3] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, the AAA group server option is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#aaa group server radius maxsmart
(config-radius)#
```

[1]Remote Authentication Dial-In User Service

[2]Terminal Access Controller Access Control System

[3]Virtual Routing and Forwarding

aaa local authentication attempts max-fail

Use this command to set the number of unsuccessful authentication attempts before a user is locked out.

Use the **no** form of this command to disable the lockout feature.

Command Syntax

```
aaa local authentication attempts max-fail <1-25>
no aaa local authentication attempts max-fail
```

Parameters

<1-25>
Number of unsuccessful authentication attempts

Default

By default, the maximum number of unsuccessful authentication attempts before a user is locked out is 3.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa local authentication attempts max-fail 2
```

aaa local authentication unlock-timeout

Use this command to set timeout value in seconds to unlock local user-account.

Use the no form of this command to set default timeout value in seconds.

> **Note:** This command is applicable only to local user but not for user or users present at the server end to authenticate using **TACACS**[1]+ or **RADIUS**[2].

Command Syntax

```
aaa local authentication unlock-timeout <1-3600>
no aaa local authentication unlock-timeout
```

Parameters

<1-3600>
Timeout in seconds to unlock local user-account.

Default

By default, the unlock timeout is 1200 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa local authentication unlock-timeout 1800
```

[1]Terminal Access Controller Access Control System

[2]Remote Authentication Dial-In User Service

debug aaa

Use this command to display AAA debugging information.

Use the **no** form of this command to stop displaying AAA debugging information.

Command Syntax

```
debug aaa
no debug aaa
```

Parameters

None

Command Mode

Configure mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug aaa
```

disable default auto-enable

Use this command to disable auto-enable feature in remote authentication for user role "network-user".

Use **no** parameter of this command to enable auto-enable feature.

Command Syntax

```
disable default auto-enable
no disable default auto-enable
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.5.1.

Examples

The following CLI disable auto-enable feature for user role "network-user" in remote authentication.

```
OcNOS(config)#disable default auto-enable
OcNOS(config)#commit
OcNOS(config)#exit
```

server

Use this command to add a server to a server group.

Use the **no** form of this command to remove from a server group.

Command Syntax

```
server (A.B.C.D | X:X::X:X | HOSTNAME)
no server (A.B.C.D | X:X::X:X | HOSTNAME)
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

HOSTNAME
DNS host name of the server.

Default

None

Command Modes

RADIUS[1] Server Group mode and **TACACS**[2] Server Group mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature tacacs+
(config)#aaa group server tacacs+ TacacsGroup4
(config-tacacs)#server 203.0.113.127
```

[1]Remote Authentication Dial-In User Service

[2]Terminal Access Controller Access Control System

show aaa authentication

Use this command to display AAA authentication configuration.

Command Syntax

```
show aaa authentication (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Modes

Execution mode

Applicability

This command was introduced before OcNOS version 1.3. Added `VRF NAME` parameter in OcNOS version 6.5.3.

Examples

```
#show aaa authentication
                VRF: default
  default: local
  console: local
```

The table below explains the output fields.

Table 11. show aaa authentication fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.
Default	Displays the aaa authentication method list.
Console	Authentication setting for the console access.

[1]Virtual Routing and Forwarding

show aaa authentication login

Use this command to display AAA authentication configuration for login default and login console.

Command Syntax

```
show aaa authentication login error-enable (vrf (NAME|management)|)
```

Parameters

error-enable
Display setting for login failure messages

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Modes

Execution mode

Applicability

This command was introduced before OcNOS version 1.3. Added `VRF NAME` parameter in OcNOS version 6.5.3.

Examples

```
#show aaa authentication login error-enable
               VRF: default
disabled
```

The table below explains the output fields.

Table 12. show aaa authentication login error-enable fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.

[1]Virtual Routing and Forwarding

show aaa authorization

Use this command to display AAA authorization configuration.

Command Syntax

```
show aaa authorization (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Modes

Execution mode

Applicability

This command is introduced in OcNOS version 6.1.0. Added `VRF NAME` parameter in OcNOS version 6.5.3.

Examples

```
#show aaa authorization
 VRF: default
default: group tacacs+
```

[1]Virtual Routing and Forwarding

show aaa groups

Use this command to display AAA group configuration.

Command Syntax

```
show aaa groups (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Modes

Execution mode

Applicability

This command was introduced before OcNOS version 1.3. Added `VRF NAME` parameter in OcNOS version 6.5.3.

Examples

```
#show aaa groups
VRF: default
radius
```

The table below explains the output fields.

Table 13. show aaa groups fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.

[1]Virtual Routing and Forwarding

show aaa accounting

Use this command to display AAA accounting configuration.

Command Syntax

```
show aaa accounting (vrf (NAME|management|all)|)
```

Parameters

vrf all
Accounting configs present in all VRFs.

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Modes

Execution mode

Applicability

This command was introduced before OcNOS version 1.3. Added `VRF NAME` parameter in OcNOS version 6.5.3.

Examples

```
#show aaa accounting
               VRF: default
 default: group tacacs+
```

The table below explains the output fields.

Table 14. show aaa accounting fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.

[1]Virtual Routing and Forwarding

show running-config aaa

Use this command to display AAA settings in the running configuration.

Command Syntax

```
show running-config aaa (vrf (NAME|management)|all)|)
```

Parameters

vrf all
All VRFs

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Modes

Execution mode

Applicability

This command was introduced before OcNOS version 1.3. Added `VRF NAME` parameter in OcNOS version 6.5.3.

Examples

```
#show running-config aaa
aaa authentication login default vrf management group tacacs+
aaa group server tacacs+ tac1
server 2.2.2.2 vrf management
```

The table below explains the output fields.

Table 15. show running-config aaa

Field	Description
AAA Authentication	Authentication method used for login.
AAA Group	AAA group for the server.
Server	IP address of the server used for the authentication.
VRF Management	The authentication process for VRF instance.

[1]Virtual Routing and Forwarding

TACACS+ Commands

Terminal Access Controller Access-Control System Plus (**TACACS**[1]+, usually pronounced like tack-axe) is an access control network protocol for network devices.

The differences between **RADIUS**[2] and TACACS+ can be summarized as follows:

- RADIUS combines authentication and authorization in a user profile, while TACACS+ provides separate authentication.
- RADIUS encrypts only the password in the access-request packet sent from the client to the server. The remainder of the packet is unencrypted. TACACS+ encrypts the entire body of the packet but leaves a standard TACACS+ header.
- RADIUS uses **UDP**[3], while TACACS+ uses TCP.
- RADIUS is based on an open standard (RFC 2865). TACACS+ is proprietary to Cisco, although it is an open, publicly documented protocol (there is no RFC protocol specification for TACACS+).

Notes:

- Only network administrators can execute these commands. For more, see the username (page 371) command.
- The commands below are supported only on the “management” **VRF**[4].

This chapter contains these commands:

[1]Terminal Access Controller Access Control System

[2]Remote Authentication Dial-In User Service

[3]User Datagram Protocol

[4]Virtual Routing and Forwarding

add policy

Use this command to add a policy to a **TACACS**[1]+ role-based authorization (RBAC) role.

Use the **no** form of this command to remove a policy from an RBAC role.

Command Syntax

```
add policy POLICY-NAME
no add policy POLICY-NAME
```

Parameters

POLICY-NAME
Name of the policy

Default

None

Command Mode

RBAC role mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples demonstrate the configuration of a role named '**myRole**,' defining its default permissions, adding '**myPolicy1**' to the role, and subsequently removing '**myPolicy2**' from it.

```
OcNOS(config)#role myRole
OcNOS(config-role)#default permit-all
OcNOS(config-role)#add policy myPolicy1
OcNOS(config-role)#no add policy myPolicy2
OcNOS(config-role)#exit
```

[1]Terminal Access Controller Access Control System

clear tacacs-server counters

Use this command to clear the counter on a specified **TACACS**[1] server.

Syntax

```
clear tacacs-server ((HOSTNAME | X:X::X:X | A.B.C.D)|) counters (vrf (management | all)|)
```

Parameters

HOSTNAME
The name of the server

X:X::X:X
IPv6 address of the server

A.B.C.D
IPv4 address of the server

vrf
VRF[2] of the sever

management
The management VRF

all
All VRFs

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear tacacs-server 10.1.1.1 counters
```

[1]Terminal Access Controller Access Control System

[2]Virtual Routing and Forwarding

debug tacacs+

Use this command to display **TACACS**[1]+ debugging information.

Use the **no** form of this command stop displaying TACACS+ debugging information.

Command Syntax

```
debug tacacs+
no debug tacacs+
```

Parameters

None

Default

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug tacacs+
```

[1]Terminal Access Controller Access Control System

default

Use this command to set the default rule for a **TACACS**[1]+ role-based authorization (RBAC) role.

Use the **no** parameter with this command to remove the default rule for a TACACS+ role-based authorization (RBAC) role.

Command Syntax

```
default (permit-all | deny-all)
no default
```

Parameters

permit-all
Permit all commands

deny-all
Deny all commands

Default

Unless this command is explicitly configured, the default rule for a role is **deny-all**.

Command Mode

RBAC role mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example illustrates the configuration of a role named '**myRole**' in OcNOS, and specifying its default permission.

```
OcNOS(config)#role myRole
OcNOS(config-role)#default permit-all
OcNOS(config-role)#exit
```

[1]Terminal Access Controller Access Control System

deny

Use this command to add a deny rule to a **TACACS**[1]+ role-based authorization (RBAC) policy.

Use the **no** form of this command to remove a deny rule from an RBAC policy.

Command Syntax

```
deny RULE-STRING (mode MODE-NAME |)
no deny RULE-STRING (mode MODE-NAME |)
```

Parameters

RULE-STRING
Command string

MODE-NAME
Command prompt string such as `config-router` or `config-if`. Deny access to the command only in this mode.

Default

None

Command Mode

RBAC policy mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The example below illustrates the configuration of a policy named **myPolicy** in OcNOS. It includes a deny rule that restricts access to the **ip address** command, specifically within the configuration interface mode (**config-if**).

```
OcNOS#configure terminal
OcNOS(config)#policy myPolicy
OcNOS(config-policy)#deny “ip address” mode config-if
OcNOS(config-policy)#end
```

[1]Terminal Access Controller Access Control System

feature dynamic-rbac

Use this command to enable the **TACACS**[1]+ role-based authorization (RBAC) feature.

Use the **no** form of this command to disable the RBAC feature.

Command Syntax

```
feature dynamic-rbac
no feature dynamic-rbac
```

Parameters

None

Default

By default, feature TACACS+ RBAC is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The example below illustrates the configuration of enabling the TACACS+ RBAC feature.

```
OcNOS#configure terminal
OcNOS(config)#feature dynamic-rbac
```

[1]Terminal Access Controller Access Control System

feature tacacs+

Use this command to enable the **TACACS**[1]+ feature.

Use the **no** form of this command to disable the TACACS+ feature.

Command Syntax

```
feature tacacs+ (vrf (NAME|management)|)
no feature tacacs+ (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[2] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added `VRF NAME` parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#feature tacacs+ vrf management
```

[1]Terminal Access Controller Access Control System

[2]Virtual Routing and Forwarding

show debug tacacs+

Use this command to display whether **TACACS**[1]+ debugging is enabled.

Command Syntax

```
show debug tacacs+
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug tacacs+
TACACS client debugging is on
```

[1]Terminal Access Controller Access Control System

show rbac-policy

Use this command to display **TACACS**[1]+ role-based authorization (RBAC) policies.

Command Syntax

```
show rbac-policy (POLICY-NAME |)
```

Parameters

POLICY-NAME
Policy[2] name

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples display the show output of the RBAC policy named **myPolicy** and its associated configurations.

```
OcNOS#show rbac-policy myPolicy
-----------------------------------------------------------------------
Policy Name     : myPolicy
permit "ip address" mode config-if
```

[1]Terminal Access Controller Access Control System

[2]A set of rules determining which actions are permitted or denied for a specific user role.

show rbac-role

Use this command to display information about **TACACS**[1]+ role-based authorization (RBAC) roles.

Command Syntax

```
show rbac-role (ROLE-NAME |)
```

Parameters

ROLE-NAME
Role name

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following examples display the show output of the RBAC role named **myRole** and its associated configurations.

```
OcNOS#show rbac-role myRole
------------------------------------------------------------------------
Role Name          : myRole
Default rule       : permit-all
Attached Policies  : myPolicy1
                   : myPolicy2

------------------------------------------------------------------------
```

Table 16. show rbac-role fields

Entry	Description
Role Name	Displays the name of the role, in this case, **myRole**.
Default rule	Indicates the default rule associated with the role, which can be **permit-all** or **deny-all**.
Attached Policies	Lists the names of policies that are attached to this role. In the example, **myPolicy1** and **myPolicy2** are attached to **myRole**.

[1]Terminal Access Controller Access Control System

show running-config tacacs+

Use this command to display **TACACS**[1]+ settings in the running configuration.

Command Syntax

```
show running-config tacacs+
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config tacacs+
feature tacacs+ vrf management
tacacs-server login host 10.16.19.2 vrf management seq-num 1 key 7 0x9f4a8983e0216052
```

Table 17 explains the output fields.

Table 17. show running-config fields

Entry	Description
TACAS server host	TACACS+ server Domain Name Server (DNS) name.
Seq-num	Sequence number of user authentication attempt with the TACACS+ server.
VRF[2] Management	The management traffic using VPN Routing and Forwarding (VRFs).

[1]Terminal Access Controller Access Control System

[2]Virtual Routing and Forwarding

show tacacs-server

Use this command to display the **TACACS**[1]+ server configuration.

Command Syntax

```
show tacacs-server (|vrf (management|all))((WORD)|(groups (GROUP|))|)|(sorted)
```

Parameters

WORD
DNS host name or IP address

groups
TACACS+ server group

GROUP
Group name; if this parameter is not specified, display all groups

sorted
Sort by TACACS+ server name

vrf
management or all VRFs

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show tacacs-server
total number of servers:1
Tacacs+ Server : 192.168.10.215/49(*)
Sequence Number : 1
Failed Auth Attempts : 0
Success Auth Attempts : 14
Failed Connect Attempts : 0
Last Successful authentication: 2017 December 18, 12:27:13
(*) indicates last active.
```

Here is the explanation of the show command output fields.

Table 18. show tacacs-server output fields

Field	Description
Sequence Number	Sequence number of user authentication attempt with the TACACS+ server.

[1]Terminal Access Controller Access Control System

Table 18. show tacacs-server output fields (continued)

Field	Description
Failed Auth Attempts	Number of times user authentication failed with the TACACS+ server. Increments for server key mismatches and password mismatches or wrong password for the user.
Success Auth Attempts	Number of times user authenticated with TACACS+ server. Increments for each successful login.
Failed Connect Attempts	Number of failed TCP socket connections to the TACACS+ server. Increments for server connection failure cases such as server not-reachable, server port mismatches.
Last Successful authentication	Timestamp when user successfully authenticated with the TACACS+ server.

tacacs-server login host

Use this command to set the **TACACS**[1]+ server host name or IP address.

Use the **no** form of this command to remove an TACACS+ server (if only a host name or IP address is specified as parameter) or to remove all of a TACACS+ server's configuration settings (if any other parameters are also specified).

Notes: When the hostname is configured as a TACACS server, and the local client interface has both IPv4 and IPv6 addresses assigned, the DNS hostname resolution prioritizes the IPv6 address. If the IPv6 address is unreachable, the system does not fall back to the IPv4 address. Therefore, the user must either:

- Configure only IPv4 or IPv6.

or

- Ensure that the IPv6 address remains reachable.

Command Syntax

```
tacacs-server login host (HOSTNAME | X:X::X:X | A.B.C.D) (vrf management|) (seq-num <1-8> |) (key ((0
WORD) | (7 WORD) | (WORD))|) (port <1025-65535> |) (timeout <1-60> |)
no tacacs-server login host (HOSTNAME | A.B.C.D | X:X::X:X) (vrf management|)
no tacacs-server login host (HOSTNAME | X:X::X:X | A.B.C.D) (vrf management|) (key ((0 WORD) | (7 WORD)
| (WORD))|) (port <1025-65535> |) (timeout <1-60> |)
```

Parameters

HOSTNAME
Host name

X:X::X:X
IPv6 address

A.B.C.D
IPv4 address

vrf
Virtual Routing and Forwarding

management
Management **VRF**[2]

seq-num
Sequence Number / Priority index for tacacs-servers

key
Authentication and encryption key (“shared secret”)

0
Unencrypted (clear text) shared key

WORD
Unencrypted key value; maximum length 63 characters

[1]Terminal Access Controller Access Control System

[2]Virtual Routing and Forwarding

7
Hidden shared key

WORD
Hidden key value; maximum length 512 characters

WORD
Unencrypted (clear text) shared key value; maximum length 63 characters

port
TACACS+ server port

<1205-65535>
TACACS+ server port number; the default is 49

timeout
TACACS+ server timeout

<1-60>
Timeout value in seconds; default is 5 seconds

Default

Enable authentication for TACACS+ server configured. Authorization is also enabled by default. The default server port is 49.The default timeout value is 5 seconds.

There is **no** command to enable authorization. Authorization functionality is enabled by default when remote. authentication is enabled with TACACS+.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#tacacs-server login host 203.0.113.31 vrf management
```

tacacs-server login key

Use this command to set a global preshared key (“shared secret”) which is a text string shared between the device and **TACACS**[1]+ servers.

Use the **no** form of this command to remove a global preshared key.

Command Syntax

```
tacacs-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|)
no tacacs-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|)
```

Parameters

0
Unencrypted (clear text) shared key

WORD
Unencrypted key value; maximum length 63 characters

7
Hidden shared key

WORD
Hidden key value; maximum length 512 characters

WORD
Unencrypted (clear text) shared key value; maximum length 63 characters

vrf
Virtual Routing and Forwarding

management
Management **VRF**[2]

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#tacacs-server login key 7 jvn05mlQH1 vrf management
```

[1]Terminal Access Controller Access Control System

[2]Virtual Routing and Forwarding

tacacs-server login timeout

Use this command to set the period to wait for a response from the server before the client declares a timeout failure. The default timeout value is 5 seconds.

You can only give this command when the **TACACS**[1]+ feature is enabled.

Use the **no** form of this command to set the timeout value to its default value (5 seconds).

> **Note:** TELNET client session's default timeout is 60 seconds, so configuring timeout of 60 seconds timeout impacts TELNET client applications, because it cannot be fallback to use the other configured server/group. Hence it is recommended to configure 57 seconds or lesser timeout while using TELNET. This timeout doesn't have an impact on SSH connections.

Command Syntax

```
tacacs-server login timeout <1-60> (vrf management|)
no tacacs-server login timeout (vrf management|)
```

Parameters

<1-60>
Timeout value in seconds

vrf
Virtual Routing and Forwarding

management
Management **VRF**[2]

Default

None

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 1.3.9

Examples

```
#configure terminal
(config)#tacacs-server login timeout 35 vrf management
```

[1]Terminal Access Controller Access Control System

[2]Virtual Routing and Forwarding

RADIUS Commands

This chapter is a reference for Remote Authentication Dial In User Service (**RADIUS**[1]) commands, RADIUS provides centralized Authentication, Authorization management for users that connect to and use a network service. RADIUS is specified in RFC 2865.

Notes: Only network administrators can execute these commands. For more, see the username (page 371) command.

The commands below are supported only on the “management” **VRF**[2].

[1]Remote Authentication Dial-In User Service

[2]Virtual Routing and Forwarding

clear radius-server

Use this command to clear Radius Server statistics.

Command Syntax

```
clear radius-server ((HOSTNAME | X:X::X:X | A.B.C.D)|) counters (vrf (management | all)|)
```

Parameters

A.B.C.D
IPv4 address of **RADIUS**[1] server

X:X::X:X
IPv6 address of RADIUS server

HOSTNAME
DNS host name of RADIUS server

vrf management
To clear radius server counters for Virtual Routing and Forwarding management

all
To clear radius server counters for both management an default vrf

counters
To clear radius server counters for default vrf

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 1.3.

Example

```
#clear radius-server counters vrf management
```

[1]Remote Authentication Dial-In User Service

debug radius

Use this command to display **RADIUS**[1] debugging information.

Use the **no** form of this command stop displaying RADIUS debugging information.

Command Syntax

```
debug radius
no debug radius
```

Parameters

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug radius
```

[1]Remote Authentication Dial-In User Service

radius-server login host

Use this command to configure a **RADIUS**[1] server for both accounting and authentication.

Use the **no** form of this command to remove a RADIUS server.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) seq-num (<1-8>)
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) seq-num (<1-8>) timeout
<1-60>
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) seq-num (<1-8>)(acct-port
<0-65535> |) | timeout <1-60> |)
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) seq-num (<1-8>)(|(auth-
port <0-65535> (|(acct-port <0-65535> (|(timeout <1-60>))))))
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) seq-num (<1-8>)(|(key ((0
WORD) | (7 WORD)) (|(auth-port <0-65535> (|(acctport <0-65535> (|(timeout <1-60>))))))))

no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|)
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|)
timeout
```

Parameters

login
Remote login

A.B.C.D
IPv4 address of RADIUS server

X:X::X:X
IPv6 address of RADIUS server

HOSTNAME
DNS host name of RADIUS server

seq-num
seq-num Sequence Number / Priority index for radius-servers

<1-8>
sequence number for servers

timeout
How long to wait for a response from the RADIUS server before declaring a timeout failure

<1-60>
Range of time out period in seconds

vrf
Virtual Routing and Forwarding

management
Management **VRF**[2]

Default

None

[1]Remote Authentication Dial-In User Service

[2]Virtual Routing and Forwarding

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15 vrf management seq-num 1
```

radius-server login host acct-port

Use this command to configure a **RADIUS**[1] server and specify a **UDP**[2] port to use for RADIUS accounting messages.

Use the **no** form of this command to remove a RADIUS server.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|) acct-
port <0-65535> |) | timeout <1-60> |)
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|)
acct-port |) | timeout <1-60> |)
```

Parameters

login
Remote login

A.B.C.D
IPv4 address of RADIUS server

X:X::X:X
IPv6 address of RADIUS server

HOSTNAME
DNS host name of RADIUS server

seq-num
seq-num Sequence Number / Priority index for radius-servers

<1-8>
sequence number for servers

acct-port
UDP port to use for RADIUS accounting messages

<0-65535>
Range of UDP port numbers

timeout
How long to wait for a response from the RADIUS server before declaring a timeout failure

<1-60>
Range of timeout period in seconds

vrf
Virtual Routing and Forwarding

management
Management **VRF**[3]

Default

By default, Radius-server login host acct-port is 1813

[1]Remote Authentication Dial-In User Service

[2]User Datagram Protocol

[3]Virtual Routing and Forwarding

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 192.168.2.3 vrf management seq-num 2 acct-port 23255
```

radius-server login host auth-port

Use this command to configure a **RADIUS**[1] server and specify a **UDP**[2] port to use for RADIUS authentication messages.

Use the **no** form of this command to remove a RADIUS server.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|) (|
(auth-port <0-65535> (|(acct-port <0-65535> (|(timeout <1-60>))))))
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|)
(auth-port (|(acct-port (|timeout))))
```

Parameters

login
Remote login

A.B.C.D
IPv4 address of RADIUS server

X:X::X:X
IPv6 address of RADIUS server

HOSTNAME
DNS host name of RADIUS server

seq-num
seq-num Sequence Number / Priority index for radius-servers

<1-8>
sequence number for servers

auth-port
UDP port to use for RADIUS accounting messages

<0-65535>
Range of UDP port numbers

acct-port
UDP port to use for RADIUS accounting messages

<0-65535>
Range of UDP port numbers

timeout
How long to wait for a response from the RADIUS server before declaring a timeout failure

<1-60>
Range of timeout period in seconds

vrf
Virtual Routing and Forwarding

[1]Remote Authentication Dial-In User Service

[2]User Datagram Protocol

management
Management **VRF**[1]

Default

By default, Radius-server login host acct-port is 1812.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15 vrf management seq-num 1 auth-port 23255
```

[1]Virtual Routing and Forwarding

radius-server login host key

Use this command to set per-server shared key (“shared secret”) which is a text string shared between the device and **RADIUS**[1] servers.

Use the no form of this command to remove a server shared key.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|) (|(key
((0 WORD) | (7 WORD)) (|(auth-port <0-65535> (|(acct-port <0-65535> (|(timeout <1-60>))))))))
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|) (key
((0 WORD) | (7 WORD) ) (|(auth-port <0-65535> (|(acct-port (|(timeout)))))))
```

Parameters

login
Remote login

A.B.C.D
IPv4 address of RADIUS server

X:X::X:X
IPv6 address of RADIUS server

HOSTNAME
DNS host name of RADIUS server

seq-num
seq-num Sequence Number / Priority index for radius-servers

<1-8>
sequence number for servers

0
Unencrypted (clear text) shared key

WORD
Unencrypted key value; maximum length 63 characters

7
Hidden shared key

WORD
Hidden key value; maximum length 63 characters

WORD
Unencrypted (clear text) shared key value; maximum length 63 characters

auth-port
UDP[2] port to use for RADIUS accounting messages

<0-65535>
Range of UDP port numbers

acct-port
UDP port to use for RADIUS accounting messages

[1]Remote Authentication Dial-In User Service

[2]User Datagram Protocol

<0-65535>
Range of UDP port numbers

timeout
How long to wait for a response from the RADIUS server before declaring a timeout failure

<1-60>
Range of timeout period in seconds

vrf
Virtual Routing and Forwarding

management
Management **VRF**[1]

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15 vrf management seq-num 1 key 0 testing auth-port 23255
```

[1]Virtual Routing and Forwarding

radius-server login key

Use this command to set a global preshared key (“shared secret”) which is a text string shared between the device and **RADIUS**[1] servers.

Use the **no** form of this command to remove a global preshared key.

Command Syntax

```
radius-server login key ((0 WORD) | (7 WORD)) (vrf management|)
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num
(<1-8>)|) (|(key ((0 WORD) | (7 WORD)) (|(auth-port <0-65535> (|(acctport <0-65535> (|(timeout <1-
60>))))))))
no radius-server login key ((0 WORD) | (7 WORD)) (vrf management|)
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME)(vrf management|)(seqnum(<1-8>)|) (key ((0
WORD) | (7 WORD)) (|(auth-port <0-65535> (|(acctport(|(timeout)))))))
```

Parameters

login
Remote login

0
Unencrypted (clear text) shared key

WORD
Unencrypted key value; maximum length 63 characters

7
Hidden shared key

WORD
Hidden key value; maximum length 63 characters

WORD
Unencrypted (clear text) shared key value; maximum length 63 characters

vrf
Virtual Routing and Forwarding

management
Management **VRF**[2]

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

[1]Remote Authentication Dial-In User Service

[2]Virtual Routing and Forwarding

Examples

```
#configure terminal
(config)#radius-server login key 7 p2AcxlQA vrf management

#configure terminal
(config)#no radius-server login key 7 p2AcxlQA vrf management
```

radius-server login timeout

Use this command to set the global timeout which is how long the device waits for a response from a **RADIUS**[1] server before declaring a timeout failure.

Use the **no** form of this command to set the global timeout to its default (1 second).

Note: TELNET client session's default timeout is 60 seconds, so configuring timeout of 60 seconds timeout impacts TELNET client applications, because it cannot be fallback to use the other configured server/group. Hence it is recommended to configure 57 seconds or lesser timeout while using TELNET. This timeout doesn't have an impact on SSH connections.

Command Syntax

```
radius-server login timeout <1-60> (vrf management|)
no radius-server login timeout (vrf management|)
```

Parameters

login
Remote login

<1-60>
Range of timeout period in seconds

vrf
Virtual Routing and Forwarding

management
Management **VRF**[2]

Note: The system takes minimum 3 secs to timeout even though the configured timeout value is less than 3 seconds. Hence do not configure timeout value less than 3 secs. The timeout range value is mentioned as 1-60 secs for backward compatibility.

Default

By default, radius-server login timeout is 5 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

[1]Remote Authentication Dial-In User Service

[2]Virtual Routing and Forwarding

Examples

```
#configure terminal
(config)#radius-server login timeout 15 vrf management

#configure terminal
(config)#no radius-server login timeout 15 vrf management
```

show debug radius

Use this command to display debugging information.

Command Syntax

```
show debug radius
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug radius
RADIUS client debugging is on
```

show radius-server

Use this command to display the **RADIUS**[1] server configuration.

Command Syntax

```
show radius-server (|vrf(management|all))((WORD)|(groups (GROUP|)|)|sorted
```

Parameters

WORD
DNS host name or IP address

groups
RADIUS server group

GROUP
Group name; if this parameter is not specified, display all groups

sorted
Sort by RADIUS server name

vrf
management or all VRFs

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show radius-server vrf management
        VRF: management
timeout value: 5
Total number of servers:2
Following RADIUS servers are configured:
Radius Server                          : 10.12.12.39
   Sequence Number                     : 1
   available for authentication on port : 1812
   available for accounting on port     : 1813
   RADIUS shared secret                : ********
   Failed Authentication count         : 0
   Successful Authentication count     : 0
   Failed Connection Request           : 0
   Last Successful authentication      :
Radius Server                          : 1.1.1.1
   Sequence Number                     : 2
   available for authentication on port : 1234
   available for accounting on port     : 1234
   timeout                             : 5
   Failed Authentication count         : 0
```

[1]Remote Authentication Dial-In User Service

```
    Successful Authentication count      : 0
    Failed Connection Request            : 0
    Last Successful authentication       :
```

Here is the explanation of the "show radius-server fields" output fields.

Table 19. show radius-server fields

Entry	Description
VRF[1]	Virtual Routing and Forwarding (VRF) default support.
Timeout Value	Period the local router waits to receive a response from a RADIUS accounting server before retransmitting the message
Total number of servers	Number of authentication requests received by the authentication server.

[1]Virtual Routing and Forwarding

show running-config radius

Use this command to display **RADIUS**[1] configuration settings in the running configuration.

Command Syntax

```
show running-config radius
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config radius
 10.12.12.39 vrf management seq-num 1 key 7 wawyanb123
 1.1.1.1 vrf management seq-num 2 auth-port 1234 acct-po
rt 1234
radius-server login key 7 wawyanb123
```

[1]Remote Authentication Dial-In User Service

REMOTE DEVICE CONNECT CONFIGURATION

Telnet Configuration

Overview

Telnet is a TCP/IP protocol used on the Internet and local area networks to provide a bidirectional interactive text-oriented communications facility using a virtual terminal connection. The Telnet program runs, connects it to a server on the network. A user can then enter commands through the Telnet program and they will be executed as if the user were entering them directly on the server console. Telnet enables users to control the server and communicate with other servers on the network. The default port number for Telnet protocol is 23. Telnet offers users the capability of running programs remotely and facilitates remote administration.

In-band Management Over Default VRF

OcNOS supports Telnet over the default and management VRFs via in-band management interface and OOB management interface, respectively.

By default, Telnet runs on the management **VRF**[1].

Telnet Configuration with IPv4 Address

Topology

Figure 6. Telnet topology

Enable and Disable the Telnet Server

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf management`	Disable Telnet feature
`(config)#feature telnet vrf management`	Enable Telnet feature
`(config)#commit`	Commit the candidate configuration to the running configuration

[1]Virtual Routing and Forwarding

`(config)#exit`	Exit configure mode

Configure the Telnet Server Port

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf management`	Disable Telnet feature
`(config)#telnet server port 6112 vrf management`	Set Telnet port to 61112
`(config)#feature telnet vrf management`	Enable Telnet feature
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Telnet Client Session

`#telnet 10.10.10.1 vrf management`	Log into remote machine using IPv4 address

Validation

```
#show telnet server

VRF MANAGEMENT
telnet server enabled port: 23
VRF DEFAULT:
telnet server enabled port: 6112

#show running-config telnet server

feature telnet vrf management
no feature telnet
```

Telnet Configuration with IPv6 Address

Telnet is performed with IPv6 IP and verified by logging on remote PC.

Topology

The sample configuration of Telnet is:

Figure 7. Telnet Configuration topology

Basic Configuration

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf management`	Disable Telnet feature
`(config)#feature telnet vrf management`	Enable Telnet feature
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Configure the Telnet Server Port

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf management`	Disable Telnet feature
`(config)#telnet server port 6112 vrf management`	Set Telnet port to 6112
`(config)#feature telnet vrf management`	Enable Telnet feature
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Telnet Client Session

`#telnet 2001::1 vrf management`	Log into remote machine using IPv6 address

Validation

```
##show telnet server

VRF MANAGEMENT
telnet server enabled port: 23

VRF DEFAULT:
telnet server enabled port: 6112
```

```
#show running-config telnet server

feature telnet vrf management
    no feature telnet
```

In-band Management Over User Defined VRF

From release 6.5.3, OcNOS supports Telnet over the user defined vrfs as well along with default and management VRFs via in-band interface.

By default, Telnet runs on the management VRF. If user wants to enable telnet feature over user defined vrfs which can be part of MPLS L3VPN/EVPN, it is possible to enable telnet feature over those user defined vrfs.

User must able to enable telnet feature over multiple user defined vrfs simultaneously with default/non default telnet ports.

Telnet Configuration with IPv4 Address

Topology

Figure 8. Telnet Configuration topology

Enable and Disable the Telnet Server on user defined vrf say vrf name is vrf_test

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf vrf_test`	Disable Telnet feature
`(config)#feature telnet vrf vrf_test`	Enable Telnet feature
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Configure the Telnet Server Port on user defined vrf say vrf name is vrf_test

`#configure terminal`	Enter configure mode
`(config)#ip vrf vrf_test`	Configure User defined vrf
`(config)#no feature telnet vrf vrf_test`	Disable Telnet feature

`(config)#telnet server port 6112 vrf vrf_test`	Set Telnet port to 61112
`(config)#feature telnet vrf vrf_test`	Enable Telnet feature
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Telnet Client Session

`#telnet 10.10.10.1`	Log into remote machine using IPv4 address

Validation

```
#show telnet server

VRF MANAGEMENT
telnet server enabled port: 23 VRF DEFAULT:
telnet server enabled port: 23
VRF vrf_test:
telnet server enabled port: 6112

#show running-config telnet server
feature telnet vrf vrf_test
feature telnet vrf management
feature telnet
```

Telnet Configuration with IPv6 Address

Telnet is performed with IPv6 IP and verified by logging on remote PC.

Topology

Figure 9. Telnet Configuration topology

Basic Configuration

`#configure terminal`	Enter configure mode
`(config)#ip vrf vrf_test`	Configure User defined vrf
`(config)#no feature telnet vrf vrf_test`	Disable Telnet feature
`(config)#feature telnet vrf vrf_test`	Enable Telnet feature

`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Configure the Telnet Server Port

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf vrf_test`	Disable Telnet feature
`(config)#telnet server port 6112 vrf vrf_test`	Set Telnet port to 6112
`(config)#feature telnet vrf vrf_test`	Enable Telnet feature
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Telnet Client Session

`#telnet 2001::1`	Log into remote machine using IPv6 address

Validation

```
#show telnet server
VRF MANAGEMENT
telnet server enabled port: 23 VRF DEFAULT:
telnet server enabled port: 23
VRF vrf_test:
telnet server enabled port: 6112

#show running-config telnet server
feature telnet vrf vrf_test
feature telnet vrf management
feature telnet
```

SSH Client Server Configuration

Overview

SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH was designed as a replacement for Telnet and other insecure remote shells, which send information, notably passwords, in plain text, rendering them susceptible to packet analysis.[2] The encryption used by SSH is intended to provide confidentiality and integrity of data over an unsecured network, such as the Internet. SSH uses public-key cryptography to authenticate the remote computer and allow the remote computer to authenticate the user.

SSH is typically used to log into a remote machine and execute commands, but it also supports tunneling, forwarding TCP ports and X11 connections; it can transfer files using the associated SFTP or SCP protocols. SSH uses the client- server model

TCP port 22 is assigned for contacting SSH servers. This document covers the SSH server configuration to enable SSH service and key generation and SSH client configuration for remote login to server.

In-band Management over Default VRF

OcNOS supports SSH over the default and management VRFs via the in-band management interface and out-of-band management interfaces, respectively.

SSH can run on the default and management VRFs simultaneously. By default, it runs on the management **VRF**[1].

SSH Configuration

SSH is performed with IPv4 and IPv6 addresses.

IPv4 Address Configuration

Topology

Figure 10. SSH sample topology

[1]Virtual Routing and Forwarding

Basic Configuration

`#configure terminal`	Enter configure mode
`(config)#ssh login-attempts 2 vrf management`	Set the number of login attempts to 2
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Validation

```
#show ssh server
ssh server enabled port: 22
authentication-retries 2

#show running-config ssh server
feature ssh vrf management
ssh login-attempts 2 vrf management
```

SSH Client Session

When the device acts as an SSH client, it supports both SSH IPv4 sessions to log into the remote machine.

`#ssh root@10.10.10.1 vrf management`	Log into remote machine using an IPv4 address

SSH Keys

Use the ssh key command to generate new RSA/DSA keys for the SSH server. By default, the system has RSA/DSA public/private key pair placed in **`/etc/ssh/`**. If you want to regenerate RSA keys, you must specify the **`force`** option.

Configuration

`#ssh keygen host rsa vrf management`	Specify the **`force`** option to regenerate SSH RSA keys. This option overwrites the existing key.

Validation

```
#sh ssh key
****************RSA KEY*******************
ssh-rsa

SSH Encryption Cipher

Overview

The Secure Shell (SSH) management uses various algorithms in the security mechanisms such as key exchange (KEX), message authentication code (MAC), and encryption (Cipher) for security and flexibility. As part of the security enhancement, additional SSH management algorithms are added into KEX, MAC, and encryption methods.

The security encryption algorithms used in SSH are enhanced to enable the users to use preferable (including weaker algorithms) security mechanisms (for legacy SSH clients) if they want to use them in their network apart from the default cipher algorithms. The default SSH configurations do not use these weaker encryption ciphers algorithms due to security priority.

However, OcNOS allows the users to enable or disable the desired algorithms option using the following commands.

- ssh server algorithm encryption (page 312)
- ssh server algorithm kex (page 314)
- ssh server algorithm mac (page 316)

- ssh server default algorithm (page 318)
- show ssh server algorithm (page 319)

Note: If the user wishes to modify these defaults, they can reconfigure them with the desired algorithms. For instance, by default, the following algorithms are applied: "chacha20-poly1305@openssh.com, aes256-gcm@openssh.com, aes128-gcm@openssh.com, aes256-ctr, aes192-ctr, aes128-ctr." To remove any of these algorithms, the user must explicitly reconfigure the necessary algorithms, such as using the command:sshserver algorithm encryption aes256-gcm@openssh.com,aes128-gcm@openssh.com.

Feature Characteristics

Following are the currently supported encryptions in the SSH session.

- Provides flexibility to user to add or remove the desired SSH encryption algorithms for the following encryption methods.
  - KEX
  - MAC
  - Encryption
- By default,*chacha20-poly1305@openssh.com,aes256-gcm@openssh.com,aes128-gcm@openssh.com,aes256-ctr,aes192-ctr,aes128-ctr*ciphers are supported for a new SSH client to connect with the SSH server
- Allows user to configure multiple algorithms.
- Supports following Strongest Cipher algorithms
  - Strongest Ciphers
    - *chacha20-poly1305@openssh.com,aes256-gcm@openssh.com,aes128-gcm@openssh.com,aes256-ctr,aes192-ctr,aes128-ctr*
  - MAC algorithms
    - *hmac-sha2-512-etm@openssh.com,*
    - *hmac-sha2-256-etm@openssh.com,*
    - *hmac-sha2-512,*
    - *hmac-sha2-256,*
- KEX algorithms
  - *curve25519-sha256@libssh.org,*
  - *diffie-hellman-group18-sha512,*
  - *diffie-hellman-group16-sha512,*
  - *ecdh-sha2-nistp521,*
  - *ecdh-sha2-nistp384,*
  - *ecdh-sha2-nistp256*
  - *diffie-hellman-group14-sha256 (uses 2048-bit keys and considered strong)*
- Avoid configuring the weaker Cipher algorithms
  - Legacy weaker Cipher

- *aes128-ctr*
- *aes192-ctr*
- *aes256-ctr*
- *aes128-cbc*
- *aes192-cbc*
- *aes256-cbc*(CBC mode is vulnerable to padding Oracle attacks)
- *3des-cbc*
- *blowfish-cbc*(Less efficient)
- *arcfour*(Based on RC4 which has significant vulnerabilities)
- *hmac-md5*(MD5 can be broken and should not be used)
- *umac-64@openssh.com (Weaker than SHA-2 based MACs)*
- *hmac-sha1*(Less secured and weak)
- Extents support to all **VRF**[1] interfaces including user-defined.

- Allows users with Network Admin or Network Engineer or Network Operator privilege to configure.
- Provides a show CLI command to view the configured SSH algorithms.
- Configured algorithms are persistent even after reload.

Benefits

Enhanced security for remote terminal connections via SSH. It enables users to utilize the legacy SSH clients with the algorithms option through newly introduced commands.

Prerequisites

SSH process should be enabled.

Configuration

This section provides an example to encrypt an SSH session with cipher algorithm.

Use any one or all of the algorithms to encrypt a default, management or user defined interface SSH session.

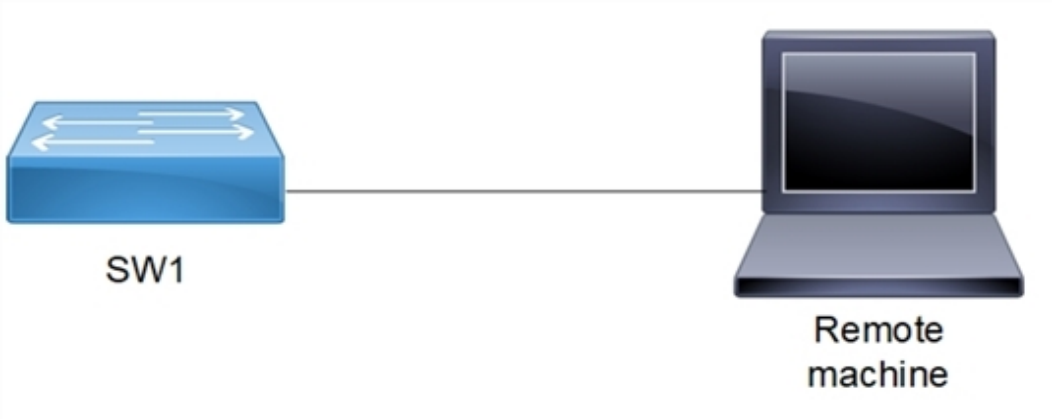
- ssh server algorithm mac (page 316)
- ssh server algorithm kex (page 314)
- ssh server algorithm encryption (page 312)
- ssh server default algorithm (page 318)

Topology

In the below topology, the SSH client from the OcNOS device is initiating an SSH connection to a remote machine.

[1]Virtual Routing and Forwarding

Figure 12. SSH Sample Topology



Note: Before configuration meet all Prerequisites (page 268).

Assign SSH security algorithm to a management Interface

1. Set the SSH server encryption algorithm for the management VRF.

```
(config)# ssh server algorithm mac hmac-sha2-256-etm hmac-sha1-96 hmac-md5-etm vrf management
```

2. Set the SSH server KEX algorithm for the management VRF.

```
(config)#ssh server algorithm kex ecdh-sha2-nistp256 ecdh-sha2-nistp384
ecdh-sha2-nistp521 vrf management
```

3. Set the SSH server MAC algorithm for the management VRF.

```
(config)# ssh server algorithm mac hmac-sha2-256-etm hmac-sha1-96 hmac-md5-etm vrf management
```

4. Commit the configuration and exit.

```
(config)#commit
(config)#exit
```

Assign SSH security algorithm to a default VRF Interface

1. Set the SSH server encryption algorithm for the default VRF.

```
(config)#ssh server algorithm encryption 3des-cbc aes128-cbc aes192-cbc aes256-cbc
```

2. Set the SSH server KEX algorithm for the default VRF.

```
(config)#ssh server algorithm kex diffie-hellman-group14-sha256 diffie-hellman-group16-sha512
diffie-hellman-group18-sha512
```

3. Set the SSH server MAC algorithm for the default VRF.

```
(config)# ssh server algorithm mac hmac-md5-etm umac-128
```

4. Commit the configuration and exit.

```
(config)#commit (config)#exit
```

Assign SSH security algorithm to a User Defined Interface

1. Create a user defined VRF interface with the name **vrf1**.

```
(config)#ip vrf vrf1
```

```
(config-vrf)# exit
```

2. Set the SSH server encryption algorithm for the User Defined **vrf1**.

```
(config)#ssh server algorithm encryption 3des-cbc aes128-cbc aes192-cbc aes256-cbc vrf vrf1
```

3. Set the SSH server KEX algorithm for the management **vrf1**.

```
ssh server algorithm kex diffie-hellman-group1-sha1 diffie-hellman-group14-sha1
```

4. Set the SSH server MAC algorithm for the management **vrf1**.

```
(config)#ssh server algorithm mac hmac-md5 hmac-md5-96 vrf vrf1
```

5. Commit the configuration and exit.

```
(config)#commit (config)#exit
```

Validation

Execute the following show command to view the SSH server informations.

```
#show running ssh server
feature ssh vrf management
ssh server algorithm mac hmac-sha2-256-etm hmac-sha1-96 hmac-md5-etm vrf management
ssh server algorithm encryption aes256-gcm rijndael-cbc aes128-ctr vrf management
ssh server algorithm kex ecdh-sha2-nistp256 ecdh-sha2-nistp384 ecdh-sha2-nistp521 vrf management

feature ssh
ssh server algorithm mac umac-128 hmac-md5-etm
ssh server algorithm encryption 3des-cbc aes128-cbc aes192-cbc aes256-cbc
ssh server algorithm kex diffie-hellman-group14-sha256 diffie-hellman-group16-sha512 diffie-hellman-
group18-sha512

feature ssh vrf vrf1

MACs hmac-md5,hmac-md5-96
```

SSH Key-Based Authentication

Enable OcNOS device SSH server to perform public key based SSH authentication, to enable machine to machine communication possible without requiring password. Public key based authentication increases the trust between

two Linux servers for easy file synchronization or transfer. Public-key authentication with SSH is more secure than password authentication, as it provides much stronger identity checking through keys.

Note: No support for Digital Signature Algorithm (DSA) public key authentication.

Topology

Figure 13. SSH Key-based authentication

Public Key Authentication Method

The server has the public key of the user stored; using this the server creates a random value, encrypts it with the public key and sends it to the user. If the user is who is supposed to be, he can decrypt the challenge using the private key and send it back to the server, server uses the public key again to decrypt received message to confirm the identity of the user. SSH is supported in-band (default **VRF**[1]) and out-band (management VRF). Installed keys are stored in the **`~/.ssh/authorized_keys`** file.

SSH key based authentication steps:

1. Login to remote machine Linux desktop (ssh client) and generate the key pair using the **`ssh-keygen`** command.
2. Create the username in OcNOS device (ssh server).
3. Install the public key of remote Linux ssh client in the OcNOS device.
4. Display the installed key in the OcNOS device using the **`show running-config`** command.
5. Log in from the remote Linux ssh client to the OcNOS device without providing a password.

Useful Commands on Remote Desktop Client

`# ssh-keygen`	To generate key pair on remote Linux machine (ssh client)
`# cd /bob/.ssh/`	To go to the location of saved key pair
`# cat id_rsa.pub`	Command to display the generated public key in remote Linux client

[1]Virtual Routing and Forwarding

Configuration commands in OcNOS

`(config)#configure terminal`	Enter configure mode.
`(config)#feature ssh vrf management`	Enable the SSH feature on vrf management. To enable in default vrf give the command "feature ssh"
`(config)#username fred`	To create username with default role as network-user. To create user with different role specify role using command "username <username> role <role_name>
`(config)#username fred sshkey ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQC8XhFiGlZP6y Y6qIWUkew884NvqXqMPSOw3fQe5kgpXvX0SbcU15axI /VHVgU2Y0/ogAtRUlAk5soRrf5lZ2+rT0zNP37m+Tm5HIEFKZZut0 FffGSuXtPKbE+GGlQYHEzC8RSnqQuHlxrlve3lGbB1U UxuWhMzJfgc2vZ78V2znd2zk4ygiN1jx1sE8UI98WyI cwuq44tzuIaUYAICIfrQJXriQml+QcJ9NER5O8rMS5D 5NnTVh1nroqoozY8i/qMKfhCFMbysjiDMHU9GclNsNbIF /DQbvWEskFFEvf6fOrzXyvq26NpgaJnZ4pQVzgkOaVw1 6Cy3csoTncw0vyXV bob@localhost.localdomain`	Install the public key of remote Linux client in OcNOS device.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

The new cipher encryption algorithm takes effect for a new incoming ssh client connection.

```
#show running-config

feature ssh vrf management
username fred role network-user

SSH Key-based Client Session

`#ssh fred@10.10.26.186`	Specify user name and ip address to access the device. Supports IPv4 and IPv6.User should be able to access without password and through key based authentication

Restrictions

- Key generation or installation are not supported for "root" user account in OcNOS device.
- Third party SSH utilities cannot be used for key installation, rather OcNOS CLI is the only way to install public keys.

Sample Use Case

1. Login to remote machine linux desktop (ssh client) and generate the key pair using the **`ssh-keygen`** command.

```
[bob@localhost ~]# ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (/bob/.ssh/id_rsa):
/bob/.ssh/id_rsa already exists.
Overwrite (y/n)? y
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /bob/.ssh/id_rsa.
Your public key has been saved in /bob/.ssh/id_rsa.pub.
The key fingerprint is:
b2:d0:cc:d2:dd:db:3d:05:c1:33:fc:4a:df:8e:85:af bob@localhost.localdomain
The key's randomart image is:
+--[ RSA 2048]----+
|             o.  |
|              =. |
|               .+ |
|     = . .    ...|
|    o * S .  . +o|
|     o o   o .o.+|
|      .   . . o= |

bob@localhost.localdomain
[bob@localhost .ssh]#
```

2. Create username in OcNOS switch device (ssh server)

```
(config)#username fred
```

> **Note:** By default, the user role is **`network-user`**.

3. Install the public key of remote Linux ssh client in OcNOS device.

```
(config)#username fred sshkey
ssh-rsa
AAAAB3NzaC1yc2EAAAADAQABAAABAQC8XhFiGlZP6yY6qIWUkew884NvqXqMPSOw3fQe5kgpXvX0SbcU15axI/VHVgU2Y0/
ogAtRUlAk5soRrf5lZ2+rT0zNP37m+Tm5HIEFKZZut0FffGSuXtPKbE+GGlQYHEzC8RSnqQuHlxrlve3lGbB1UUxuWhMzJf
gc2vZ78V2znd2zk4ygiN1jx1sE8UI98WyIcwuq44tzuIaUYAICIfrQJXriQml+QcJ9NER5O8rMS5D5NnTVh1nroqoozY8i/
qMKfhCFMbysjiDMHU9GclNsNbIF/DQbvWEskFFEvf6fOrzXyvq26NpgaJnZ4pQVzgkOaVw16Cy3csoTncw0vyXV
bob@localhost.localdomain
```

4. Display the installed key in OcNOS device using the **`show running-config`** command.

```
#show running-configg
<skipped other content>
username fred role network-user
username fred sshkey
ssh-rsa
AAAAB3NzaC1yc2EAAAADAQABAAABAQC8XhFiGlZP6yY6qIWUkew884NvqXqMPSOw3fQe5kgpXvX0SbcU15axI/VHVgU2Y0/
ogAtRUlAk5soRrf5lZ2+rT0zNP37m+Tm5HIEFKZZut0FffGSuXtPKbE+GGlQYHEzC8RSnqQuHlxrlve3lGbB1UUxuWhMzJf
gc2vZ78V2znd2zk4ygiN1jx1sE8UI98WyIcwuq44tzuIaUYAICIfrQJXriQml+QcJ9NER5O8rMS5D5NnTVh1nroqoozY8i/

bob@localhost.localdomain
<skipped other content>
```

5. Login from remote Linux ssh client to OcNOS device without providing password.

```
[bob@localhost .ssh]# ssh fred@10.10.26.186
```

Max Session and Session Limit Configuration

Overview

User can configure session-limit for Telnet and SSH sessions separately but this max-session parameter value takes the precedence to restrict the maximum number of sessions. If user configured this max-session to be 4, then the device would allow only maximum of 4 SSH and Telnet sessions collectively irrespective of the individual SSH and Telnet max-session configuration. Active sessions won't be disturbed even if the configured max-session limit is lesser than the current active sessions. Default value for max-session value is 40 in line mode. There is no default value for the telnet-server-limit and ssh-server-limit.

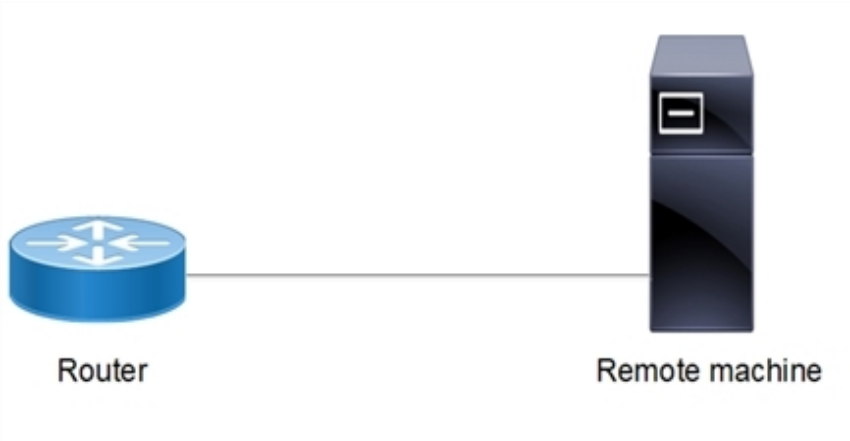
After configuring max-session parameter if user tries to configure SSH/Telnet sessions then the total value of Telnet and SSH session limit should be lesser than the max-session value otherwise error will be thrown.

If already Telnet and SSH session-limits configured, now if user is configuring max-session then there won't be any error but maximum number of sessions will be limited to max-session value.

Topology

The procedures in this section use the topology as mentioned below. Setup consists of one node acting as Telnet server.

Figure 14. Telnet topology



Configuration of Telnet Session Limit Lesser than Max-Session

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf management`	Disable Feature Telnet in **VRF**[1] Managementv
`(config)#telnet server session-limit 12 vrf management`	Configure the Session limit as 12 which is less than Max-Sesssion parameter in line VTY

[1]Virtual Routing and Forwarding

`(config)#commit`	Perform commit to submit the changes done
`(config)#feature telnet vrf management`	Enable telnet feature in VRF management
`(config)#commit`	Perform commit to submit the changes done
`(config)#exit`	Exit configure mode

Validation

Check that the maximum telnet session possible are 12 which is lesser than Max-Session limit parameter value in line VTY.

```
#show running-config telnet server
telnet server session-limit 12 vrf management
feature telnet vrf management
no feature telnet
```

Configuration of SSH Server Session Limit Lesser than Max-Session

Configure SSH Server Session limit to be lesser than Max-Session.

Topology

Setup consists of one node acting as SSH server.

Figure 15. SSH Server topology

Configuration of SSH Server Session Limit Lesser than Max-Session

`#configure terminal`	Enter configure mode
`(config)#no feature ssh vrf management`	Disable feature SSH
`(config)#ssh server session-limit 12 vrf management`	Configure SSH server session-limit to be lesser than Max-Session limit
`(config)#commit`	Perform Commit to submit changes done
`(config)#feature ssh vrf management`	Enable feature SSH
`(config)#commit`	Perform commit to submit changes
`(config)#exit`	Exit configure mode

Validation

Check that the maximum SSH session possible are 12 which is lesser than Max-Session limit parameter value in line VTY.

```
#show running-config ssh server
feature ssh vrf management
ssh server session-limit 12 vrf management
no feature ssh
```

Configuration of Telnet Session Limit Greater than Max-Session

In the below section, configure Telnet Session limit to be greater than Max-Session limit.

Topology

Setup consists of one node acting as Telnet server.

Figure 16. Telnet Session Topology

Configuration of Telnet server Session-Limit to be greater than line-VTY max-session

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf management`	Disable feature telnet
`(config)#telnet server session-limit 12 vrf management`	Configure Session-limit as 12 for telnet server
`(config)#commit`	Perform commit to submit changes
`(config)#feature telnet vrf management`	Enable Telnet server
`(config)#commit`	Perform commit to submit changes
`(config)#line vty`	Enter line VTY mode
`(config-line)#max-session 10`	Configure max-session as 10
`(config-line)#commit`	Perform commit to submit changes
`(config)#exit`	Exit configure mode

Validation

Check that the total telnet sessions possible is 10 even though telnet server session limit is configured as 12.

```
#show running-config telnet server
telnet server session-limit 12 vrf management
feature telnet vrf management
no feature telnet

#show running-config | grep max-session
 max-session 10
```

Configuration of SSH Session Limit Greater than Max-Session

In the below section, configure SSH Session limit to be greater than Max-Session limit.

Topology

Setup consists of one node acting as SSH server.

Configuration of SSH server Session-Limit to be greater than line-vty max-session

`#configure terminal`	Enter configure mode
`(config)#no feature ssh vrf management`	Disable feature SSH
`(config)#ssh server session-limit 12 vrf management`	Configure Session-limit as 12 for SSH server
`(config)#commit`	Perform commit to submit changes
`(config)#feature ssh vrf management`	Enable SSH server
`(config)#commit`	Perform commit to submit changes
`(config)#line vty`	Enter line VTY mode
`(config-line)#max-session 10`	Configure max-session as 10
`(config-line)#commit`	Perform commit to submit changes
`(config)#exit`	Exit configure mode

Validation

Check that the total SSH sessions possible is 10 even though SSH server session limit is configured as 12.

```
#show running-config ssh server
feature ssh vrf management
ssh server session-limit 12 vrf management
no feature ssh

#show running-config | grep max-session
 max-session 10
```

REMOTE DEVICE CONNECT COMMAND REFERENCE

Telnet

This chapter describes telnet commands.

Telnet is a client/server protocol that establishes a session between a user terminal and a remote host:

- The telnet client software takes input from the user and sends it to the server's operating system
- The telnet server takes output from the host and sends it to the client to display to the user

While telnet is most often used to implement remote login capability, the protocol is general enough to allow it to be used for a variety of functions.

Notes: In OcNOS, the default Linux terminal type is "export TERM=xterm"

The commands below are supported only on the "management" **VRF**[1].

This chapter contains these commands:

[1]Virtual Routing and Forwarding

debug telnet server

Use this command to display telnet debugging information.

Use the **no** form of this command to stop displaying telnet debugging information.

Command Syntax

```
debug telnet server
no debug telnet server
```

Parameters

None

Default

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug telnet-server

telnet server debugging is on
#
```

feature telnet

Use this command to enable the telnet server.

Use the **no** form of this command to disable the telnet server.

Note: Executing **no** form command closes the active telnet session.

Command Syntax

```
feature telnet (vrf management|)
no feature telnet (vrf management|)
```

Parameters

management
Virtual Routing and Forwarding name

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature telnet vrf management
```

show debug telnet-server

Use this command to display whether telnet debugging is enabled.

Command Syntax

```
show debug telnet-server
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug telnet-server
telnet server debugging is on
```

show running-config telnet server

Use this command to display telnet settings in the running configuration.

Command Syntax

```
show running-config telnet server
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config telnet server

feature telnet vrf management
no feature telnet
```

show telnet-server

Use this command to display the telnet server status.

Command Syntax

```
show telnet server
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show telnet server

VRF MANAGEMENT
telnet server enabled port: 23

VRF DEFAULT:
telnet server disabled port: 23
```

telnet

Use this command to open a telnet session to an ipv4 address or host name resolved to ipv4 address.

Command Syntax

```
telnet (A.B.C.D | HOSTNAME) (vrf (NAME|management))
telnet (A.B.C.D | HOSTNAME) (<1-65535>) (vrf (NAME|management))
```

Parameters

A.B.C.D
Destination IPv4 Address to open a telnet session.

HOSTNAME
Destination Hostname to resolve into IPv4 address to open a telnet session.

1-65535
Destination Port to open a telnet session. Default is 23.

vrf
Specify the VPN routing/forwarding instance.

NAME
Specify the name if the VPN routing/forwarding instance.

management
Management VPN routing/forwarding instance name.

Default

By default, telnet is 23

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#telnet 10.12.16.17 2543 vrf management
Trying 10.12.16.17...
```

telnet6

Use this command to open a telnet session to an ipv6 address or host name resolved to ipv6 address.

Command Syntax

```
telnet6 (X:X::X:X| HOSTNAME) (vrf (NAME|management))
telnet6 (X:X::X:X | HOSTNAME) (<1-65535>) (vrf (NAME|management))
```

Parameters

X:X::X:X
Destination IPv6 Address to open a telnet session.

HOSTNAME
Destination Host name to resolve into IPv6 address to open a telnet session.

1-65535
Destination Port to open a telnet session. Default is 23.

vrf
Specify the VPN routing/forwarding instance.

NAME
Specify the name if the VPN routing/forwarding instance.

management
Management VPN routing/forwarding instance name.

Default

By default, telnet is 23.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#telnet6 2:2::2:2 2543 vrf management
 Trying 2:2::2:2...
```

telnet server port

Use this command to set the port number on which the telnet server listens for connections. The default port on which the telnet server listens is 23.

You can only give this command when the telnet server is disabled. See the feature telnet (page 283) command.

Use the **no** form of this command to set the default port number (23).

Command Syntax

```
telnet server (port <1024-65535>) (vrf management|)
no telnet server port (vrf management|)
```

Parameters

<1024-65535>
Port number

management
Virtual Routing and Forwarding name

Default

By default, telnet server port number is 23

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#telnet server port 1157 vrf management
```

telnet server session-limit

Use this command to limit number of Telnet sessions. Only 40 sessions allowed including Telnet and SSH. User can only give this command when the telnet server is disabled. See the feature telnet (page 283) command.

Use **no** form of this command to set to default value.

Command Syntax

```
telnet server session-limit <1-40> (vrf management|)
no telnet server session-limit (vrf management|)
```

Parameters

<1-40>
Number of sessions

management
Virtual Routing and Forwarding name

Default

By default, 40 sessions are allowed.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.2

Examples

```
#configure terminal
(config)#telnet server session-limit 4 vrf management
```

Secure Shell Commands

This chapter describes Secure Shell (SSH) commands.

SSH is a cryptographic protocol for secure data communication, remote login, remote command execution, and other secure network services between two networked computers.

- In OcNOS, the default Linux terminal type is "export TERM=xterm"
- The commands below are supported only on the “management” **VRF**[1].

This chapter contains these commands:

[1]Virtual Routing and Forwarding

clear ssh host-key

Use this command to clear the host keys.

Command syntax

```
clear ssh host-key  ((dsa|rsa|ecdsa|ed25519)|) (vrf (NAME|management)|)
```

Parameters

dsa
dsa keys

rsa
rsa keys

ecdsa
ecdsa keys

ed25519
ed25519 keys

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0. Added parameter NAME in OcNOS version 6.5.3.

Examples

```
OcNOS#clear ssh host-key
```

[1]Virtual Routing and Forwarding

clear ssh hosts

Use this command to clear the **known_hosts** file.

This command clears all trusted relationships established with SSH servers during previous connections. When a client downloads a file from an external server the first time, the client stores the server keys in the **known_hosts** file. After that, other connections to the same server will use the server keys stored in the **known_hosts** file. In other words, a trusted relationship is created when a client accepts the server keys the first time.

An example of when you need to clear a trusted relationship is when SSH server keys are changed.

Command Syntax

```
clear ssh hosts
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ssh hosts
```

clear ssh keypair

Use this command to clear RSA/DSA keypair generated for an user. This command can be executed only by networkadmin.

Command Syntax

```
clear ssh keypair user USERNAME
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 4.1.

Examples

```
#clear ssh keypair user test
```

debug ssh server

Use this command to display SSH server debugging information.

Use the **no** form of this command to stop displaying SSH server debugging information.

Command Syntax

```
debug ssh server
no debug ssh server
```

Parameters

None

Default

By default, disabled.

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ssh server
```

feature ssh

Use this command to enable the SSH server.

Use the **no** form of this command to disable the SSH server.

Command Syntax

```
feature ssh (vrf (NAME|management)|)
no feature ssh (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, feature ssh is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added parameter vrf NAME in OcNOS version 6.5.3

Examples

```
#configure terminal
(config)#feature ssh
```

[1]Virtual Routing and Forwarding

show debug ssh-server

Use this command to display whether SSH debugging is enabled.

Command Syntax

```
show debug ssh-server
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug ssh-server
ssh server debugging is on
```

show running-config ssh server

Use this command to display SSH settings in the running configuration.

Command Syntax

```
show running-config ssh server
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config ssh server
feature ssh vrf management
ssh server port 1024 vrf management
ssh login-attempts 2 vrf management
ssh server algorithm encryption 3des-cbc
```

show ssh host-key

Use this command to display the SSH server key.

By default, ssh feature is enabled in "management" vrf. Until and unless the same feature is explicitly enabled in "default" vrf, respective show command output will be empty.

Command syntax

```
show ssh host-key  ((dsa|rsa|ecdsa|ed25519)|) no feature ssh (vrf (NAME|management)|)
```

Parameters

dsa
dsa keys

rsa
rsa keys

ecdsa
ecdsa keys

ed25519
ed25519 keys

management
Management **VRF**[1]

NAME
Custom VRF

Default

If no keys are specified, all host keys will be displayed

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0. Added parameter NAME in OcNOS version 6.5.3.

Examples

```
#sh ssh host-key
************************************************
dsa public key :

Use this command to display the SSH server status.

Command Syntax

```
show ssh server
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ssh server
VRF MANAGEMENT:
ssh server enabled port: 22
authentication-retries 3
VRF DEFAULT:
ssh server enabled port: 22
authentication-retries 3
#
```

show username

Use this command to display the RSA or DSA key pair for a user.

Command Syntax

```
show username USERNAME keypair
```

Parameters

USERNAME
User identifier

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show username OcNOS keypair

```

ssh

Use this command to open an ssh session to a IPv4 address or host name resolved to an IPv4 address.

Command Syntax

```
ssh WORD (vrf (NAME | management))
ssh WORD <1-65535> (vrf (NAME | management))
ssh (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc| aes256-cbc | 3des-cbc))
WORD  (vrf (NAME | management))
ssh (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc | aes256-cbc | 3des-cbc))
WORD <1-65535> (vrf (NAME | management))
```

Parameters

WORD
User and Destination Host name to resolve into IPv4 Address or IPv4 adress to open a SSH session as user@ipv4-address/Hostname

1-65535
Destination Port to open a SSH session. Default is 22

cipher
Specify algorithm to encrypt SSH session

aes128-ctr
Advanced Encryption Standard 128 bit Counter Mode

aes192-ctr
Advanced Encryption Standard 192 bit Counter Mode

aes256-ctr
Advanced Encryption Standard 256 bit Counter Mode

aes128-cbc
Advanced Encryption 128 bit Standard Cipher Block Chaining

aes192-cbc
Advanced Encryption Standard 192 bit Cipher Block Chaining

aes256-cbc
Advanced Encryption Standard 256 bit Cipher Block Chaining

3des-cbc
Triple Data Encryption Standard Cipher Block Chaining

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

The default destination port is 22.

[1]Virtual Routing and Forwarding

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#ssh cipher aes128-ctr 10.12.16.17 22 vrf management
    The authenticity of host '10.12.16.17 (10.12.16.17)' can't be established.
    RSA key fingerprint is 93:82:98:ce:b7:20:1a:85:a5:9a:2e:93:13:84:ea:9e.
    Are you sure you want to continue connecting (yes/no)?
```

ssh6

Use this command to open an ssh session to an IPv6 address or host name resolved to an IPv6 address.

Command Syntax

```
ssh6 (X:X::X:X | HOSTNAME) (vrf (NAME | management))
ssh6 (X:X::X:X | HOSTNAME) <1-65535> (vrf (NAME | management))
ssh6 (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc | aes256-cbc | 3des-cbc))
(X:X::X:X | HOSTNAME) (vrf (NAME | management))
ssh6 (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc | aes256-cbc | 3des-cbc))
(X:X::X:X | HOSTNAME) <1-65535> (vrf (NAME | management))
```

Parameters

X:XX::X:X
User and Destination IPv6 Address to open a ssh session as user@ipv6-address

HOSTNAME
User and Destination Host name to resolve into IPv6 Address to open an ssh session as user@ipv4-address/Hostname

1-65535
Destination Port to open a ssh session. Default is 22.

cipher
Specify algorithm to encrypt SSH session

aes128-ctr
Advanced Encryption Standard 128 bit Counter Mode

aes192-ctr
Advanced Encryption Standard 192 bit Counter Mode

aes256-ctr
Advanced Encryption Standard 256 bit Counter Mode

aes128-cbc
Advanced Encryption 128 bit Standard Cipher Block Chaining

aes192-cbc
Advanced Encryption Standard 192 bit Cipher Block Chaining

aes256-cbc
Advanced Encryption Standard 256 bit Cipher Block Chaining

3des-cbc
Triple Data Encryption Standard Cipher Block Chaining

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

The default destination port is 22.

[1]Virtual Routing and Forwarding

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#ssh6 cipher aes128-ctr 2:2::2:2 22 vrf management
    The authenticity of host '2:2::2:2 (2:2::2:2)' can't be established.
    RSA key fingerprint is 93:82:98:ce:b7:20:1a:85:a5:9a:2e:93:13:84:ea:9e.
    Are you sure you want to continue connecting (yes/no)?
```

ssh algorithm encryption

Use this command to set an encryption algorithm for SSH sessions.

An SSH server authorizes connection of only those algorithms that are configured from the list below. If a client tries establishing a connection to the server with the algorithm encryption that are not part of the list, the connection will not established.

SSH supports these encryption algorithms:

Advanced Encryption Standard Counter:

- aes128-ctr
- aes192-ctr
- aes256-ctr
- aes128-cbc

Advanced Encryption Standard Cipher Block Chaining:

- aes192-cbc
- aes256-cbc

Triple Data Encryption Standard Cipher Block Chaining:

3des-cbc

Use the no form of this command to not encrypt SSH sessions.

Command Syntax

```
ssh server algorithm encryption {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc |
aes256-cbc | 3des-cbc} (vrf (NAME|management)|))
no ssh server algorithm encryption {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc |
aes256-cbc | 3des-cbc} (vrf (NAME|management)|)
```

Parameters

aes18-ctr
AES 128 bit Counter Mode

aes192-ctr
AES 192 bit Counter Mode

aes256-ctr
AES 256 bit Counter Mode

aes128-cbc
AES 128 bit Cipher block chaining

aes192-cbc
AES 192 bit Cipher block chaining

aes256-cbc
AES 256 bit Cipher block chaining

3des-cbc
Triple DES Cipher block chaining

vrf
Virtual Routing and Forwarding

NAME
Virtual Routing and Forwarding name

Default

No default value is specified.

By default, all the ciphers are supported for a new SSH client to connect to the SSH server.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added parameter **VRF**[1] NAME in OcNOS version 6.5.3

Examples

```
#configure terminal
    (config)#ssh server algorithm encryption aes128-ctr
```

[1]Virtual Routing and Forwarding

ssh keygen host

Use these commands to create SSH server host, and public keys. These host keys are added in the SSH clients known_hosts file after user's acceptance.

Once entry is added in known_hosts, for the subsequent attempt login to the server will be validated against the host key and if there is key mismatch user will be prompted about the change in server identity.

Command syntax

```
ssh keygen host dsa (vrf (NAME|management)|) (force|)
ssh keygen host rsa (length <1024-4096>|) (vrf (NAME|management)|) (force|)
ssh keygen host ecdsa (length (256|384|521)|) (vrf (NAME|management)|) (force|)
ssh keygen host ed25519 (vrf (NAME|management)|) (force|)
```

Parameters

dsa
dsa keys

rsa
rsa keys

ecdsa
ecdsa keys

ed25519
ed25519 keys

force
Replace the old host-key with newly generated host-key

<1024-4096>
Number of bits to use when creating the SSH server key; this parameter is only valid for RSA keys (DSA keys have a default length of 1024).

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

DSA key has length of 1024 bits

RSA key has default length of 2048 bits

ECDSA key has default length of 521 bits

ED25519 key has length of 256 bits

Command Mode

Privileged execution mode

[1]Virtual Routing and Forwarding

Applicability

This command was introduced in OcNOS version 5.0. Added parameter NAME in OcNOS version 6.5.3.

Examples

```
OcNOS#ssh keygen host rsa vrf management
   OcNOS#
   OcNOS#ssh keygen host ecdsa vrf management
   OcNOS#
   OcNOS#ssh keygen host ecdsa
   %% ssh host key exists, use force option to overwrite
   OcNOS#
   OcNOS#ssh keygen host ecdsa force
   OcNOS#
```

ssh login-attempts

Use this command to set the number of times SSH client would try to authenticate to establish the SSH session.

Use the **no** form of this command to set the number of authentication attempts to its default (3).

Note: By default, SSH clients may send the keys to authenticate, such a implicit authentication failures would also decrease authentication attempt count. Hence the configured value is not directly proportional to the user's password based authentication attempt.

Enable the feature ssh command to configure this command on default **VRF**[1] port.

You can only give this command when the SSH server is enabled for default VRF. See the feature ssh command.

Command Syntax

```
ssh login-attempts <1-3> (vrf (NAME|management)|)
no ssh login-attempts (vrf (NAME|management)|)
```

Parameters

<1-3>
Retries attempts, default is 3 attempts

vrf management
Defines the management VRF instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, the device attempts to negotiate a connection with the connecting host three times.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ssh login-attempts 3
```

[1]Virtual Routing and Forwarding

ssh server algorithm encryption

Use this command to configure Cipher algorithms.

Use **no** parameter to remove the Cipher algorithms.

Command Syntax

```
ssh server algorithm encryption CIPHER_NAME vrf (|management|NAME)
no ssh server algorithm encryption
```

Parameters

CIPHER_NAME

Specifies the SSH encryption type as Cipher exchange.

3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
rijndael-cbc
aes128-ctr
aes192-ctr
aes256-ctr
aes128-gcm
aes256-gcm
chacha20-poly1305

vrf management

Defines the management **VRF**[1] instance.

vrf NAME

Specify the user-defined VRF instance name.

Default

Refer to ssh server default algorithm (page 318).

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the specific encryption algorithm, execute the following command.

[1]Virtual Routing and Forwarding

```
OcNOS(config)#ssh server algorithm encryption chacha20-poly1305
OcNOS(config)#ssh server algorithm encryption chacha20-poly1305 vrf management
OcNOS(config)#commit
```

To configure the multiple encryption algorithms, execute the following command.

```
OcNOS(config)#ssh server algorithm encryption 3des-cbc rijndael-cbc aes256-cbc aes128-gcm
OcNOS(config)#ssh server algorithm encryption 3des-cbc rijndael-cbc aes256-cbc aes128-gcm vrf
management
OcNOS(config)#commit
```

To unconfigure the multiple encryption algorithms, execute the following command.

```
OcNOS(config)#no ssh server algorithm encryption 3des-cbc rijndael-cbc aes256-cbc aes128-gcm
OcNOS(config)#no ssh server algorithm encryption 3des-cbc rijndael-cbc aes256-cbc aes128-gcm vrf
management
OcNOS(config)#commit
```

ssh server algorithm kex

Use this command to configure KEX algorithms.

Use **no** parameter to remove the KEX algorithms.

Command Syntax

```
ssh server algorithm kex KEY_NAME vrf (|management|NAME)
no ssh server algorithm kex
```

Parameters

KEY_NAME

Specifies the SSH encryption type as Key exchange.

curve25519-sha256

curve25519-sha256-libssh-org

diffie-hellman-group-exchange-sha1

diffie-hellman-group-exchange-sha256

diffie-hellman-group1-sha1

diffie-hellman-group14-sha1

diffie-hellman-group14-sha256

diffie-hellman-group16-sha512

diffie-hellman-group18-sha512 ecdh-sha2-nistp256 ecdh-sha2-nistp384 ecdh-sha2-nistp521

vrf management

Defines the management **VRF**[1] instance.

vrf NAME

Specify the user-defined VRF instance name.

Default

Refer to ssh server default algorithm (page 318) CLI section.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the specific KEX algorithm, execute the following command.

```
OcNOS(config)#ssh server algorithm kex curve25519-sha256
OcNOS(config)#ssh server algorithm kex curve25519-sha256 vrf management
```

To configure the multiple KEX algorithms, execute the following command.

[1]Virtual Routing and Forwarding

```
OcNOS#conf t Enter configuration commands, one per line. End with CNTL/Z.
OcNOS(config)#ssh server algorithm kex diffie-hellman-group-exchange-sha256 diffie-hellman-group14-
sha256 ecdh-sha2-nistp256
OcNOS(config)#ssh server algorithm kex diffie-hellman-group-exchange-sha256 diffie-hellman-group14-
sha256 ecdh-sha2-nistp256 vrf management
OcNOS(config)#commit OcNOS(config)#end
```

To unconfigure the multiple KEX algorithms, execute the following command.

```
OcNOS(config)#no ssh server algorithm kex diffie-hellman-group-exchange-sha256 diffie-hellman-
group14-sha256
OcNOS(config)#no ssh server algorithm kex diffie-hellman-group-exchange-sha256 diffie-hellman-
group14-sha256 vrf management
```

ssh server algorithm mac

Use this command to configure MAC algorithms.

Use **no** parameter to remove the MAC algorithms.

Command Syntax

```
ssh server algorithm mac MAC_NAME vrf (|management|NAME)
no ssh server algorithm mac
```

Parameters

mac

Specifies the SSH encryption type as MAC exchange.

hmac-sha1
hmac-sha1-96
hmac-sha2-256
hmac-sha2-512
hmac-md5
hmac-md5-96
umac-64@openssh.com
umac-128@openssh.com
hmac-sha1-etm@openssh.com
hmac-sha1-96-etm@openssh.com
hmac-sha2-256-etm@openssh.com
hmac-sha2-512-etm@openssh.com
hmac-md5-etm@openssh.com
hmac-md5-96-etm@openssh.com
umac-64-etm@openssh.com
umac-128-etm@openssh.com

vrf management

Defines the management **VRF**[1] instance.

vrf NAME

Specify the user-defined VRF instance name.

Default

Refer to ssh server default algorithm (page 318).

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.3.

[1]Virtual Routing and Forwarding

Example

To configure the specific MAC algorithm, execute the following command.

```
OcNOS(config)#ssh server algorithm mac hmac-sha2-256
OcNOS(config)#ssh server algorithm mac hmac-sha2-256 vrf management
```

To configure the multiple MAC algorithms, execute the following command.

```
OcNOS(config)#ssh server algorithm mac hmac-sha2-512 umac-128-etm hmac-md5-96-etm hmac-sha2-256-etm
hmac-sha1-etm
OcNOS(config)#ssh server algorithm mac hmac-sha2-512 umac-128-etm hmac-md5-96-etm hmac-sha2-256-etm
hmac-sha1-etm vrf management
```

To modify the MAC algorithm for user defined VRF, execute the following command.

```
OcNOS(config)#ssh server algorithm mac hmac-md5-96-etm hmac-sha2-256 hmac-sha2-512-etm vrf VRF1
OcNOS(config)#ssh server algorithm encryption 3des-cbc vrf VRF1
OcNOS(config)#ssh server algorithm kex diffie-hellman-group-exchange-sha1 diffie-hellman-group14-
sha256 vrf VRF1
```

ssh server default algorithm

Use this command to configure default strong SSH encryption algorithms. This command reset the existing algorithms.

Use **no** parameter to remove the default strong SSH encryption algorithms.

Command Syntax

```
ssh server default algorithm (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

```
OcNOS#configure terminal OcNOS#ssh server default algorithm
```

[1]Virtual Routing and Forwarding

show ssh server algorithm

Use this command to display the current SSH algorithm policy configured.

Use **no** parameter to remove the default encryption algorithms.

Command Syntax

```
show ssh server algorithm
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

To view the ssh key configured, execute the following command.

```
OcNOS#sh ssh server algorithm
vrf management ssh server algorithm: KexAlgorithms curve25519-sha256

MACs hmac-sha2-256,hmac-sha2-512,umac-128@openssh.com,hmac-sha2-256-etm@openssh.com,hmac-sha2-512-
etm@openssh.com

Default vrf ssh server algorithm:

KexAlgorithms curve25519-sha256

MACs hmac-sha2-256,hmac-sha2-512,umac-128@openssh.com,hmac-sha2-256-etm@openssh.com,hmac-sha2-512-
etm@openssh.com
```

ssh server port

Use this command to set the port number on which the SSH server listens for connections. The default port on which the SSH server listens is 22.

Use the **no** form of this command to set the default port number (22).

Command Syntax

```
ssh server port <1024-65535> (vrf (NAME|management)|)
no ssh server port (vrf (NAME|management)|)
```

Parameters

<1024-65535>
Port number

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, SSH server port is 22.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ssh server port 1720
```

[1]Virtual Routing and Forwarding

ssh server session-limit

Use this command to limit number of SSH sessions. Only 40 sessions allowed including Telnet and SSH.

Use **no** form of this command to set to default value.

> **Note:** Few Terminal application (Ex: Mobaxterm) where user run SSH Client has limits to use this SSH session limit option.

Command Syntax

```
ssh server session-limit <1-40> (vrf (NAME|management)|)
no ssh server session-limit (vrf (NAME|management)|)
```

Parameters

<1-40>
Number of sessions

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, 40 sessions are allowed.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.2 Added parameter NAME in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#ssh server session-limit 4 vrf management
```

[1]Virtual Routing and Forwarding

username sshkey

Use this command to add public key of the ssh clients to perform pasword-less login into the switch.

Command Syntax

```
username USERNAME sshkey LINE
```

Parameters

USERNAME
User identifier

LINE
Digital System Algorithm (DSA) key or Rivest, Shamir, and Adelman (RSA) key in OpenSSH format; this key is written to the **`authorized_keys`** file

Default

By default, SSHKEY is 1024.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#username fred
(config)#username fred sshkey
ssh-rsa AAAAB3NzaC1kc3MAAAEBAIirweZzCdyITqbMWB8Wly9ivGxY1JBVnWTVtcWKi6uc

ZA==
```

username keypair

Use this command to generate the key for users.

Command Syntax

```
username USERNAME keypair rsa
username USERNAME keypair dsa
username USERNAME keypair rsa length <1024-4096>
username USERNAME keypair rsa length <1024-4096> force
username USERNAME keypair rsa force
username USERNAME keypair dsa force
```

Parameters

USERNAME
User identifier

rsa
Rivest, Shamir, and Adelman (RSA) public-key cryptography SSH server key

dsa
Digital System Algorithm (DSA) SSH key

<1024-4096>
Number of bits to use when creating the SSH server key; this parameter is only valid for RSA keys (DSA keys have a default length of 1024)

force
Forces the replacement of an SSH key

Default

DSA keys have a default value of 1024.

RSA keys have a minimum key length of 1024 bits and the default length is 4096.

By default the system has RSA/DSA public/private key pair placed in /etc/ssh/. The force option is used if the user wants to regenerate the ssh rsa keys. The same thing applies for dsa also.

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#username fred keypair rsa
```

USER MANAGEMENT CONFIGURATION

User Config AES Encryption

Overview

Sensitive information, such as authentication keys configured in plain text, is stored in the OcNOS database in an encrypted format. Currently, by default, this information is encrypted using the 3DES algorithm. With this new feature, users will have the option to store sensitive information encrypted using the Advanced Encryption Standard (AES) algorithm. It ensures confidentiality and integrity in routing protocols like BGP, OSPF, RIP, IS-IS, LDP, BFD, MSDP, and Radius authentication.

Feature Characteristics

- Users can choose to encrypt sensitive information using either the 3DES or AES algorithm.
- Global configuration allows users to select the preferred encryption algorithm for data stored within the OcNOS database.
- If sensitive data is already encrypted, OcNOS accepts both AES and 3DES-encrypted data.
  - AES-encrypted data must be encrypted by OcNOS, as it adds a tag to differentiate AES from 3DES-encrypted data.
- Users can change the global encryption algorithm at any time without affecting previously configured sensitive data.
  - OcNOS maintains internal control over the encryption algorithm used for each piece of sensitive data.
- If no encryption algorithm is specified by the user, OcNOS defaults to using the 3DES algorithm, preserving the existing behavior.

Benefits

This feature enhance security by using AES 256-bit encryption with Galois/Counter Mode(GCM).

Configuration

These steps provide a standardized approach to configuring AES Encryption across different routing protocols. These configurations ensure that sensitive routing data is encrypted and secure, protecting network infrastructure from malicious threats.

Configuration Snapshot:

BGP configuration:

3DES encryption algorithm:

```
router bgp 100
neighbor 10.10.10.11 remote-as 200
neighbor 10.10.10.11 authentication-key 0xb376ebccbde0bb44ebba6c415d533683
```

AES encryption algorithm:

```
router bgp 100
neighbor 10.10.10.11 remote-as 200
```

```
neighbor 10.10.10.11 authentication-key
0x25fdc4e11aaf5d9caa36b6a904ad7ec476dca3447b42486c119032b2b06e7c1daf8bfde097ed
```

OSPF configuration:

3DES encryption algorithm:

```
interface xe49
ip ospf message-digest-key 1 md5 0xebe3bd4b01e1198ff808f31af4a0adf1
```

AES encryption algorithm:

```
interface xe1
ip ospf message-digest-key 1 md5
0xc5cf7a352927208c029d58dec379f7459207509788ff04311b04a8ccc06f4eb95171b28fa6
```

RIP Configuration

3DES encryption algorithm:

```
interface xe2
ip rip authentication mode md5
ip rip authentication string 0xebe3bd4b01e1198ff808f31af4a0adf1
```

AES encryption algorithm:

```
interface xe1
ip rip authentication mode md5
ip rip authentication string
0x528bd88845782cf7595bfb2c60742358f980a733bb208276b60f6e184fcb239724c4585152
```

IS-IS Key-Chain authentication

3DES encryption algorithm:

```
key chain TEST
key-id 1
key-string encrypted 0xebe3bd4b01e1198ff808f31af4a0adf1
```

AES encryption algorithm:

```
key chain TEST
key-id 1
key-string encrypted 0x93f3323b28293e577235b61aef68418931fa74095b20f5aa989aceadb3b5cdda45d004e5ab
LDP MD5 authentication
```

LDP MD5 authentication

3DES encryption algorithm:

```
router ldp
neighbor all auth md5 password encrypt 0x93c51ab33976afff
session-group name 1
auth md5 password encrypt 0x93c51ab33976afff
```

AES encryption algorithm:

```
router ldp
neighbor all auth md5 password encrypt
0x7b34695900344ff981d097ca3b76d3f7602c97533ae71fb5a24f6f63b5a1b36a0a2e11f5
session-group name 1
auth md5 password encrypt 0x7b34695900344ff981d097ca3b76d3f7602c97533ae71fb5a24f6f63b5a1b36a0a2e11f5
```

BFD authentication

3DES encryption algorithm:

```
interface eth1
bfd auth type simple key-id 100 1 key 0xb376ebccbde0bb44ebba6c415d533683
```

AES encryption algorithm:

```
interface eth1
bfd auth type simple key-id 100 1 key
0x25fdc4e11aaf5d9caa36b6a904ad7ec476dca3447b42486c119032b2b06e7c1daf8bfde097ed
```

MSDP

3DES encryption algorithm:

```
ip msdp peer 1.1.1.1
ip msdp password 0x93c51ab33976afff9c2308c1131e52b8 peer 1.1.1.1
```

AES encryption algorithm:

```
ip msdp peer 1.1.1.1
ip msdp password 0x2bf091e584673fda07def61c29a16ac38ceff092e11fe75d12122fb6d4683b1bfa8d8379f1de peer
1.1.1.1
```

Radius authentication

3DES encryption algorithm:

```
radius-server login key 7 0xf6fe51115a8718c8541a2369d0222f7f
radius-server login host 10.3.4.17 seq-num 7 key 7 0x923502641e0b7d352b09d097ceb464da auth-port 4567
timeout 40
```

AES encryption algorithm

```
radius-server login key 7 0x1c5c4abfd0cb21baf4d1980261f16f2f9dad69fc5e732b322f6d9c764f864f696ee7668e1f7a
radius-server login host 10.3.4.17 seq-num 7 key 7
0x35404c0de9ca6cb64531aad49b8d7ebf64550c4d52d0201e423f7de5227ccb5c52d8242b12bd auth-port 4567 timeout 40
```

Validation

Execute the following command to verify the global key-encryption:

```
OcNOS#show global key-encryption
Current global key-encryption in use is AES.
OcNOS#
```

Implementation Examples

To choose which global cipher algorithm will be used by OcNOS, the user simply runs the following command:

```
OcNOS(config)#global key-encryption AES
OcNOS(config)#commit
OcNOS(config)#
```

The configuration will appear in show running-config:

```
OcNOS#sh ru
!
...
global key-encryption AES
...
!
end
OcNOS#
```

global key-encryption

Use this command to configure the global cipher algorithm.

Use **no** parameter of this command to unconfigure the global cipher algorithm for OcNOS.

Command Syntax

```
global key-encryption (3DES|AES)
[no] global key-encryption
```

Parameters

key-encryption (3DES|AES)
Specifies the cipher algorithm to be used by OcNOS

Default

3DES encryption

Applicability

This command was introduced in OcNOS 6.6.0 version.

Example

```
OcNOS(config)#global key-encryption AES
```

show global key-encryption

Use this command to show global key-encryption.

Command Syntax

```
show global key-encryption
```

Parameters

None

Default

3DES encryption

Applicability

This command was introduced in OcNOS 6.6.0 version.

Example

```
OcNOS#show global key-encryption
Current global key-encryption in use is AES.
OcNOS#
```

Using the Management Interface

Overview

OcNOS provides support for different types of Management Interfaces. The management interface can be the standard out of band (OOB) port, or any in-band port.

To provide segregation between management traffic and data traffic, OcNOS provides a Management **VRF**[1]. The Management VRF is created by default when OcNOS boots. This VRF cannot be deleted. All ports used as Management Interface needs to be in Management VRF. The management VRF is used for all types of Management applications listed below

- Remote access to router (SSH/Telnet)
- File transfer applications (SFTP/SCP)
- Login Authentication via Radius/Tacacs
- Network management protocols (SNMP, Netconf)

Apart from this, **DHCP**[2], DNS, NTP, Syslog, **sFlow**[3], and license/software upgrade also uses ports mapped to the management VRF for their operations. Also LLDP can run on any ports mapped to the management VRF.

Note: If the management interface flaps, the device becomes unreachable.

[1]Virtual Routing and Forwarding

[2]Dynamic Host Configuration Protocol

[3]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

Management Port

The Out of Band (OOB) Management Port in OcNOS is identified as “eth0.” This port is automatically mapped to the Management **VRF**[1] when OcNOS boots, and will remain in same VRF throughout. It cannot be moved out of this VRF.

The IP address of the management port can be configured statically or via **DHCP**[2].

Static IP Configuration

A static IP can be configured on the management port during ONIE installation itself, or after installation using the OcNOS CLIs commands. To configure a static IP during ONIE installation, do the following

```
#onie-stop
#ifconfig eth0 <ip address> netmask <subnet mask> up
```

Please check the Install Guide for details.

The IP address configured during ONIE installation will be applied to the management port and the same will be retained when OcNOS boot up, and the port becomes part of Management VRF.

```
#show running-config interface eth0
!
interface eth0
 ip vrf forwarding management
 ip address 10.12.44.109/24
```

After getting the OcNOS prompt, this IP address can be changed from the CLI.

`#configure terminal`	Enter configure mode
`(config)#interface eth0`	Enter interface mode
`(config-if)#ip address 10.12.44.120/24`	Assign an IPv4 address to the interface
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

If a static IP is not configured during ONIE installation the same can be configured via CLI by following the above steps. Using the OcNOS CLI, DHCP can also be enabled on the Management port.

`#configure terminal`	Enter configure mode
`(config)#interface eth0`	Enter interface mode
`(config-if)#ip address dhcp`	Enable DHCP on interface

[1]Virtual Routing and Forwarding

[2]Dynamic Host Configuration Protocol

`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Obtaining IP Address via DHCP

During onie installation, the management port attempts to acquire IP address via DHCP automatically unless stopped explicitly using the **`onie-stop`** command. So, if management port is getting IP via DHCP, after OcNOS boots, the management port will continue to use DHCP, even when it is part of the Management VRF.

```
#show running-config interface eth0
!
interface eth0
 ip vrf forwarding management
 ip address dhcp
```

After OcNOS boots, the IP address can be changed to any static IP from the command line as shown earlier.

In-Band Ports

Any front-end ports of the device (in-band ports) can be made part of the management **VRF**[1]. Once they are part of the management VRF they can also support all management applications such as SSH/Telnet and others as listed in Overview (page 330).

Once the ports are part of the management VRF, they should not be used for data traffic and routing or switching purposes. In-band ports can be added or removed from Management VRF as and when required.

`#configure terminal`	Enter configure mode
`(config)#interface xe1/1`	Enter interface mode
`(config-if)#ip vrf forwarding management`	Add in-band port to Management VRF
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

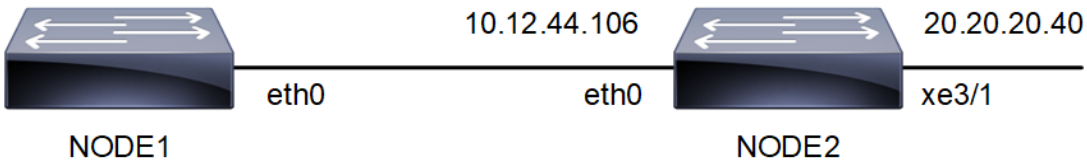
`#configure terminal`	Enter configure mode
`(config)#interface xe1/1`	Enter interface mode
`(config-if)# no ip vrf forwarding management`	Remove in-band port from Management VRF
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Using Ping in Management VRF

To check reachability to any node in the management network, you need to explicitly mention the VRF name as “management.”

In the following example, Node-1 has management interface eth0 and Node-2 has management interfaces eth0 and xe3/1. In order to reach the network 20.20.20.40/24 from Node-1 a static route needs to added.

Figure 17. Ping in Management VRF topology



`#configure terminal`	Enter configure mode
`(config)# ip route vrf management 20.20.20.0/24`	Add static route in management VRF to reach

[1]Virtual Routing and Forwarding

`10.12.44.106 eth0`	20.20.20.0/24 network
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

```
Node-1#show ip route vrf management
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "management"
C       10.12.44.0/24 is directly connected, eth0
S       20.20.20.0/24 [1/0] via 10.12.44.106, eth0

Gateway of last resort is not set

Node-1#ping 20.20.20.40 vrf management
PING 20.20.20.40 (20.20.20.40) 56(84) bytes of data.
64 bytes from 20.20.20.40: icmp_seq=1 ttl=64 time=0.494 ms
64 bytes from 20.20.20.40: icmp_seq=2 ttl=64 time=0.476 ms
```

User Configuration

Overview

User management is an authentication feature that provides administrators with the ability to identify and control the users who log into the network.

OcNOS provides 4 different roles for users.

- Network Administrator: Can make permanent changes to the switch configuration. Changes are persistent across reset or reboot of switch.
- Network Engineer: Can make permanent changes to the switch configuration. Changes are persistent across reset or reboot of switch.
- Network Operator: Can make permanent changes to the switch configuration. Changes are not persistent across reset or reboot of switch.
- Network User: Can display information but cannot modify the configuration.

User Configuration

`#configure terminal`	Enter configure mode.
`(config)#username user1 password User12345$`	Create a user `user1` with password `User12345$` with default role of network user. Password must be 8-32 characters, username 2-15 characters.
`(config)#username user1 role network-operator password User12345$`	Change the role for `user1` to network-operator.
`(config)#username user2 role network-operator password User12345$`	Create a user `user2` with role as network-operator.
`(config)#username user3 role network-admin password User12345$`	Create a user `user3` with role as network-admin.
`(config)#username user4 role network-engineer password User12345$`	Create a user `user4` with role as network-engineer.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
#show user-account
User:user1
                roles: network-operator
User:user2
                roles: network-operator
User:user3
                roles: network-admin
User:user4
                roles: network-engineer

#show role
```

```
Role Name                              Info
------------------------------------------------------------------------
network-admin          Network Administrator - Have all permissions
network-engineer       Network Engineer - Can save configuration
network-operator       Network Operator - Can not save configuration
network-user           Network User - Can not change configuration
rbac-customized-role   RBAC User - Can change only  permitted configuration

#show user-account user1
User:user1
                roles: network-operator
```

Configurable Password Policy

Overview

A password is a sequence of characters utilized to confirm a user's identity in the authentication procedure. A strong password helps to protect user accounts and prevents unauthorized access. Strong passwords are the first defense against cyberattacks. Hackers commonly use automated tools to crack passwords. Weak passwords are easily guessed or cracked. Every organization encourages its users to use long passwords combining alphanumeric and special characters. A lengthy password is more complex for hackers, who also need to invest a lot of time to hack the system.

OcNOS manages the user account and its password in its OcNOS configuration, then their password is reflected to LINUX standard user management db,/etc/passwd and /etc/shadow.

The password expiration settings in OcNOS and in the standard user management system in LINUX are not always identical. Since the operation of the OcNOS shell is not the same as that of standard shells like bash, similar mechanisms must be implemented in the OcNOS shell to enforce default password changes and set expiration dates.

Feature Characteristics

Setting up strong passwords safeguards sensitive data associated with user accounts, including those of employees and customers, against unauthorized access.

Integrating PAM to OcNOS

Privileged Access Management (**PAM**[1]) is a third party pluggable security tool that protects organizations from cyberthreats by overseeing, detecting, and thwarting unauthorized privileged access to vital resources.

To satisfy customer requirements, use pam_pwquality or pam_history, standard PAM modules in LINUX. These are more optimal than implementing a custom password-strength verification system within this system.

When a user sets a password in plain text, it is immediately hashed, and from then on, this hashed password is used for internal management to save settings. The plain text password is not stored anywhere. However, the verification of password strength through PAM is only possible with the plain text password, hence verification can only be conducted while the plain text password is available.

In OcNOS, an actual password change is not performed while the plain text password is held. When a 'commit' operation is executed, it is saved until 'write' operation is executed. However, since PAM cannot verify the strength of a password without setting it, OcNOS temporarily sets the password and while holdd the plain text password to check if the new password meets the password policy and can be changed. If it meets the policy and the password is changed, a process is necessary to revert to the original password.

PAM modules are configured in /etc/security/pwquality.conf and /etc/pam.d/common_password. This system internally holds default values based on customer requirements and sets them in these files at system startup. These files are updated if the corresponding configuration values are changed through the CLI and prompts user to update the default password.

To update these default passwords, check if the encrypted password calculated by its username and then prompt the user to update the password. Since the user ‘OcNOS’ shell is ‘cmlsh’ and the ‘root’ shell is ‘bash’, this code is

[1]Privileged Access Management is a third party pluggable security tool that protects organization from cyberthreats by overseeing.

developed independently. For the OcNOS user, it is implemented in cmlsh_start() in cmlsh_main. For the root user, it is done in /root/.bash

Benefits

- Strong passwords protect user accounts and devices from unauthorized access and safeguard sensitive information.
- If the passwords are complex, data is safe from cyber threats and hackers.

Configuration

The OcNOS configuration triggers all user management or password updates including LINUX accounts.

The below configurations allow the user to authenticate the password policy.

Topology

Use the OcNOS interface to configure user accounts, such as creating, disabling passwords and maintain user accounts information.

The image illustrates a method for authenticating and authorizing user account passwords.

Figure 18. OcNOS

OcNOS Device

1. Enable the aaa local authentication password-policy.

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy
OcNOS(config)#commit
```

2. Configure the aaa local authentication password-policy parameter to perform the below actions.

```
OcNOS(config)#aaa local authentication password-policy disable-usercheck
OcNOS(config)#aaa local authentication password-policy history 10
OcNOS(config)#aaa local authentication password-policy lowercase-count 3
OcNOS(config)#aaa local authentication password-policy maxrepeat 2
OcNOS(config)#aaa local authentication password-policy maxsequence 3
OcNOS(config)#aaa local authentication password-policy min-length 10
OcNOS(config)#aaa local authentication password-policy numeric-count 3
OcNOS(config)#aaa local authentication password-policy special-count 3
OcNOS(config)#aaa local authentication password-policy uppercase-count 2
```

Validation 1

Before enabling the local authentication password-policy.

```
# show aaa authentication password-policy

Password policy parameter:

Password policy feature: Disabled
Minimum number of digit: 1
Minimum number of uppercase character: 1
Minimum number of lowercase character: 1
Minimum number of special character: 1
Allowed the number of monotonic character sequences: 5
Username check: Enabled
Allowed the number of same consecutive characters: 1
Minimum length of password: 8
Number of remembered passwords: 5
```

After enabling the local authentication password-policy.

```
#show running-config

aaa local authentication password-policy

#show aaa authentication password-policy

Password policy parameter:
Password policy feature: Enabled
Minimum number of digit: 1
Minimum number of uppercase character: 1
Minimum number of lowercase character: 1
Minimum number of special character: 1
Allowed the number of monotonic character sequences: 5
Username check: Enabled
Allowed the number of same consecutive characters: 1
Minimum length of password: 8
Number of remembered passwords: 5
```

Validation 2

```
#show aaa authentication password-policy

Password policy parameter:
Password policy feature: Enabled
Minimum number of digit: 3
Minimum number of uppercase character: 2
Minimum number of lowercase character: 3
Minimum number of special character: 3
Allowed the number of monotonic character sequences: 3
Username check: Disabled
Allowed the number of same consecutive characters: 2
Minimum length of password: 10
Number of remembered passwords: 10
```

Implementation Examples

Set own password policy parameter and enter the password not as per the password-policy.

```
OcNOS(config)#username OcNOS role network-admin password Testing@123
```

BAD PASSWORD: The password contains less than 2 uppercase letters.

%% The password is too weak.

Password-policy logs

```
OcNOS(config)#username OcNOS role network-admin password T3$$Ting@123
```

```
OcNOS(config)#commit
OcNOS(config)#
```

Based on the above configuration set the password in the below format:

- Uppercase characters: 2
- Lowercase characters:3
- Special characters:3
- Numerical characters: 3
- Total Password length: 12

max-password-age

The maximum age for a user password for OcNOS is 60 days.The password policy setting describes how long users can use their password before it expires. This helps the users periodically change their passwords. When a user's password is updated, the expiry is set according to the user's role. This can be modified or updated per user. Once the expiry is set at the user level, the system will check for user-level expiry.

When a user logs in and cmlsh is invoked for the admin user, the admin user is prompted to change the password. A non- admin receives a message to contact the admin to update the password. If the user password has e xpired and it is not updated within the next 30 days, the user account removed from the database.

All these features are enabled and disabled entirely with a CLI. When disabled, /etc/pam.d/common-password should be updated not to use both pam_pwquality and pam_pwhistory modules.

Configuration

The below configurations allow the user to authenticate the maximum password age.

OcNOS Device

1. Enable the aaa local authentication password-policy

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy
OcNOS(config)#commit
```

2. Configure the aaa local authentication password expire for user and role

```
OcNOS(config)#aaa local authentication expire 40 role network-admin
OcNOS(config)#aaa local authentication expire 45 role network-engineer
OcNOS(config)#aaa local authentication expire 35 role network-operator
OcNOS(config)#aaa local authentication expire 50 role network-user
OcNOS(config)#aaa local authentication expire 50 user Test1
OcNOS(config)#commit
```

Note: The password will not expire, if we select the number of days as 0.

Validation 1

Before enabling the **`local authentication password-policy`**.

```
#show aaa authentication password-policy
Password policy parameter:
Minimum number of digit: 1
```

```
Minimum number of uppercase character: 1
Minimum number of lowercase character: 1
Minimum number of special character: 1
Allowed the number of monotonic character sequences: 5
Username check: Enabled
Allowed the number of same consecutive characters: 1
Minimum length of password: 8
Number of remembered passwords: 5
network-admin expiration days: Disabled
network-engineer expiration days: Disabled
network-operator expiration days: Disabled
network-user expiration days: Disabled
```

After enable the **`local authentication password-policy`**.

By default, password expire is enable as well

```
#show aaa authentication password-policy
Password policy parameter:
Password policy feature: Enabled
Minimum number of digit: 1
Minimum number of uppercase character: 1
Minimum number of lowercase character: 1
Minimum number of special character: 1
Allowed the number of monotonic character sequences: 5
Username check: Enabled
Allowed the number of same consecutive characters: 1
Minimum length of password: 8
Number of remembered passwords: 5
network-admin expiration days: 30
network-engineer expiration days: 60
network-operator expiration days: 60
network-user expiration days: 60
```

After configuring the password expire for role and user.

```
#show aaa authentication password-policy
Password policy parameter:
Password policy feature: Enabled
Minimum number of digit: 1
Minimum number of uppercase character: 1
Minimum number of lowercase character: 1
Minimum number of special character: 1
Allowed the number of monotonic character sequences: 5
Username check: Enabled
Allowed the number of same consecutive characters: 1
Minimum length of password: 8
Number of remembered passwords: 5
network-admin expiration days: 40
network-engineer expiration days: 45
network-operator expiration days: 35
network-user expiration days: 50
Test1: will expire in 50 days!!!
```

Removing Users with Expired Passwords

When a user's password is updated, the on set depending on the user's role. This is modified per user. Once the expiry is set, the system will automatically check for expired passwords. When a user logs in and cmlsh is invoked, for the admin user the user will be prompted to change the password. A non- admin user will receive a message to contact the admin to update the password.

If the user is expired and never update password or expiry for next 30 days, that user is removed from the database. All these features are enabled or disabled entirely with a CLI. When disabled, /etc/pam.d/common-password needs to be updated but not to use both pam_pwquality and pam_pwhistory modules.

Note: When updating a user's level expiry, any days already lapsed are deducted from the new expiry value. If the updated value is greater than the remaining days, it becomes the new remaining days. For example, if a user initially has 20 days and, after 5 days, the expiry is updated to 30 days, the user will have 25 days left (30 - 5). Conversely, if the expiry is updated to 10 days after 5 days have passed, the remaining time is set to 10 days.

Glossary

Key Terms/Acronym	Description
PAM[1]	Privileged Access Management s a third party pluggable security tool that protects organization from cyberthreats by overseeing.

New CLI Commands

The **configurable password policy** introduces the following configuration commands.

[1]Privileged Access Management is a third party pluggable security tool that protects organization from cyberthreats by overseeing.

aaa authentication password-policy

Use this command to verify the output for password-policy.

Command Syntax

```
show aaa authentication password-policy
```

Parameters

None

Default

None

Command Mode

Privilege mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS# show aaa authentication password-policy

Password policy parameter:

Password policy feature: Enabled
Minimum number of digit: 1
Minimum number of uppercase character: 1
Minimum number of lowercase character: 1
Minimum number of special character: 1
Allowed the number of monotonic character sequences: 5
Username check: Enabled
Allowed the number of same consecutive characters: 1
Minimum length of password: 8
Number of remembered passwords: 5
```

aaa local authentication password-policy

Use this command to enable/disable the password-policy.

Use no parameter of this command to disable.

Command Syntax

```
aaa local authentication password-policy
no aaa local authentication password-policy
```

Parameters

None

Default

The aaa local authentication password-policy is disabled under authentication password policy.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy
OcNOS(config)#commit
```

aaa local authentication password expire role

Use this command to enable or disable the password expire for role.

Use no parameter of this command to disable.

Command Syntax

```
aaa local authentication password expire <0-1000> role (network-admin|network-engineer|network-
operator|network-user)
no aaa local authentication password expire role (network-admin|network-engineer|network-
operator|network-user)
```

Parameters

expire <0-1000>
Specifies the number of days for password expiry for a particular role.

role network-admin
Specifies the network administration role for which the configured password expiry days are applicable.

role network-engineer
Specifies the network engineer role for which the configured password expiry days are applicable.

role network-operator
Specifies the network operator role for which the configured password expiry days are applicable.

role network-user
Specifies the network user role for which the configured password expiry days are applicable.

Default

Disabled

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password expire 50 role network-admin
OcNOS(config)#commit
```

aaa local authentication password expire user

Use this command to enable or disable the password expire for role.

Use no parameter of this command to disable.

Command Syntax

```
aaa local authentication password expire <0-1000> user WORD
no aaa local authentication password expire user WORD
```

Parameters

expire <0-1000>
Specifies the number of days for password expiry for a particular user.

user WORD
Specifies the user name.

Default

Disabled

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password expire 50 user user test
OcNOS(config)#commit
```

aaa local authentication password-policy disable-usercheck

Use this command to set the enable/disable the username check .

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy disable-usercheck
```

Parameters

<1-400>

Specifies the password disable range

Default

The aaa local authentication password-policy usercheck is enabled under authentication password-policy.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy disable-usercheck
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
OcNOS(config)# no aaa local authentication password-policy disable-usercheck
OcNOS(config)# commit
OcNOS#show aaa authentication password-policy
```

aaa local authentication password-policy history

Use this command to set the remembered password.

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy history <1-400>
```

Parameters

<1-400>
Specifies the password history range

Default

The aaa local authentication password-policy history value is 5.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy history 10
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
OcNOS(config)#no aaa local authentication password-policy history
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
```

aaa local authentication password-policy lowercase-count

Use this command to set the minimum number of lowercase character.

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy lowercase-count <1-32>
```

Parameters

<1-32>
Specifies the minimum number of uppercase characters range.

Default

The aaa local authentication password-policy uppercase-count value is 1.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy lowercase-count 2
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
OcNOS(config)# no aaa local authentication password-policy lowercase-count
OcNOS(config)# commit
OcNOS#show aaa authentication password-policy
```

aaa local authentication password-policy maxrepeat

Use this command to set the same consecutive character.

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy maxrepeat <1-32>
```

Parameters

<1-32>
Specifies the same consecutive character range.

Default

The aaa local authentication password-policy maxrepeat value is 1.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy maxrepeat 2
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
OcNOS(config)# no aaa local authentication password-policy maxrepeat
OcNOS(config)# commit
OcNOS#show aaa authentication password-policy
```

aaa local authentication password-policy maxsequence

Use this command to set the number of monotonic character sequence.

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy maxsequence <1-32>
```

Parameters

<1-32>

Specifies the monotonic character sequences characters range.

Default

The aaa local authentication password-policy maxsequence value is 5.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
#configure terminal
(config)#aaa local authentication password-policy maxsequence 7
(config)#commit
#show aaa authentication password-policy
(config)# no aaa local authentication password-policy maxsequence
(config)# commit
#show aaa authentication password-policy
```

aaa local authentication password-policy min-length

Use this command to set the minimum length of password.

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy min-length <8-32>
```

Parameters

<8-32>

Specifies the minimum password length range.

Default

The aaa local authentication password-policy min-length value is 8.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy min-length 10
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
OcNOS(config)#no aaa local authentication password-policy min-length
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
```

aaa local authentication password-policy numeric-count

Use this command to set the minimum number of digits.

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy numeric-count <1-32>

no aaa local authentication password-policy numeric-count <1-32>
```

Parameters

<1-32>
Specifies the numeric count range.

Default

The aaa local authentication password-policy numeric-count value is 1.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy numeric-count 2
OcNOS(config)#commit
OcNOS(#show aaa authentication password-policy
OcNOS(config)# no aaa local authentication password-policy numeric-count
OcNOS(config)# commit
OcNOS#show aaa authentication password-policy
```

aaa local authentication password-policy special-count

Use this command to set the minimum number of special character.

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy special-count <1-32>
```

Parameters

<1-32>
Specifies the minimum number of special characters range.

Default

The aaa local authentication password-policy special-count value is 1.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy special-count 2
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
OcNOS(config)# no aaa local authentication password-policy special-count
OcNOS(config)# commit
OcNOS#show aaa authentication password-policy
```

aaa local authentication password-policy uppercase-count

Use this command to set the minimum number of uppercase characters.

Use no parameter of this command to get the default value.

Command Syntax

```
aaa local authentication password-policy uppercase-count <1-32>
```

Parameters

<1-32>
Specifies the uppercase characters count range.

Default

The aaa local authentication password-policy uppercase-count value is 1.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
OcNOS(config)#aaa local authentication password-policy uppercase-count 2
OcNOS(config)#commit
OcNOS#show aaa authentication password-policy
OcNOS(config)# no aaa local authentication password-policy uppercase-count
OcNOS(config)# commit
OcNOS#show aaa authentication password-policy
```

Stronger User Password Hashes

Overview

Passwords entered during user creation are initially in plain text but must never be stored as such due to security concerns. OcNOS addresses this by using hashing algorithms to convert plain-text passwords into hashed versions before storing them in the database. Once hashed, recovering the original password becomes virtually impossible.

Feature Characteristics

This feature updates the default behavior of OcNOS when generating user password hashes. Previously, the MD5 algorithm served as the default hashing mechanism. OcNOS now uses the more secure SHA-512 algorithm as the default hash generator.

A new CLI command has been introduced to enable users to select the desired hashing algorithm for password encryption. The available options include:

- MD5
- SHA-256
- SHA-512

Key Considerations

- The selected hashing algorithm applies only to newly created usernames. Existing usernames retain the hash algorithm used at the time of creation.
- Passwords for previously configured usernames remain encrypted with their original hash algorithm.

Benefits

While MD5 has been widely used for hashing passwords in Linux-based systems, it has notable vulnerabilities:

- Collision Attacks: Different inputs can generate the same hash.
- Preimage Attacks: The original input can potentially be deduced from the hash.

With advancements in computational power, these vulnerabilities make MD5 unsuitable for modern systems. SHA-512, being a part of the SHA-2 family, offers significantly stronger cryptographic security, making it the preferred choice for password hashing.

Configuration

This steps provides a standardized approach to configuring sha-512 on OcNOS routers.

Topology

The topology represents a network device running OCNOS, with sha-512 password encryption implemented for secure communication and authentication.

Figure 19. SHA-512 Password Encryption Topology

The steps include enabling password encryption:

1. Enter Configuration Mode
```
# configure terminal
```
2. Configure the password user encryption.
```
(config)# user password encryption default sha-256
(config)# commit
(config)# exit
```

Note: By default, SHA-512 with MD5 is enabled.

3. Create a new user with password:
```
#configure terminal
(config)# username test2 password test1234
(config)#commit
(config)#exit
```

Configuration Snapshot:

```
!
user password encryption default sha-256
username test2  password encrypted $5$dV7Df2V1$yaAyIm7g8HE2mfKuBlJ2LdHYuNLg8KnP6vJw98W6tQ7
username test3  password encrypted
$6$nVoAfXI0$lsZI4H3M09B3I.fREbBMLPWTdfAzzEXCua5TcoaemaSHJt2hctR01.Jy3PyCS3utW6fGYbc8ZB1NQ3cC7.d1m1
!
```

Validation

To verify the hash algorithm used for passwords, use the **`show running-config`** and **`show user password encryption`** commands.

```
ocnos#sh running-config user-management
user password encryption default sha-256
username test2 password encrypted
$5$dV7Df2V1$yaAyIm7g8HE2mfKuBlJ2LdHYuNLg8KnP6vJw98W6tQ7
```

The prefix 6 indicates SHA-512.

Note: If 1 indicates md5, or 5 indicate SHA-256.

`ocnos#show user password encryption`

Implementation Examples

To create a new username with a MD5 hashing algorithm, use the following commands. Once committed, the password is hashed and stored securely:

```
OcNOS(config)#username admin password test1234
OcNOS(config)#commit
```

CLI Commands

Password encryption feature introduces the following configuration commands:

- `user password encryption default`
- `show user password encryption`

user password encryption default

Use this command to configure the hash algorithm for encrypting user passwords. Changes apply only to new usernames.

Use the **no** form of this command to disable the hash algorithm for encrypting user passwords.

Command Syntax

```
user password encryption default (md5|sha-256|sha-512)
no user password encryption default (md5|sha-256|sha-512)
```

Parameters

md5
Sets MD5 as the hash algorithm.

sha-256
Sets sha-256 as the hash algorithm.

sha-sha-512
Sets SHA-512 as the hash algorithm.

Default

SHA-512

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.6.0.

Examples

To configure SHA-256 as the default algorithm:

```
OcNOS(config)#user password encryption default sha-256
OcNOS(config)#commit
```

To remove SHA-256 as the default algorithm:

```
OcNOS(config)#no user password encryption default
OcNOS(config)#commit
```

show user password encryption

Use this command to display the currently configured hash algorithm.

Command Syntax

```
show user password encryption
```

Parameters

None

Default

SHA-512

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.6.0.

Examples

To show password encryption:

```
OcNOS#show user password encryption
Username password hash algorithm: sha-512
OcNOS#
```

In-band Management over Custom VRF

Overview

OcNOS currently supports system management protocols within the Default and Management Virtual Routing and Forwarding (**VRF**[1]). However, this configuration is insufficient for customer deployments that require the ability to

[1]Virtual Routing and Forwarding

run these protocols in user-defined VRFs. This document outlines the requirements for expanding OcNOS to support system management protocols in custom VRFs.

Feature Characteristics

- Support for System Management Protocols in User-Defined VRFs: Provide the flexibility to run system management protocols over user-defined VRFs. In large-scale networks, deploying an out-of-band management network is not always practical, making in-band device management over user-defined VRFs necessary to handle the volume of management traffic.
- Supported Protocols: SSH, Telnet, **RADIUS**[1], **TACACS**[2], Syslog, SNMP, NETCONF, and gNMI will operate within user-defined VRFs. Simultaneous support for multiple VRFs for specific protocols, such as SNMP Traps and Syslog. Support for both default and customizable port values for each protocol.
- Multi-VRF Protocol Operations: Management protocols, including SSH and NETCONF, allows simultaneous operations across multiple VRFs, providing enhanced flexibility in managing network devices.
- Service Traffic Segmentation: Management traffic, such as SNMP and Syslog, can be segmented across user-defined VRFs, allowing for more efficient traffic management and security.

Benefits

- Scalability and Flexibility:Enabling system management protocols to operate over custom VRFs allows for ease of managing service provider networks, especially in environments where out-of-band management is impractical.
- Protocol Customization: Support for both standard and customizable port values for management protocols provides greater flexibility, allowing customers to tailor the system management configuration to meet their specific network needs.

Configuration

This steps provides a standardized approach to configuring User-Defined VRF on PE routers.

Topology

In this topology, the management traffic from the Linux Server is routed through a specific VRF that is isolated from the traffic on the L3VPN.

Provider Edge (PE) Routers: PE1 and PE2 are Provider Edge routers in the network. These routers are responsible for managing and routing the traffic between the local network and the wider service provider network.

Both PE routers are connected through L3VPN, which is used to segment and isolate traffic between the two routers over a shared infrastructure. Each customer or service can have its own isolated routing table (VRF).

In-Band Connection: The In-Band Connection shown between PE1 and the Linux Server means that both management and normal traffic flow over the same physical network links.

[1]Remote Authentication Dial-In User Service

[2]Terminal Access Controller Access Control System

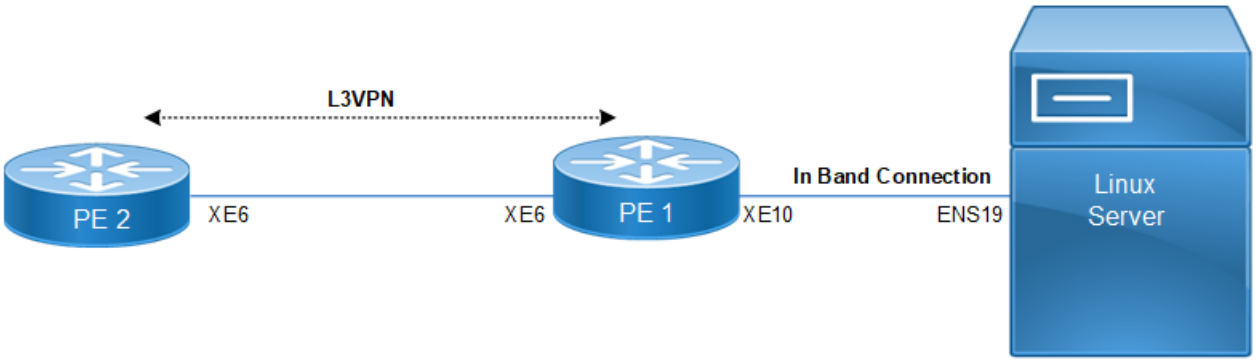
The in-band management traffic is directed over the custom VRF, ensuring it is separated from the service traffic, providing network isolation.

Custom VRF Feature: In this case, the custom VRF is applied to manage the traffic between the Linux Server and the network. This VRF allows traffic related to management tasks to remain separate from other traffic handled by the provider.

VRF helps ensure that different traffic types (such as syslog, or SSH sessions) remain isolated for security and performance reasons.

Multi-VRF Management: Using user-defined VRFs, run management services like Syslog, or SSH on separate VRFs, ensuring that management tasks are not mixed with customer or service traffic.

Figure 20. Custom VRF



Perform the following configuration steps for setting up a custom VRF with routing protocols like BGP, OSPF, and management protocols such as SSH. These can be applied to multiple Provider Edge (PE) routers, or other routers, with adjustments in interface names and IP addresses depending on the specific deployment.

The steps include defining VRFs, configuring interfaces, setting up routing protocols like OSPF and BGP, enabling management features (SSH), and ensuring MPLS support:

1.Enter configuration mode and define the VRF.

```
#configure terminal
(config)# ip vrf vrf1
(config)# rd 100:1
(config)# route-target both 10:10
(config)#exit
```

2. Assign the VRF to the relevant access and loopback interfaces, and configure both IPv4 or IPv6 addresses:

Access Interface Configuration:

```
#configure terminal
(config)# interface xe10
(config)# ip vrf forwarding vrf1
(config)# ip address 20.20.20.3/24
(config)# ipv6 address 2500::3/64
(config)#exit
Loopback Interface Configuration:
#configure terminal
(config)# interface lo.vrf1
(config)# ip vrf forwarding vrf1
(config)# ip address 172.16.1.10/24 secondary
(config)# ipv6 address 2000::10/64
(config)#exit
```

3.On interfaces facing the provider network, configure MPLS and enable LDP:

```
(config)# interface xe6
(config)# ip address 192.168.69.1/24
(config)# ipv6 address 1000::11/64
(config)# label-switching
(config)# enable-ldp ipv4
(config)#exit
```

4.Set up OSPF routing within the network, and ensure to advertise the necessary interfaces:

```
(config)# router ospf 100
(config)# network 1.1.1.1/32 area 0.0.0.0
(config)# network 192.168.69.0/24 area 0.0.0.0
(config)#commit
(config)#exit
#configure terminal
(config)# router ldp
(config)#exit
```

5.Configure BGP for both VPNv4 and VPNv6 address families:

```
#configure terminal
(config)# router bgp 1000
(config)# neighbor 2.2.2.2 remote-as 1000
(config)# neighbor 2.2.2.2 update-source 1.1.1.1
(config)# address-family vpnv4 unicast
(config)# neighbor 2.2.2.2 activate
(config)# exit-address-family
(config)# address-family ipv4 vrf vrf1
(config)# redistribute connected
(config)# exit-address-family
(config)# address-family vpnv6 unicast
(config)# neighbor 2.2.2.2 activate
(config)# exit-address-family
(config)# address-family ipv6 vrf vrf1
(config)# redistribute connected
(config)# exit-address-family
(config)#exit
```

6.Enable SSH (or respective protocols) for VRF Management:

```
#configure terminal
(config)# feature ssh vrf management
(config)# feature ssh vrf
(config)# feature ssh vrf vrf1
(config)#exit

(config)# ssh server port 10000 vrf management
(config)# ssh server port 10000
(config)# ssh server port 10000 vrf vrf1
(config)#exit

(config)# ssh login-attempts 2 vrf management
(config)# ssh login-attempts 2
(config)# ssh login-attempts 2 vrf vrf vrf1
(config)#exit
```

```
(config)# ssh server session-limit 10 vrf management
(config)# ssh server session-limit 10
(config)# ssh server session-limit 20 vrf vrf1
(config)#exit

(config)# ssh server algorithm encryption 3des-cbc vrf management
(config)# ssh server algorithm encryption 3des-cbc
(config)# ssh server algorithm encryption 3des-cbc vrf vrf1
(config)#exit
```

Validation

Validate the VRF and SSH configurations to ensure they support the custom VRF functions as expected.

- Verify VRF Configuration:

```
OcNOS#show running-config vrf vrf1
!
ip vrf vrf1
rd 100:1
route-target both 10:10
!
OcNOS#show running-config interface xe10
!
interface xe10
ip vrf forwarding vrf1
ip address 20.20.20.3/24
ipv6 address 2500::3/64
!
OcNOS#show running-config interface lo.vrf1
!
interface lo.vrf1
ip vrf forwarding vrf1
ip address 172.16.1.10/24 secondary
ipv6 address 2000::10/64
!
OcNOS#show running-config interface xe6
interface xe6
speed 10g
ip address 192.168.69.1/24
ipv6 address 1000::11/64
label-switching
enable-ldp ipv4
!
```

- Verify SSH Config:

```
OcNOS#show running-config ssh server
feature ssh vrf management
no feature ssh
feature ssh vrf vrf1
ssh server port 10000 vrf vrf1
ssh login-attempts 2 vrf vrf1
ssh server algorithm encryption 3des-cbc vrf vrf1
ssh server session-limit 20 vrf vrf1
OcNOS#show ssh server
VRF MANAGEMENT:
ssh server enabled port: 22
authentication-retries: 3
VRF DEFAULT:
ssh server disabled port: 22
```

```
authentication-retries: 3
VRF vrf1:
ssh server enabled port: 10000
session-limit: 20
authentication-retries: 2
```

Implementation Examples

- L3VPN/EVPN Tunnel Support: In a service provider network, user-defined VRFs are configured on managed nodes, such as PE and RR nodes. Management nodes connect to a PE node, enabling access to other PE/RR nodes through L3VPN/EVPN tunnels. This architecture supports in-band management of devices over user-defined VRFs.
- Service Traffic Segmentation: Management traffic, such as SNMP and Syslog packets, is segmented across different user-defined VRFs, ensuring separation from other network operations and enhancing security.
- Multi-VRF Support for Protocols: SSH and NETCONF services support connections from multiple VRFs simultaneously, allowing for scalable management across complex networks.

Glossary

Note: List key terms used in this document and add the term and explanation to our existing Glossary.

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
Virtual Routing and Forwarding (VRF)	A technology that allows multiple instances of a routing table to coexist on the same router. Each VRF operates independently, enabling isolated network paths and address spaces within a single physical infrastructure.
Multiprotocol Label Switching (MPLS)	A method for forwarding packets based on labels rather than network addresses. MPLS is commonly used in conjunction with VRF to route traffic through the network efficiently.
Label Distribution Protocol (LDP)	A protocol used in MPLS networks to establish label-switched paths (LSPs). LDP is responsible for distributing labels between routers to forward packets in an MPLS environment.
Open Shortest Path First (OSPF)	A link-state interior gateway protocol (IGP) used to distribute IP routing information within a single autonomous system. It is commonly used in conjunction with VRFs to handle routing within a VRF instance.
Border Gateway Protocol (BGP)	The protocol used to exchange routing information between different autonomous systems. When combined with VRFs, BGP can handle VPNv4 and VPNv6 routes for isolated routing domains.
Secure Shell (SSH)	A protocol that provides secure access to network devices and systems. In a VRF configuration, SSH can be enabled per VRF, allowing secure management access to routers on a per-VRF basis.

USER MANAGEMENT COMMAND REFERENCE

User Management

This chapter is a reference for user management commands.

This chapter includes these commands:

clear aaa local user lockout username

Use this command to unlock the locked user due to three times wrong password login attempt.

Command Syntax

```
clear aaa local user lockout username USERNAME
```

Parameters

USERNAME
User name; length 2-15 characters

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear aaa local user lockout username testuser
```

debug user-mgmt

Use this command to display user management debugging information.

Use the **no** form of this command stop displaying user management debugging information.

Command Syntax

```
debug user-mgmt
no debug user-mgmt
```

Parameters

None

Default

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug user-mgmt

#config t
(config)#debug user-mgmt
```

show user-account

Use this command to display information about all users or a given user.

Command Syntax

```
show user-account (WORD|)
```

Parameters

WORD
User name

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show user-account
User:user1
                roles: network-operator
User:user2
                roles: network-operator
User:user3
                roles: network-operator
```

username

Use this command to add a user or to change a user password.

The **role** parameter maps to privilege levels in the **TACACS**[1]+ server as shown in the table below.

Table 20. Role/privilege level mapping

Role	Privilege level
Network administrator	15
Network engineer	14
Network operator	1 to 13
Network user	0 or greater then 15

Use the **no** form of this command to remove a user.

Command Syntax

```
username USERNAME
username USERNAME password (encrypted|) PASSWORD
username USERNAME role (network-admin|network-engineer|network-operator|network-user)
username USERNAME role (network-admin|network-engineer|network-operator|network-user) password
(encrypted|) PASSWORD
username disable-default
no username disable-default
no username USERNAME
```

Parameters

USERNAME
User name; length 2-15 characters

encrypted
Encrypted password

PASSWORD
Password; length: 8-32 characters. Password must contain at least:
- One uppercase letter
- One lowercase letter
- One digit
- One special character (acceptable special characters: ~`!@#$%^&*(){}'[],.\"</\+-_:;) ,

Note: The following characters are not acceptable in passwords: **'=?|>**

network-admin
Network administrator role with all access permissions that can make permanent changes to the configuration. Changes persist after a reset/reboot of the switch.

[1]Terminal Access Controller Access Control System

Only network administrators can manage other users with the enable password, Authentication, Authorization and Accounting (page 198), **RADIUS**[1] Commands, and TACACS+ Commands.

network-engineer
Network engineer role with all access permission that can make permanent changes to the configuration. Changes persist after a reset/reboot of the switch.

network-operator
Network operator role with all access permissions that can make temporary changes to the configuration. Changes do not persist after a reset/reboot of the switch.

network-user
Network user role with access permissions to display the configuration, but cannot change the configuration.

disable-default
This option is used to disable the implicit configuration of default user by the system. This command can be executed only by users with "**`network-admin`**" privileges. When this option is configured, explicit configuration of default user will be rejected. If default-user is explicitly configured using "**`username`**" CLI, it should be removed using "**`no username USERNAME`**" before configuring "disable-default".

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#username fred_smith password Fred123$
```

[1]Remote Authentication Dial-In User Service

DHCP CONFIGURATION

DHCP Client Configuration

Overview

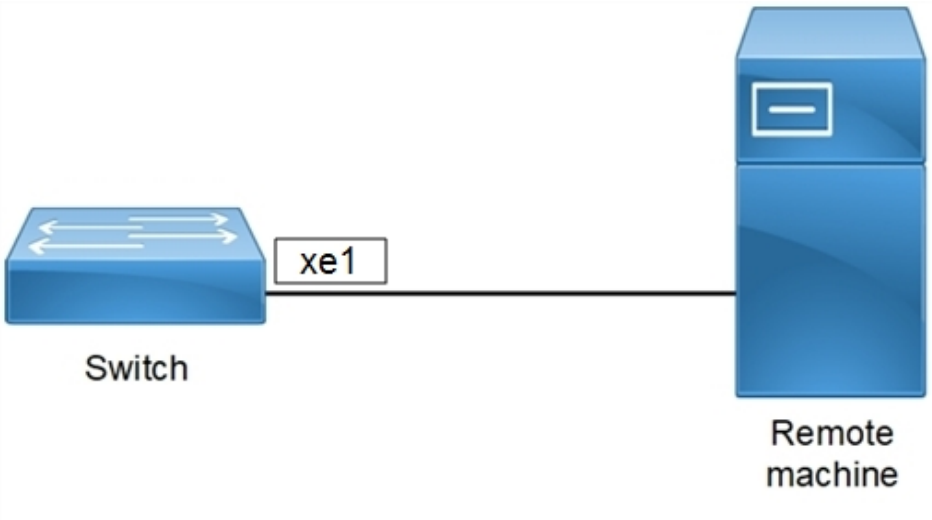
Dynamic Host Configuration Protocol (**DHCP**[1]) protocol is used for assigning dynamic IP addresses to systems on a network. Dynamic addressing allows a system to have an IP address each time it connects to the network. DHCP makes network administration easier by removing the need to manually assign a unique IP address every time a new system is added to the network. It is especially useful to manage mobile users. Once a system is configured to use DHCP, it can be automatically configured on any network that has a DHCP server.

DHCP uses a client-server model, in which the DHCP server centrally manages the IP addresses used in the network. DHCP clients obtain an IP address on lease from the DHCP server.

DHCP Client Configuration for IPv4

Before configuring the DHCP in client, make sure that DHCP server is ready and also dhcpd is running on the server machine.

Figure 21. DHCP sample topology



`#configure terminal`	Enter Configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This will be enabled by default.
`(config)#interface xe1`	Specify the interface(xe1) to be configured and enter the interface mode.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the acknowledgment from the server, it

[1]Dynamic Host Configuration Protocol

	assigns the IP address to the interface in which this command is enabled.
`(config if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#interface eth0`	Enter management interface mode.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the Acknowledgment from the server, it assigns the IP address to the management interface.
`(config if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.

Validation Commands

```
#show running-config dhcp
interface xe1
 ip address dhcp
!
ip dhcp relay information option

#sh ip interface brief

Interface            IP-Address      Admin-Status          Link-Status           GMPLS Type
eth0                 10.12.44.20     up                    up                    -
lo                   127.0.0.1       up                    up                    -

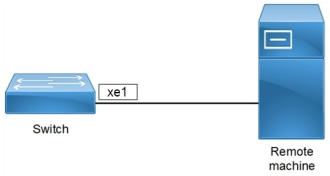
xe3/1                20.20.30.1      up                    up                    -
```

DHCP Client Configuration for IPv6

Before configuring the DHCP in client, make sure that DHCP server is ready and also dhcpd is running on the server machine.

Figure 22. DHCP sample topology



`#configure terminal`	Enter Configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This will be enabled by default.

`(config)#interface xe1`	Specify the interface(xe1) to be configured and enter the interface mode.
`(config-if)#ipv6 dhcp client request dns-nameserver`	The client request for name-server configured in server
`(config-if)#ipv6 dhcp client request domain-search`	The client request for domain names with ip
`(config-if)#ipv6 dhcp client request ntp-server`	The client request for Ntp server details configured in server
`(config-if)#ipv6 dhcp client request rapid-commit`	Enables rapid commit option
`(config-if)#ipv6 dhcp client request vendor-specific-information`	The client request for vendor specific information
`(config-if)#ipv6 dhcp client duid llt`	Set duid type for DHCP Client. Possible values are llt or ll
`(config-if)#ipv6 dhcp client dad-wait-time 300`	Max time that the client process should wait for the duplicate address detection to complete before initiating DHCP requests. Values range from 1 - 600
`(config-if)#ipv6 address dhcp`	The client requests for the IP address to the server, once it receives the acknowledgment from the server, it assigns the IP address to the interface in which this command is enabled.
`(config if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#interface eth0`	Enter management interface mode.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the Acknowledgement from the server, it assigns the IP address to the management interface.
`(config if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running. configuration

DHCP Server Configuration

Overview

A **DHCP**[1] Server is a network server that automatically provides and assigns IP addresses, default gateways and other network parameters to client devices. It relies on the standard protocol known as Dynamic Host Configuration Protocol or DHCP to respond to broadcast queries by clients.

DHCP Server Configuration for IPv4

Before configuring make sure that DHCP server is ready.

Topology

Figure 23. DHCP IPv4 topology

Configuration

DHCP IPv4 Client Interface

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface (xe1) to be configured and enter the interface mode.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the acknowledgment from the server, it assigns the IP address to the interface in which this command is enabled.
`(config-if)#ip dhcp client request dns-nameserver`	The client requests for the DNS name server.
`(config-if)#ip dhcp client request ntp-server`	The client requests for the NTP server .
`(config-if)#ip dhcp client request host-name`	The client requests for the Name of the client.
`(config-if)#ip dhcp client request log-server`	The client requests for the log server.
`(config if)#exit`	Exit interface mode.

[1]Dynamic Host Configuration Protocol

DHCP IPv4 Server Interface

`#configure terminal`	Enter Configure mode.
`(config)#interface xe2`	Specify the interface (xe2) to be configured and enter the interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure the IP address to the server interface.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the acknowledgment from the server, it assigns the IP address to the interface in which this command is enabled.
`(config if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.

DHCP IPv4 Server Feature

`#configure terminal`	Enter Configure mode.
`(config)#ip vrf vrf1`	Configure IP **VRF**[1] name.
`(config-vrf)#ip dhcp server max-lease-time 100`	Configure max lease time.
`(config-vrf)#ip dhcp server default-lease-time 100`	Configure default lease time.
`(config-vrf)#ip dhcp server pool test`	Configure DHCP server pool name.
`(dhcp-config)#network 3.3.3.0 netmask 255.255.255.0`	Configure network and netmask.
`(dhcp-config)#address range low-address 3.3.3.1 high-address 3.3.3.4`	Configure address IPv4 range.
`(dhcp-config)#routers 3.3.3.1`	IPv4 DHCP Server option to provide router details to a **DHCP client**[2].
`(dhcp-config)#boot-file test`	Configure boot-file name.
`(dhcp-config)#host-name dhcp-server`	Configure host name.
`(dhcp-config)#ntp-server 4.4.4.5`	Configure NTP server.
`(dhcp-config)#log-server 5.5.5.6`	Configure log server.
`(dhcp-config)#dns-server 5.5.5.5`	Configure DNS server.
`(dhcp-config)#tftp-server 5.5.5.6`	Configure TFTP server.
`(dhcp-config)#boot-file test`	Configure boot-file name.

DHCP Server Configuration for IPv6

Before configuring make sure that DHCP server is ready.

[1]Virtual Routing and Forwarding

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

Topology

Figure 24. DHCP IPv6 topology

Configuration

DHCP IPv6 Client Interface

`#configure terminal`	Enter Configure mode.
`(config)#interface xe47`	Specify the interface (xe47) to be configured and enter the interface mode.
`(config-if)#ipv6 address dhcp`	The client requests for the IPv6 address to the server, once it receives the acknowledgment from the server, it assigns the IP address to the interface in which this command is enabled.
`(config-if)#ipv6 dhcp client request dns-nameserver`	The client requests for the DNS name server.
`(config-if)#ipv6 dhcp client request ntp-server`	The client requests for the NTP server.
`(config-if)#ipv6 dhcp client request domain-search`	The client request for IPv6 domain search.
`(config-if)#ipv6 dhcp client request vendor-specific-information`	The client request for IPv6 vendor-specific-information.
`(config-if)#ipv6 dhcp client request rapid-commit`	The client request to enable rapid-commit.
`(config if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.

DHCP IPv6 Server Interface

`#configure terminal`	Enter Configure mode.
`(config)#interface xe2`	Specify the interface (xe2) to be configured and enter the interface mode.
`(config-if)#ipv6 address dhcp`	The client requests for the IPv6 address to the server, once it receives the acknowledgment from the server, it assigns the IP address to the interface in which this command is enabled.
`(config-if)#ipv6 address 2001::1/64`	Configure the IPv6 address to the server interface.
`(config if)#ipv6 dhcp server`	Configure an interface as a DHCP server starting

	interface.
(config if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.

DHCP IPv6 Server Feature

#configure terminal	Enter Configure mode
(config)#ip vrf vrf1	Configure IP VRF name
(config-vrf)#ipv6 dhcp server preference	Configure IPv6 DHCP server preference
(config-vrf)#ipv6 dhcp server rapid-commit	Configure IPv6 DHCP server rapid-commit
(config-vrf)#ipv6 dhcp server pool test	Configure IPv6 DHCP server pool name
(dhcp6-config)#network 2001:: netmask 64	Configure IPv6 network and netmask
(dhcp6-config)#address range low-address 2001::1 high-address 2001::124	Configure IPv6 address range
(dhcp6-config)#vendor-options 00:00:09:bf:63	Configure IPv6 vendor option
(dhcp6-config)#ntp-server 4001::1	Configure IPv6 NTP server
(dhcp6-config)#dns-server 3001::1	Configure IPv6 DNS server
(dhcp-config)#log-server 5.5.5.6	Configure log server
(dhcp6-config)#domain-name abcd	Configure domain name
(dhcp-config)#tftp-server 5.5.5.6	Configure TFTP server
(dhcp-config)#boot-file test	Configure boot-file name

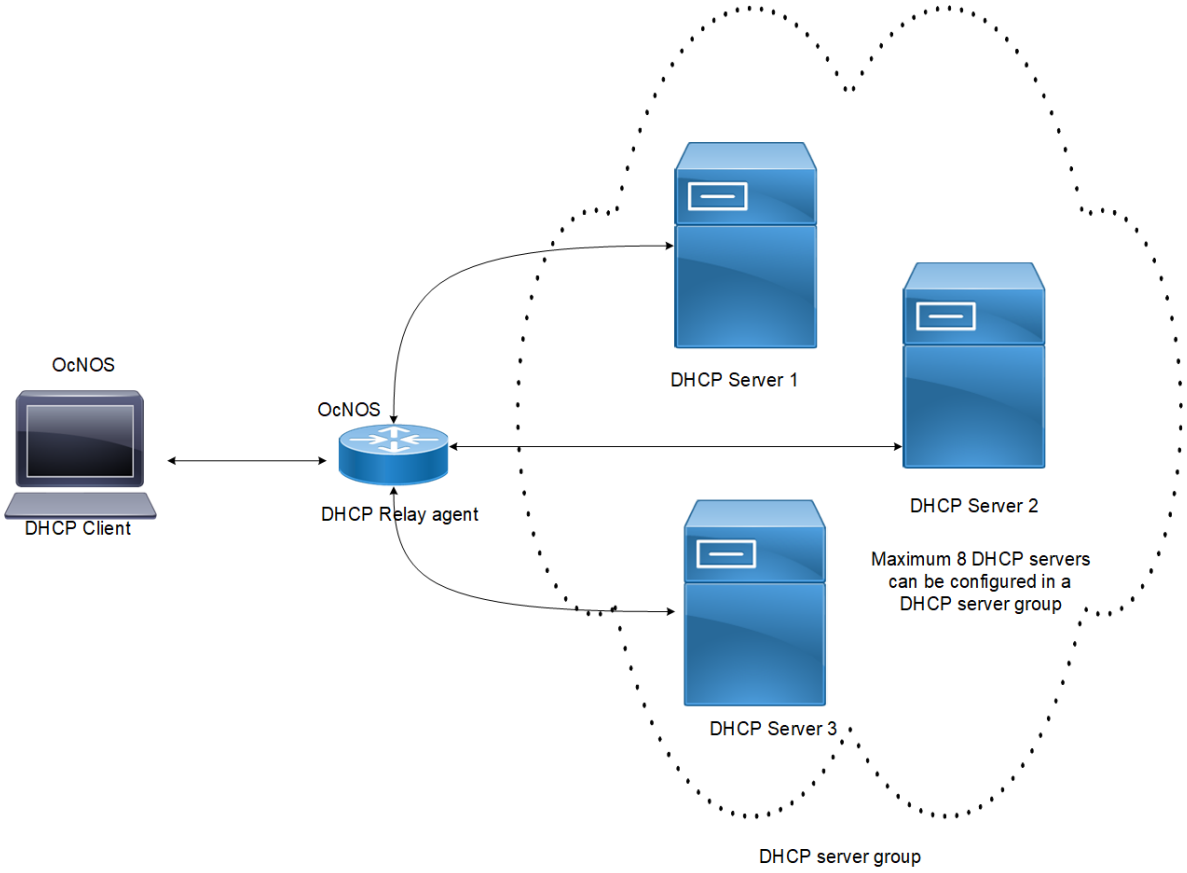
DHCP Server Group

Overview

Dynamic Host Control Protocol (**DHCP**[1]) Group provides the capability to specify multiple DHCP servers as a group on the **DHCP relay agent**[2] and to correlate a relay agent interface with the server group. When the interface receives request messages from clients, the relay agent forwards the message to all the DHCP servers of the group. One or multiple DHCP servers in the group process the request and respond with an offer to the client. The client reviews the offer and sends the request message to the chosen server to obtain the network configuration that includes an IP address. The illustration below shows a **DHCP client**[3] sending a request message to a DHCP relay agent that forwards the message to the three servers in the DHCP server group to get their network configuration. The DHCP client and DHCP relay agent run OcNOS, but the DHCP servers can be OcNOS or Linux devices.

Figure 1-1: DHCP server group



[1]Dynamic Host Configuration Protocol

[2]A DHCP relay forwards the request from a DHCP client to the DHCP server group and takes the response from the DHCP server group to the DHCP client.

[3]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

Feature Characteristics

This feature enables the configuration of the DHCP server group and attaches it to a DHCP relay agent through the CLI and the NetConf interface. A DHCP server group can be attached with multiple DHCP relay uplink interfaces, but at a given time, a single DHCP relay uplink interface is allowed to be attached with a single DHCP server group. The attachment of the DHCP relay uplink interface to another DHCP server group dissociates its attachment with the earlier attached DHCP server group.

This feature helps to configure DHCP IPv4 and IPv6 groups and attach server IP addresses to the group. Creating a maximum of 32 IPv4 and 32 IPv6 groups per **VRF**[1] is allowed, and configuring 8 DHCP servers is permitted for each DHCP server group.

Benefits

The DHCP relay agent forwards the request message from the DHCP client to multiple DHCP servers in the group. Forwarding the request message to multiple DHCP servers increases the reliability of obtaining the network configuration.

Configuration

Before configuring the **DHCP client**[2] and the **DHCP relay agent**[3], make sure that **DHCP**[4] server is configured and the **`dhcpd`** service is running in the DHCP server.

Topology

In the below example, DHCP server1 and DHCP server2 (OcNOS or Linux devices) are connected to the DHCP relay agent (an OcNOS device), and the DHCP relay is connected to a DHCP client (an OcNOS device). The DHCP client sends discover message to the DHCP servers through the DHCP relay agent.

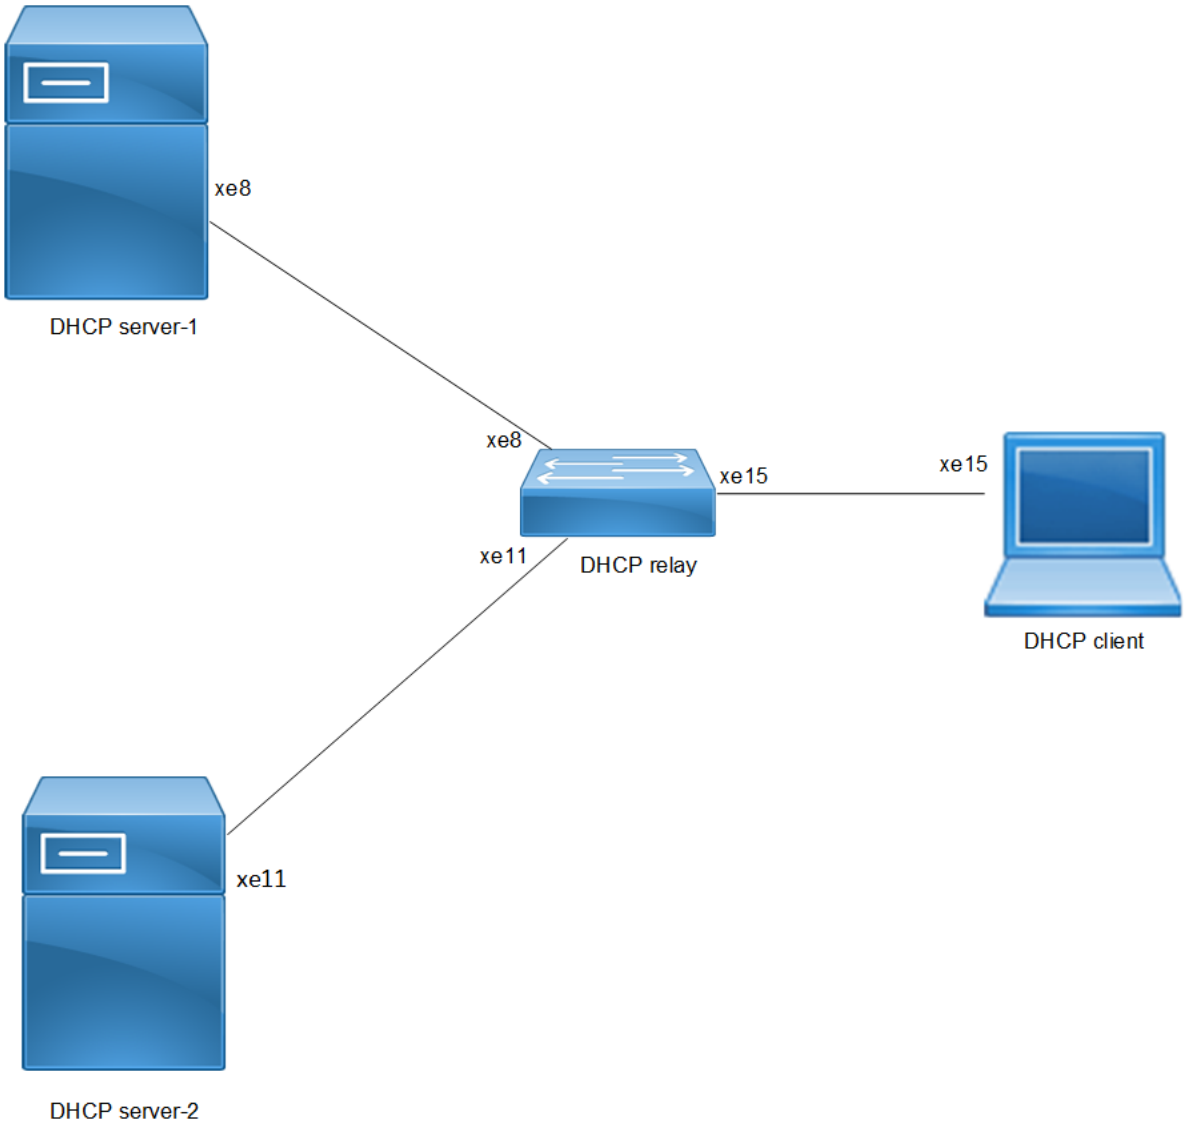
[1]Virtual Routing and Forwarding

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[3]A DHCP relay forwards the request from a DHCP client to the DHCP server group and takes the response from the DHCP server group to the DHCP client.

[4]Dynamic Host Configuration Protocol

Figure 1-1: DHCP server group topology



DHCP Server-1 Configuration for IPv4

This section shows how to configure the DHCPv4 Server-1.

DHCPv4 Server-1

`OcNOS#configure terminal`	Enter configure mode.
`OcNOS(config)ip dhcp server pool DHCP`[1]`-Server-1`	Configure DHCP server group for server in global mode.
`OcNOS(dhcp-config)#network 10.10.10.0 netmask 255.255.255.0`	Configure network **`10.10.10.0`** and netmask **`255.255.255.0`**.
`OcNOS(dhcp-config)#address range low-address`	Configure address range from **`10.10.10.1`** to

[1]Dynamic Host Configuration Protocol

`10.10.10.1 high-address 10.10.10.254`	**`10.10.10.254`**.
`OcNOS(dhcp-config)#dns-server 192.2.2.2`	Configure the DNS server **`192.2.2.2`**.
`OcNOS(dhcp-config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(dhcp-config)#exit`	Exit DHCP config mode.
`OcNOS(config)#ip dhcp server pool DHCP-SER`	Configure DHCP server group for client in global mode.
`OcNOS(dhcp-config)#network 20.20.20.0 netmask 255.255.255.0`	Configure network **`20.20.20.0`** and netmask **`255.255.255.0`**.
`OcNOS(dhcp-config)#address range low-address 20.20.20.1 high-address 20.20.20.30`	Configure address range from **`20.20.20.1`** to **`20.20.20.30`**.
`OcNOS(dhcp-config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(dhcp-config)#exit`	Exit dhcp config mode.
`OcNOS(config)#interface xe8`	Enter interface mode **`xe8`**.
`OcNOS(config-if)#ip address 10.10.10.2/24`	Configure IP address on the interface **`xe8`**.
`OcNOS(config-if)#ip dhcp server`	Server should be configured on the interface while connected to the relay.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.
`OcNOS(config)#ip route 20.20.20.0/24 10.10.10.3`	Configure static route of **`20.20.20.0/24`** by next hop interface **`10.10.10.3`**.
`OcNOS(config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config)#exit`	Exit config mode.

Validation

The below shows the running configuration of the DHCPv4 Server-1 node:

```
OcNOS#show running-config dhcp
interface eth0
 ip address dhcp
!
!

ip dhcp server pool DHCP-Server-1
 network 10.10.10.0 netmask 255.255.255.0
 address range low-address 10.10.10.1 high-address 10.10.10.254
 dns-server 192.2.2.2
ip dhcp server pool DHCP-SER
 network 20.20.20.0 netmask 255.255.255.0
 address range low-address 20.20.20.1 high-address 20.20.20.30
interface xe8
 ip dhcp server
!
OcNOS#
```

DHCP Server-2 Configuration for IPv4

This section shows how to configure the DHCPv4 Server-2.

DHCPv4 Server-2

`OcNOS#configure terminal`	Enter configure mode.
`OcNOS(config)#ip dhcp server pool` **`DHCP`**[1]`-Server-2`	Configure DHCP server group for server in global mode.
`OcNOS(dhcp-config)#network 40.10.10.0 netmask 255.255.255.0`	Configure network **`40.10.10.0`** and netmask **`255.255.255.0`**.
`OcNOS(dhcp-config)#address range low-address 40.10.10.1 high-address 40.10.10.254`	Configure address range from **`40.10.10.1`** to **`40.10.10.254`**.
`OcNOS(dhcp-config)#dns-server 192.2.2.2`	Configure DNS server **`192.2.2.2`**.
`OcNOS(dhcp-config)#ip dhcp server pool DHCP-SER`	Configure DHCP server group for client in global mode.
`OcNOS(dhcp-config)#network 20.20.20.0 netmask 255.255.255.0`	Configure network **`20.20.20.0`** and netmask **`255.255.255.0`**.
`OcNOS(dhcp-config)#address range low-address 20.20.20.1 high-address 20.20.20.30`	Configure address range from **`20.20.20.1`** to **`20.20.20.30`**.
`OcNOS(dhcp-config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(dhcp-config)#exit`	Exit DHCPv6 config mode.
`OcNOS(config)#interface xe11`	Enter interface mode **`xe11`**.
`OcNOS(config-if)#ip address 40.10.10.2/24`	Configure IP address **`40.10.10.2/24`** on the interface **`xe11`**.
`OcNOS(config-if)#ip dhcp server`	Server should be configured on the interface while connected to the relay.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.
`OcNOS(config)#ip route 20.20.20.0/24 40.10.10.3`	Configure static route **`20.20.20.0/24`** by next hop interface **`40.10.10.3`**.
`OcNOS(config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config)#exit`	Exit config mode.

Validation

The below shows the running configuration of the DHCPv4 Server-2 node:

```
OcNOS#show running-config dhcp
interface eth0
```

[1]Dynamic Host Configuration Protocol

```
 ip address dhcp

DHCP Relay Agent Configuration for IPv4

This section shows how to configure the DHCPv4 relay agent.

DHCPv4 Relay Agent

`OcNOS#configure terminal`	Enter configure mode.
`OcNOS(config)#ip dhcp relay server-group dhcp-relay-gp`	Configure relay server-group group name in global mode.
`OcNOS(dhcp-relay-group)#server 10.10.10.2`	Configure server **`10.10.10.2`**.
`OcNOS(dhcp-relay-group)#exit`	Exit **DHCP**[1] relay group.
`OcNOS(config)#interface xe15`	Enter interface mode **`xe15`**.
`OcNOS(config-if)#ip address 20.20.20.2/24`	Configure IPv4 address **`20.20.20.2`** on the interface **`xe15`**.
`OcNOS(config-if)#ip dhcp relay`	Relay should be configured on the interface connecting to the client.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.
`OcNOS(config)#interface xe8`	Enter interface mode **`xe8`**.
`OcNOS(config-if)#ip address 10.10.10.3/24`	Configure IPv4 address **`10.10.10.3`** on the interface **`xe8`**.
`OcNOS(config-if)#ip dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`OcNOS(config-if)#ip dhcp relay server-select dhcp-relay-gp`	Configure relay server-select group name on the device connected to the server.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.
`OcNOS(config)#ip dhcp relay server-group dhcp-`	Configure relay server-group group name in global

[1]Dynamic Host Configuration Protocol

`relay-gp`	mode.
`OcNOS(dhcp-relay-group)#server 40.10.10.2`	Configure IPv4 DHCP server address **`40.10.10.2`** on the server group.
`OcNOS(dhcp-relay-group)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(dhcp-relay-group)#exit`	Exit DHCP relay group.
`OcNOS(config)#interface xe11`	Enter interface mode **`xe11`**.
`OcNOS(config-if)#ip address 40.10.10.3/24`	Configure IPv4 address **`40.10.10.3`** on the interface **`xe11`**.
`OcNOS(config-if)#ip dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`OcNOS(config-if)#ip dhcp relay server-select dhcp-relay-gp`	Configure relay server-select group name on the device connected to the server.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.

Validation

The below shows the running configuration of the DHCPv4 relay agent node:

```
OcNOS#show running-config dhcp

```

DHCP Client Configuration for IPv4

This section shows how to configure the DHCPv4 Client.

DHCPv4 Client

`OcNOS#configure terminal`	Enter configure mode.
`OcNOS(config)#feature dhcp`	Enable the feature **DHCP**[1]. This will be enabled by default.
`OcNOS(config)#int xe15`	Enter interface mode **`xe15`**.
`OcNOS(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the acknowledgment from the server, it assigns the IP address to the interface in which this command is enabled.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.

Validation

The below shows the running configuration of the DHCPv4 client node:

```
OcNOS#show running-config dhcp

DHCP Server-1 Configuration for IPv6

This section shows how to configure the DHCPv6 Server-1.

DHCPv6 Server-1

`OcNOS#configure terminal`	Enter configure mode.
`OcNOS(config)#ipv6 dhcp server pool DHCPv6-Server-1`	Configure **DHCP**[1] server group for server in global mode.
`OcNOS(dhcp6-config)#network 2001:: netmask 64`	Configure network **`2001::`** and netmask **`64`**.
`OcNOS(dhcp6-config)#address range low-address 2001::1 high-address 2001::124`	Configure address range from **`2001::1`** to **`2001::124`**.
`OcNOS(dhcp6-config)#ipv6 dhcp server pool DHCPv6-SER`	Configure DHCP server group for client in global mode.
`OcNOS(dhcp6-config)#network 3001:: netmask 64`	Configure network **`3001::`** and netmask **`64`**.
`OcNOS(dhcp6-config)#address range low-address 3001::1 high-address 3001::124`	Configure address range from **`3001::1`** to **`3001::124`**.
`OcNOS(dhcp6-config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(dhcp6-config)#exit`	Exit DHCPv6 config mode.
`OcNOS(config)#interface xe8`	Enter interface mode **`xe8`**.
`OcNOS(config-if)#ipv6 address 2001::2/64`	Configure IPv6 address **`2001::2/64`** on the interface **`xe8`**.
`OcNOS(config-if)#ipv6 dhcp server`	Server should be configured on the interface while connected to the relay.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.

[1]Dynamic Host Configuration Protocol

`OcNOS(config)#ipv6 route 3001::/64 2001::3`	Configure static route **`3001::/64`** by next hop interface **`2001::3`**.
`OcNOS(config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config)#exit`	Exit config mode.

Validation

The below shows the running configuration of the DHCPv6 Server-1 node:

```
OcNOS#show running-config dhcp
interface eth0
 ip address dhcp
!
!

ipv6 dhcp server pool DHCPv6-Server-1
 network 2001:: netmask 64
 address range low-address 2001::1 high-address 2001::124
ipv6 dhcp server pool DHCPv6-SER
 network 3001:: netmask 64
 address range low-address 3001::1 high-address 3001::124
interface xe8
 ipv6 dhcp server
!
OcNOS#
```

DHCP Server-2 Configuration for IPv6

This section shows how to configure the DHCPv6 Server-2.

DHCPv6 Server-2

`OcNOS#configure terminal`	Enter configure mode.
`OcNOS(config)#ipv6 dhcp server pool DHCPv6-Server-2`	Configure dhcp server group for server in global mode.
`OcNOS(dhcp6-config)#network 4001:: netmask 64`	Configure network **`4001::`** and netmask **`64`**.
`OcNOS(dhcp6-config)#address range low-address 4001::1 high-address 4001::124`	Configure address range from **`4001::1`** to **`4001::124`**.
`OcNOS(dhcp6-config)#ipv6 dhcp server pool DHCPv6-SER`	Configure **DHCP**[1] server group for client in global mode.
`OcNOS(dhcp6-config)#network 3001:: netmask 64`	Configure network **`3001::`** and netmask **`64`**.
`OcNOS(dhcp6-config)#address range low-address 3001::1 high-address 3001::124`	Configure address range from **`3001::1`** to **`3001::124`**.
`OcNOS(dhcp6-config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(dhcp6-config)#exit`	Exit DHCPv6 config mode.
`OcNOS(config)#interface xe11`	Enter interface mode **`xe11`**.

[1]Dynamic Host Configuration Protocol

`OcNOS(config-if)#ipv6 address 4001::2/64`	Configure IPv6 address on the interface **`xe11`**.
`OcNOS(config-if)#ipv6 dhcp server`	Server should be configured on the interface while connected to the relay.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.
`OcNOS(config)#ipv6 route 3001::/64 4001::3`	Configure static route **`3001::/64`** by next hop interface **`4001::3`**.
`OcNOS(config)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config)#exit`	Exit config mode.

Validation

The below shows the running configuration of the DHCPv6 Server-2 node:

```
OcNOS#show running-config dhcp
interface eth0
 ip address dhcp
!
!

ipv6 dhcp server pool DHCPv6-Server-2
 network 4001:: netmask 64
 address range low-address 4001::1 high-address 4001::124
ipv6 dhcp server pool DHCPv6-SER
 network 3001:: netmask 64
 address range low-address 3001::1 high-address 3001::124
interface xe11
 ipv6 dhcp server
!
OcNOS#
```

DHCP Relay Agent Configuration for IPv6

This section shows how to configure the DHCPv6 relay agent.

DHCPv6 Relay Agent

`OcNOS#configure terminal`	Enter configure mode.
`OcNOS(config)#ipv6 dhcp relay server-group dhcpv6-relay-gp`	Configure relay server-group group name in global mode.
`OcNOS(dhcp6-relay-group)#server 2001::2`	Configure server address **`2001::2`**.
`OcNOS(dhcp6-relay-group)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(dhcp6-relay-group)#exit`	Exit DHCPv6 relay group.
`OcNOS(config)#interface xe8`	Enter interface mode **`xe8`**.
`OcNOS(config-if)#ipv6 address 2001::3/64`	Configure IPv6 address **`2001::3/64`** on the interface **`xe8`**.
`OcNOS(config-if)#ipv6 dhcp relay uplink`	Configure relay uplink on the device connecting the

	server.
`OcNOS(config-if)#ipv6 dhcp relay server-select dhcpv6-relay-gp`	Configure relay server-select group name on the device connected to the server.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.
`OcNOS(config)#interface xe15`	Enter interface mode.
`OcNOS(config-if)#ipv6 address 3001::2/64`	Configure IPv6 address on the interface **`xe15`**.
`OcNOS(config-if)#ipv6 dhcp relay`	By default, this will be enabled. This command starts the IPv6 dhcp relay service.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.
`OcNOS(config)#ipv6 dhcp relay server-group dhcpv6-relay-gp`	Configure relay server-group group name in global mode.
`OcNOS(dhcp6-relay-group)#server 4001::2`	Configure server address **`4001::2`**.
`OcNOS(dhcp6-relay-group)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(dhcp6-relay-group)#exit`	Exit DHCPv6 relay group.
`OcNOS(config)#interface xe11`	Enter interface mode.
`OcNOS(config-if)#ipv6 address 4001::3/64`	Configure IPv6 **`4001::3/64`** address on the interface **`xe11`**.
`OcNOS(config-if)#ipv6 dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`OcNOS(config-if)#ipv6 dhcp relay server-select dhcpv6-relay-gp`	Configure relay server-select group name on the device connected to the server.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.

Validation

The below shows the running configuration of the DHCPv6 relay agent node:

```
OcNOS#show running-config dhcp
interface eth0
 ip address dhcp
!
!

ipv6 dhcp relay server-group dhcpv6-relay-gp

DHCP Client Configuration for IPv6

This section shows how to configure the DHCPv6 client.

DHCPv6 client

`OcNOS#configure terminal`	Enter configure mode.
`OcNOS (config)#feature dhcp`	Enable the feature dhcp. This is enabled by default.
`OcNOS(config)#int xe15`	Enter interface mode **`xe15`**.
`OcNOS(config-if)#ipv6 address dhcp`	The client requests for the IPv6 address to the server. Once it receives the acknowledgment from the server, it assigns the IPv6 address to the interface in which this command is enabled.
`OcNOS(config-if)#commit`	Commit the candidate configuration to the running configuration.
`OcNOS(config-if)#exit`	Exit interface mode.

Validation

The below shows the running configuration of the DHCPv6 client node:

```
OcNOS#show running-config dhcp
interface eth0
 ip address dhcp
!
interface xe15
 ipv6 address dhcp

OcNOS#show ipv6 int br

New CLI Commands

ip dhcp relay server-group

Use this command to create the **DHCP**[1] IPv4 server group. This group lists the servers to which DHCP Relay forwards the **DHCP client**[2] requests.

Use the **no** form of this command to unconfigure the DHCP IPv4 server group.

Command Syntax

```
ip dhcp relay server-group GROUP_NAME
no ip dhcp relay server-group GROUP_NAME
```

Parameters

GROUP_NAME
Name of the DHCP server group (specify a maximum 63 alphanumeric characters).

Command Mode

Configure mode and **VRF**[3] mode. In the configure mode, the DHCP IPv4 server group is created in the default VRF. In the configure-vrf mode, the DHCP IPv4 server group is created in the user-defined VRF.

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The example below shows the creation of DHCP IPv4 server groups.

```
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#ip dhcp relay server-group Group1
OcNOS(dhcp-relay-group)#end
OcNOS#configure terminal
OcNOS(config)#ip dhcp relay server-group Group2
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[3]Virtual Routing and Forwarding

ip dhcp relay server-select

Use this command to attach the **DHCP**[1] IPv4 server group to the DHCP relay uplink interface.

Use the **no** form of this command to remove the DHCP IPv4 server group attached to the DHCP relay interface.

Note: Attach the groups only to the DHCP relay uplink interfaces.

Command Syntax

```
ip dhcp relay server-select GROUP_NAME
no ip dhcp relay server-select
```

Parameters

GROUP_NAME
Name of the DHCP server group (specify a maximum 63 alphanumeric characters).

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example shows attaching the DHCP IPv4 server group to the DHCP relay uplink interface:

```
OcNOS#configure terminal
OcNOS(config)#interface xe1
OcNOS(config-if)#ip dhcp relay server-select group1
```

[1]Dynamic Host Configuration Protocol

ipv6 dhcp relay server-group

Use this command to create the **DHCP**[1] IPv6 server group. This group lists the servers to which DHCP relay forwards the **DHCP client**[2] requests.

Use the no form of this command to unconfigure the DHCP IPv6 server group.

Command Syntax

```
ipv6 dhcp relay server-group GROUP_NAME
no ipv6 dhcp relay server-group GROUP_NAME
```

Parameters

GROUP_NAME
Name of the DHCP server group (specify a maximum of 63 alphanumeric characters).

Command Mode

Configure mode and **VRF**[3] mode. In the configure mode, the DHCP IPv6 server group is created in the default VRF. In the configure-vrf mode, the DHCP IPv6 server group is created in the user-defined VRF.

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The example below shows the creation of DHCP IPv6 server groups:

```
OcNOS#configure terminal
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#ipv6 dhcp relay server-group Group1
OcNOS(dhcp relay server-group)#end
OcNOS#configure terminal
OcNOS(config)#ipv6 dhcp relay server-group Group2
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[3]Virtual Routing and Forwarding

ipv6 dhcp relay server-select

Use this command to attach the **DHCP**[1] IPv6 group to the DHCP relay uplink interface.

Use the **no** form of this command to remove the DHCP IPv6 group attached to the interface.

Note: Attach the groups only to the DHCP relay uplink interfaces.

Command Syntax

```
ipv6 dhcp relay server-select GROUP_NAME
no ipv6 dhcp relay server-select
```

Parameters

GROUP_NAME
Name of the DHCP server group (specify a maximum of 63 alphanumeric characters).

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example shows how to attach the DHCP IPv6 server group to the DHCP relay uplink interface:

```
#configure terminal
(config)#interface xe1
(config-if)#ipv6 dhcp relay server-select group1
```

[1]Dynamic Host Configuration Protocol

server A.B.C.D

Use this command to add the **DHCP**[1] IPv4 servers to the DHCP server group.

Use the **no** form of this command to remove the DHCP IPv4 servers from the DHCP server Group.

Note: A maximum of eight servers can be added to a DHCP group.

Command Syntax

```
server A.B.C.D
no server A.B.C.D
```

Parameters

A.B.C.D
DHCP IPv4 Relay group server address to be added in the DHCP server group.

Command Mode

DHCP Relay Group Mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example shows the addition of DHCP IPv4 servers to a DHCP server group:

```
OcNOS#configure terminal
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#ip dhcp relay server-group group
OcNOS(dhcp-relay-group)#server 10.12.23.205
OcNOS(dhcp-relay-group)#end
OcNOS#configure terminal
OcNOS(config)#ip dhcp relay server-group group1
OcNOS(dhcp-relay-group)#server 10.12.33.204
```

[1]Dynamic Host Configuration Protocol

server X:X::X:X

Use this command to add the **DHCP**[1] IPv6 servers to the DHCP server group.

Use the **no** form of this command to remove the DHCP IPv6 servers from the DHCP server group.

Note: A maximum of eight servers can be added to a DHCP group.

Command Syntax

```
server X:X::X:X
no server X:X::X:X
```

Parameters

X:X::X:X
DHCP IPv6 Relay Group server address to be added in the DHCP server group.

Command Mode

DHCP Relay Group Mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example shows the addition of DHCP IPv6 servers to a DHCP server group:

```
OcNOS#configure terminal
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#ipv6 dhcp relay server-group group
OcNOS(dhcp6-relay-group)#server 2003::1
OcNOS(dhcp6-relay-group)#end

OcNOS#configure terminal
OcNOS(config)#ipv6 dhcp relay server-group group1
OcNOS(dhcp-relay-group)#server 2001::1
OcNOS(dhcp6-relay-group)end
```

[1]Dynamic Host Configuration Protocol

DHCP Relay Agent Configuration

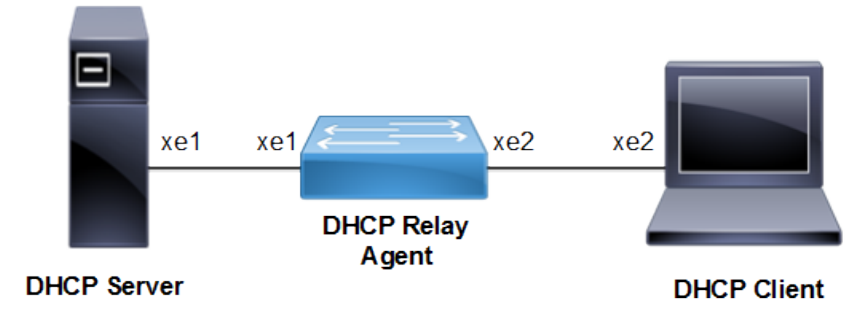
Overview

The **DHCP**[1] Relay feature was designed to forward DHCP broadcast requests as unicast packets to a configured DHCP server or servers for redundancy in different network segments..

DHCP Relay for IPv4

Before configuring **DHCP**[2] Relay, make sure DHCP server and client configurations are done.

Figure 25. DHCP Relay Configuration



DHCP Agent

`#configure terminal`	Enter configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This is enabled by default.
`(config)#ip dhcp relay`	By default this will be enabled. It starts the ip dhcp relay service.
`(config)#ip dhcp relay address 10.10.10.2`	The relay address configured should be server interface address connected to DUT machine.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure ipv4 address on the interface xe1.
`(config-if)#ip dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe2`	Enter interface mode.

[1]Dynamic Host Configuration Protocol

[2]Dynamic Host Configuration Protocol

`(config-if)#ip address 20.20.20.1/24`	Configure ipv4 address on the interface xe2.
`(config-if)#ip dhcp relay`	Relay should be configured on the interface connecting to the client.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation Commands

```
#show running-config dhcp

ip dhcp relay address 10.10.10.2
interface xe2
 ip dhcp relay
!
interface xe1
 ip dhcp relay uplink
!

#show ip dhcp relay
DHCP relay service is Enabled.
VRF Name: default
  Option 82: Disabled
  DHCP Servers configured: 10.10.10.2
  Interface               Uplink/Downlink
  ---------               ---------------
  xe2                     Downlink
  xe1                     Uplink

#show ip dhcp relay address
 VRF Name: default
  DHCP Servers configured: 10.10.10.2
```

DHCP Relay for IPv6 Configuration

DHCP Agent

`#configure terminal`	Enter configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This is enabled in default.
`(config)#ipv6 dhcp relay`	By default this will be enabled. It starts the ipv6 dhcp relay service.
`(config)#ipv6 dhcp relay address 2001::2`	The relay address configured should be server interface address connected to DUT machine.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ipv6 address 2001::1/64`	Configure ipv6 address on the interface xe1.
`(config-if)#ipv6 dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

`(config)#interface xe2`	Enter interface mode.
`(config-if)#ipv6 address 2002::1/64`	Configure ipv6 address on the interface xe2.
`(config-if)#ipv6 dhcp relay`	Relay should be configured on the interface connecting to the client.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation Commands

```
#sh ipv6 dhcp relay address

VRF Name: default
  DHCPv6 Servers configured: 2001::2

#show running-config dhcp

Ipv6 dhcp relay address 2001::2
 interface xe2
 ipv6 dhcp relay
!
interface xe1
 ipv6 dhcp relay uplink
!
```

DHCP Relay option 82

This section contains examples of **DHCP**[1] Relay option-82 configuration. DHCP option 82 (Agent Information Option) provides additional security when DHCP is used to allocate network addresses. It enables the **DHCP relay agent**[2] to prevent **DHCP client**[3] requests from untrusted sources. Service Providers use remote identifier (option 82 sub option 2) for troubleshooting, authentication, and accounting. The DHCP Option 82 Remote ID Format feature adds support for the interpretation of **remote-IDs** that are inserted by end users. On the relay agent, you can configure information option to add option 82 information to DHCP requests from the clients before forwarding the requests to the DHCP server. When configured with option 82 and remote-id, the server will receive the DHCP request packet with Agent Circuit ID and remote-id.

The two examples below, show how to configure the DHCP Relay option 82:

- Configuration of DHCP Relay option 82 on a physical interface with Agent information and remote-id.
- Configuration of DHCP Relay option 82 on a VLAN interface with Agent information and remote-id.

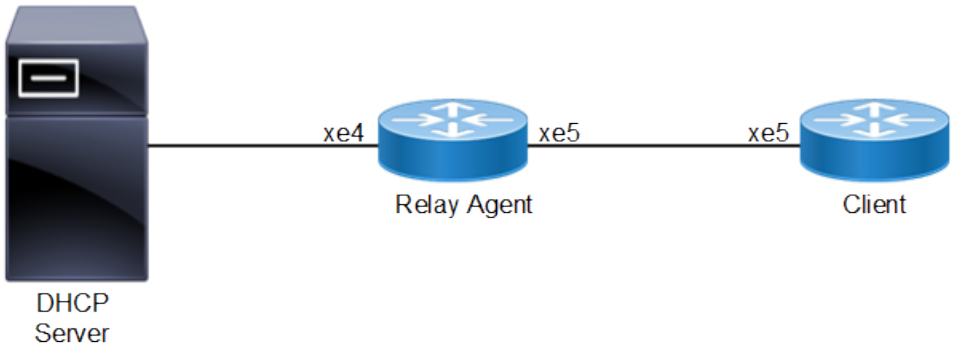
[1]Dynamic Host Configuration Protocol

[2]A DHCP relay forwards the request from a DHCP client to the DHCP server group and takes the response from the DHCP server group to the DHCP client.

[3]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

Topology

Figure 26. DHCP Option 82 interface topology



Physical Interface Configuration

Here, the DHCP Server is running with IP 192.168.1.2 with another pool of subnet 10.10.20.0 configured in the server. Configure a static route to 10.10.20.0 network for **DHCP OFFER** packets to reach the Relay Agent.

Relay agent

`#configure terminal`	Enter configure mode.
`(config)#ip dhcp relay`	Enable DHCP Relay
`(config)#ip dhcp relay address 192.168.1.2`	The relay address configured should be server interface address connected to DUT machine
`(config)#ip dhcp relay information option remote-id hostname`	Enable DHCP Relay information option with both agent circuit id which is sub option 1 of option 82 and remote-id which is sub option 2 of option 82. String support is also provided for remote-id.
`(config)#interface xe5`	Enter interface mode.
`(config-if)#ip address 10.10.20.2/24`	Add IP address
`(config-if)#ip dhcp relay`	Configure DHCP relay for the interface connecting to client.
`(config-if)#exit`	Exit from interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe4`	Enter interface mode
`(config-if)#ip address 192.168.1.1/24`	Configure ipv4 address on the interface xe4
`(config-if)#ip dhcp relay uplink`	Configure DHCP relay uplink for the interface connecting to server.

`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Client

`#configure terminal`	Enter configure mode.
`(config)#interface xe5`	Enter interface mode.
`(config-if)#ip address dhcp`	Configure IP address DHCP
`(config-if)#exit`	Exit from interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation

Relay Agent

```
#show running-config dhcp
!
ip dhcp relay information option remote-id hostname
ip dhcp relay address 192.168.1.2
interface xe5
 ip dhcp relay
!
interface xe4
 ip dhcp relay uplink
!

Physical Interface Configuration with non-default VRF

Here, the **DHCP**[1] Server is running with IP 192.168.1.2 with another pool of subnet 10.10.20.0 configured in the server. Configure a static route to 10.10.20.0 network for DHCP OFFER packets to reach the Relay Agent.

Relay agent

`#configure terminal`	Enter configure mode.
`(config)#ip dhcp relay`	Enable DHCP Relay.
`(config)#ip vrf vrf_dhcp`	Configuring non default vrf vrf_dhcp
`(config-vrf)#ip dhcp relay information option remote-id hostname`	Enable DHCP Relay information option with both agent circuit id which is sub option 1 of option 82 and remote-id which is sub option 2 of option 82 on non default vrf.. String support is also provided for remote-id.
`(config-vrf)#ip dhcp relay address 192.168.1.2`	Configure DHCP relay address in non default vrf.
`(config)#interface xe5`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf_dhcp`	Configure vrf forwarding for vrf_dhcp.
`(config-if)#ip address 10.10.20.2/24`	Add IP address.

[1]Dynamic Host Configuration Protocol

`(config-if)#ip dhcp relay`	Configure DHCP relay for the interface connecting to client.
`(config-if)#exit`	Exit from interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe4`	Enter interface mode
`(config-if)#ip vrf forwarding vrf_dhcp`	Configure vrf forwarding for vrf_dhcp
`(config-if)#ip dhcp relay uplink`	Configure DHCP relay uplink for the interface connecting to server.
`(config-if)#ip address 192.168.1.4/24`	Add IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Client

`#configure terminal`	Enter configure mode.
`(config)#interface xe5`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf_dhcp`	Configure ip vrf forwarding for non default vrf.
`(config-if)#ip address dhcp`	Configure IP address DHCP.
`(config-if)#exit`	Exit from interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation

```

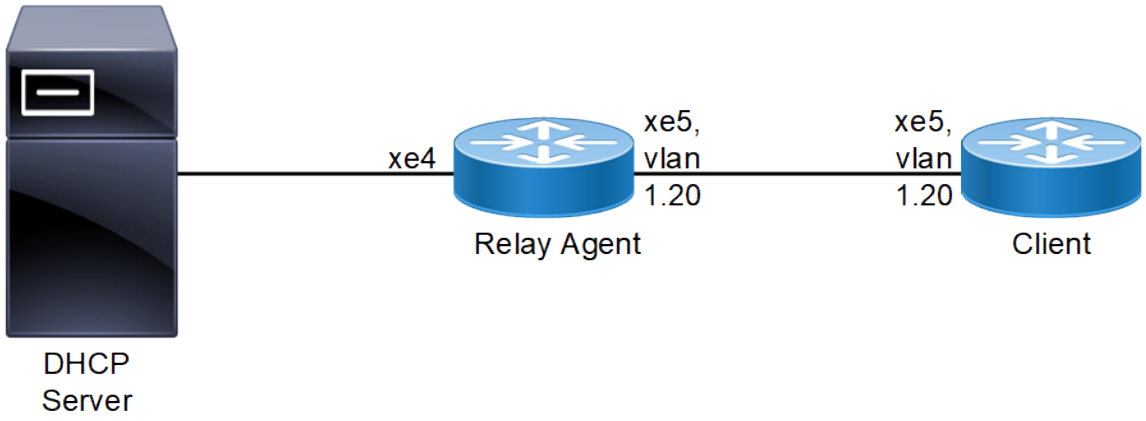
VLAN Interface Configuration

Topology

Figure 27. DHCP 82 vlan topology



Here, the DHCP Server is running with IP 192.168.1.2 with another pool of subnets 10.10.20.0 configured in the server. Configure a static route to 10.10.20.0 network for DHCP OFFER packets to reach the Relay Agent. In the above topology, vlan 20 is part of interface xe5 in relay Agent and xe5 in Client.

Relay Agent

`#configure terminal`	Enter configure mode.
`(config)#ip dhcp relay`	Enable DHCP Relay
`(config)#ip dhcp relay information option remote-id hostname`	Enable DHCP Relay information option with both agent circuit id which is sub option 1 of option 82 and remote-id which is sub option 2 of option 82. String support is also provided for remote-id.
`(config)#ip dhcp relay address 192.168.1.2`	Configure DHCP relay address
`(config)#bridge 1 protocol rstp vlan-bridge`	Configure bridge
`(config)#vlan 2-100 bridge 1 state enable`	Enable some VLANs
`(config)#interface xe5`	Enter interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Configure bridge-group
`(config-if)#switchport mode hybrid`	Configure switchport mode
`(config-if)#switchport hybrid allowed vlan all`	Enable vlan
`(config-if)#exit`	Exit from interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface vlan1.20`	Enter interface mode for the vlan interface towards client.
`(config-if)#ip address 10.10.20.2/24`	Add IP address

`(config-if)#ip dhcp relay`	Configure DHCP relay on the vlan interface connecting to client.
`(config-if)#exit`	Exit from interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe4`	Enter interface mode
`(config-if)#ip dhcp relay uplink`	Configure DHCP relay uplink for the interface connecting to server.
`(config-if)#ip address 192.168.1.4/24`	Add IP address
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Client

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol rstp vlan-bridge`	Configure bridge
`(config)#vlan 2-100 bridge 1 state enable`	Enable VLANs
`(config)#interface xe5`	Enter interface mode.
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Configure bridge-group
`(config-if)#switchport mode hybrid`	Configure switchport mode
`(config-if)#switchport hybrid allowed vlan add 20 egress-tagged enable`	Enable vlan
`(config-if)#exit`	Exit from interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface vlan1.20`	Enter interface mode for the vlan interface which connects relay.
`(config-if)#ip address dhcp`	Configure IP address DHCP
`(config-if)#exit`	Exit from interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration

DHCP-Relay with different VRFs

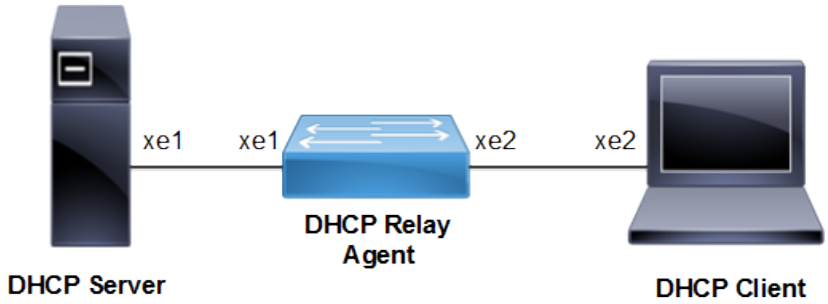
This chapter explains about **DHCP**[1] Relay package to make Relay talk to different VRFs when Client and Server are running in different VRFs.

[1]Dynamic Host Configuration Protocol

DHCP Relay for IPv4 with different VRFs

Before configuring DHCP Relay, make sure DHCP server and client configurations are done.

Figure 28. DHCP Relay Configuration



DHCP Agent

`#configure terminal`	Enter configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This is enabled in default.
`(config)#ipv4 dhcp relay`	By default this will be enabled. It starts the ipv4 dhcp relay service.
`(config)# ip vrf vrf1`	Configure IP **VRF**[1]
`(config)# ip dhcp relay address 10.10.10.2 global`	Configure DHCP relay address
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure ipv4 address on the interface xe1.
(config-if)#ip dhcp relay uplink	Configure relay uplink on the device connecting the server.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running
`(config)#interface xe2`	Enter interface mode.
`(config)#ip vrf forwarding vrf1`	Configure IP VRF forwarding
`(config-if)#ip address 20.20.20.1/24`	Configure ipv4 address on the interface xe2.
(config-if)#ip dhcp relay	Relay should be configured on the interface connecting to the client.
`(config-if)#exit`	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running

Validation Commands

```
#show running-config dhcp
      interface eth0
 ip address dhcp
```

[1]Virtual Routing and Forwarding

```
!
ip vrf vrf1
ip dhcp relay address 10.10.10.2 global
!
interface xe2
ip dhcp relay
!
interface xe1
ip dhcp relay uplink
!

#show ip dhcp relay
DHCP relay service is Enabled. VRF Name: vrf1
Option 82: Disabled
DHCP Servers configured:
10.10.10.2 default
Interface   Uplink/Downlink

xe2   Downlink
VRF Name: default
Interface   Uplink/Downlink

xe1   Uplink

Incoming DHCPv4 packets which already contain relay agent option are FORWARDED
unchanged.
#show ip dhcp relay address
VRF Name: vrf1
  DHCP Servers configured:
  10.10.10.2        default
Incoming DHCPv4 packets which already contain relay agent option are FORWARDED unchanged.
```

DHCP Relay for IPv6 Configuration with different VRFs

DHCP Agent

`#configure terminal`	Enter configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This is enabled in default.
`(config)#ipv6 dhcp relay`	By default, this will be enabled. It starts the ipv6 dhcp relay service.
`(config)#ip vrf vrf1`	Configure vrf1
`(config)#ipv6 dhcp relay address 2001::2 global`	The relay address configured should be server interface address which is in default vrf , connected to DUT machine.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ipv6 address 2001::1/64`	Configure ipv6 address on the interface xe1.
`(config-if)#ipv6 dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe2`	Enter interface mode.

`(config-if)# ip vrf forwarding vrf1`	Attach vrf1 under downlink interface
`(config-if)#ipv6 address 2002::1/64`	Configure ipv6 address on the interface xe2.
`(config-if)#ipv6 dhcp relay`	Relay should be configured on the interface connecting client.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation Commands

```
#show ipv6 dhcp relay address
VRF Name: vrf1
  DHCPv6 Servers configured:
  2001::2    default
#show running-config dhcp
interface eth0
 ip address dhcp
!
ip vrf vrf1
ipv6 dhcp relay address 2001::1 global
interface xe2
ipv6 dhcp relay
!
interface xe1
ipv6 dhcp relay uplink
!

#show ipv6 dhcp relay
IPv6 DHCP relay service is Enabled.
VRF Name: vrf1
  DHCPv6 Servers configured:
  2001::2    default
  DHCPv6 IA_PD Route injection: Disabled
  Interface               Uplink/Downlink
  ---------               -------------
  Xe2                     Downlink
  DHCPv6 IA_PD Route injection: Disabled
  Interface               Uplink/Downlink
  ---------               -------------
  Xe1                     Uplink
```

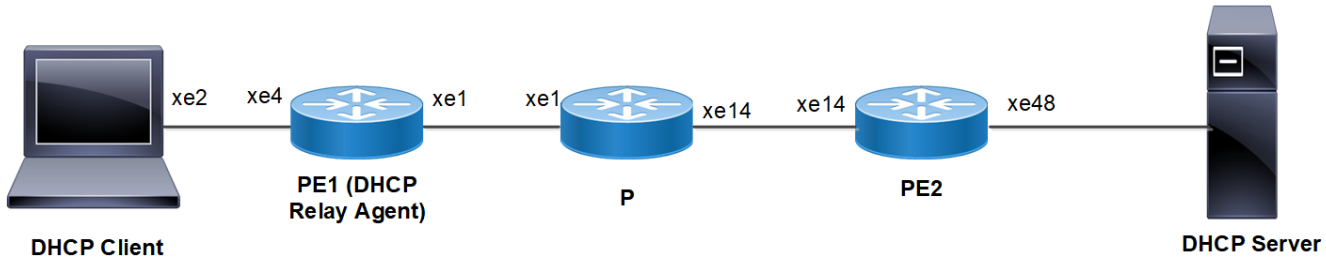
DHCP Relay Agent Over L3VPN Configuration

The **DHCP**[1] Relay feature was designed to forward DHCP broadcast requests as unicast packets to a configured DHCP server or servers for redundancy. In the L3VPN case, there is a special tunnel which gets created through which all the communication happens. In OcNOS, the interface created is named as tunmpls. This tunnel name is not exposed to the OcNOS control plane.This interface is directly created in the kernel.

DHCP Relay Over L3 VPN for IPv4

Before configuring DHCP Relay, make sure DHCP server and client configurations are done.

Figure 29. DHCP Relay Over L3 VPN Configuration



DHCP Client

`#configure terminal`	Enter configure mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address dhcp`	Enable DHCP on interface
`(config-if)#commit`	Commit the candidate configuration to the running configuration

PE1 (DHCP Relay Agent)

`#configure terminal`	Enter configure mode.
`(config)#ip dhcp relay`	By default this will be enabled. It starts the ip dhcp relay service.
`(config)#ip vrf vrf1`	Configuring non default vrf vrf1
`(config-vrf)#rd 10:10`	Assign a route distinguisher to **VRF**[2]
`(config-vrf)#route-target both 10:10`	Configure a route target for vrf1.
`(config-vrf)#ip dhcp relay address 11.11.0.1`	Configure DHCP server address.

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

`(config-vrf)#ip dhcp relay uplink l3vpn`	configure IPv4 DHCP Relay over L3VPN.
`(config)#interface xe4`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf1`	Configure vrf forwarding for vrf1
`(config-if)#ip address 50.50.50.1/24`	Add IP address.
`(config-if)#ip dhcp relay`	Configure DHCP relay for the interface connecting to client.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface mode
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 1.1.1.1/32 secondary`	Set an IP address on the interface
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface mode
`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 1.1.1.1`	Configure an LDP router ID.
`(config-router)#exit`	Exit from Router LDP mode
`(config)#interface xe1`	Enter interface mode
`(config-if)#ip address 10.1.1.1/24`	Add IP address.
`(config-if)#label-switching`	Enable label switching on the interface
`(config-if)#enable-ldp ipv4`	Enable IPv4 LDP configuration on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface mode
`(config)#router ospf 100`	Enter the Router OSPF mode.
`(config-router)#network 1.1.1.1/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`(config-router)#network 10.1.1.0/24 area 0.0.0.0`	Advertise network address in OSPF.
`(config-router)#exit`	Exit Router OSPF mode and return to Configure mode.
`(config)# router bgp 100`	Enter the Router BGP mode, ASN: 100
`(config-router)# bgp router-id 1.1.1.1`	Configure a fixed Router ID (1.1.1.1)
`(config-router)# neighbor 3.3.3.3 remote-as 100`	Configuring PE2 as iBGP neighbor using it's loopback IP
`(config-router)# neighbor 3.3.3.3 update-source lo`	Source of routing updates as loopback
`(config-router)# address-family ipv4 unicast`	Entering into IPV4 unicast address family
`(config-router-af)# neighbor 3.3.3.3 activate`	Activate the neighbor in the IPV4 address family
`(config-router-af)#exit`	Exiting of Address family mode
`(config-router)# address-family vpnv4 unicast`	Entering into address family mode as vpnv4

(config-router-af)# neighbor 3.3.3.3 activate	Activate the neighbor in the vpnv4 address family
(config-router-af)#exit	Exiting of Address family mode
(config-router)# address-family ipv4 vrf vrf1	Entering into address family mode as ipv4 vrf vrf1
(config-router-af)# redistribute connected	Redistribute connected routes.
(config-router-af)#exit	Exiting of Address family mode
(config-router)# commit	Commit the candidate configuration to the running configuration

P

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.2/32 secondary	Set an IP address on the interface
(config-if)#exit	Exit from interface mode
(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 2.2.2.2	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode
(config)#interface xe14	Enter interface mode
(config-if)# ip address 20.1.1.1/24	Add IP address.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from interface mode
(config)#interface xe1	Enter interface mode
(config-if)# ip address 10.1.1.2/24	Add IP address.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from interface mode
(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#network 3.3.3.3/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 20.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#network 10.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)# commit	Commit the candidate configuration to the running configuration

PE2

#configure terminal	Enter configure mode.

`(config)#ip vrf vrf1`	Configuring non default vrf vrf1
`(config-vrf)# rd 10:10`	Assign a route distinguisher to VRF
`(config-vrf)# route-target both 10:10`	Configure a route target for vrf1.
`(config)#interface xe48`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf1`	Configure vrf forwarding for vrf1
`(config-if)# commit`	Commit the candidate config
`(config-if)#ip address 11.11.0.2/24`	Add IP address.
`(config-if)#exit`	Exit from interface mode
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 3.3.3.3/32 secondary`	Set an IP address on the interface
`(config-if)#exit`	Exit from interface mode
`(config)#router ldp`	Enter the Router LDP mode.
`(config-router)#router-id 3.3.3.3`	Configure an LDP router ID.
`(config-router)#exit`	Exit from Router LDP mode
`(config)#interface xe14`	Enter interface mode
`(config-if)# ip address 20.1.1.2/24`	Add IP address.
`(config-if)# label-switching`	Enable label switching on the interface
`(config-if)# enable-ldp ipv4`	Enable IPv4 LDP configuration on the interface.
`(config-if)#exit`	Exit from interface mode
`(config)#router ospf 100`	Enter the Router OSPF mode.
`(config-router)#network 3.3.3.3/32 area 0.0.0.0`	Advertise loopback address in OSPF.
`(config-router)#network 20.1.1.0/24 area 0.0.0.0`	Advertise network address in OSPF.
`(config-router)#exit`	Exit Router OSPF mode and return to Configure mode.
`(config)# router bgp 100`	Enter the Router BGP mode, ASN: 100
`(config-router)# bgp router-id 3.3.3.3`	Configure a fixed Router ID (3.3.3.3)
`(config-router)# neighbor 1.1.1.1 remote-as 100`	Configuring PE1 as iBGP neighbor using it's loopback IP
`(config-router)# neighbor 1.1.1.1 update-source lo`	Source of routing updates as loopback
`(config-router)# address-family ipv4 unicast`	Entering into IPV4 unicast address family
`(config-router-af)# neighbor 1.1.1.1 activate`	Activate the neighbor in the IPV4 address family
`(config-router-af)#exit`	Exiting of Address family mode
`(config-router)# address-family vpnv4 unicast`	Entering into address family mode as vpnv4
`(config-router-af)# neighbor 1.1.1.1 activate`	Activate the neighbor in the vpnv4 address family
`(config-router-af)#exit`	Exiting of Address family mode
`(config-router)# address-family ipv4 vrf vrf1`	Entering into address family mode as ipv4 vrf vrf1
`(config-router-af)# redistribute connected`	Redistribute connected routes.

`(config-router-af)#exit`	Exiting of Address family mode
`(config-router)# commit`	Commit the candidate configuration to the running configuration

Validation

PE1 (DHCP Relay Agent)

```
Use this for Command syntax, and Validation code snippets.

To use:
Insert this snippet where you want the code block to be.
Right click and select convert to text.
Copy the code you want to insert.
Right click on the block and select Edit Code Snippet to open the editor.
Paste the code and click OK in the bottom right.
```

Incoming DHCPv4 packets which already contain relay agent option are FORWARDED and changed.

```
PE1#show ip dhcp relay address
VRF Name: vrf1
  DHCP Servers configured: 11.11.0.1
```

Incoming DHCPv4 packets which already contain relay agent option are FORWARDED and changed.

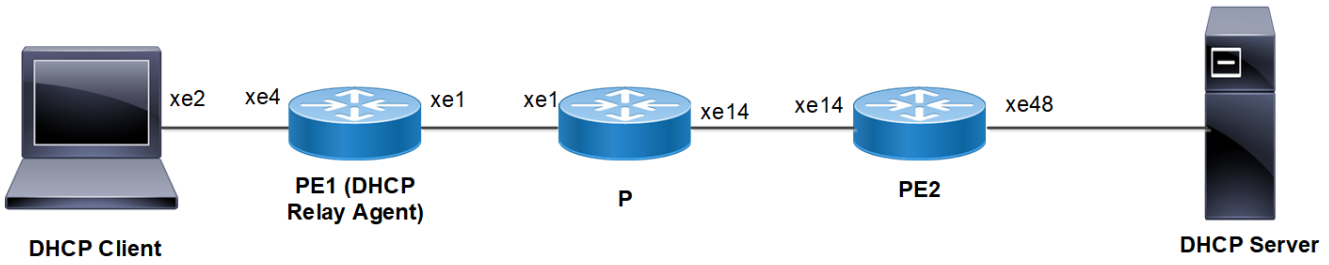
DHCP Client

```
#show ip interface brief | include xe2
  xe5      *50.50.50.2     up        up
```

DHCP Relay Over L3 VPN for IPv6

Before configuring DHCP Relay, make sure DHCP server and client configurations are done.

Figure 30. DHCP Relay Over L3 VPN Configuration



DHCP Client

`#configure terminal`	Enter configure mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ipv6 address dhcp`	Enable DHCP on interface

(config-if)#commit	Commit the candidate configuration to the running configuration

PE1 (DHCP Relay Agent)

#configure terminal	Enter configure mode.
(config)#ipv6 dhcp relay	By default this will be enabled. It starts the ipv6 dhcp relay service.
(config)#ip vrf vrf1	Configuring non default vrf vrf1
(config-vrf)#rd 10:10	Assign a route distinguisher to VRF
(config-vrf)#route-target both 10:10	Configure a route target for vrf1.
(config-vrf)#ipv6 dhcp relay address 2002::1	Configure DHCP server address.
(config-vrf)#ipv6 dhcp relay uplink l3vpn	configure IPv6 DHCP Relay over L3VPN.
(config)#interface xe4	Enter interface mode.
(config-if)#ip vrf forwarding vrf1	Configure vrf forwarding for vrf1
(config-if)# ipv6 address 2001::1/64	Add IPv6 address.
(config-if)#ipv6 dhcp relay	Configure DHCP relay for the interface connecting to client.
(config-if)#exit	Exit from interface mode
(config)#interface lo	Enter interface mode
(config-if)#ip address 1.1.1.1/32 secondary	Set an IP address on the interface
(config-if)#exit	Exit from interface mode
(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 1.1.1.1	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode
(config)#interface xe1	Enter interface mode
(config-if)# ip address 10.1.1.1/24	Add IP address.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from interface mode
(config)#router ospf 100	Enter the Router OSPF mode.
(config-router)#network 1.1.1.1/32 area 0.0.0.0	Advertise loopback address in OSPF.
(config-router)#network 10.1.1.0/24 area 0.0.0.0	Advertise network address in OSPF.
(config-router)#exit	Exit Router OSPF mode and return to Configure mode.
(config)#router bgp 100	Enter the Router BGP mode, ASN: 100
(config-router)#bgp router-id 1.1.1.1	Configure a fixed Router ID (1.1.1.1)
(config-router)#neighbor 3.3.3.3 remote-as 100	Configuring PE2 as iBGP neighbor using it's loopback IP

(config-router)#neighbor 3.3.3.3 update-source lo	Source of routing updates as loopback
(config-router)#address-family ipv4 unicast	Entering into IPV4 unicast address family
(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor in the IPV4 address family
(config-router-af)#exit	Exiting of Address family mode
(config-router)#address-family vpnv4 unicast	Entering into address family mode as vpnv4
(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor in the vpnv4 address family
(config-router-af)#exit	Exiting of Address family mode
(config-router)#address-family vpnv6 unicast	Entering into address family mode as vpnv6
(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor in the vpnv6 address family
(config-router-af)#exit	Exiting of Address family mode
(config-router)# address-family ipv4 vrf vrf1	Entering into address family mode as ipv4 vrf vrf1
(config-router-af)#redistribute connected	Redistribute connected routes.
(config-router-af)#exit	Exiting of Address family mode
(config-router)# address-family ipv6 vrf vrf1	Entering into address family mode as ipv6 vrf vrf1
(config-router-af)#redistribute connected	Redistribute connected routes.
(config-router-af)#exit	Exiting of Address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration

P

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.2/32 secondary	Set an IP address on the interface
(config-if)#exit	Exit from interface mode
(config)#router ldp	Enter the Router LDP mode.
(config-router)#router-id 2.2.2.2	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode
(config)#interface xe14	Enter interface mode
(config-if)#ip address 20.1.1.1/24	Add IP address.
(config-if)#label-switching	Enable label switching on the interface
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from interface mode
(config)#interface xe1	Enter interface mode
(config-if)#ip address 10.1.1.2/24	Add IP address.
(config-if)#label-switching	Enable label switching on the interface
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.

DHCPv6 Prefix Delegation Configuration

Overview

The prefix delegation feature facilitates the Dynamic Host Control Protocol (**DHCP**[1]) server capable of assigning prefixes to DHCP clients from a global pool, enabling the Customer Premise Equipment (CPE) to learn the prefix. This feature also supports the DHCP server in assigning multiple prefixes to a single client. The user configures the IPv6 address using the learned prefix on its **Local Area Network (LAN)**[2] interface with the subnet prefix. The LAN hosts are learning the subnetted prefix through **Router Advertisement (RA)**[3] messages, an important **Neighbor Discovery Protocol (NDP)**[4] component, enabling the device to auto-configure the number of IPv6 addresses from 1 to 64.

This feature would enable service providers to assign IP for the CPE that is acting as a router between the service providers' core network and the subscribers' internal network.

Feature Characteristics

- DHCPv6 **Identity association for non-temporary addresses (IA_NA)**[5] assigns a global IPv6 address on the **Wide Area Network (WAN)**[6] link. The address comes from a local pool specified in the DHCP Server.
- The **Requesting Router (RR)**[7] uses the delegated prefix to define the subnet for the LAN based on the prefix received from the DHCP Server.
- The Requesting Router uses the delegated prefix to assign addresses to the LAN devices. The RR can send a Router Advertisement or the devices shall send a Router solicitation.

Benefits

The key benefits are as follows:

- This feature helps the Internet Service Providers (ISPs) to assign the dynamic IPv6 addresses to their customers automatically instead of statically assigning the address.
- This feature adds the capability to get the multiple DHCPv6 prefixes as per the customer requirement.
- This feature allows the centralized management of the IPv6 addresses.

Configuration

This section shows the configuration of the DHCPv6 prefix delegation.

[1]Dynamic Host Configuration Protocol

[2]Local Area Network is a network of devices in a small area that may include a building or home.

[3]Router Advertisement is a critical component in the IPv6 network. The router sends a message to the devices connected to the LAN to communicate its presence and share the configurations with the LAN host.

[4]Neighbor Discovery Protocol is a crucial protocol in the IPv6 networks, helping establish the communication and auto-configuration to run the devices in the local network segment seamlessly.

[5]Identity association for non-temporary addresses is a unique identifier associated with a set of IPv6 addresses assigned to client devices permanently or for a long time.

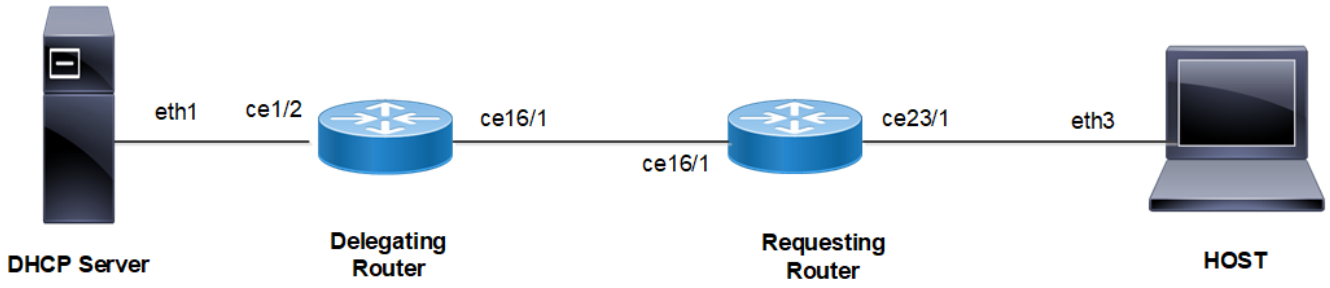
[6]Wide Area Network refers to large network that includes multiple LANs and spans over a large geographical area.

[7]Requesting Router is a network device that requests the IPv6 address prefixes to the DHCP server to share it with the downstream devices.

Topology

The requesting router sends the prefix request to the delegating router, which sends the request to the **DHCP**[1] server. The DHCP server sends the prefix to the requesting router through the delegating router. The IPv6 address is created in the requesting router by combining the prefix learned from the server and the user-defined suffix. The host receives the IPv6 address from the requesting router.

Figure 31. DHCPv6 Prefix Delegation Configuration



Configuring DHCP prefixes

Follow the steps to configure the DHCPv6 prefix delegation.

Configure the Delegating Router

1. Specify the server interface address connected to the delegating router.

```
(config)#ipv6 dhcp relay address 2001:101:0:1::131
```

2. Configure the DHCPv6 up-link interface from the delegating router to the DHCPv6 server using **`ipv6 dhcp relay uplink`** command.

```
(config)#interface ce1/2
(config-if)#ipv6 address 2001:101:0:1::130/64
(config-if)#ipv6 dhcp relay uplink
```

3. Configure the DHCPv6 down-link interface from the delegating router to the requesting router using **`ipv6 dhcp relay`** command.

```
(config)#interface ce16/1
(config-if)#ipv6 address 3001:101:0:1::135/64
(config-if)#ipv6 dhcp relay
```

4. Add a static route on the delegating router to reach the host device.

```
(config)#ipv6 route ::/0 3001:101:0:1::
```

Configure the Requesting Router device

1. In the WAN interface, configure the address prefix length option (**`64`**). Get the IPv6 address from the server using **`ipv6 address dhcp`** command. Enable the requesting router to request the prefix by using **`ipv6`**

[1]Dynamic Host Configuration Protocol

dhcp prefix-delegation and configure the number of prefixes using **ipv6 dhcp client max-delegated-prefixes.**

- The default value of simultaneous prefixes delegated to a single client is 8. The minimum of simultaneous prefixes delegated to a single client is 1 and the maximum is 64.
- If the configured **max-delegated-prefix count** is greater than 30, then configure the lease times greater than 180 seconds.

```
(config)#interface ce16/1
(config-if)#ipv6 dhcp address-prefix-len 64
(config-if)#ipv6 address dhcp
(config-if)#ipv6 dhcp prefix-delegation PREFIX_FROM_SERVER
(config-if)#ipv6 dhcp client max-delegated-prefixes 10
```

2. In the LAN interface, configure the command **ipv6 address** to create the IPv6 address by using the DHCP prefix learned from the server and user defined suffix.

```
(config)#interface ce23/1
   (config-if)#ipv6 address PREFIX_FROM_SERVER ::1:0:0:0:1/64
```

3. Add a static route on the requesting router to reach the host device.

```
(config)#ipv6 route 2001:101:0:1::/64 3001:101:0:1::135
```

Configure the HOST

1. In the LAN interface, configure the auto-configuration to get the dynamic IPv6 address from the server.

```
(config)#interface eth3
(config-if)#ipv6 address autoconfig max-address 10
(config if)#exit
(config)#commit
```

2. Add a static route on the host to reach the server.

```
(config)#ipv6 route 2001:101:0:1::/64 3001:101:0:1::135
```

Running configurations

The running configuration for the Delegating Router is as follows:

```
#show running-config
!
ipv6 dhcp relay address 2001:101:0:1::131
!
interface ce1/2
 ipv6 address 2001:101:0:1::130/64
 ipv6 dhcp relay uplink
!
interface ce16/1
 ipv6 address 3001:101:0:1::135/64
 ipv6 dhcp relay
 commit
 end
!
```

The running configuration for the Requesting Router is as follows:

```
#show running-config
!
interface ce16/1
```

```
 ipv6 dhcp client max-delegated-prefixes 10
 ipv6 address dhcp
 ipv6 dhcp address-prefix-len 64
 ipv6 dhcp prefix-delegation PREFIX_FROM_SERVER
!
interface ce23/1
 ipv6 address PREFIX_FROM_SERVER ::1:0:0:0:1/64
 commit
 end
!
```

The running configuration for the HOST is as follows:

```
#show running-config
!
interface eth3
 ipv6 address autoconfig max-address 10
 commit
 end
!
```

Validation

Validate the show output after configuration as shown below.

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
Border Network Gateway (BNG)[1]	Border Network Gateway is a critical component in the telecommunication network that serves as the entry and exit point between the **ISP**[2] and the global network.
Customer Premises Equipment (CPE)[3]	Customer Premises Equipment is a networking device located on the customer premises. It is present on the edge of the service provider network, which connects the customer devices to the service provider network.
Delegating Router (DR)[4]	Delegating Router is a network device that delegates the IPv6 address prefixes to the downstream devices.

[1]Border Network Gateway is a critical component in the telecommunication network that serves as the entry and exit point between the ISP and the global network.

[2]Internet Service Provider

[3]Customer Premises Equipment is a networking device located on the customer premises. It is present on the edge of the service provider network, which connects the customer devices to the service provider network.

[4]Delegating Router is a network device that delegates the IPv6 address prefixes to the downstream devices.

Key Terms/Acronym	Description
Identity association for non-temporary addresses (IA_NA)[1]	Identity association for non-temporary addresses is a unique identifier associated with a set of IPv6 addresses assigned to client devices permanently or for a long time.
Local Area Network (LAN)[2]	Local Area Network is a network of devices in a small area that may include a building or home.
Neighbor Discovery Protocol (NDP)[3]	Neighbor Discovery Protocol is a crucial protocol in the IPv6 networks, helping establish the communication and auto-configuration to run the devices in the local network segment seamlessly.
Neighbor Discovery Router Advertisement (NDRA)[4]	Neighbor Discovery Router Advertisement facilitates a network device to advertise the routing information with the neighboring devices so that the neighboring devices take the forwarding decision in dynamic routing.
Router Advertisement (RA)[5]	Router Advertisement is a critical component in the IPv6 network. The router sends a message to the devices connected to the LAN to communicate its presence and share the configurations with the LAN host.
Requesting Router (RR)[6]	Requesting Router is a network device that requests the IPv6 address prefixes to the DHCP server to share it with the downstream devices.
Router Solicitation (RS)[7]	Router Solicitation is a component of the neighbor discovery protocol in the IPv6 network where the host sends a message to discover routers in the local area. When a router receives RS, it responds to the host with RA, which includes the configuration.
Wide Area Network (WAN)[8]	Wide Area Network refers to large network that includes multiple LANs and spans over a large geographical area.

[1]Identity association for non-temporary addresses is a unique identifier associated with a set of IPv6 addresses assigned to client devices permanently or for a long time.

[2]Local Area Network is a network of devices in a small area that may include a building or home.

[3]Neighbor Discovery Protocol is a crucial protocol in the IPv6 networks, helping establish the communication and auto-configuration to run the devices in the local network segment seamlessly.

[4]Neighbor Discovery Router Advertisement facilitates a network device to advertise the routing information with the neighboring device so that the neighboring devices take the forwarding decision in dynamic routing.

[5]Router Advertisement is a critical component in the IPv6 network. The router sends a message to the devices connected to the LAN to communicate its presence and share the configurations with the LAN host.

[6]Requesting Router is a network device that requests the IPv6 address prefixes to the DHCP server to share it with the downstream devices.

[7]Router Solicitation is a component of the neighbor discovery protocol in the IPv6 network where the host sends a message to discover routers in the local area. When a router receives RS, it responds to the host with RA, which includes the configuration.

[8]Wide Area Network refers to large network that includes multiple LANs and spans over a large geographical area.

DHCPv6 Relay Prefix Delegation Route Injection Configuration

Overview

The prefix delegation feature lets a **DHCP**[1] server assign prefixes chosen from a global pool to DHCP clients. The **DHCP client**[2] can then configure an IPv6 address on its LAN interface using the prefix it received. It will then send router advertisements including the prefix, allowing other devices to auto-configure their own IPv6 addresses.

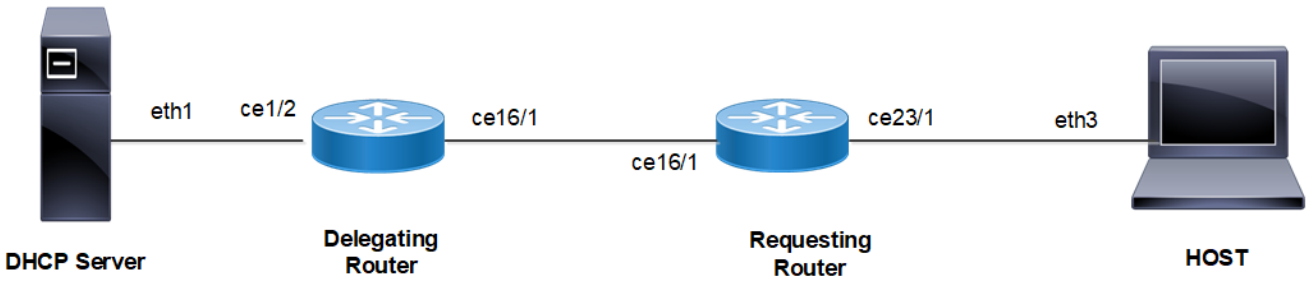
If the network topology where Prefix Delegation is running has a Relay agent, then a route needs to be injected in Delegating Router, so that the traffic from the DHCP server-side shall be forwarded towards the Requesting Router.

Notes:

- Auto-injected routes cannot be leaked between VRFs.
- To ensure smooth auto injection of routes, the operator must ensure that unicast DHCP Renew packets are routed through the Delegating Router.

Topology

Figure 32. DHCPv6 Relay Delegating Configuration



.

DHCP Relay - Delegating Router (DR)

`#configure terminal`	Enter configure mode.
`(config)#feature dhcp`	Enable the feature DHCP. This is enabled by default.
`(config)#ipv6 dhcp relay`	By default, this will be enabled. It starts the IPv6 DHCP relay service.

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

`(config)#ipv6 dhcp relay address 2001:101:0:1::131`	The relay address configured should be server interface address connected to Delegating Router.
`(config)#interface ce1/2`	Enter interface mode.
`(config-if)#ipv6 address 2001:101:0:1::130/64`	Configure IPv6 address on the interface ce1/2
`(config-if)#ipv6 dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface ce16/1`	Enter interface mode.
`(config-if)#ipv6 address 3001:101:0:1::135/64`	Configure IPv6 address on the interface ce16/1
`(config-if)#ipv6 dhcp relay`	Relay should be configured on the interface connecting to the client.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#ipv6 dhcp relay pd-route-injection`	Configure to enable auto route injection.

Requesting Router (RR)

`#configure terminal`	Enter configure mode.
`(config)#interface ce16/1`	Enter interface mode.
`(config-if)#ipv6 address dhcp`	Configure IPv6 address DHCP.
`(config-if)#ipv6 dhcp prefix-delegation PREFIX_ FROM_SERVER`	Configure IPv6 DHCP prefix-delegation
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface ce23/1`	Enter interface mode.
`(config-if)#ipv6 address PREFIX_FROM_SERVER ::1:0:0:0:1/64`	Configure IPv6 address from the prefix learnt
`(config-if)#ipv6 nd ra-interval 4`	Configure ra-interval
`(config-if)#exit`	Exit interface mode.
`(config)#ipv6 route 2001:101:0:1::/64 3001:101:0:1::135`	Configure static route towards server
`(config)#commit`	Commit the candidate configuration to the running configuration

HOST

`#configure terminal`	Enter configure mode.

`(config)#interface ce23/1`	Enter interface mode.
`(config-if)#ipv6 address autoconfig`	Configure IPv6 autoconfig
`(config if)#exit`	Exit interface mode.
`(config)#ipv6 route 2001:101:0:1::/64 fe80::ce37:abff:fec9:7426 ce23/1`	Configure static route towards server
`(config)#commit`	Commit the candidate configuration to the running configuration

Linux Host

`IPV6_AUTOCONF=yes`	IPv6 autoconfig should be set to yes in interface config file.

DHCP Server

`ifconfig eth1 inet6 add 2001:101:0:1::131/64`	Configure IPv6 address on client facing interface
`dhcpd -d -6 -cf /etc/dhcp/dhcpd6.conf eth1`	Start server
`ipv6 route 1212:501:102:1::/64 2001:101:0:1::130`	Configure static route towards Requesting Router

Sample dhcpd6.conf file

```
#
#DHCPv6 Server Configuration file.
#see /usr/share/doc/dhcp*/dhcpd6.conf.sample
#see dhcpd.conf(5) man page
#
preferred-lifetime 400;
default-lease-time 600;

subnet6 2001:101:0:1::/64 {
range6 2001:101:0:1::129 2001:101:0:1::254;
}
subnet6 3001:101:0:1::/64 {
range6 3001:101:0:1::129 3001:101:0:1::254;

DHCP COMMAND REFERENCE

Dynamic Host Configuration Protocol Client

This chapter describes the Dynamic Host Configuration Protocol (**DHCP**[1]) client commands.

DHCP is used to configure devices that are connected to a network so they can communicate on that network using the Internet Protocol (IP). DHCP is implemented in a client-server model where DHCP clients request configuration data, such as an IP address, a default route, or DNS server addresses from a DHCP server.

This chapter contains these commands.

[1]Dynamic Host Configuration Protocol

feature dhcp

Use this command to enable the **DHCP client**[1] and **DHCP**[2] relay on the device.

Use the **no** form of this command to disable the DHCP client and DHCP relay and delete any DHCP-related configuration.

Command Syntax

```
feature dhcp
no feature dhcp
```

Parameters

None

Default

By default, feature dhcp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature dhcp
```

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[2]Dynamic Host Configuration Protocol

ip address dhcp

Use this command to get an IP address from a **DHCP**[1] server for this interface.

Use the **no** form of this command to disable the **DHCP client**[2] for this interface.

Configure the comand ip dhcp client request (page 444) before configuring the ip address dhcp (page 443) command to request additional options.

Command Syntax

```
ip address dhcp
no ip address dhcp
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip address dhcp
(config-if)#
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

ip dhcp client request

Use this command to add an option to a **DHCP**[1] request.

Use the **no** form of this command to remove an option from a DHCP request.

Command Syntax

```
ip dhcp client request dns-nameserver
ip dhcp client request host-name
ip dhcp client request log-server
ip dhcp client request ntp-server
no ip dhcp client request dns-nameserver
no ip dhcp client request host-name
no ip dhcp client request log-server
no ip dhcp client request ntp-server
```

Parameters

dns-nameserver
List of DNS name servers (DHCP option 6)

host-name
Name of the client (DHCP option 12)

ntp-server
List of NTP servers (DHCP option 42)

log-server
List of log servers (DHCP option 7)

Default

By default, ip dhcp client request is enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip dhcp client request ntp-server
```

[1]Dynamic Host Configuration Protocol

ipv6 address dhcp

Use this command to get an IPV6 address from a **DHCP**[1] server for this interface.

Use the **no** form of this command to disable the **DHCP client**[2] for this interface.

You can give the ipv6 dhcp client request command before giving this command to request additional options.

Command Syntax

```
ipv6 address dhcp
no ipv6 address dhcp
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 address dhcp
(config-if)#
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

ipv6 dhcp address-prefix-length

Use this command to configure the prefix-length for dynamically allocated IPv6 address.

Use the **no** form of this command to unconfigure the prefix-length.

Command Syntax

```
ipv6 dhcp address-prefix-length <1-128>
no ipv6 dhcp address-prefix-length
```

Parameters

<1-128>
IPv6 address prefix length

Default

Default ipv6 address prefix length is 128

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 4.2 .

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ipv6 dhcp address-prefix-length 64
(config-if)
```

ipv6 dhcp client request

Use this command to add an option to a DHCPv6 request.

Use the **no** form of this command to remove an option from a DHCPv6 request.

Notes:

- Vendor-specific options allow a specific vendor to define a set of **DHCP**[1] options that really make sense for their device or operating system.
- By default DHCPv6 uses four messages exchange (Solicit, Advertise, Request, and Reply) to obtain configuration parameters from a server. But when rapid-commit is specified, **dhcp6-client** will include a rapid-commit option in solicit messages and wait for an immediate reply instead of advertisements.The Rapid Commit option is used to signal the use of the two message exchange for address assignment.

Command Syntax

```
ipv6 dhcp client request dns-nameserver
ipv6 dhcp client request ntp-server
ipv6 dhcp client request domain-search
ipv6 dhcp client request vendor-specific-information
ipv6 dhcp client request rapid-commit
no ipv6 dhcp client request rapid-commit
no ipv6 dhcp client request vendor-specific-information
no ipv6 dhcp client request domain-search
no ipv6 dhcp client request ntp-server
no ipv6 dhcp client request dns-nameserver
```

Parameters

dns-nameserver
List of DNS name servers

ntp-server
Request for IPv6 NTP server

domain-search
Request for IPv6 domain search

vendor-specific-information
Request for IPv6 vendor-specific-information

rapid-commit
Request to enable rapid-commit

Default

None

Command Mode

Interface mode

[1]Dynamic Host Configuration Protocol

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 5.0

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 dhcp client request dns-nameserver
(config-if)#

(config)#interface eth0
(config-if)#ipv6 dhcp client request ntp-server
(config-if)#exit

(config)#interface eth0
(config-if)#ipv6 dhcp client request domain-search
(config-if)#exit

(config)#interface eth0
(config-if)#ipv6 dhcp client request vendor-specific-information
(config-if)#exit

(config)#interface eth0
(config-if)#ipv6 dhcp client request rapid-commit
(config-if)#exit
```

ipv6 dhcp client

Use this command to configure **DHCP client**[1] options to a DHCPv6 request.

Use the **no** form of this command to remove client options from a DHCPv6 request.

Notes:

- The command **ipv6 dhcp client information-request** is used to get only stateless configuration parameters (i.e., without address).
- DAD-wait-time value is the maximum time (in seconds) that the client should wait for the duplicate address detection (DAD) to complete on an interface.
- DUID option override the default when selecting the type of DUID to use. By default, DHCPv6 dhclient creates an identifier based on the link-layer address (DUID-LL) if it is running in stateless mode (with -S, not requesting an address), or it creates an identifier based on the link-layer address plus a timestamp (DUID-LLT) if it is running in stateful mode (without -S, requesting an address).

Command Syntax

```
ipv6 dhcp client information-request
ipv6 dhcp client dad-wait-time <1-600>
ipv6 dhcp client duid (ll | llt)
no ipv6 dhcp client duid
no ipv6 dhcp client dad-wait-time
no ipv6 dhcp client information-request
```

Parameters

information-request
Request to enable information-request

<1-600>
DAD wait-time in seconds

duid ll
Link-layer address

duid llt
Link-layer address plus timestamp

Default

None

Command Mode

Interface mode

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 5.0

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 dhcp client information-request
(config-if)#exit

(config)#interface eth0
(config-if)#ipv6 dhcp client dad-wait-time 20
(config-if)#exit

(config)#interface eth0
(config-if)#ipv6 dhcp client duid ll
(config-if)#exit
```

show ipv6 dhcp vendor-opts

Use this command to display vendor-specific-information option value given by **DHCP**[1] server.

Command Syntax

```
show ipv6 dhcp vendor-opts
```

Parameters

None

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 5.0

Examples

```
#show ipv6 dhcp vendor-opts
ifName              vendor-opts
==========          ====================
xe5                 IP Infusion Inc
```

[1]Dynamic Host Configuration Protocol

Dynamic Host Configuration Protocol Relay

This chapter describes the Dynamic Host Configuration Protocol (**DHCP**[1]) relay commands.

In small networks with only one IP subnet, DHCP clients communicate directly with DHCP servers. When DHCP clients and associated servers do not reside on the same subnet, a **DHCP relay agent**[2] can be used to forward **DHCP client**[3] messages to DHCP server.

The DHCP client broadcasts on the local link, the relay agents receives the broadcast DHCP messages, and then generate a new DHCP message to send out on another interface.

The relay agent sets the gateway IP address (**`giaddr`** field of the DHCP packet) and, if configured, adds the relay agent information option (option 82) in the packet and forwards it to the DHCP server. The DHCP server replies to the client and the relay agent then retransmits the response on the local network.

This chapter contains these commands:

[1]Dynamic Host Configuration Protocol

[2]A DHCP relay forwards the request from a DHCP client to the DHCP server group and takes the response from the DHCP server group to the DHCP client.

[3]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

clear ip dhcp relay option statistics

Use this command to clear ipv4 relay option statistics.

Command Syntax

```
clear ip dhcp relay option statistics
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 1.3.9.

Examples

```
#clear ip dhcp relay option statistics
```

clear ipv6 dhcp pd-route (|vrf NAME)

Use this command to clear the routes in RIBD module learnt as part of Route injection feature.

Command Syntax

```
clear ipv6 dhcp pd-route (|vrf NAME)
```

Parameters

NAME
Name of the **VRF**[1]

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#clear ipv6 dhcp pd-route vrf vrf1
```

[1]Virtual Routing and Forwarding

clear ip dhcp relay statistics

Use this command to clear ipv4 relay statistics.

Command Syntax

```
clear ip dhcp relay statistics
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 1.3.9.

Examples

```
#clear ip dhcp relay statistics
```

ip dhcp relay (configure mode)

Use this command to enable the **DHCP relay agent**[1]. The **DHCP**[2] relay starts forwarding packets to the DHCP server address once configured.

Use the **no** form of this command to disable the DHCP relay agent.

Command Syntax

```
ip dhcp relay
no ip dhcp relay
```

Parameters

None

Default

By default, this feature is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip dhcp relay

#configure terminal
(config)#no ip dhcp relay
```

[1]A DHCP relay forwards the request from a DHCP client to the DHCP server group and takes the response from the DHCP server group to the DHCP client.

[2]Dynamic Host Configuration Protocol

ip dhcp relay (interface mode)

Use this command to configure an interface as a **DHCP client**[1]-facing port.

Use the **no** form of this command to remove an interface as a **DHCP**[2] client-facing port.

Command Syntax

```
ip dhcp relay
no ip dhcp relay
```

Parameters

None

Default

No default value is specified.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#ip dhcp relay
```

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[2]Dynamic Host Configuration Protocol

ip dhcp relay (L3VPN)

Use this command to specify IPv4 **DHCP**[1] relay to use tunnel interfaces as Uplink/Downlink.

Use the **no** form of this command to remove the usage of tunnel interfaces in IPv4 DHCP relay.

Command Syntax

```
ip dhcp relay (uplink|downlink) (l3vpn)
no ip dhcp relay (uplink|downlink) (l3vpn)
```

Parameters

uplink
DHCP Relay uplink interface

downlink
DHCP Relay downlink interface

l3vpn
L3VPN interface

Default

None

Command Mode

Configure mode and **VRF**[2] mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay uplink l3vpn
(config-vrf)#end

#configure terminal
(config)#ip dhcp relay uplink l3vpn
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ip dhcp relay address

Use this command to set an IPv4 address of a **DHCP**[1] server to which a **DHCP relay agent**[2] forwards client requests.

Use the **no** form of this command to remove the IP address of a DHCP server.

User must enable the DHCP relay feature with the ip dhcp relay (configure mode) (page 457) command to configure server address.

Command Syntax

```
ip dhcp relay address A.B.C.D
no ip dhcp relay address A.B.C.D
```

Parameters

A.B.C.D
IPv4 address of the DHCP server

Default

None

Command Mode

Configure mode

VRF[3] mode

Applicability

This command was introduced before OcNOS version 1.3 and was changed in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay address 198.51.100.127

#configure terminal
(config)#ip dhcp relay address 198.51.100.127
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP relay forwards the request from a DHCP client to the DHCP server group and takes the response from the DHCP server group to the DHCP client.

[3]Virtual Routing and Forwarding

ip dhcp relay address global

When the IPv4 **DHCP**[1] server resides in a different VPN or global space that is different from the VPN, then use this command to specify the name of the **VRF**[2] or global space in which the DHCP server resides.

Use the no form of this command to remove the VRF in which IPv4 DHCP server resides.

Command Syntax

```
ip dhcp relay address A.B.C.D global (|VRF-NAME)
no ip dhcp relay address A.B.C.D global
```

Parameters

A.B.C.D
IPv4 address of the DHCP server

VRF-NAME
Name of VRF where the DHCP server is present

Default

If no input given, default VRF is the default Value.

Command Mode

Configure mode and VRF mode

Applicability

This command was introduced in OcNOS version 5.1.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay address 198.51.100.127 global

#configure terminal
(config)#ip dhcp relay address 198.51.100.127 global vrf1
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ip dhcp relay information option

Use this command to enable the device to insert and remove option 82 information in **DHCP**[1] packets forwarded by the relay agent.

The option 82 suboption remote-id can be configured either as hostname or any string provided by the User.

Use the **no** form of this command to disable inserting and removing option-82 information.

Command Syntax

```
ip dhcp relay information option (|remote-id (hostname|WORD))
no ip dhcp relay information option (|remote-id)
```

Parameters

remote-id
Remote host Identifier, can either be the System's hostname or a user-specified string.

WORD
Specify a string as remote-id (Maximum 255 alphanumeric characters).

Default

None

Command Mode

Configure mode and **VRF**[2] mode

Applicability

This command was introduced before OcNOS version 1.3 and was changed in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay information option remote-id hostname

#configure terminal
(config)#ip dhcp relay information option

#configure terminal
(config)#no ip dhcp relay information option
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ip dhcp relay information option always-on

Use this command to enable the device to insert options 82 information in **DHCP**[1] packets forwarded by the relay-agent and keep them while forwarding to client.

Use the **no** form of this command to disable the option-82 always-on information.

Command Syntax

```
ip dhcp relay information option always-on
no ip dhcp relay information option always-on
```

Parameters

None

Default

None

Command Mode

Configure mode

VRF[2] mode

Applicability

This command was introduced before OcNOS version 1.3 and was changed in OcNOS version 6.2.0.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay information option always-on

#configure terminal
(config)#ip dhcp relay information option always-on

#configure terminal
(config)#no ip dhcp relay information option always-on
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ip dhcp relay information source-ip

Use this command to enable **DHCP**[1] relay option 82 link selection.

Use the no form of this command to disable DHCP relay option 82 link selection.

Command Syntax

```
ip dhcp relay information source-ip A.B.C.D
no ip dhcp relay information source-ip
```

Parameters

A.B.C.D
IPv4 address

Default

None

Command Mode

Configure mode and **VRF**[2] mode

Applicability

This command was introduced before OcNOS version 1.3.6.

Example

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay information option source-ip 2.2.2.2

#configure terminal
(config)#ip dhcp relay information option source-ip 3.3.3.3
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ip dhcp relay server-group

Use this command to create the **DHCP**[1] IPv4 server group. This group lists the servers to which DHCP Relay forwards the **DHCP client**[2] requests.

Use the **no** form of this command to unconfigure the DHCP IPv4 server group.

Command Syntax

```
ip dhcp relay server-group GROUP_NAME
no ip dhcp relay server-group GROUP_NAME
```

Parameters

GROUP_NAME
Name of the DHCP server group (specify a maximum 63 alphanumeric characters).

Command Mode

Configure mode and **VRF**[3] mode. In the configure mode, the DHCP IPv4 server group is created in the default VRF. In the configure-vrf mode, the DHCP IPv4 server group is created in the user-defined VRF.

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The example below shows the creation of DHCP IPv4 server groups.

```
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#ip dhcp relay server-group Group1
OcNOS(dhcp-relay-group)#end
OcNOS#configure terminal
OcNOS(config)#ip dhcp relay server-group Group2
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[3]Virtual Routing and Forwarding

ip-dhcp-relay-server-select

Use this command to attach the **DHCP**[1] IPv4 server group to the DHCP relay uplink interface.

DHCP Server Group

Use the no form of this command to remove the DHCP IPv4 server group attached to the DHCP relay interface.

Note: Attach the groups only to the DHCP relay uplink interfaces.

Command Syntax

```
ip dhcp relay server-select GROUP_NAME
no ip dhcp relay server-select
```

Parameters

GROUP_NAME
Name of the DHCP server group (specify a maximum 63 alphanumeric characters).

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.4.1

Examples

The below example shows attaching the DHCP IPv4 server group to the DHCP relay uplink interface:

```
OcNOS#configure terminal
OcNOS(config)#interface xe1
OcNOS(config-if)#ip dhcp relay server-select group1
```

[1]Dynamic Host Configuration Protocol

ipv6 dhcp relay (configure mode)

Use this command to enable the **DHCP**[1] IPv6 relay agent.

Use the **no** form of this command to disable the DHCP IPv6 relay agent.

Command Syntax

```
ipv6 dhcp relay
no ipv6 dhcp relay
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 dhcp relay

#configure terminal
(config)#no ipv6 dhcp relay
```

[1]Dynamic Host Configuration Protocol

ipv6 dhcp relay (interface mode)

Use this command to configure an interface as a DHCPv6 client-facing port.

Use the **no** form of this command to remove an interface as a DHCPv6 client-facing port.

Command Syntax

```
ipv6 dhcp relay
no ipv6 dhcp relay
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 dhcp relay
```

ipv6 dhcp relay (L3VPN)

Use this command to specify IPv6 **DHCP**[1] relay to use tunnel interfaces as Uplink/Downlink.

Use the **no** form of this command to remove the usage of tunnel interfaces in IPv6 DHCP relay.

Command Syntax

```
ipv6 dhcp relay (uplink|downlink) (l3vpn)
no ipv6 dhcp relay (uplink|downlink) (l3vpn)
```

Parameters

uplink
DHCP Relay uplink interface

downlink
DHCP Relay downlink interface

l3vpn
L3VPN interface

Default

None

Command Mode

Configure mode and **VRF**[2] mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp relay uplink l3vpn
(config-vrf)#end

#configure terminal
(config)#ipv6 dhcp relay uplink l3vpn
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ipv6 dhcp relay address

Use this command to set an IPv6 address of a **DHCP**[1] server to which a **DHCP relay agent**[2] forwards client requests.

Use the **no** form of this command to remove an IPv6 address of a DHCP server.

User must enable the IPv6 DHCP relay feature with the ipv6 dhcp relay (configure mode) (page 467) command to configure server address.

Command Syntax

```
ipv6 dhcp relay address X:X::X:X
no ipv6 dhcp relay address X:X::X:X
```

Parameters

X:X::X:X
IPv6 address of the DHCP server

Default

None

Command Mode

Configure mode

VRF[3] mode

Applicability

This command was introduced before OcNOS version 1.3 and was changed in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp relay address 2001:db8::7F

#configure terminal
(config)#ipv6 dhcp relay address 2001:db8::7F
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP relay forwards the request from a DHCP client to the DHCP server group and takes the response from the DHCP server group to the DHCP client.

[3]Virtual Routing and Forwarding

ipv6 dhcp relay address global

When the IPv6 **DHCP**[1] server resides in a different VPN or global space that is different from the VPN, then use this command to specify the name of the **VRF**[2] or global space in which the DHCP server resides.

Use the no form of this command to remove the VRF in which IPv6 DHCP server resides.

Command Syntax

```
ipv6 dhcp relay address X:X::X:X global (|VRF-NAME)
no ipv6 dhcp relay address X:X::X:X global
```

Parameters

X:X::X:X
IPv6 address of the DHCP server

VRF-NAME
Name of VRF where the DHCP server is present

Default

If no input given, default VRF is the default Value.

Command Mode

Configure mode and VRF mode

Applicability

This command was introduced in OcNOS version 5.1.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp relay address 2001:db8::7F global

#configure terminal
(config)#ipv6 dhcp relay address 2001:db8::7F global vrf1
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ipv6 dhcp relay pd-route-injection

Use this command to enable the Route Injection of the delegated prefixes in **DHCP**[1] Relay.

Use the no form of this command to disable Route Injection.

Command Syntax

```
ipv6 dhcp relay pd-route-injection
no ipv6 dhcp relay pd-route-injection
```

Parameters

None

Default

By default this feature is disabled.

Command Mode

Configure mode

VRF[2] mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)# ip vrf vrf1
(config-vrf)# ipv6 dhcp relay pd-route-injection

#configure terminal
(config)#ipv6 dhcp relay pd-route-injection
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ipv6 dhcp relay server-group

Use this command to create the **DHCP**[1] IPv6 server group. This group lists the servers to which DHCP relay forwards the **DHCP client**[2] requests.

Use the no form of this command to unconfigure the DHCP IPv6 server group.

Command Syntax

```
ipv6 dhcp relay server-group GROUP_NAME
no ipv6 dhcp relay server-group GROUP_NAME
```

Parameters

GROUP_NAME
Name of the DHCP server group (specify a maximum of 63 alphanumeric characters).

Command Mode

Configure mode and **VRF**[3] mode. In the configure mode, the DHCP IPv6 server group is created in the default VRF. In the configure-vrf mode, the DHCP IPv6 server group is created in the user-defined VRF.

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The example below shows the creation of DHCP IPv6 server groups:

```
OcNOS#configure terminal
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#ipv6 dhcp relay server-group Group1
OcNOS(dhcp relay server-group)#end
OcNOS#configure terminal
OcNOS(config)#ipv6 dhcp relay server-group Group2
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[3]Virtual Routing and Forwarding

ipv6 dhcp relay server-select

Use this command to attach the **DHCP**[1] IPv6 group to the DHCP relay uplink interface.

Use the **no** form of this command to remove the DHCP IPv6 group attached to the interface.

Note: Attach the groups only to the DHCP relay uplink interfaces.

Command Syntax

```
ipv6 dhcp relay server-select GROUP_NAME
no ipv6 dhcp relay server-select
```

Parameters

GROUP_NAME
Name of the DHCP server group (specify a maximum of 63 alphanumeric characters).

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example shows how to attach the DHCP IPv6 server group to the DHCP relay uplink interface:

```
#configure terminal
(config)#interface xe1
(config-if)#ipv6 dhcp relay server-select group1
```

[1]Dynamic Host Configuration Protocol

ipv6 dhcp relay subscriber-id

Use this command to configure subscriber-ID for IPv6 **DHCP**[1] relay.

Use **no** form of this command to disable subscriber-id.

Command Syntax

```
ipv6 dhcp relay information option subscriber-id WORD
no ipv6 dhcp relay information option subscriber-id
```

Parameters

WORD
Subscriber ID

Default

None

Command Mode

Configure mode and **VRF**[2] mode

Applicability

This command is introduced in OcNOS version 5.0

Examples

```
#configure terminal
(config)#ipv6 dhcp relay information option subscriber-id test
(config)#exit
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

server A.B.C.D

Use this command to add the **DHCP**[1] IPv4 servers to the DHCP server group.

Use the **no** form of this command to remove the DHCP IPv4 servers from the DHCP server Group.

Note: A maximum of eight servers can be added to a DHCP group.

Command Syntax

```
server A.B.C.D
no server A.B.C.D
```

Parameters

A.B.C.D
DHCP IPv4 Relay group server address to be added in the DHCP server group.

Command Mode

DHCP Relay Group Mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example shows the addition of DHCP IPv4 servers to a DHCP server group:

```
OcNOS#configure terminal
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#ip dhcp relay server-group group
OcNOS(dhcp-relay-group)#server 10.12.23.205
OcNOS(dhcp-relay-group)#end
OcNOS#configure terminal
OcNOS(config)#ip dhcp relay server-group group1
OcNOS(dhcp-relay-group)#server 10.12.33.204
```

[1]Dynamic Host Configuration Protocol

server X:X::X:X

Use this command to add the **DHCP**[1] IPv6 servers to the DHCP server group.

Use the **no** form of this command to remove the DHCP IPv6 servers from the DHCP server group.

Note: A maximum of eight servers can be added to a DHCP group.

Command Syntax

```
server X:X::X:X
no server X:X::X:X
```

Parameters

X:X::X:X
DHCP IPv6 Relay Group server address to be added in the DHCP server group.

Command Mode

DHCP Relay Group Mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The below example shows the addition of DHCP IPv6 servers to a DHCP server group:

```
OcNOS#configure terminal
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#ipv6 dhcp relay server-group group
OcNOS(dhcp6-relay-group)#server 2003::1
OcNOS(dhcp6-relay-group)#end

OcNOS#configure terminal
OcNOS(config)#ipv6 dhcp relay server-group group1
OcNOS(dhcp-relay-group)#server 2001::1
OcNOS(dhcp6-relay-group)end
```

[1]Dynamic Host Configuration Protocol

show ip dhcp relay

Use this command to display **DHCP**[1] relay status including DHCP server addresses configured on interfaces.

Command Syntax

```
show ip dhcp relay
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show ip dhcp relay
DHCP relay service is Enabled.
VRF Name: vrf1
  Option 82: Enabled
  Remote Id: ocnos-device
  Link selection Source-IP: 1.4.5.6
  DHCP Servers configured: 9.9.9.9 8.8.8.8
  Interface               Uplink/Downlink
  ---------               -------------
  ge10                    Uplink
  ge28                    Downlink
VRF Name: default
  Option 82: Enabled
  Remote Id: OcNOS
  Link selection Source-IP: 1.2.3.4
  DHCP Servers configured: 1.1.1.1 2.2.2.2
  Interface               Uplink/Downlink
  ---------               -------------
  ge11                    Uplink
  ge27                    Downlink
```

[1]Dynamic Host Configuration Protocol

show ip dhcp relay address

Use this command to display **DHCP**[1] relay addresses.

Command Syntax

```
show ip dhcp relay address
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show ip dhcp relay address
VRF Name: vrf1
  DHCP Servers configured: 9.9.9.9 8.8.8.8
VRF Name: default
  DHCP Servers configured: 1.1.1.1 2.2.2.2
```

[1]Dynamic Host Configuration Protocol

show ip dhcp relay option statistics

Use this command to display IPv4 **DHCP**[1] Relay Agent Option(Option82) packet statistics

Command Syntax

```
show ip dhcp relay option statistics
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 1.3.9.

Examples

```
#sh ip dhcp relay option statistics
VRF Name: default
Remote ID : OcNOS
Circuit ID : ge5
Number of packets forwarded without agent options  : 0
Dropped pkts due to bad relay agent information option : 0
Dropped pkts due to no RAI option match found : 0
Circuit ID option is not matching with known circuit ID : 0
Circuit ID option in matching RAI option was missing : 0
#
```

[1]Dynamic Host Configuration Protocol

show ip dhcp relay statistics

Use this command to display IPv4 **DHCP**[1] relayed packet statistics.

Note: DHCPv6 relay statistics is not supported

Command Syntax

```
show ip dhcp relay statistics
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 1.3.9.

Examples

```
#sh ip dhcp relay statistics
VRF Name: default
Packets sent with a bogus giaddr : 0
Packets relayed from client to server : 12
Errors sending packets to servers : 0
Packets relayed from server to client : 1
Errors sending packets to clients : 0
#
```

[1]Dynamic Host Configuration Protocol

show ipv6 dhcp pd-route

Use this command to display the routes and their properties installed as part of the Route Injection feature

Command Syntax

```
show ipv6 dhcp pd-route
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#show ipv6 dhcp pd-route
VRF : vrf1
  4002:db8:1bff::/48 via xe9 (2019-02-14 10:50:18 - 2019-02-14 10:51:58)
```

show ipv6 dhcp relay

Use this command to display **DHCP**[1] IPv6 relay status including DHCP IPv6 server addresses configured on interfaces.

Command Syntax

```
show ipv6 dhcp relay
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show ipv6 dhcp relay
IPv6 DHCP relay service is Enabled.
VRF Name: vrf1
  DHCPv6 Servers configured: 2001::1
  Interface                Uplink/Downlink
  ---------                -------------
  ge35                     Uplink
  xe50                     Downlink
VRF Name: default
  DHCPv6 Servers configured: 3001::1
  Interface                Uplink/Downlink
  ---------                -------------
  ge34                     Uplink
  xe49                     Downlink
```

[1]Dynamic Host Configuration Protocol

show ipv6 dhcp relay address

Use this command to display **DHCP**[1] IPv6 relay addresses.

Command Syntax

```
show ipv6 dhcp relay address
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show ipv6 dhcp relay address
VRF Name: vrf1
  DHCPv6 Servers configured: 2001::1
VRF Name: default
  DHCPv6 Servers configured: 3001::1
```

[1]Dynamic Host Configuration Protocol

show running-config dhcp

Use this command to display **DHCP**[1] settings in the running configuration.

Command Syntax

```
show running-config dhcp
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show running-config dhcp
ip vrf vrf1
 ip dhcp relay information option remote-id hostname
 ip dhcp relay address 1.1.1.2

ip dhcp relay information option remote-id hostname
ip dhcp relay information source-ip 5.4.3.2
ip dhcp relay address 1.1.1.1
```

[1]Dynamic Host Configuration Protocol

DHCPv6 Prefix Delegation Commands

This chapter describes the Dynamic Host Configuration Protocol (**DHCP**[1]) v6 Prefix delegation commands.

The prefix delegation feature lets a DHCP server assign prefixes chosen from a global pool to DHCP clients. The **DHCP client**[2] can configure an IPv6 address on its LAN interface using the prefix it received. Then it send router advertisements including the prefix, allowing other devices to auto configure their own IPv6 addresses.

Enable OcNOS device DHCP Client to receive the prefixes from external DHCP Server and enable IPv6 address autoconfiguration of LAN interfaces and the respective host machines.

This feature enables the service providers to assign IP for the Customer Premise Equipment acting as a router between the service providers core network and subscribers internal network.

This chapter contains these commands:

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

ipv6 address

Use this command to configure the global IPv6 address using the learned prefix and user provided suffix.

Use the **no** form of this command to remove the configuration.

Command Syntax

```
ipv6 address PREFIX-NAME X:X::X:X/M
no ipv6 address PREFIX-NAME X:X::X:X/M
```

Parameters

PREFIX-NAME
Name of the prefix which stores the address-prefix learnt using prefix delegation enabled in the client interface

X:X::X:X/M
Suffix address consists subnet id and host address. This value must start with '::', and end with a /64 bit prefix.

Default

DHCPv6 IA_PD option is not requested by default.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ipv6 address dhcp
(config-if)#ipv6 dhcp prefix-delegation prefix_xe1
(config-if)#

(config)#interface xe3
(config-if)#ipv6 address prefix_xe1 ::1:0:0:0:1/64
(config-if)#
```

ipv6 address autoconfig

Use this command to enable autoconfiguration of IPv6 address in host interface. IPv6 address are formed using the Prefix learned from RA and suffix formed using EUI-64 method.

Autoconfiguration of IPv6 address is successful when the received prefix length is 64.

Use the command **ipv6 address autoconfig max-address <1-64>** to configure the max-address that can be autoconfigured on an interface.

Use the **no** form of **ipv6 address autoconfig** command to disable the IPv6 address autoconfiguration and max-address if configured.

Use the **no** form of **ipv6 address autoconfig max-address <1-64>** to unconfigure the max-address configured on an interface and set the max-address to its default value of 15, but the autoconfig configuration remains enabled.

Command Syntax

```
ipv6 address autoconfig (max-address <1-64>|)
no ipv6 address autoconfig (max-address <1-64>|)
```

Parameters

max-address <1-64>
(Optional) The minimum number of configurable IPv6 addresses is one and the maximum is 64. The default num

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 4.2 and.**max-address <1-64>** option is introduced inOcNOS version 6.5.1.

Examples

The below configuration shows how to configure the autoconfig:

```
OcNOS#configure terminal
OcNOS(config)#interface eth0
OcNOS(config-if)#ipv6 address autoconfig
```

The below configuration shows how to configure the number of IPv6 addresses with autoconfig:

```
OcNOS#configure terminal
OcNOS(config)#interface xe1
OcNOS(config-if)#ipv6 address autoconfig max-address 64
OcNOS(config-if)#commit
OcNOS(config-if)#end
```

ipv6 dhcp client max-delegated-prefixes

Use this command to configure multiple DHCPv6 prefix delegation for a single client.

Command Syntax

```
ipv6 dhcp client max-delegated-prefixes <1-64>
```

Parameters

max-delegated-prefixes <1-64>
Specifies the number of prefixes need for a **DHCP client**[1]. Default number of **DHCP**[2] prefixes are 8.

Default

None

Command Mode

Interface mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

This example shows how to configure multiple DHCPv6 prefix delegation for a single client:

```
RR#configure terminal
RR#(config)#interface ce16/1
RR#(config-if)#ipv6 dhcp address-prefix-len 64
RR#(config-if)#ipv6 address dhcp
RR#(config-if)#ipv6 dhcp prefix-delegation PREFIX_FROM_SERVER
RR#(config-if)#ipv6 dhcp client max-delegated-prefixes 10
RR#(config-if)#exit
RR#(config)#commit
```

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[2]Dynamic Host Configuration Protocol

ipv6 dhcp prefix-delegation

Use this command to enable the DHCPv6 client to request the prefix (IA_PD) for the interface.

Prefixes delegated by the **DHCP**[1] server are stored in the general prefix called PREFIX-NAME.

Use the no form of command to remove the IA_PD option from the DHCPv6 client request. This command also deletes the learned prefix if it exists.

Command Syntax

```
ipv6 dhcp prefix-delegation PREFIX-NAME
no ipv6 dhcp prefix-delegation
```

Parameters

PREFIX-NAME
Name of the learnt prefix (maximum length 255 characters).

Default

DHCPv6 Prefix delegation client is not enabled by default.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ipv6 dhcp prefix-delegation prefix_xe1
(config-if)#
```

[1]Dynamic Host Configuration Protocol

show ipv6 dhcp interface

Use this command to display the DHCPv6 prefix delegation information in the Requesting Router device.

Command Syntax

```
show ipv6 dhcp interface
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#show ipv6 dhcp interface
      xe1 is in client mode
      prefix name: prefix_xe1
      learned prefix: 1212:501:102::/48
      preferred lifetime 600, valid lifetime 600
      interfaces using the learned prefix
      xe3    1212:501:102:1::1
```

DHCP Server Commands

This chapter describes the Dynamic Host Configuration Protocol (**DHCP**[1]) server commands.

A DHCP server is a network server that automatically provides and assigns IP addresses, default gateways, and other network parameters to client devices. A DHCP server relies on the standard protocol known as Dynamic Host Configuration Protocol or DHCP to respond to broadcast queries by clients.

This chapter contains these commands:

[1]Dynamic Host Configuration Protocol

address range low-address A.B.C.D

Use this command to create an address-range in the IPv4 **DHCP**[1] server pool.

Use the **no** form of this command to delete an address-range from the IPv4 DHCP server pool.

Command Syntax

```
address range low-address A.B.C.D (high-address A.B.C.D|)
no address range low-address A.B.C.D (high-address A.B.C.D|)
```

Parameters

low-address A.B.C.D
The low range of the IPv4 addresses that the DHCP server should assign to DHCP clients.

high-address A.B.C.D
The high range of the IPv4 addresses that the DHCP server should assign to DHCP clients.

Default

None

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#address range low-address 3.3.3.1 high-address 3.3.3.4

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
(dhcp-config)#address range low-address 3.3.3.1 high-address 3.3.3.4
```

[1]Dynamic Host Configuration Protocol

address range low-address X:X::X:X

Use this command to create an address-range in the IPv6 **DHCP**[1] server pool.

Use the **no** form of this command to delete an address-range from the IPv6 DHCP server pool.

Command Syntax

```
address range low-address X:X::X:X (high-address X:X::X:X|)
no address range low-address X:X::X:X (high-address X:X::X:X|)
```

Parameters

low-address X:X::X:X
The low range of the IPv6 addresses that the DHCP server should assign to DHCP clients.

high-address X:X::X:X
The high range of the IPv6 addresses that the DHCP server should assign to DHCP clients.

Default

None

Command Mode

DHCP6 configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#address range low-address 2001::1 high-address 2001::124

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#address range low-address 2001::1 high-address 2001::124
```

[1]Dynamic Host Configuration Protocol

boot-file

Use this command to specify a boot file in the IPv4 **DHCP**[1] server pool.

Use the **no** form of this command to delete a boot file from the IPv4 DHCP server pool.

Command Syntax

```
boot-file BOOTFILE
no boot-file BOOTFILE
```

Parameters

BOOTFILE
Name of the boot file (maximum 63 alphanumeric characters)

Default

No default Value is specified

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#boot-file ocnos-boot-file

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
(dhcp-config)#boot-file ocnos-boot-file
```

[1]Dynamic Host Configuration Protocol

dns-server A.B.C.D

Use this command to specify a DNS name server in the IPv4 **DHCP**[1] server pool. Multiple name servers can be added to the pool.

Use the **no** form of this command to delete a DNS name server details from the IPv4 DHCP server pool.

Command Syntax

```
dns-server A.B.C.D
no dns-server A.B.C.D
```

Parameters

A.B.C.D
IPv4 DNS name server address

Default

None

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#dns-server 10.12.3.23

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
(dhcp-config)#dns-server 10.12.3.23
```

[1]Dynamic Host Configuration Protocol

dns-server X:X::X:X

Use this command to specify a DNS name server in the IPv6 **DHCP**[1] server pool. Multiple DNS name servers can be added to the pool.

Use the **no** form of this command to delete a DNS name server from the IPv6 DHCP server pool.

Command Syntax

```
dns-server X:X::X:X
no dns-server X:X::X:X
```

Parameters

X:X::X:X
DNS IPv6 name server address

Default

None

Command Mode

DHCP6 configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#dns-server 2001::2

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#dns-server 2001::2
```

[1]Dynamic Host Configuration Protocol

domain-name

Use this command to set the domain name in the IPv6 **DHCP**[1] server pool.

Use the **no** form of this command to delete the domain name from the IPv6 DHCP server pool.

Command Syntax

```
domain-name NAME
no domain-name NAME
```

Parameters

NAME
Name of the domain (maximum 63 alphanumeric characters)

Default

No default Value is specified

Command Mode

DHCP6 configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#domain-name ipinfusion.com

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#domain-name ipinfusion.com
```

[1]Dynamic Host Configuration Protocol

host-name

Use this command to set a host name in the IPv4 **DHCP**[1] server pool.

Use the **no** form of this command to delete the host name from the IPv4 DHCP server pool.

Command Syntax

```
host-name NAME
no host-name NAME
```

Parameters

NAME
Name of the host (maximum 63 alphanumeric characters)

Default

None

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#host-name dhcp-server

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
(dhcp-config)#host-name dhcp-server
```

[1]Dynamic Host Configuration Protocol

ip dhcp server (interface mode)

Use this command to configure an interface as a **DHCP**[1] server starting interface.

Use the **no** form of this command to remove an interface as a DHCP server starting interface.

Command Syntax

```
ip dhcp serverno ip dhcp server
no ip dhcp server
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#ip dhcp server
```

[1]Dynamic Host Configuration Protocol

ip dhcp server default-lease-time

Use this command to set the default lease time for the **DHCP**[1] server to be shared with the **DHCP client**[2].

Use the **no** form of this command to delete the IPv4 default lease time configuration.

Command Syntax

```
ip dhcp server default-lease-time SECONDS
no ip dhcp server default-lease-time
```

Parameters

SECONDS
Default lease time in seconds. Default is 86400 seconds.

Default

Default value is 86400 seconds

Command Mode

Configure mode and **VRF**[3] mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server default-lease-time 500

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server default-lease-time 400
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[3]Virtual Routing and Forwarding

ip dhcp server max-lease-time

Use this command to set the maximum lease time for the **DHCP**[1] server to be shared with the **DHCP client**[2].

Use the **no** form of this command to delete the IPv4 maximum lease time configuration.

Command Syntax

```
ip dhcp server max-lease-time SECONDS
no ip dhcp server max-lease-time
```

Parameters

SECONDS
Maximum lease time in seconds. Default is 86400 seconds.

Default

Default value is 86400 seconds

Command Mode

Configure mode and **VRF**[3] mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server max-lease-time 500

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server max-lease-time 400
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[3]Virtual Routing and Forwarding

ip dhcp server pool

Use this command to create a IPv4 **DHCP**[1] server pool.

Use the **no** form of this command to delete a IPv4 DHCP server pool.

Command Syntax

```
ip dhcp server pool NAME
no ip dhcp server pool NAME
```

Parameters

NAME
Name of the pool (maximum 63 alphanumeric characters)

Default

No default value is specified

Command Mode

Configure mode

VRF[2] mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ipv6 dhcp server (interface mode)

Use this command to set an interface as a DHCPv6 server starting interface.

Use the **no** form of this command to remove an interface as a DHCPv6 server starting interface.

Command Syntax

```
ipv6 dhcp server
no ipv6 dhcp server
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#ipv6 dhcp server
```

ipv6 dhcp server pool

Use this command to create a IPv6 **DHCP**[1] server pool.

Use the **no** form of this command to delete a IPv6 DHCP server pool.

Command Syntax

```
ipv6 dhcp server pool NAME
no ipv6 dhcp server pool NAME
```

Parameters

NAME
Name of the pool (maximum 63 alphanumeric characters)

Default

No default value is specified

Command Mode

Configure mode and **VRF**[2] mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server pool test-pool

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool test-pool
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

ipv6 dhcp server preference

Use this command to make a DHCPv6 server preferred.

Use the **no** form of this command to disable a server preference.

Command Syntax

```
ipv6 dhcp server preference
no ipv6 dhcp server preference
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

VRF[1] mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server preference

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server preference
```

[1]Virtual Routing and Forwarding

ipv6 dhcp server rapid-commit

Use this command to enable the **DHCP client**[1] to obtain configuration parameters from the server through a rapid two message exchange (solicit and reply).

Use the **no** form of this command to disable the IPv6 **DHCP**[2] server rapid-commit option.

Command Syntax

```
ipv6 dhcp server rapid-commit
no ipv6 dhcp server rapid-commit
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

VRF[3] mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server rapid-commit

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server rapid-commit
```

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[2]Dynamic Host Configuration Protocol

[3]Virtual Routing and Forwarding

log-server

Use this command to specify a log server in the IPv4 **DHCP**[1] server pool. Multiple log servers can be added to the pool.

Use the **no** form of this command to delete a log server from the IPv4 DHCP server pool.

Command Syntax

```
log-server A.B.C.D
no log-server A.B.C.D
```

Parameters

A.B.C.D
IPv4 log server address

Default

No default value is specified

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#log-server 10.12.43.97

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
(dhcp-config)#log-server 10.12.43.97
```

[1]Dynamic Host Configuration Protocol

network A.B.C.D netmask

Use this command to specify a network and netmask in the IPv4 **DHCP**[1] server pool.

Use the **no** form of this command to delete the network and netmask from the IPv4 DHCP server pool.

Command Syntax

```
network A.B.C.D netmask A.B.C.D
no network A.B.C.D netmask A.B.C.D
```

Parameters

network A.B.C.D
Network part of the subnet to use to assign IPv4 addresses to hosts

netmask A.B.C.D
Mask part of the subnet to use to assign IPv4 addresses to host

Default

No default value is specified

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#network 3.3.3.0 netmask 255.255.255.0

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
(dhcp-config)#network 3.3.3.0 netmask 255.255.255.0
```

[1]Dynamic Host Configuration Protocol

network X:X::X:X netmask

Use this command to specify a network and netmask in the IPv6 **DHCP**[1] server pool.

Use the **no** form of this command to delete the network and netmask from the IPv6 DHCP server pool.

Command Syntax

```
network X:X::X:X netmask <1-128>
no network X:X::X:X netmask <1-128>
```

Parameters

network X:X:X:X
Network part of the subnet to use to assign IPv6 addresses to hosts

netmask <1-128>
Mask part of the subnet to use to assign IPv6 addresses to host

Default

No default value is specified

Command Mode

DHCP6 configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#network 2001:: netmask 64

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#network 2001:: netmask 64
```

[1]Dynamic Host Configuration Protocol

ntp-server A.B.C.D

Use this command to specify an NTP server in the IPv4 **DHCP**[1] server pool. Multiple NTP servers can be added to the pool.

Use the **no** form of this command to delete an NTP server from the IPv4 DHCP server pool.

Command Syntax

```
ntp-server A.B.C.D
no ntp-server A.B.C.D
```

Parameters

A.B.C.D
NTP IPv4 server address

Default

None

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#ntp-server 10.12.43.97

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
(dhcp-config)#ntp-server 10.12.43.97
```

[1]Dynamic Host Configuration Protocol

ntp-server X:X::X:X

Use this command to specify an NTP server in the IPv6 **DHCP**[1] server pool. Multiple NTP servers can be added to the pool.

Use the **no** form of this command to delete an NTP server from the IPv6 DHCP server pool.

Command Syntax

```
ntp-server X:X::X:X
no ntp-server X:X::X:X
```

Parameters

X:X::X:X
NTP IPv6 server address

Default

No default Value is specified

Command Mode

DHCP6 configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#ntp-server 2001::2

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#ntp-server 2001::2
```

[1]Dynamic Host Configuration Protocol

prefix high-range

Use this command to add the DHCPv6 prefix range in the IPv6 **DHCP**[1] server pool used for prefix delegation.

Use the *no* form of this command to delete the prefix-range from the IPv6 DHCP server pool.

Command Syntax

```
prefix high-range X:X::X:X low-range X:X::X:X netmask <1-128>
no prefix high-range X:X::X:X low-range X:X::X:X netmask <1-128>
```

Parameters

high-range X:X::X:X
IPv6 prefix high range value

low-range X:X::X:X
IPv6 prefix low range value

netmask <1-128>
Network Mask

Default

None

Command Mode

DHCL6 configure mode and **VRF**[2] mode

Applicability

This command is introduced in OcNOS version 6.1.0.

Example

```
#configure terminal
(config)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#prefix high-range 3001:db8:1234:: low-range 3001:db8:1c0f:: netmask 48

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#prefix high-range 3001:db8:1234:: low-range 3001:db8:1c0f:: netmask 48
```

[1]Dynamic Host Configuration Protocol

[2]Virtual Routing and Forwarding

routers A.B.C.D

Use this command to specify the routers in the IPv4 **DHCP**[1] server pool.

Use the **no** form of this command to delete an routers from the IPv4 DHCP server pool.

Command Syntax

```
routers A.B.C.D
no routers A.B.C.D
```

Parameters

A.B.C.D
NTP IPv4 server address

Default

None

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#routers 10.12.43.97

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test--pool
(dhcp-config)#routers 10.12.43.97
```

[1]Dynamic Host Configuration Protocol

temporary address X:X::X:X

Use this command to add an IPv6 temporary address to the IPv6 **DHCP**[1] server pool.

Use the **no** form of this command to delete an IPv6 temporary address from the IPv6 DHCP server pool.

Command Syntax

```
temporary address X:X::X:X
no temporary address
```

Parameters

X:X::X:X
IPv6 DHCP Temporary address

Default

None

Command Mode

DHCP6 configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#temporary address 2001::

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#temporary address 2001::
```

[1]Dynamic Host Configuration Protocol

tftp-server

Use this command to specify a TFTP server in the IPv4 **DHCP**[1] server pool.

Use the **no** form of this command to delete a TFTP server from the IPv4 DHCP server pool.

Command Syntax

```
tftp-server A.B.C.D
no tftp-server A.B.C.D
```

Parameters

A.B.C.D
TFTP IPv4 server address

Default

No default Value is specified

Command Mode

DHCP configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ip dhcp server pool test-pool
(dhcp-config)#tftp-server 10.12.43.97

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp server pool test-pool
(dhcp-config)#tftp-server 10.12.43.97
```

[1]Dynamic Host Configuration Protocol

vendor-options

Use this command to specify vendor options in the IPv6 **DHCP**[1] server pool.

Use the **no** form of this command to delete the vendor options from the IPv6 DHCP server pool.

Command Syntax

```
vendor-options VENDOR-OPTS
no vendor-options VENDOR-OPTS
```

Parameters

VENDOR-OPTS
Vendor option details

Default

None

Command Mode

DHCP6 configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#vendor-options 00:00:09:bf:63

#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp server pool ipv6_pool
(dhcp6-config)#vendor-options 00:00:09:bf:63
```

[1]Dynamic Host Configuration Protocol

DNS CONFIGURATION

DNS Configuration

Overview

The Domain Name System (DNS) is an Internet service that translates domain names into IP addresses. When a domain name is used, DNS service translates the name into the corresponding IP address. If one DNS server does not know how to translate a particular domain name, it gathers information from other Domain Name Systems to obtain the correct IP address.

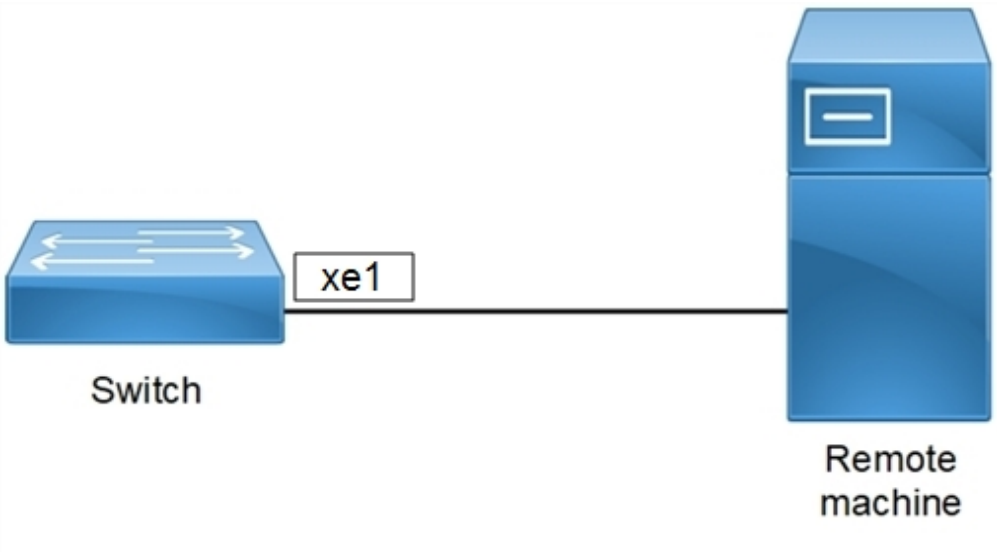
In-band management over Default VRF

OcNOS supports syslog over the default and management VRFs via in-band management interface and OOB management interface, respectively.

By default, syslog runs on the management **VRF**[1].

Topology

Figure 33. DNS sample topology



VRF Management Configuration-IPv4

`#configure terminal`	Enter Configure mode.
`(config)#ip name-server vrf management 10.12.17.11`	This add a IPv4 Name Server to the DNS.
`(config)#ip name-server vrf management 10.1.1.2`	This add a IPv4 Name Server to the DNS.
`(config)#ip host vrf management BINGO 10.1.1.1`	This will add IPv4 host to the DNS

[1]Virtual Routing and Forwarding

`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
#show hosts vrf management
         VRF: default

 DNS lookup is disabled
 Default domain is empty
 DNS domain list is empty

 Name Servers        : 10.12.17.11 10.1.1.2
Host                                                            Address

----                                                            -------

BINGO                                                           10.1.1.1

 * - Values assigned by DHCP Client.
```

VRF Management Configuration-IPv6

`#configure terminal`	Enter Configure mode.
`(config)#ip name-server vrf management 3001::1`	This add a IPv6 Name Server to the DNS.
`(config)#ip host vrf management bingo 5001::1`	This will add IPv6 host to the DNS
`(config)#commit`	Commit the Candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
OcNOS#show hosts vrf management
       VRF: management

DNS lookup is enabled
 Default domain is empty
 DNS domain list is empty

 Name Servers        : 3001::1
Host                                                            Address
----                                                            -------
bingo                                                           5001::1

 * - Values assigned by DHCP Client.
OcNOS#
```

User Defined VRF Configuration-IPv4

`#configure terminal`	Enter Configure mode.

`(config)#ip vrf vrf1`	Configuring user defined vrf in global.
`(config)#commit`	Commit the candidate configuration to the running configuration
`#configure terminal`	Enter Configure mode.
`(config)#ip domain-lookup vrf vrf1`	This command is to enable DNS for user-defined vrf.
`(config)#ip name-server vrf vrf1 10.12.17.11`	This add a IPv4 Name Server to the DNS
`(config)#ip name-server vrf vrf1 10.1.1.2`	This add a IPv4 Name Server to the DNS
`(config)#ip host vrf vrf1 BINGO 10.1.1.1`	This will add IPv4 host to the DNS
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
#show hosts vrf vrf1
VRF: vrf1
DNS lookup is enabled
 Default domain is empty
 DNS domain list is empty
Name Servers   : 10.12.17.11 10.1.1.2
Host   Address
BINGO   10.1.1.1
* - Values assigned by DHCP Client.
```

User Defined Configuration-IPv6

`#configure terminal`	Enter Configure mode.
`(config)#ip name-server vrf vrf1 3001::1`	This add a IPv6 Name Server to the DNS.
`(config)#ip host vrf vrf1 bingo 5001::1`	This will add IPv6 host to the DNS
`(config)#commit`	Commit the Candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
OcNOS#show hosts vrf vrf1
VRF: vrf1

   DNS lookup is disabled
       Default domain is empty
       DNS domain list is empty

Name Servers   : 3001::1
Host      Address
----      -------
bingo      5001::1
* - Values assigned by DHCP Client.
```

DNS Relay Configuration

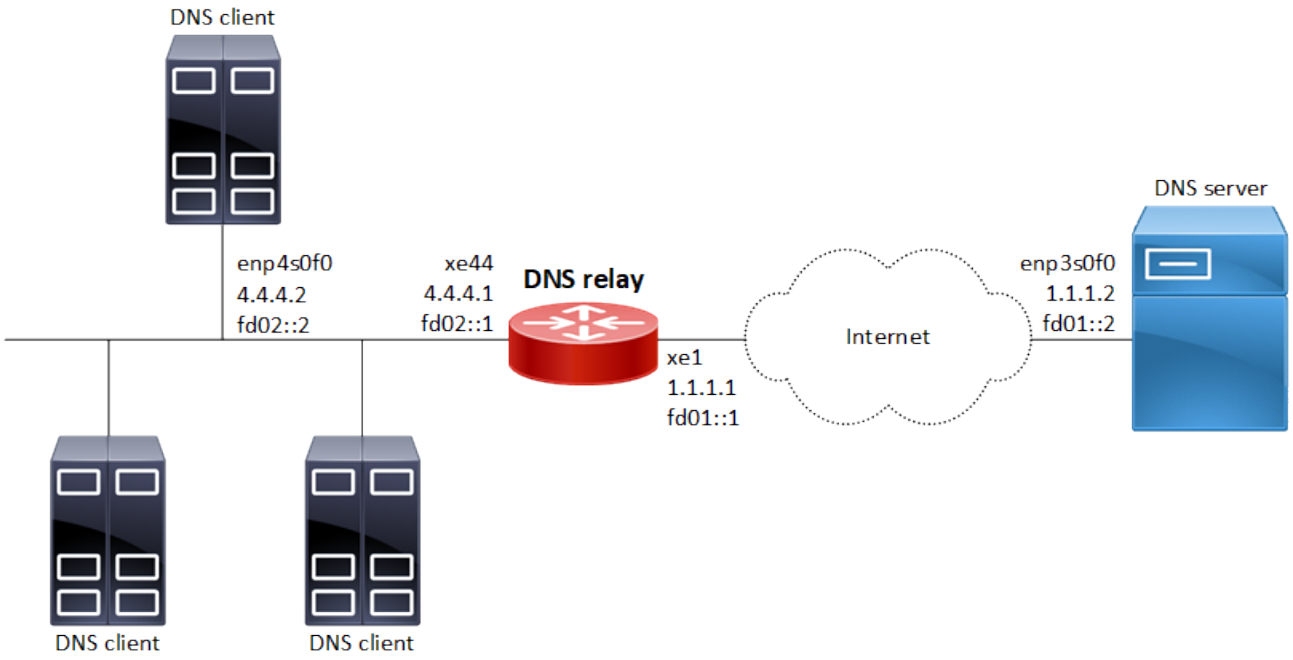
Overview

DNS relay is used to forward DNS request and reply packets between the DNS client and DNS server. In the network where DNS relay is used, the DNS client sends DNS request packets to the DNS relay. The DNS relay forwards request packets to the DNS server and sends reply packets to the DNS client, and domain resolution is realized.

Configuration

Topology

Figure 34. DNS relay configuration



Linux Configuration on the DNS client

1. `sudo ifconfig enp4s0f0 4.4.4.2/24`
2. `sudo ifconfig enp4s0f0 inet6 add fd02::2/16`
3. `echo nameserver fd02::1 >> /etc/resolv.conf`
4. `echo nameserver 4.4.4.1 >> /etc/resolv.conf`

Linux Configuration on the DNS server

1. `sudo ifconfig enp3s0f0 1.1.1.2/24`
2. `sudo ifconfig enp3s0f0 inet6 add fd01::2/16`

3. Install and configure BIND9:

> **Note:** Maximum of 10 bind9 instances is supported.

   a. **`apt-get -y update && apt install -y bind9`**

   b. Configure 'forwarders' section in the **`/etc/bind/named.conf.options`** file like this:

```
      forwarders  { 8.8.8.8;  2001:4860:4860::8888; };
```

DNS Relay Router

`#configure terminal`	Enter configure mode
`(config)#ip dns relay address 1.1.1.2`	Set the IPv4 address of a DNS server
`(config)#ipv6 dns relay address fd01::2`	Set the IPv6 address of a DNS server
`(config)#commit`	Commit the configuration
`(config)#interface xe44`	Enter interface mode (interface connected to client)
`(config-if)#ip address 4.4.4.1/24`	Assign an IPv4 address to the interface
`(config-if)#ip dns relay`	Set the interface as a DNS relay client-facing IPv4 port
`(config-if)#ipv6 address fd02::1/16`	Assign an IPv6 address to the interface
`(config-if)#ipv6 dns relay`	Set the interface as a DNS relay client-facing IPv6 port
`(config-if)#commit`	Commit the configuration
`(config)#interface xe1`	Enter interface mode (interface connected to server)
`(config-if)#ip address 1.1.1.1/24`	Assign an IPv4 address to the interface
`(config-if)#ip dns relay uplink`	Set the interface as a DNS relay server-facing IPv4 port
`(config-if)#ipv6 address fd01::1/16`	Assign an IPv6 address to the interface
`(config-if)#ipv6 dns relay uplink`	Set the interface as a DNS relay server-facing IPv6 port
`(config-if)#commit`	Commit the configuration
`(config)#exit`	Exit configure mode

Validation

```
#sh run dns relay
!
ip dns relay address 1.1.1.2
!
ipv6 dns relay address fd01::2
!
interface xe1
 ip dns relay uplink
 ipv6 dns relay uplink
```

```
!
interface xe44
 ip dns relay
 ipv6 dns relay
!
#show running-config interface xe1
!
interface xe1
 ip address 1.1.1.1/24
 ipv6 address fd01::1/16
 ip dns relay uplink
 ipv6 dns relay uplink
!
#show running-config interface xe44
!
interface xe44
 ip address 4.4.4.1/24
 ipv6 address fd02::1/16
 ip dns relay
 ipv6 dns relay
!
```

Verify DNS Query result on DNS client machine:

```
[root@localhost ~]# host google.com
google.com has address 172.217.160.238
google.com has IPv6 address 2404:6800:4002:804::200e
google.com mail is handled by 40 alt3.aspmx.l.google.com.
google.com mail is handled by 10 aspmx.l.google.com.
google.com mail is handled by 50 alt4.aspmx.l.google.com.
google.com mail is handled by 30 alt2.aspmx.l.google.com.
google.com mail is handled by 20 alt1.aspmx.l.google.com.
```

DNS COMMAND REFERENCE

Domain Name System Commands

This chapter describes Domain Name System (DNS) commands. DNS translates easily-to-remember domain names into numeric IP addresses needed to locate computer services and devices. By providing a worldwide, distributed keyword-based redirection service, DNS is an essential component of the Internet.

The DNS database is hierarchical. When a client such as a Web browser gives a request that specifies a host name, the DNS resolver on the client first contacts a DNS server to determine the server's IP address. If the DNS server does not contain the needed mapping, it forwards the request to a different DNS server at the next higher level in the hierarchy. After potentially several forwarding and delegation messages are sent within the DNS hierarchy, the IP address for the given host eventually arrives at the resolver, that in turn completes the request over Internet Protocol (IP).

Note: The commands below are supported only on the “management” **VRF**[1].

The chapter contains these commands:

debug dns client

Use this command to display DNS debugging messages.

Use the **no** form of this command to stop displaying DNS debugging messages.

Command Syntax

```
debug dns client
no debug dns client
```

Parameters

None

Default

NoneBy default, disabled.

[1]Virtual Routing and Forwarding

Command Mode

Execution mode, Privileged execution mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug dns client
```

ip domain-list

Use this command to define a list of default domain names used to complete unqualified host names. Each domain in the list is to be tried in turn.

The **ip domain-list** command is similar to the ip domain-name (page 528) command, except that with the **ip domain-list** command you can define a list of domains, each to be tried in turn.

If there is no domain list, the default domain name specified with the **ip domain-name** command is used. If there is a domain list, the default domain name is not used.

Use the **no** form of this command to remove a domain.

Command Syntax

```
ip domain-list (vrf (NAME|management)|) DOMAIN-NAME
no ip domain-list (vrf (NAME|management)|) DOMAIN-NAME
```

Parameters

DOMAIN-NAME
Domain string (e.g. company.com)(Max Size 64)

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added parameter NAME in OcNOS version 6.5.3.

[1]Virtual Routing and Forwarding

Example

```
#configure terminal
(config)#ip domain-list mySite.com
```

ip domain-lookup

Use this command to enable DNS host name-to-address translation.

Use the **no** form of this command to disable DNS.

Command Syntax

```
ip domain-lookup (vrf (NAME|management)|)
no ip domain-lookup (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance

vrf NAME
Specify the user-defined VRF instance name

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added parameter NAME in OcNOS version 6.5.3.

Example

```
#configure terminal
(config)#ip domain-lookup
```

ip domain-name

Use this command to set the default domain name used to complete unqualified host names (names without a dotted-decimal domain name).

The ip domain-list (page 527) command is similar to the **ip domain-name** command, except that with the **ip domain-list** command you can define a list of domains, each to be tried in turn.

If a domain list has been created with ip domain-list (page 527), the default domain name is not used. If there is no domain list, the default domain name is used.

[1]Virtual Routing and Forwarding

Use the **no** form of this command to disable DNS.

Command Syntax

```
ip domain-name (vrf (NAME|management)|) DOMAIN-NAME
no ip domain-name (vrf (NAME|management)|) DOMAIN-NAME
```

Parameters

DOMAIN-NAME
Domain string (e.g. company.com)(Max Size 64)

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added NAME parameter in OcNOS version 6.5.3.

Example

```
#configure terminal
(config)#ip domain-name company.com
```

ip host

Use this command to define static a hostname-to-address mapping in DNS. You can specify one mapping in a command.

Use the **no** form of this command remove a hostname-to-address mapping.

Note: If the command **ip host <hostname> <ip>** is enabled and the hostname is configured for any feature, the old IP associated with the hostname will be used until the feature is disabled and re-enabled, even if the IP associated with the hostname is changed later.

Command Syntax

```
ip host (vrf (NAME|management)|) WORD (X:X::X:X | A.B.C.D)
no ip host (vrf (NAME|management)|) WORD (X:X::X:X | A.B.C.D)
```

[1]Virtual Routing and Forwarding

Parameters

WORD
Host name, such as company.com

X:X::X:X
IPv6 address of the host

A.B.C.D
IPv4 address of the host

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added parameter NAME in OcNOS version 6.5.3

Examples

```
#configure terminal
(config)#ip host company.com 192.0.2.1
```

ip name-server

Use this command to add a DNS server address that is used to translate hostnames to IP addresses.

Use the **no** form of this command to remove a DNS server address.

Note: If the hostname resolution takes time even after adding proper name-servers, check the list of name-servers added. Non-responsive name-servers take a long time to resolve the hostnames and result in utilities timeout and "Failed to resolve hostname" error. Ensure that the non-reachable/non-DNS name-servers are removed from the configured list.

Command Syntax

```
ip name-server (vrf (NAME|management)|) (X:X::X:X | A.B.C.D)
no ip name-server (vrf (NAME|management)|) (X:X::X:X | A.B.C.D)
```

[1]Virtual Routing and Forwarding

Parameters

A.B.C.D
IPv4 address of the host

X:X::X:X
IPv6 address of the host

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added parameter NAME in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#ip name-server 123.70.0.23
```

show hosts

Use this command to display the DNS name servers and domain names.

Command Syntax

```
show hosts (vrf (NAME|management|all)
```

Parameters

vrf management
Defines the management **VRF**[2] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Execution mode and Privileged execution mode

[1]Virtual Routing and Forwarding

[2]Virtual Routing and Forwarding

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Example

The following is a sample output of this command displaying two name servers: 10.10.0.2 and 10.10.0.88.

```
#show hosts
       VRF: management

DNS lookup is enabled
 Default domain      : .com
 Additional Domain   : .in .ac
 Name Servers        : 10.12.3.23
Host                                                        Address
----                                                        -------
test                                                        10.12.12.67
test                                                        10::23

 * - Values assigned by DHCP Client.
```

Table 21 explains the output fields.

Table 21. show hosts fields

Entry	Description
VRF: management	DNS configuration of specified VRF.
DNS lookup is enabled	DNS feature enabled or disabled.
Default domain	Default domain name used to complete unqualified host names (names without a dotted decimal domain name).
Additional Domain	A list of default domain names used to complete unqualified host names. Each domain in the list is to be tried in turn.
Name Servers	DNS server addresses that are used to translate hostnames to IP addresses.
Host	Static hostname-to-address mappings in DNS.
Test	Static hostname-to-address mappings in DNS.
* - Values assigned by **DHCP**[1] Client.	Name-server indicates it has been learned dynamically.

show running-config dns

Use this command to show the DNS settings of the running configuration.

Command Syntax

```
show running-config dns (vrf (NAME|management)|)
```

[1]Dynamic Host Configuration Protocol

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Example

```
#show running-config dns
ip domain-lookup vrf management
ip domain-name vrf management .com
ip domain-list vrf management .in
ip domain-list vrf management .ac
ip name-server vrf management 10.12.3.23
ip host vrf management test 10.12.12.67 10::23
```

[1]Virtual Routing and Forwarding

Domain Name System Relay Commands

This chapter describes the DNS relay commands:

ip dns relay global

Use this command to globally enable the IPv4 DNS relay agent.

Use the **no** form of this command to globally disable the IPv4 DNS relay agent.

Command Syntax

```
ip dns relay
no ip dns relay
```

Parameters

None

Default

By default, IPv4 DNS relay agent is enabled.

Command Mode

Configure mode

Applicability

This command was introduced inOcNOS version 6.5.0.

Example

```
#configure terminal
(config)#ip dns relay
(config)#no ip dns relay
```

ip dns relay (interface)

Use this command to configure an IPv4 interface as a DNS relay client-facing port.

Use the **no** form of this command to remove an IPv4 interface as a DNS relay client-facing port.

Command Syntax

```
ip dns relay
no ip dns relay
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#int xe44
(config-if)#ip address 4.4.4.1/24
(config-if)#ip dns relay

(config)#int xe44
(config-if)#ip vrf forwarding vrf1
(config-if)#ip address 4.4.4.1/24
(config-if)#ip dns relay
```

ip dns relay address

Use this command to set the IP address of a DNS server.

Use the **no** form of this command to remove the IP address of a DNS server.

Command Syntax

```
ip dns relay address A.B.C.D
no ip dns relay address A.B.C.D
```

Parameters

A.B.C.D
IPv4 address of the DNS server

Default

None

Command Mode

Configure mode and **VRF**[1] mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ip dns relay address 1.1.1.2
#
(config)#ip vrf vrf1
(config-vrf)#ip dns relay address 1.1.1.2
```

[1]Virtual Routing and Forwarding

ip dns relay uplink

Use this command to configure an IPv4 interface as a DNS relay server-facing port.

Use the **no** form of this command to remove an IPv4 interface as a DNS relay server-facing port.

Command Syntax

```
ip dns relay uplink
no ip dns relay uplink
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#int xe44
(config-if)#ip address 4.4.4.1/24
(config-if)#ip dns relay uplink
```

ipv6 dns relay (global)

Use this command to globally enable the IPv6 DNS relay agent.

Use the **no** form of this command to globally disable the IPv6 DNS relay agent.

Command Syntax

```
ipv6 dns relay
no ipv6 dns relay
```

Parameters

None

Default

By default, the IPv6 DNS relay agent is enabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ipv6 dns relay

(config)#no ipv6 dns relay
```

ipv6 dns relay (interface)

Use this command to configure an IPv6 interface as a DNS relay client-facing port.

Use the **no** form of this command to remove an IPv6 interface as a DNS relay client-facing port.

Command Syntax

```
ipv6 dns relay
no ipv6 dns relay
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#int xe44
(config-if)#ipv6 address fd02::1/16
(config-if)#ipv6 dns relay

(config)#int xe44
(config-if)#ip vrf forwarding vrf1
(config-if)#ipv6 address fd02::1/16
(config-if)#ipv6 dns relay
```

ipv6 dns relay address

Use this command to set the IPv6 address of a DNS server.

Use the **no** form of this command to remove the IPv6 address of a DNS server.

Command Syntax

```
ipv6 dns relay address X:X::X:X
no ipv6 dns relay address X:X::X:X
```

Parameters

X:X::X:X
IPv6 address of the DNS server

Default

None

Command Mode

Configure mode and **VRF**[1] mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ipv6 dns relay address 2001:4860:4860::8888

(config)#ip vrf vrf1
(config-vrf)#ip dns relay address 2001:4860:4860::8888
```

[1]Virtual Routing and Forwarding

ipv6 dns relay uplink

Use this command to configure an IPv6 interface as a DNS relay server-facing port.

Use the **no** form of this command to remove an IPv6 interface as a DNS relay server-facing port.

Command Syntax

```
ipv6 dns relay uplink
no ipv6 dns relay uplink
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#int xe44
(config-if)#ipv6 address fd02::1/16
(config-if)#ipv6 dns relay uplink
```

show ip dns relay

Use this command to display the IPv4 DNS relay configuration including **VRF**[1] name, DNS servers, and client/user facing interfaces.

Command Syntax

```
show ip dns relay
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show ip dns relay
  DNS feature status:            Enabled
  DNS relay service status:      Enabled
  VRF Name: vrf1
    Status     : Running
    DNS Servers: 1.1.1.2
    Interfaces :
      Name        Type            State   Address
      ------------------------------- ----------
      xe1         Uplink          UP      1.1.1.1
      xe32        Downlink        UP      2.2.2.1
      xe33        Downlink        UP      3.3.3.1
      xe44        Downlink        UP      4.4.4.1
  VRF Name: management
    Status     : Running
    DNS Servers: 8.8.8.8
    Interfaces :
      Name        Type            State   Address
      ------------------------------- ----------
      eth0        Downlink        UP      172.29.4.139
```

Here is the explanation of the show command output fields.

Table 22. show ip dns relay fields

Field	Description
DNS feature status	Whether DNS relay is enabled
DNS relay service status	Whether DNS relay is enabled

[1]Virtual Routing and Forwarding

VRF Name	Name of the VRF
Status	Not-running, Running, or Failed
DNS Servers	IPv4 address of the DNS server
Name	DNS server facing interface
Type	Whether an uplink or a downlink
State	Whether the interface is up of down
Address	IPv4 address of the interface

show ip dns relay address

Use this command to display the IPv4 DNS relay configuration including **VRF**[1] name and DNS servers.

Command Syntax

```
show ip dns relay address
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show ip dns relay address
  DNS feature status:            Enabled
  DNS relay service status:      Enabled
  VRF Name: vrf1
    Status     : Running
    DNS Servers: 1.1.1.2
  VRF Name: management
    Status     : Running
    DNS Servers: 8.8.8.8
```

Here is the explanation of the show command output fields.

Table 23. show ip dns relay address fields

Field	Description
DNS feature status	Whether DNS relay is enabled
DNS relay service status	Whether DNS relay is enabled
VRF Name	Name of the VRF
Status	Not-running, Running, or Failed
DNS Servers	IPv4 address of the DNS server

[1]Virtual Routing and Forwarding

show ipv6 dns relay

Use this command to display IPv6 DNS relay configuration including **VRF**[1] name, DNS servers, and client/user facing interfaces.

Command Syntax

```
show ipv6 dns relay
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show ipv6 dns relay
  DNS feature status:            Enabled
  DNS relay IPv6 service status: Enabled
  VRF Name: vrf1
    Status     : Not-running
    DNS Servers: fd01::2
    Interfaces :
      Name        Type            State   Address
      ------------------------------- ----------
      xe44        Downlink        UP      fd02::1
```

Here is the explanation of the show command output fields.

Table 24. show ipv6 dns relay fields

Field	Description
DNS feature status	Whether DNS relay is enabled
DNS relay service status	Whether DNS relay is enabled
VRF Name	Name of the VRF
Status	Not-running, Running, or Failed
DNS Servers	IPv6 address of the DNS server
Name	DNS server facing interface
Type	Whether an uplink or a downlink

[1]Virtual Routing and Forwarding

State	Whether the interface is up of down
Address	IPv4 address of the interface

show ipv6 dns relay address

Use this command to display the IPv6 DNS relay configuration including the **VRF**[1] name and DNS servers.

Command Syntax

```
show ipv6 dns relay address
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show ipv6 dns relay
  DNS feature status:            Enabled
  DNS relay IPv6 service status: Enabled
  VRF Name: vrf1
    Status     : Not-running
    DNS Servers: fd01::2
```

Here is the explanation of the show command output fields.

Table 25. show ipv6 dns relay address fields

Field	Description
DNS feature status	Whether DNS relay is enabled
DNS relay service status	Whether DNS relay is enabled
VRF Name	Name of the VRF
Status	Not-running, Running, or Failed
DNS Servers	IPv6 address of the DNS server

[1]Virtual Routing and Forwarding

show running-config dns relay

Use this command to display DNS relay settings in the running configuration.

Command Syntax

```
show running-config dns relay
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show running-config dns relay
no ipv6 dns relay
!
ip vrf vrf1
 ip dns relay address 1.1.1.2
 ipv6 dns relay address fd01::2
!
ip vrf management
 ip dns relay address 8.8.8.8
!
interface eth0
 ip dns relay
!
interface xe1
 ip dns relay uplink
!
interface xe32
 ip dns relay
!
interface xe33
 ip dns relay
!
interface xe44
 ip dns relay
 ipv6 dns relay
!
```

NTP CONFIGURATION GUIDE

NTP Client Configuration

Overview

NTP modes differ based on how NTP allows communication between systems. NTP communication consists of time requests and control queries. Time requests provide the standard client/server relationship in which a client requests time synchronization from an NTP server. Control queries provide ways for remote systems to get configuration information and reconfigure NTP servers.

In-band management via Default VRF

OcNOS now offers support for NTP over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can either be running on the default or management **VRF**[1]. By default, it runs on the management VRF.

NTP Modes

The following describes the various NTP node types.

Client

An NTP client is configured to let its clock be set and synchronized by an external NTP timeserver. NTP clients can be configured to use multiple servers to set their local time and are able to give preference to the most accurate time sources. They do not, however, provide synchronization services to any other devices.

Server

An NTP server is configured to synchronize NTP clients. Servers can be configured to synchronize any client or only specific clients. NTP servers, however, will accept no synchronization information from their clients and therefore will not let clients update or affect the server's time settings.

Peer

With NTP peers, one NTP-enabled device does not have authority over the other. With the peering model, each device shares its time information with the others, and each device can also provide time synchronization to the others.

Authentication

For additional security, you can configure your NTP servers and clients to use authentication. Routers support MD5 authentication for NTP. To enable a router to do NTP authentication:

[1]Virtual Routing and Forwarding

1. Enable NTP authentication with the **`ntp authenticate`** command.
2. Define an NTP authentication key with the ntp authentication-key vrf management command. A unique number identifies each NTP key. This number is the first argument to the ntp authentication-key vrf management command.
3. Use the ntp trusted-key vrf management command to tell the router which keys are valid for authentication. If a key is trusted, the system will be ready to synchronize to a system that uses this key in its NTP packets. The trusted key should already be configured and authenticated.

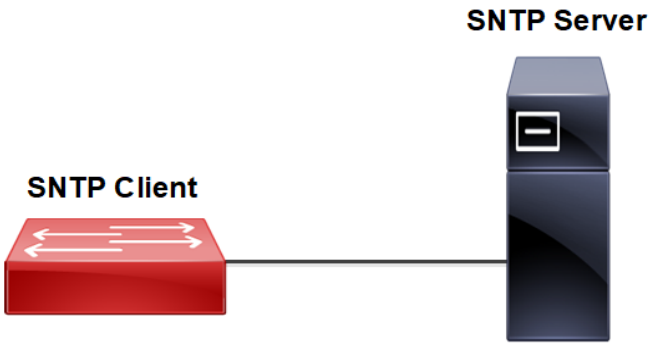
NTP Client Configuration with IPv4 Address

NTP client, user can configure an association with a remote server. In this mode the client clock can synchronize to the remote server

After configuring the NTP servers, wait a few minutes before you verify that clock synchronization is successful. When the clock synchronization has actually happened, there will be an '*' symbol along with the interface while you give the "**`show ntp peers`**" command.

Topology

Figure 35. SNTP Client and Server



NTP Client for User Management

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf management`	Configure feature on default or management **VRF**[1]. By default this feature runs on management VRF.
`(config)#ntp enable vrf management`	This feature enables ntp. This will be enabled in default.
`(config)#ntp server 10.1.1.1 vrf management`	Configure ntp server ip address.
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit from the Configure Mode.

Validation

```
#show ntp peers
```

[1]Virtual Routing and Forwarding

```
------------------------------------------------------------
Peer IP Address Serv/Peer
------------------------------------------------------------
10.1.1.1 Server (configured)

#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.1.1.1        LOCAL(0)         7 u   14   32   37    0.194   -4.870   3.314
```

NTP Client for User Defined VRF

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf vrf1`	Configure feature on default or management VRF. By default this feature runs on management VRF.
`(config)#ntp enable vrf vrf1`	This feature enables ntp. This will be enabled in default.
`(config)ntp server 192.168.2.2 vrf vrf1`	Configure ntp server ip address.
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit from the Configure Mode.

Validation

```
#show ntp peers
------------------------------------------------------------
Peer IP Address Serv/Peer
------------------------------------------------------------
10.1.1.1 Server (configured)

#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.1.1.1        LOCAL(0)         7 u   14   32   37    0.194   -4.870   3.314
```

Maxpoll and Minpoll Configuration

The maximum poll interval are specified in defaults to 6 (64 seconds), but can be increased by the **`maxpoll`** option to an upper limit of 16 (18.2 hours). The minimum poll interval defaults to 4 (16 seconds), and this is also the minimum value of the **`minpoll`** option.

The client will retry between **`minpoll`** and **`maxpoll`** range configured for synchronization with the server.

Management VRF for Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf management`	Configure feature on default or management **VRF**[1]. By

[1]Virtual Routing and Forwarding

	default this feature runs on management VRF.
`(config)#ntp server 10.1.1.1 maxpoll 7 minpoll 5 vrf management`	Configure **`minpoll`** and **`maxpoll`** range for ntp server.
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit from the Configure Mode.

Validation

```
#show ntp peers
------------------------------------------------------------
Peer IP Address Serv/Peer
------------------------------------------------------------
10.1.1.1 Server (configured)

#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.1.1.1        LOCAL(0)         7 u   14   32   37    0.194   -4.870   3.314
```

User Defined VRF for Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf vrf1`	Configure feature on default or management VRF. By default this feature runs on management VRF.
`(config)#ntp server 192.168.2.2 maxpoll 7 minpoll 5 vrf vrf1`	Configure **`minpoll`** and **`maxpoll`** range for ntp server.
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit from the Configure Mode.

Validation

```
#show ntp peers
------------------------------------------------------------
Peer IP Address Serv/Peer
------------------------------------------------------------
10.1.1.1 Server (configured)

#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.1.1.1        LOCAL(0)         7 u   14   32   37    0.194   -4.870   3.314   3.314
```

NTP Authentication

When you enable NTP authentication, the device synchronizes to a time source only if the source carries the authentication keys specified with the source by key identifier. The device drops any packets that fail the authentication check, and prevents them from updating the local clock.

Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf vrf1`	Enable feature on default or management **VRF**[1]. By default this feature runs on management VRF..
`(config)#ntp server 192.168.2.2 vrf vrf1`	Configure ntp server ip address.
`(config)#ntp authenticate vrf vrf1`	Enable NTP Authenticate. NTP authentication is disabled by default.
`(config)#ntp authentication-key 1 md5 cisco vrf vrf1`	Configure ntp authentication key along with md5 value.
`(config)#ntp request-key 1 vrf vrf1`	Configure reuest-key
`(config)#ntp trusted-key 1 vrf vrf1`	Configure trusted key <1-65535>
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit from the Configure Mode.

Validation

```
#show ntp authentication-status
Authentication enabled

#show ntp authentication-keys
--------------------------
 Auth Key       MD5 String
--------------------------
1234              SWWX

#show ntp trusted-keys
Trusted Keys:
1234
```

NTP Client Configuration with IPv6 Address

NTP client, user can configure an association with a remote server. In this mode the client clock can synchronize to the remote server.

[1]Virtual Routing and Forwarding

Topology

Figure 36. NTP Client topology

Configuration of VRF Management

`#configure terminal`	Enter configure mode
`(config)#feature ntp vrf management`	Configure feature on default or management **VRF**[1]. By default this feature runs on management VRF.
`(config)# ntp enable vrf management`	This feature enables NTP. This will be enabled in default.
`(config)#ntp server 2001::1 vrf management`	Configure NTP server IP address.
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit from the Configure Mode.

Validation

```
#show ntp peers
     ================================================
     Peer IP Address Serv/Peer
     ================================================
     2001::1 Server (configured)
     #show ntp peer-status
     Total peers : 1
     * - selected for sync, + - peer mode(active),
     - - peer mode(passive), = - polled in client mode
         Remote  refid     st when             poll reach delay   offset        jitter
==============================================================================
        *2001::1         LOCAL(0) 7 u   14  32  37    0.194       -4.870       3.314
```

Configuration of User Defined VRF

`#configure terminal`	Enter configure mode
`(config)#feature ntp vrf vrf1`	Configure feature on default or management VRF. By default this feature runs on management VRF.

[1]Virtual Routing and Forwarding

`(config)# ntp enable vrf vrf1`	This feature enables NTP. This will be enabled in default.
`(config)#ntp server 2001::1 vrf vrf1`	Configure NTP server IP address.
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit from the Configure Mode.

Validation

```
#show ntp peers
     ================================================
     Peer IP Address Serv/Peer
     ================================================
     2001::1 Server (configured)
     #show ntp peer-status

                   1234       SWWX

 #show ntp trusted-keys
 Trusted Keys: 1234
```

NTP Server Configuration

The Network Time Protocol (NTP) synchronizes the time of day among a set of distributed time servers and clients so that you can correlate events when you receive system logs and other time-specific events from multiple network de-vices. NTP uses the User Datagram Protocol (**UDP**[1]) as its transport protocol. All NTP communications use Coordinated Universal Time (UTC).

An NTP server usually receives its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server, and then distributes this time across the network.

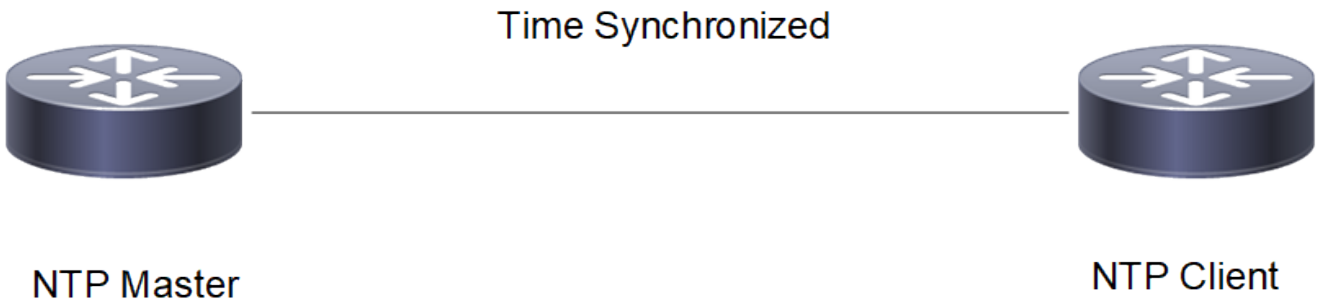
The NTP Server and Client functionality explained above will be supported in OcNOS. NTP Access restrictions can be configured to allow Client devices to access NTP Server.

Topology

The procedures in this section use the topology as mentioned below :

Setup consists of two nodes. One node acting as NTP Master and the other node acting as NTP Client.

Figure 37. Synchronization of NTP Master and NTP Client



Configuration

NTP Master

`#configure terminal`	Enter configure mode.
`(config)#feature ntp vrf management`	Enable feature NTP.
`(config)#ntp enable vrf management`	Enable NTP.
`(config)#ntp master vrf management`	Configure the node as NTP master.
`(config)#ntp master stratum 1 vrf management`	Configure the NTP stratum level as 1 indicating that it is using local clock.
`(config)#ntp allow 10.12.20.6 vrf management`	Configure NTP client address in the NTP allow list.
`(config)#commit`	Commit the candidate configuration to the running

[1]User Datagram Protocol

	configuration.
`(config)#exit`	Exit configure mode.

NTP Client

`#configure terminal`	Enter configure mode.
`(config)#feature ntp vrf management`	Enable feature NTP.
`(config)#ntp enable vrf management`	Enable NTP.
`(config)#ntp server 10.12.20.5 vrf management`	Configure NTP server address for the sync to happen.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#exit`	Exit Configure mode.

Validation

Check the local clock synchronization in the NTP Master as mentioned below:

```
VTEP1#show ntp peer-status
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*127.127.1.0     .LOCL.           1 l   59   64  377    0.000    0.000   0.000

Check the ntp client synchronization status as mentioned below:
#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u    4   16  377    0.137   -0.030   0.004
```

Synchronization of more than one NTP clients with the NTP Master

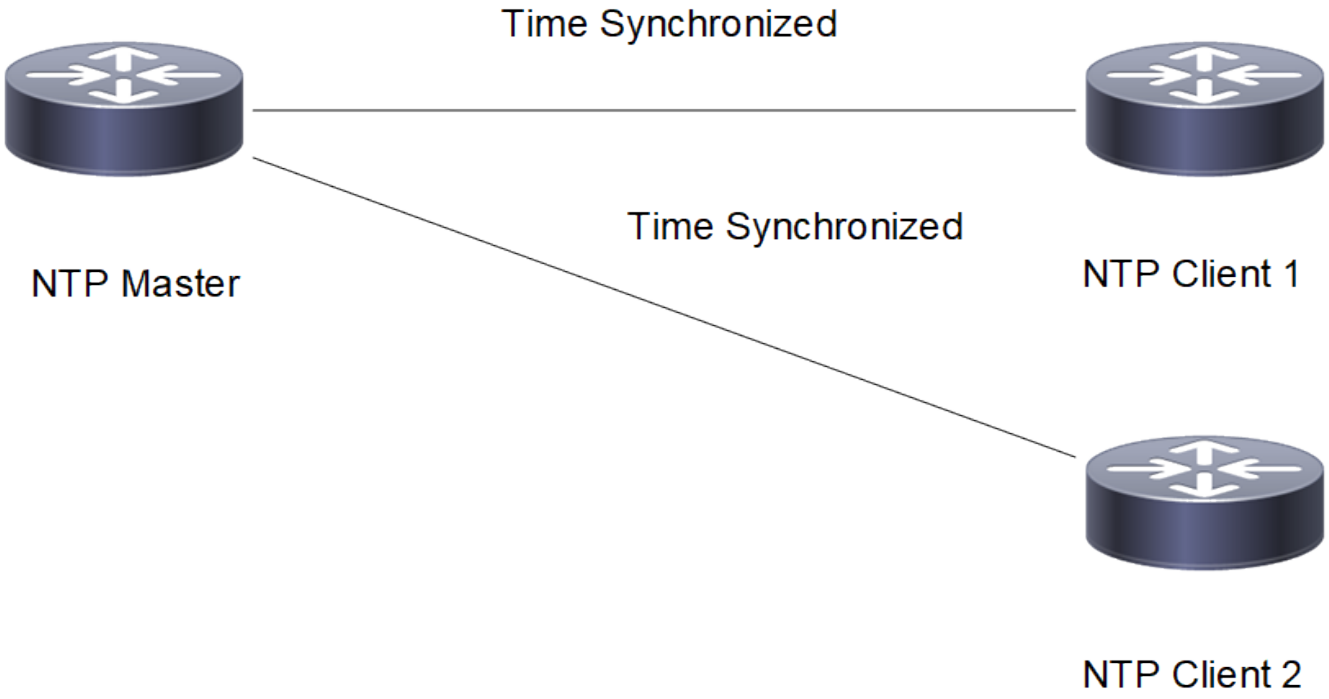
In the below section, check the Synchronization of more than one NTP clients with the NTP Master using Subnet defintion on the NTP Master.

Topology

The procedures in this section use the topology as mentioned below:

Setup consists of three nodes. One node acting as NTP Master and the other two nodes acting as NTP Clients.

Figure 38. Synchronization of more than one NTP clients with NTP Master using subnet definition



VRF Management Configuration

NTP Master

`#configure terminal`	Enter configure mode
`(config)# feature ntp vrf management`	Enable feature ntp
`(config)# ntp enable vrf management`	Enable ntp
`(config)# ntp master vrf management`	Configure the node as NTP master
`(config)# ntp master stratum 1 vrf management`	Configure the ntp stratum level as 1 indicating that it is using local clock
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 vrf management`	Configure the mask in the ntp allow list
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)# exit`	Exit configure mode

NTP Client1

`#configure terminal`	Enter configure mode.
`(config)# feature ntp vrf management`	Enable feature ntp.
`(config)# ntp enable vrf management`	Enable ntp
`(config)# ntp server 10.12.20.5 vrf management`	Configure ntp server address for the sync to happen

(config)#commit	Commit the candidate configuration to the running configuration
(config)# exit	Exit Configure mode

NTP Client2

#configure terminal	Enter configure mode.
(config)# feature ntp vrf management	Enable feature ntp.
(config)# ntp enable vrf management	Enable ntp
(config)# ntp server 10.12.20.5 vrf management	Configure ntp server address for the sync to happen
(config)#commit	Commit the candidate configuration to the running configuration
(config)# exit	Exit Configure mode

Validation

Check the local clock synchronization in the NTP Master as mentioned below:

```
VTEP1#show ntp peer-status
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*127.127.1.0     .LOCL.           1 l   59   64  377    0.000    0.000   0.000

Check the ntp client1 synchronization status as mentioned below :
#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u    8   32  377    0.153   -0.053   0.020
```

Check the ntp client2 synchronization status as mentioned below:

```
VTEP2#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u   14   16  377    0.150   -0.686   0.034
```

User Defined VRF Configuration

NTP Master

#configure terminal	Enter configure mode
(config)# feature ntp vrf vrf1	Enable feature ntp
(config)# ntp enable vrf vrf1	Enable ntp
(config)# ntp master vrf vrf1	Configure the node as NTP master
(config)# ntp master stratum 1 vrf vrf1	Configure the ntp stratum level as 1 indicating that it

	is using local clock
(config)# ntp allow 192.168.2.0 mask 255.255.255.0 vrf vrf1	Configure the mask in the ntp allow list for ipv4
(config)# ntp allow 2001:: mask 64 vrf vrf1	Configure the mask in the ntp allow list for ipv6
(config)# ntp allow 5001:: mask 64 vrf vrf1	Configure the mask in the ntp allow list for ipv6
(config)#commit	Commit the candidate configuration to the running configuration
(config)# exit	Exit configure mode

NTP Client1

#configure terminal	Enter configure mode.
(config)# feature ntp vrf vrf1	Enable feature ntp.
(config)# ntp enable vrf vrf1	Enable ntp
(config)# ntp server 192.168.3.2 vrf vrf1	Configure ipv4 ntp server address for the sync to happen
(config)# ntp server 2001::2 vrf vrf1	Configure ipv6 ntp server address for the sync to happen
(config)#commit	Commit the candidate configuration to the running configuration
(config)# exit	Exit Configure mode

NTP Client2

#configure terminal	Enter configure mode.
(config)# feature ntp vrf vrf1	Enable feature ntp.
(config)# ntp enable vrf vrf1	Enable ntp
(config)# ntp server 192.168.2.2 vrf vrf1	Configure ipv4 ntp server address for the sync to happen
(config)# ntp server 5001::2 vrf vrf1	Configure ipv6 ntp server address for the sync to happen
(config)#commit	Commit the candidate configuration to the running configuration
(config)# exit	Exit Configure mode

Validation

Check the local clock synchronization in the NTP Master as mentioned below:

```
ntpmaster#show ntp peer-status
  remote           refid      st t when poll reach   delay   offset  jitter
 ==============================================================================
 *127.127.1.0     .LOCL.           1 l   46   64  377    0.000    0.000   0.000
```

Check the ntp client1 synchronization status as mentioned below:

```
ntpclient-7012#show ntp peer-status
Total peers : 2
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*192.168.2.2     LOCAL(0)         2 u   54   64  377    0.410    0.088   0.026
+2001::2         LOCAL(0)         2 u   54   64  377    0.453    0.019   0.206
```

Check the ntp client2 synchronization status as mentioned below:

```
ntpclient-7025#show ntp peer-status
Total peers : 2
* - selected for sync, + -  peer mode(active),qw
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*192.168.3.2     LOCAL(0)         2 u   30   64  377    0.476   -0.021   0.033
  +5001::2         LOCAL(0)         2 u   34   64  377    0.451   -0.060   0.040
```

Synchronization with Authentication

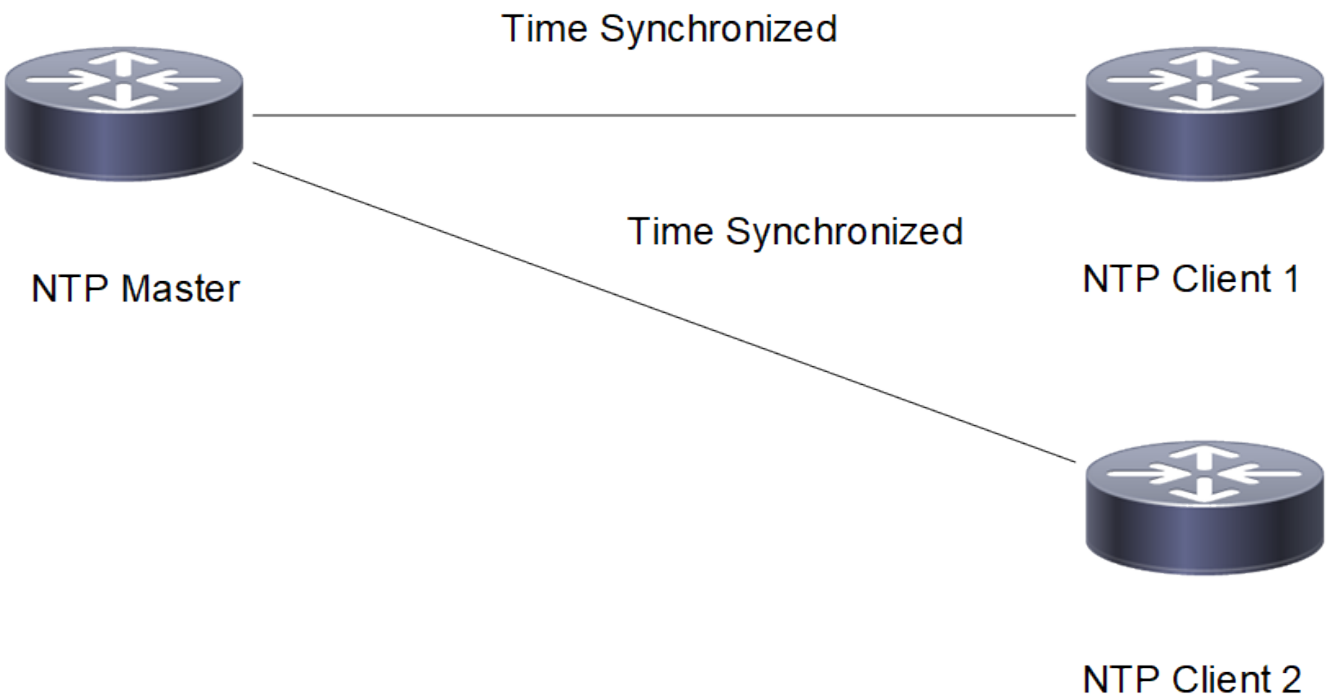
In the below section, check the synchronization of NTP Master and NTP Client with Authentication.

Topology

The procedures in this section use the topology as mentioned below:

Setup consists of three nodes. One node acting as NTP Master and the other two nodes acting as NTP Clients.

Figure 39. Synchronization of NTP Master and NTP Clients using authentication



VRF Management Configuration

NTP Master

`#configure terminal`	Enter configure mode
`(config)# feature ntp vrf management`	Enable feature ntp
`(config)# ntp enable vrf management`	Enable ntp
`(config)# ntp master vrf management`	Configure the node as NTP master
`(config)# ntp master stratum 1 vrf management`	Configure the ntp stratum level as 1 indicating that it is using local clock
`(config)# ntp authenticate vrf management`	Configure ntp server for authentication
`(config)# ntp authentication-key 65 md5 test123 vrf management`	Configure ntp authentication key with password
`(config)# ntp trusted-key 65 vrf management`	Configure ntp trusted key
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 vrf management`	Configure the mask in the ntp allow list
`(config)#commit`	Commit the configuration
`(config)# exit`	Exit configure mode

NTP Client1

`#configure terminal`	Enter configure mode.
`(config)# feature ntp vrf management`	Enable feature ntp.
`(config)# ntp enable vrf management`	Enable ntp
`(config)# ntp authenticate vrf management`	Configure ntp client for authentication
`(config)# ntp authentication-key 65 md5 test123 vrf management`	Configure ntp authentication key with password
`(config)# ntp trusted-key 65 vrf management`	Configure ntp trusted key
`(config)# ntp server 10.12.20.5 key 65 vrf management`	Configure ntp server address for the sync to happen with authentication key
`(config)#commit`	Commit the configuration
`(config)# exit`	Exit Configure mode

NTP Client2

`#configure terminal`	Enter configure mode.
`(config)# feature ntp vrf management`	Enable feature ntp.
`(config)# ntp enable vrf management`	Enable ntp
`(config)# ntp authenticate vrf management`	Configure ntp client for authentication
`(config)# ntp authentication-key 65 md5 test123 vrf management`	Configure ntp authentication key with password
`(config)# ntp trusted-key 65 vrf management`	Configure ntp trusted key

`(config)# ntp server 10.12.20.5 key 65 vrf management`	Configure ntp server address for the sync to happen with authentication key
`(config)#commit`	Commit the configuration
`(config)# exit`	Exit Configure mode

Validation

Check the local clock synchronization in the NTP Master as mentioned below:

```
VTEP1#show ntp peer-status
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*127.127.1.0     .LOCL.           1 l   64   64  377    0.000    0.000   0.000
Check the ntp client1 synchronization status as mentioned below:
#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u   12   64  377    0.185    0.002   0.006

Check the ntp client2 synchronization status as mentioned below :
VTEP2#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u   16   32  377    0.175   -0.360   0.226
```

User Defined VRF Configuration

NTP Master

`#configure terminal`	Enter configure mode
`(config)# feature ntp vrf vrf1`	Enable feature ntp
`(config)# ntp enable vrf vrf1`	Enable ntp
`(config)# ntp master vrf vrf1`	Configure the node as NTP master
`(config)# ntp master stratum 1 vrf vrf1`	Configure the ntp stratum level as 1 indicating that it is using local clock
`(config)# ntp authenticate vrf vrf1`	Configure ntp server for authentication
`(config)# ntp authentication-key 1 md5 cisco 7 vrf vrf1`	Configure ntp authentication key with password
`(config)# ntp trusted-key 1 vrf vrf1`	Configure ntp trusted key
`(config)# ntp request-key 1 vrf vrf1`	Configure request key
`(config)# ntp allow 192.168.2.0 mask 255.255.255.0 vrf vrf1`	Configure the mask in the ntp allow list for ipv4
`(config)# ntp allow 2001:: mask 64 vrf vrf1`	Configure the mask in the ntp a6llow list for ipv6
`(config)# ntp allow 192.168.3.0 mask 255.255.255.0`	Configure the mask in the ntp allow list for ipv4

`vrf vrf1`	
`(config)# ntp allow 5001:: mask 64 vrf vrf1`	Configure the mask in the ntp allow list for ipv6
`(config)#commit`	Commit the configuration
`(config)# exit`	Exit configure mode

NTP Client1

`#configure terminal`	Enter configure mode.
`(config)# feature ntp vrf vrf1`	Enable feature ntp.
`(config)# ntp enable vrf vrf1`	Enable ntp
`(config)# ntp authenticate vrf vrf1`	Configure ntp client for authentication
`(config)# ntp authentication-key 1 md5 cisco vrf vrf1`	Configure ntp authentication key with password
`(config)# ntp request-key 1 vrf vrf1`	Configure ntp trusted key
`(config)# ntp trusted-key 1 vrf vrf1`	Configure ntp trusted key
`(config)# ntp server 192.168.2.2 key 1 vrf vrf1`	Configure ntp server address for the sync to happen with authentication key
`(config)#commit`	Commit the configuration
`(config)# exit`	Exit Configure mode

NTP Client2

`#configure terminal`	Enter configure mode.
`(config)# feature ntp vrf vrf1`	Enable feature ntp.
`(config)# ntp enable vrf vrf1`	Enable ntp
`(config)# ntp authenticate vrf vrf1`	Configure ntp client for authentication
`(config)# ntp authentication-key 1 md5 cisco vrf vrf1`	Configure ntp authentication key with password
`(config)# ntp request-key 1 vrf vrf1`	Configure ntp trusted key
`(config)# ntp trusted-key 1 vrf vrf1`	Configure ntp trusted key
`(config)# ntp server 192.168.3.2 key 1 vrf vrf1`	Configure ntp server address for the sync to happen with authentication key
`(config)#commit`	Commit the configuration

Validation

Check the local clock synchronization in the NTP Master as mentioned below:

```
VTEP1#show ntp peer-status
     remote           refid      st t when poll reach    delay    offset  jitter
   ==============================================================================
   *127.127.1.0     .LOCL.           1 l   50   64  377    0.000    0.000   0.000
```

Check the ntp client1 synchronization status as mentioned below:

```
#show ntp peer-status
```

```
Total peers : 2
  * - selected for sync, + -  peer mode(active),
  - - peer mode(passive), = - polled in client mode,
  x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
  ==============================================================================
  *192.168.2.2     LOCAL(0)         2 u   43   64  377    0.407   -0.018   0.034
  +2001::2         LOCAL(0)         2 u   22   64  377    0.432   -0.031   0.063
```

Check the ntp client2 synchronization status as mentioned below

```
#show ntp peer-status
Total peers : 2
  * - selected for sync, + -  peer mode(active),
  - - peer mode(passive), = - polled in client mode,
  x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
  ==============================================================================
  *192.168.2.2     LOCAL(0)         2 u   43   64  377    0.407   -0.018   0.034
  +2001::2         LOCAL(0)         2 u   22   64  377    0.432   -0.031   0.063
```

Synchronization of NTP Server and NTP Clients with NTP ACL

The command **`nomodify ntp acl`** signifies NTP Clients must be denied ntpq(1) and ntpdc(1) queries which attempt to modify the state of the server (i.e., run time reconfiguration). Queries which return information shall be permitted.

The command **`noquery ntp acl`** signifies Deny ntpq(1) and ntpdc(1) queries by NTP Clients. But Time service shall not be affected.

The command **`nopeer ntp acl`** signifies NTP Clients shall be denied access if unauthenticated packets which would result in mobilizing a new association is sent.

The command **`notrap ntp acl`** signifies NTP Clients shall be declined to provide mode 6 control message trap service to matching hosts. The trap service is a sub-system of the ntpq(1) control message protocol which is intended for use by remote event logging programs.

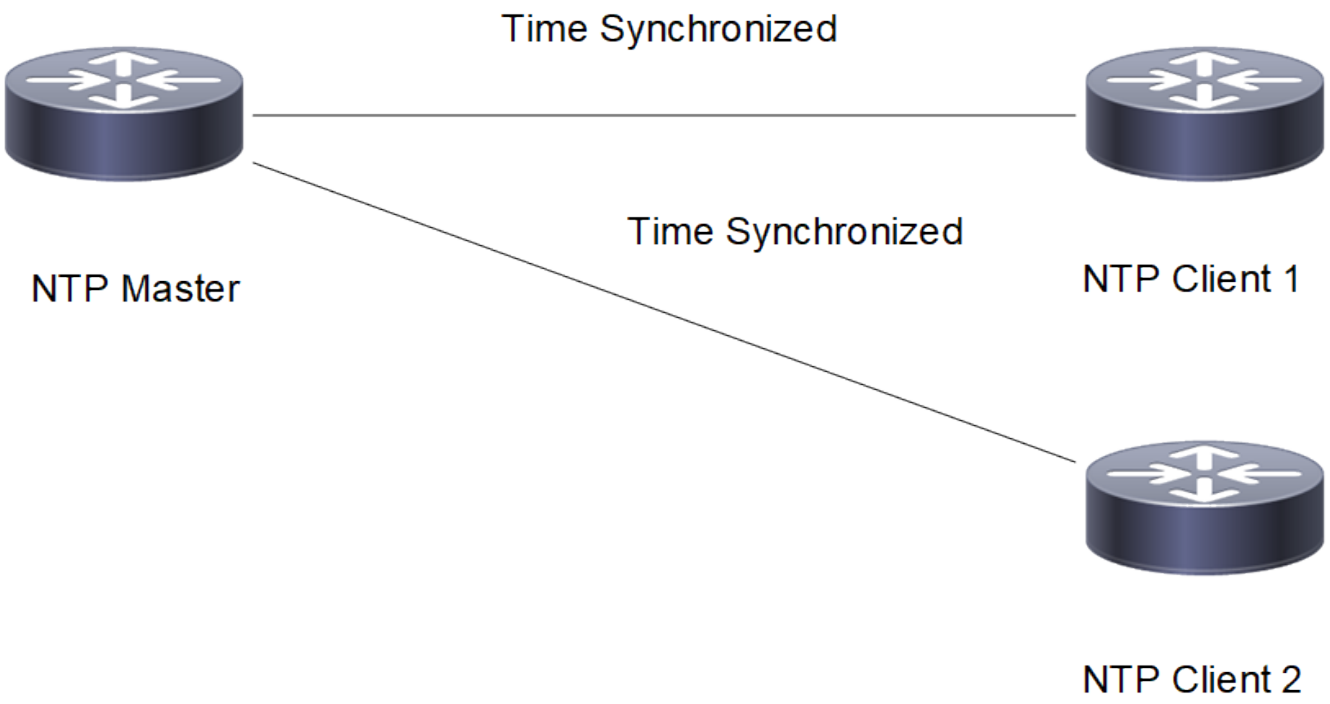
The command **`KoD ntp acl`** signifies When an access violation happens by NTP Clients, the server must send the KoD (kiss-o'-death) packets. KoD packets are rate limited to no more than one per second. If another KoD packet occurs within one second after the last one, the packet is dropped.

Topology

The procedures in this section use the topology as mentioned below:

Setup consists of three nodes. One node acting as NTP Master and the other two nodes acting as NTP Clients.

Figure 40. Synchronization of NTP Master and NTP Clients with NTP ACL



VRF Management Configuration

NTP Master

`#configure terminal`	Enter configure mode
`(config)# feature ntp vrf management`	Enable feature ntp
`(config)# ntp enable vrf management`	Enable ntp
`(config)# ntp master vrf management`	Configure the node as NTP master
`(config)# ntp master stratum 1 vrf management`	Configure the ntp stratum level as 1 indicating that it is using local clock
`(config)# ntp authenticate vrf management`	Configure ntp server for authentication
`(config)# ntp authentication-key 65 md5 test123 vrf management`	Configure ntp authentication key with password
`(config)# ntp trusted-key 65 vrf management`	Configure ntp trusted key
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 nomodify vrf management`	Configure the ntp acl nomodify in the ntp allow list
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 noquery vrf management`	Configure the ntp acl noquery in the ntp allow list
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 nopeer vrf management`	Configure the ntp acl nopeer in the ntp allow list
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 notrap vrf management`	Configure the ntp acl notrap in the ntp allow list
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 kod vrf management`	Configure the ntp acl KoD in the ntp allow list

(config)#commit	Commit the configuration
(config)# exit	Exit configure mode

NTP Client1

#configure terminal	Enter configure mode.
(config)# feature ntp vrf management	Enable feature ntp.
(config)# ntp enable vrf management	Enable ntp
(config)# ntp authenticate vrf management	Configure ntp client for authentication
(config)# ntp authentication-key 65 md5 test123 vrf management	Configure ntp authentication key with password
(config)# ntp trusted-key 65 vrf management	Configure ntp trusted key
(config)# ntp server 10.12.20.5 key 65 vrf management	Configure ntp server address for the sync to happen with authentication key
(config)#commit	Commit the configuration
(config)# exit	Exit Configure mode

NTP Client2

#configure terminal	Enter configure mode.
(config)# feature ntp vrf management	Enable feature ntp.
(config)# ntp enable vrf management	Enable ntp
(config)# ntp authenticate vrf management	Configure ntp client for authentication
(config)# ntp authentication-key 65 md5 test123 vrf management	Configure ntp authentication key with password
(config)# ntp trusted-key 65 vrf management	Configure ntp trusted key
(config)# ntp server 10.12.20.5 key 65 vrf management	Configure ntp server address for the sync to happen with authentication key
(config)#commit	Commit the configuration
(config)# exit	Exit Configure mode

Validation

Check the local clock synchronization in the NTP Master as mentioned below:

Note: Normal Time synchronization is not affected.

```
VTEP1#show ntp peer-status
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*127.127.1.0     .LOCL.           1 l   40   64  377    0.000    0.000   0.000
VTEP1#
```

Check the ntp client1 synchronization status as mentioned below:

```
#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u   13   16  377    0.180    0.019   0.013
```

Check the ntp client2 synchronization status as mentioned below:

```
VTEP2#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u   15   16  377    0.185   -0.018   0.017
```

User Defined VRF Configuration

NTP Master

`#configure terminal`	Enter configure mode
`(config)# feature ntp vrf vrf1`	Enable feature ntp
`(config)# ntp enable vrf vrf1`	Enable ntp
`(config)# ntp master vrf vrf1`	Configure the node as NTP master
`(config)# ntp master stratum 1 vrf vrf1`	Configure the ntp stratum level as 1 indicating that it is using local clock
`(config)# ntp authenticate vrf vrf1`	Configure ntp server for authentication
`(config)# ntp authentication-key 1 md5 cisco vrf vrf1`	Configure ntp authentication key with password
`(config)# ntp trusted-key 1 vrf vrf1`	Configure ntp trusted key
`(config)# ntp request-key 1 vrf vrf1`	Configure ntp request key
`(config)# ntp allow 192.168.2.0 mask 255.255.255.0 nomodify vrf vrf1`	Configure the ntp acl nomodify in the ntp allow list
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 noquery vrf management`	Configure the ntp acl noquery in the ntp allow list
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 nopeer vrf management`	Configure the ntp acl nopeer in the ntp allow list
`(config)# ntp allow 192.168.2.0 mask 255.255.255.0 noquery vrf vrf1`	Configure the ntp acl notrap in the ntp allow list
`(config)# ntp allow 192.168.2.0 mask 255.255.255.0 nopeer vrf vrf1`	Configure the ntp acl nopeer in the ntp allow list
`(config)# ntp allow 192.168.2.0 mask 255.255.255.0 notrap vrf vrf1`	Configure the ntp acl notrap in the ntp allow list
`(config)# ntp allow 10.12.20.6+-192.168.2.0 mask 255.255.255.0 kod vrf vrf1`	Configure the ntp acl KoD in the ntp allow list
`(config)#commit`	Commit the configuration
`(config)# exit`	Exit configure mode

NTP Client1

`#configure terminal`	Enter configure mode.
`(config)# feature ntp vrf vrf1`	Enable feature ntp.
`(config)# ntp enable vrf vrf1`	Enable ntp
`(config)# ntp authenticate vrf vrf1`	Configure ntp client for authentication
`(config)# ntp authentication-key 1 md5 cisco vrf vrf1`	Configure ntp authentication key with password
`(config)# ntp trusted-key 1 vrf vrf1`	Configure ntp trusted key
`(config)# ntp request-key 1 vrf vrf1`	Configure ntp request key
`(config)# ntp server 192.168.2.2 key 1 vrf vrf1`	Configure ntp server address for the sync to happen with authentication key
`(config)#commit`	Commit the configuration
`(config)# exit`	Exit Configure mode

NTP Client2

`#configure terminal`	Enter configure mode.
`(config)# feature ntp vrf vrf1`	Enable feature ntp.
`(config)# ntp enable vrf vrf1`	Enable ntp
`(config)# ntp authenticate vrf vrf1`	Configure ntp client for authentication
`(config)# ntp authentication-key 1 md5 cisco vrf vrf1`	Configure ntp authentication key with password
`(config)# ntp trusted-key 1 vrf vrf1`	Configure ntp trusted key
`(config)# ntp request-key 1 vrf vrf1`	Configure ntp request key
`(config)# ntp server 192.168.3.2 key 1 vrf vrf1`	Configure ntp server address for the sync to happen with authentication key
`(config)#commit`	Commit the configuration

Validation

Check the local clock synchronization in the NTP Master as mentioned below:

Note: Normal Time synchronization is not affected.

```
VTEP1#show ntp peer-status
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*127.127.1.0     .LOCL.           1 l   40   64  377    0.000    0.000   0.000
VTEP1#
```

Check the ntp client1 synchronization status as mentioned below:

```
#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
```

```
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u   13   16  377    0.180    0.019   0.013
```

Check the ntp client2 synchronization status as mentioned below:

```
VTEP2#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      LOCAL(0)         2 u   15   16  377    0.185   -0.018   0.017
```

Synchronization of NTP Server and NTP Clients with NTP ACL configured as noserve

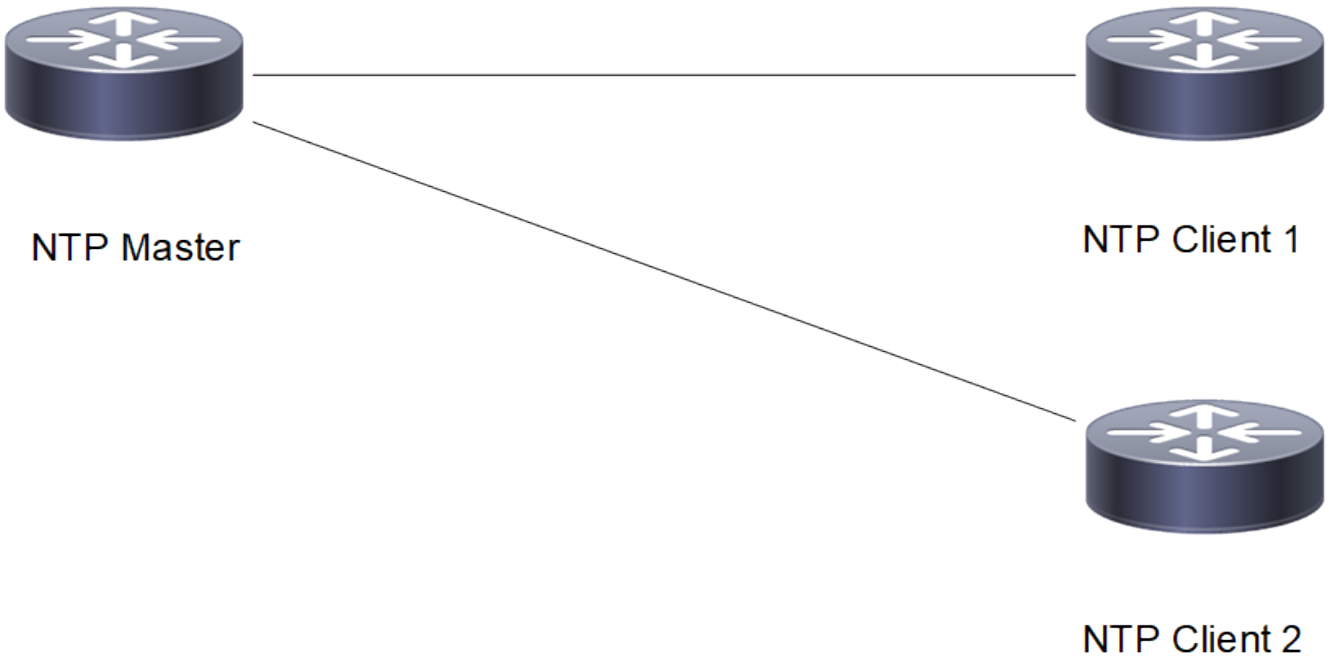
The command **`noserve ntp acl`** signifies NTP Clients shall be denied all packets except ntpq(1) and ntpdc(1) queries.

Topology

The procedures in this section use the topology as mentioned below:

Setup consists of three nodes. One node acting as NTP Master and the other two nodes acting as NTP Clients.

Figure 41. Synchronization of NTP Master and NTP Clients with NTP ACL as noserve



VRF Management Configuration

NTP Master

`#configure terminal`	Enter configure mode
`(config)# feature ntp vrf management`	Enable feature ntp
`(config)# ntp enable vrf management`	Enable ntp
`(config)# ntp master vrf management`	Configure the node as NTP master
`(config)# ntp master stratum 1 vrf management`	Configure the ntp stratum level as 1 indicating that it is using local clock
`(config)# ntp authenticate vrf management`	Configure ntp server for authentication
`(config)# ntp authentication-key 65 md5 test123 vrf management`	Configure ntp authentication key with password
`(config)# ntp trusted-key 65 vrf management`	Configure ntp trusted key
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0 noserve vrf management`	Configure the ntp acl noserve in the ntp allow list
`(config)#commit`	Commit the configuration
`(config)# exit`	Exit configure mode

NTP Client1

`#configure terminal`	Enter configure mode.
`(config)#feature ntp vrf management`	Enable feature ntp.
`(config)#ntp enable vrf management`	Enable ntp
`(config)#ntp authenticate vrf management`	Configure ntp client for authentication
`(config)#ntp authentication-key 65 md5 test123 vrf management`	Configure ntp authentication key with password
`(config)#ntp trusted-key 65 vrf management`	Configure ntp trusted key
`(config)#ntp server 10.12.20.5 key 65 vrf management`	Configure ntp server address for the sync to happen with authentication key
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit Configure mode

NTP Client2

`#configure terminal`	Enter configure mode.
`(config)#feature ntp vrf management`	Enable feature ntp.
`(config)#ntp enable vrf management`	Enable ntp
`(config)#ntp authenticate vrf management`	Configure ntp client for authentication
`(config)#ntp authentication-key 65 md5 test123 vrf management`	Configure ntp authentication key with password
`(config)#ntp trusted-key 65 vrf management`	Configure ntp trusted key

`(config)#ntp server 10.12.20.5 key 65 vrf management`	Configure ntp server address for the sync to happen with authentication key
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit Configure mode

Validation

Check that with NTP acl configured as noserve, Normal Time synchronization is affected and there is no synchronization.

Check the local clock synchronization in the NTP Master as mentioned below

```
VTEP1#show ntp peer-status
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*127.127.1.0     .LOCL.           1 l   41   64  377    0.000    0.000   0.000
```

Check the ntp client1 synchronization status as mentioned below

```
#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
 10.12.20.5      .INIT.          16 u    -   64    0    0.000    0.000   0.000
```

Check the ntp client2 synchronization status as mentioned below

```
VTEP2#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
 10.12.20.5      .INIT.          16 u    -   64    0    0.000    0.000   0.000
```

User Defined VRF Configuration

NTP Master

`#configure terminal`	Enter configure mode
`(config)# feature ntp vrf vrf1`	Enable feature ntp
`(config)# ntp enable vrf vrf1`	Enable ntp
`(config)# ntp master vrf vrf1`	Configure the node as NTP master
`(config)# ntp master stratum 1 vrf vrf1`	Configure the ntp stratum level as 1 indicating that it is using local clock
`(config)# ntp authenticate vrf vrf1`	Configure ntp server for authentication
`(config)# ntp authentication-key 65 md5 test123 vrf vrf1`	Configure ntp authentication key with password
`(config)# ntp trusted-key 65 vrf vrf1`	Configure ntp trusted key
`(config)# ntp allow 10.12.20.6 mask 255.255.255.0`	Configure the ntp acl noserve in the ntp allow list

noserve vrf vrf1	
(config)#commit	Commit the configuration
(config)# exit	Exit configure mode

NTP Client1

#configure terminal	Enter configure mode.
(config)#feature ntp vrf vrf1	Enable feature ntp.
(config)#ntp enable vrf vrf1	Enable ntp
(config)#ntp authenticate vrf vrf1	Configure ntp client for authentication
(config)ntp authentication-key 65 md5 test123 vrf vrf1	Configure ntp authentication key with password
(config)#ntp ntp trusted-key 65 vrf vrf1	Configure ntp trusted key
(config)#ntp server 10.12.20.5 key 65 vrf vrf1	Configure ntp server address for the sync to happen with authentication key
(config)#commit	Commit the configuration
(config)#exit	Exit Configure mode

NTP Client2

#configure terminal	Enter configure mode.
(config)#feature ntp vrf vrf1	Enable feature ntp.
(config)#ntp enable vrf vrf1	Enable ntp
(config)#ntp authenticate vrf vrf1	Configure ntp client for authentication
(config)#ntp authentication-key 65 md5 test123 vrf vrf1	Configure ntp authentication key with password
(config)#ntp trusted-key 65 vrf vrf1	Configure ntp trusted key
(config)#ntp server 10.12.20.5 key 65 vrf vrf1	Configure ntp server address for the sync to happen with authentication key
(config)#commit	Commit the configuration
(config)#exit	Exit Configure mode

Validation

Check that with NTP acl configured as noserve, Normal Time synchronization is affected and there is no synchronization.

Check the local clock synchronization in the NTP Master as mentioned below

```
VTEP1#show ntp peer-status
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*127.127.1.0     .LOCL.           1 l   41   64  377    0.000    0.000   0.000
```

Check the ntp client1 synchronization status as mentioned below

```
#show ntp peer-status
```

```
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
 10.12.20.5      .INIT.          16 u    -   64    0    0.000    0.000   0.000
```

Check the ntp client2 synchronization status as mentioned below

```
VTEP2#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
 10.12.20.5      .INIT.          16 u    -   64    0    0.000    0.000   0.000
```

Synchronization of NTP Client with Stratum 2 NTP Master

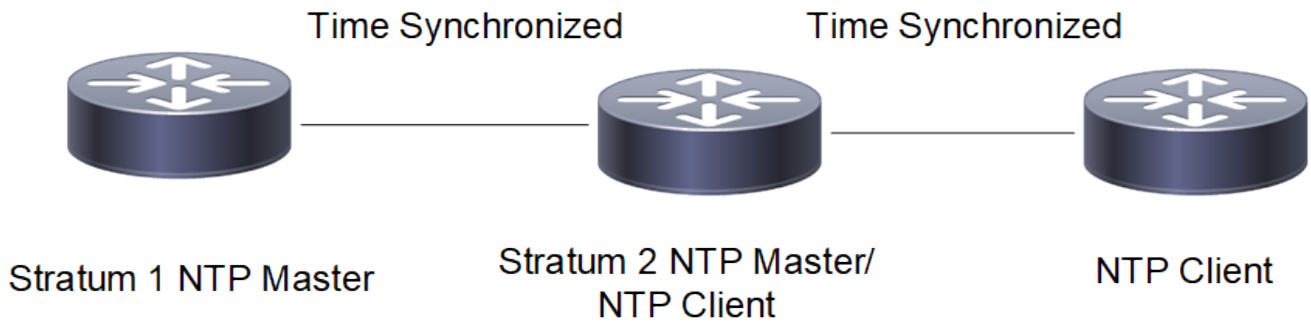
In the below section, check Synchronization of NTP Client with Stratum 2 NTP Master.

Topology

The procedures in this section use the topology as mentioned below:

Setup consists of three nodes. First node acting as Stratum 1 NTP Master, Second node acting as Stratum 2 NTP master and the third node acting as NTP client.

Figure 42. Synchronization of Stadium 2 NTP Master with NTP Client



Management VRF Configuration

Stratum 1 NTP Master

`#configure terminal`	Enter configure mode
`(config)#feature ntp vrf management`	Enable feature ntp
`(config)#ntp enable vrf management`	Enable ntp
`(config)#ntp master vrf management`	Configure the node as NTP master
`(config)#ntp master stratum 1 vrf management`	Configure the ntp stratum level as 1 indicating that it

	is using local clock
(config)#ntp allow 10.12.20.5 vrf management	Configure the ntp client ip address in the ntp allow list
(config)#commit	Commit the configuration
(config)#exit	Exit configure mode

Stratum 2 NTP Server/NTP Client

#configure terminal	Enter configure mode.
(config)#feature ntp vrf management	Enable feature ntp.
(config)#ntp enable vrf management	Enable ntp
(config)#ntp master vrf management	Configure the node as NTP Master
(config)#ntp master stratum 2 vrf management	Configure the node as stratum 2 ntp master
(config)#ntp allow 10.12.20.6 vrf management	Configure NTP client ip address in the ntp allow list
(config)#ntp server 10.12.20.7 vrf management	Configure the stratum 1 NTP master ip address for time synchronization
(config)#commit	Commit the configuration
(config)#exit	Exit Configure mode

NTP Client

#configure terminal	Enter configure mode.
(config)#feature ntp vrf management	Enable feature ntp.
(config)#ntp enable vrf management	Enable ntp
(config)#ntp server 10.12.20.5 vrf management	Configure ntp server address for the sync to happen
(config)#commit	Commit the configuration
(config)#exit	Exit Configure mode

Validation

Check that NTP Client successfully synchronizes the time with stratum 2 NTP Master.

Check the local clock synchronization in the Stratum 1 NTP Master as mentioned below:

```
Use this for Command syntax, and Validation code snippets.

To use:
Insert this snippet where you want the code block to be.
Right click and select convert to text.
Copy the code you want to insert.
Right click on the block and select Edit Code Snippet to open the editor.
Paste the code and click OK in the bottom right.
```

Check the Stratum 2 NTP Master/NTP client synchronization status as mentioned below:

```
VTEP1#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
```

```
===============================================================================
*10.12.20.7      LOCAL(0)         2 u   33   64  377    0.145    0.010   0.009
 127.127.1.0     .LOCL.           2 l 110m   64    0    0.000    0.000   0.000
```

Check the NTP Client synchronization status as mentioned below:

```
Use this for Command syntax, and Validation code snippets.

To use:
Insert this snippet where you want the code block to be.
Right click and select convert to text.
Copy the code you want to insert.
Right click on the block and select Edit Code Snippet to open the editor.
Paste the code and click OK in the bottom right.
```

User Defined VRF Configuration

Stratum 1 NTP Master

`#configure terminal`	Enter configure mode
`(config)#feature ntp vrf vrf1`	Enable feature ntp
`(config)#ntp enable vrf vrf1`	Enable ntp
`(config)#ntp master vrf vrf1`	Configure the node as NTP master
`(config)#ntp master stratum 1 vrf vrf1`	Configure the ntp stratum level as 1 indicating that it is using local clock
`(config)#ntp allow 192.168.3.0 vrf vrf1`	Configure the ntp client ip address in the ntp allow list
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit configure mode

Stratum 2 NTP Server/NTP Client

`#configure terminal`	Enter configure mode.
`(config)#feature ntp vrf management`	Enable feature ntp.
`(config)#ntp enable vrf management`	Enable ntp
`(config)#ntp master vrf management`	Configure the node as NTP Master
`(config)#ntp master stratum 2 vrf management`	Configure the node as stratum 2 ntp master
`(config)#ntp allow 10.12.20.6 vrf management`	Configure NTP client ip address in the ntp allow list
`(config)#ntp server 10.12.20.7 vrf management`	Configure the stratum 1 NTP master ip address for time synchronization
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit Configure mode

NTP Client

`#configure terminal`	Enter configure mode.
`(config)#feature ntp vrf management`	Enable feature ntp.
`(config)#ntp enable vrf management`	Enable ntp

`(config)#ntp server 10.12.20.5 vrf management`	Configure ntp server address for the sync to happen
`(config)#commit`	Commit the configuration
`(config)#exit`	Exit Configure mode

Validation

Check that NTP Client successfully synchronizes the time with stratum 2 NTP Master.

Check the local clock synchronization in the Stratum 1 NTP Master as mentioned below:

```
VTEP2#show ntp peer-status
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*127.127.1.0     .LOCL.           1 l   22   64  377    0.000    0.000   0.000
```

Check the Stratum 2 NTP Master/NTP client synchronization status as mentioned below:

```
VTEP1#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.7      LOCAL(0)         2 u   33   64  377    0.145    0.010   0.009
 127.127.1.0     .LOCL.           2 l 110m   64    0    0.000    0.000   0.000
```

Check the NTP Client synchronization status as mentioned below:

```
#show ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*10.12.20.5      10.12.20.7       3 u   16   64  377    0.137   -2.596   0.235
```

NTP COMMAND REFERENCE

Network Time Protocol

This chapter is a reference for Network Time Protocol (NTP) commands.

NTP synchronizes clocks between computer systems over packet-switched networks. NTP can synchronize all participating computers to within a few milliseconds of Coordinated Universal Time (UTC).

NTP uses a hierarchical, layered system of time sources. Each level of this hierarchy is called a “stratum” and is assigned a number starting with zero at the top. The number represents the distance from the reference clock and is used to prevent cyclical dependencies in the hierarchy.

Note: The default time-to-live value for the unicast packets is 64.

This chapter contains these commands:

clear ntp statistics

Use this command to reset NTP statistics.

Command Syntax

```
clear ntp statistics (all-peers | io | local | memory)
```

Parameters

all-peers
Counters associated with all peers

io
Counters maintained in the input-output module

local
Counters maintained in the local protocol module

memory
Counters related to memory allocation

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ntp statistics all-peers
```

debug ntp

Use this command to display NTP debugging messages.

Use the **no** form of this command to stop displaying NTP debugging messages.

Command Syntax

```
debug ntp
no debug ntp
```

Parameters

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug ntp

(config)#no debug ntp
```

feature ntp

Use this command to enable to NTP feature.

Use the **no** form of this command to disable NTP feature and delete all the NTP related configurations.

Command Syntax

```
feature ntp ( (NAME|management)|)
no feature ntp ( (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, feature ntp is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added `VRF NAME` parameter in OcNOS version 6.5.3

Examples

```
#configure terminal
(config)#feature ntp vrf management

(config)#no feature ntp vrf management
```

[1]Virtual Routing and Forwarding

ntp acl

Use this command to allow paticular client to communicate with NTP server.

Use the **no** form of this command to remove the particular client from NTP server.

Note: ntp discard (page 592) option and limited rate flag are required for sending the KOD packet.

Command Syntax

```
ntp allow (A.B.C.D | X:X::X:X) (mask (A.B.C.D| <1-128>)|)
({nopeer|noserve|noquery|nomodify|kod|limited|notrap}|) (NAME|management)|)
no ntp allow (A.B.C.D | X:X::X:X) (mask (A.B.C.D| <1-128>)|)
({nopeer|noserve|noquery|nomodify|kod|limited|notrap}|) (NAME|management)|)
```

Parameters

A.B.C.D
IPV4 address of the client

X:X::X:X
IPV6 address of the client

A.B.C.D
Mask for the IPv4 address

1-128
Mask for the IPv6 address

nopeer
Prevent the client from establishing a peer association

noserve
Prevent the client from performing time queries

noquery
Prevent the client from performing NTPq and NTPdc queries, but not time queries

nomodify
Restrict the client from making any changes to the NTP configurations

kod
Send a kiss-of-death packet if the client limit has exceeded

limited
Deny time service if the packet violates the rate limits established by the discard command

notrap
Prevent the client from configuring control message traps

vrf
Virtual Router and Forwarding

vrf management
Defines the management **VRF**[1] instance.

[1]Virtual Routing and Forwarding

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, only local host is permitted.

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 4.1. Added VRF NAME parameter in OcNOS version 6.5.3.

Example

```
#configure terminal
(config)#ntp allow 1.1.1.1 mask 255.255.255.0 nopeer kod notrap noserve vrf management
```

ntp authenticate

Use this command to enable NTP authentication.

Use the **no** form of this command to disable authentication.

Command Syntax

```
ntp authenticate ((NAME|management)|)
no ntp authenticate ((NAME|management)|)
```

Parameters

management
Virtual Routing and Forwarding name

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Example

```
#configure terminal
(config)#ntp authenticate vrf management
```

[1]Virtual Routing and Forwarding

ntp authentication-key

Use this command to set an NTP Message Digest Algorithm 5 (MD5) authentication key.

Use the **no** form of this command to delete an authentication key.

Command Syntax

```
ntp authentication-key <1-65534> md5 WORD ((NAME|management)|)
ntp authentication-key <1-65534> md5 WORD 7 ((NAME|management)|)
no ntp authentication-key <1-65534> md5 WORD ((NAME|management)|)
```

Parameters

<1-65534>
Authentication key number

WORD
MD5 string (maximum 8 characters)

7
Encrypt using weak algorithm

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Example

```
#configure terminal
(config)#ntp authentication-key 535 md5 J@u-b;l2 vrf management
```

[1]Virtual Routing and Forwarding

ntp enable

Use this command to enable NTP feature and start the NTP service.

Use the **no** form of this command to stop the NTP service.

Command Syntax

```
ntp enable ( (NAME|management)|)
no ntp enable ( (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, ntp is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3

Example

```
#configure terminal
(config)#ntp enable vrf management
```

[1]Virtual Routing and Forwarding

ntp discard

Use this command to enable rate limiting access to the NTP service running on a system.

Use the no form of this command to disable rate limiting access to the NTP service running on a system.

This NTP discard option and limited rate flag are required for sending the KOD packet. KOD (Kiss of Death) packets have the leap bits set unsynchronized and stratum set to zero and the reference identifier field set to a four-byte ASCII code. If the noserve or notrust flag of the matching restrict list entry is set, the code is "DENY"; if the limited flag is set and the rate limit is exceeded, the code is "RATE".

Command Syntax

```
ntp discard minimum <1-65535> (vrf management|)
no ntp discard minimum (vrf management|)
```

Command Syntax

minimum
Specify the minimum interpacket spacing <default 2>

<0-65535>
Minimum value

Default

By default, the minimum value is 2.

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 4.2.

Example

```
#configure terminal
(config)#ntp discard minimum 50 vrf management
```

ntp logging

Use this command to log NTP events.

Use the **no** form of this command to disable NTP logging.

Command Syntax

```
ntp logging ( (NAME|management)|)
no ntp logging ( (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, ntp logging message is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3

Example

```
#configure terminal
(config)#ntp logging vrf management
```

[1]Virtual Routing and Forwarding

ntp master

Use this command to run a device as an NTP server.

Use the **no** command to disable the NTP server.

Command Syntax

```
ntp master  ( (NAME|management)|)
no ntp master  ( (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, NTP master is disabled

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 4.1. Added VRF NAME parameter in OcNOS version 6.5.3

Example

```
#configure terminal
(config)#ntp master vrf management
```

[1]Virtual Routing and Forwarding

ntp master stratum

Use this command to set stratum value for NTP server.

Use the **no** command to remove stratum value.

The NTP Stratum model is a representation of the hierarchy of time servers in an NTP network, where the Stratum level (0-15) indicates the device's distance to the reference clock.

Command Syntax

```
ntp master stratum <1-15>  ( (NAME|management)|)
no ntp master stratum <1-15> ( (NAME|management)|)
```

Parameters

<1-15>
Stratum value for NTP server

vrf
Virtual Router and Forwarding

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

16

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 4.1. Added VRF NAME parameter in OcNOS version 6.5.3.

Example

```
#configure terminal
(config)#ntp master stratum 2 vrf management
```

[1]Virtual Routing and Forwarding

ntp peer

Use this command to configure a peer association. In a peer association, this system can synchronize with the other system or the other system can synchronize with this system.

Use the **no** command to remove a peer association.

Command Syntax

```
ntp peer (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
ntp peer (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf
management|)
no ntp peer (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf
management|)
no ntp peer (A.B.C.D | HOSTNAME) ({prefer|key|minpoll|maxpoll}|) (vrf management|)
no ntp peer (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf
management|)
no ntp peer (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key|minpoll|maxpoll}|) (vrf management|)
```

Parameters

A.B.C.D
IPv4 address of peer

HOSTNAME
Host name of peer

X:X::X:X
IPv6 address of peer

prefer
Prefer this peer; preferred peer responses are discarded only if they vary dramatically from other time sources

key
Peer authentication key

<1-65534>
Peer authentication key value

minpoll
Minimum poll interval

<4-16>
Minimum poll interval value in seconds raised to a power of 2 (default 4 = 16 seconds)

maxpoll
Maximum poll interval

<4-16>
Maximum poll interval value in seconds raised to a power of 2 (default 6 = 64 seconds)

management
Virtual Routing and Forwarding name

Default

By default, value of **minpoll** is 4 and **maxpoll** is 6.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ntp peer 10.10.0.23 vrf management
(config)#ntp peer 10.10.0.23 prefer key 12345 vrf management

(config)#no ntp peer 10.10.0.23 vrf management
```

ntp request-key

Use this command to define NTP request-key which is used by the NTPDC utility program. NTP client should be able to modify NTP server configuration by using this request-key. Request key must be a trusted key.

Use **no** form of this command to remove a request key.

Command Syntax

```
ntp request-key <1-65534>  ((NAME|management)|)
no ntp request-key <1-65534> ((NAME|management)|)
```

Parameter

<1-65534>
Request key number

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 5.1 MR. Added VRF NAME parameter in OcNOS version 6.5.3.

Example

```
  #configure terminal
  (config)#ntp request-key 123 vrf management
t
```

[1]Virtual Routing and Forwarding

ntp server

Use this command to configure an NTP server so that this system synchronizes with the server, but not vice versa.

Use the **no** option with this command to remove an NTP server.

Command Syntax

```
ntp server (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|)
(NAME|management)|
ntp server (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|)
(NAME|management)|)
no ntp server (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf
management|)
no ntp server (A.B.C.D | HOSTNAME) ({prefer|key|minpoll|maxpoll}|) (NAME|management)|
no ntp server (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|)
(NAME|management)|
no ntp server (A.B.C.D | HOSTNAME) ({prefer|key|minpoll|maxpoll}|)(NAME|management))
```

Parameters

A.B.C.D
IPv4 address of the server

HOSTNAME
Host name of the server

X:X::X:X
IPv6 address of the server

prefer
Prefer this server; preferred server responses are discarded only if they vary dramatically from other time sources

key
Server authentication key

<1-65534>
Server authentication key

minpoll
Minimum poll interval

<4-16>
Minimum poll interval value in seconds raised to a power of 2 (default 4 = 16 seconds)

maxpoll
Maximum poll interval

<4-16>
Maximum poll interval value in seconds raised to a power of 2 (default 6 = 64 seconds)

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

[1]Virtual Routing and Forwarding

Default

By default, **`minpoll`** is 4 and **`maxpoll`** is 6.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#ntp server 10.10.0.23 vrf management
(config)#ntp server 10.10.0.23 prefer key 12345 vrf management

(config)#no ntp server 10.10.0.23 vrf management
```

ntp sync-retry

Use this command to retry NTP synchronization with configured servers.

Command Syntax

```
ntp sync-retry vrf (NAME|management)|)
```

Parameter

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Example

```
#configure terminal
#ntp sync-retry vrf management
```

[1]Virtual Routing and Forwarding

ntp trusted-key

Use this command to define a “trusted” authentication key. If a key is trusted, the device will synchronize with a system that specifies this key in its NTP packets.

Use the **no** option with this command to remove a trusted key.

Command Syntax

```
ntp trusted-key <1-65534> ((NAME|management)|)
no ntp trusted-key <1-65534> ((NAME|management)|)
```

Parameter

<1-65534>
Authentication key number

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

By default, ntp trusted key is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. A Added VRF NAME parameter in OcNOS version 6.5.3.

Example

```
#configure terminal
(config)#ntp trusted-key 234676 vrf management
```

[1]Virtual Routing and Forwarding

show ntp authentication-keys

Use this command to display authentication keys.

Command Syntax

```
show ntp authentication-keys
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh ntp authentication-keys
--------------------------
Auth Key MD5 String
--------------------------
123 0xa2cb891442844220
#
```

Table 26

Table 26. show ntp authentication-key fields

Entry	Description
Auth key	Authentication key (password). Use the password to verify the authenticity of packets sent from this interface or peer interface.
MD5 String	One or more MD5 key strings. The MD5 key values can be from 1 through 16 characters long. You can specify more than one key value within the list.

show ntp authentication-status

Use this command to display whether authentication is enabled or disabled.

Command Syntax

```
show ntp authentication-status
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp authentication-status
Authentication enabled
```

show ntp logging-status

Use this command to display the NTP logging status.

Command Syntax

```
show ntp logging-status
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp logging-status
NTP logging enabled
```

show ntp peer-status

Use this command to display the peers for which the server is maintaining state along with a summary of that state.

Command Syntax

```
show ntp peer-status
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh ntp peer-status
Total peers : 1
* - selected for sync, + - peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
remote refid st t when poll reach delay offset jitter
==============================================================================
*216.239.35.4 .GOOG. 1 u 24 64 377 38.485 0.149 0.053
#
```

Table 27 explains the output fields.

Table 27. show ntp peer-status fields

Entry	Description
Total peers	Number of servers and peers configured.
* - selected for sync, + - peer mode (active), - - peer mode (passive), = - polled in client mode x - source false ticker	Fate of this peer in the clock selection process.
Remote	Address of the remote peer.
refid	Reference ID (0.0.0.0 for an unknown reference ID).
st	The stratum of the remote peer (a stratum of 16 indicated remote peer is unsynchronized).
t	Type of peer (local, unicast, multicast and broadcast).

Table 27. show ntp peer-status fields (continued)

Entry	Description
when	Time the last packet was received.
poll	The polling interval (seconds).
reach	The reachability register (octal).
delay	Current estimated delay in seconds.
offset	Current estimated offset in seconds.
jitter	Current dispersion of the peer in seconds.

show ntp peers

Use this command to display NTP peers.

Note: The commands "show ntp statistics" and "show ntp peer-status" do not produce output when both IPv6 and IPv4 ACL rules, configured with `deny udp any any eq ntp`, are applied to the **line vty**.

Command Syntax

```
show ntp peers
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp peers
------------------------------------------------------------
Peer IP Address Serv/Peer
------------------------------------------------------------
216.239.35.4 Server (configured)
```

Table 28 explains the output fields.

Table 28. show ntp peers fields

Entry	Description
Peer IP Address	Address of the neighbor protocol.
Serv/Peer	List of NTP peers and servers configured or dynamically learned.

show ntp statistics

Use this command to display NTP statistics.

Note: The commands "show ntp statistics" and "show ntp peer-status" do not produce output when both IPv6 and IPv4 ACL rules, configured with `deny udp any any eq ntp`, are applied to the **line vty**.

Command Syntax

```
show ntp statistics (io | local | memory | peer ( ipaddr (A.B.C.D | X:X::X:X ) | name (HOSTNAME)) )
```

Command Syntax

io
Counters maintained in the input-output module

local
Counters maintained in the local protocol module

memory
Counters related to memory allocation

peer
Counters associated with the specified peer

A.B.C.D
Peer IPv4 address

X:X::X:X
Peer IPv6 address

HOSTNAME
Peer host name

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp statistics local
time since restart: 1685
time since reset: 1685
packets received: 4
packets processed: 0
current version: 0
previous version: 0
declined: 0
access denied: 0
```

```
bad length or format: 0
bad authentication: 0
rate exceeded: 0
#show ntp statistics memory
time since reset: 1698
total peer memory: 15
free peer memory: 15
calls to findpeer: 0
new peer allocations: 0
peer demobilizations: 0
hash table counts: 0 0 0 0 0 0 0 0
0 0 0 0 0 0 0 0
0 0 0 0 0 0 0 0

0 0 0 0 0 0 0 0
```

Table 29 explains the output fields.

Table 29. show ntp statisticsfields

Entry	Description
Time since restart	Time when the ntp protocols were last started and how long they have been running.
Time since reset	Time when the ntp protocols were last reset and how long they have been running.
Packets received	Number of packets received from the peers.
Packets processed	Number of packets processed to the peers.
Current version	Current version of the protocol that is being used.
Previous version	Previous version of the protocol that has been used.
Declined	Access to the protocol declined
Access denied	Number of attempts denied to access protocol
Bad length or format	Number of messages received with length or format errors so severe that further classification could not occur.
Bad authentication	Number of messages received with incorrect authentication.
Rate exceeded	Exceed the configured rate if additional bandwidth is available from other queues
Total peer memory	Actual memory available to the peer system.
Free peer memory	Free memory available to the peer system.
Calls to find peer	Number of calls to find peer.
New peer allocations	Number of allocations from the free peer list.
Peer demobilizations	Number of structures freed to free peer list.
Hash table counts	Peer hash table’s each bucket count.

show ntp trusted-keys

Use this command to display keys that are valid for authentication.

Command Syntax

```
show ntp trusted-keys
```

Command Syntax

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp trusted-keys
Trusted Keys:
333
#
```

Table 30 explains the output fields.

Table 30. show ntp trusted-keys fields

Entry	Description
Trusted Keys	Keys that are valid for authentication.

show running-config ntp

Use this command to display the NTP running configuration.

Command Syntax

```
show running-config ntp (|all)
```

Command Syntax

all
Reserved for future use

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh running-config ntp
feature ntp vrf management
ntp enable vrf management
ntp authenticate vrf management
ntp logging vrf management
ntp authentication-key 123 md5 0xa2cb891442844220 7 vrf management
ntp trusted-key 123 vrf management
ntp server 216.239.35.4 vrf management
```

FAULT MANAGEMENT SYSTEM CONFIGURATION

Fault Management System Configuration

The Fault Management System (FMS) provides a framework for event detection, correlation, and alarm generation. Each event triggers an alarm based on correlation logic parameters specified by individual Protocol Modules. Events, as OPER_LOGs relayed from the VLOGd module, are processed according to the correlation rules in the configuration file `alarm_def_config.yaml`. The generated alarms persist to indicate faults and are maintained in a database accessible via `show` commands.

Notes:

- FMS is disabled by default. Once enabled, it triggers alarms for all valid OPER_LOG events received by the FMS `node.js` process.
- The FMS event-alarm correlation configuration is stored in a YAML file (`alarm_def_config.yaml`), which cannot be modified via CMLSH commands. If changes are required, an operator with the appropriate privileges can edit the file in YAML syntax, but only before starting FMS. Once FMS is active, editing this file is prohibited, as changes take effect only after FMS is disabled, updated, and then re-enabled.
- The device's logging level must be set to at least 4 (NOTIFY) to ensure that FMS receives notification events and can take appropriate action. Setting a lower logging level may prevent FMS from receiving clear events, resulting in unresolved active alarms. FMS does not manage the system logging level.
- FMS relies on the loopback interface (`lo0`) for communication with VLOGd, so the operational status of `lo0` is essential for both FMS and VLOGd.
- If Localhost communication is blocked by the Access Control List (ACL), FMS must be disabled. Conversely, if FMS is enabled, the ACL must not block Localhost.
- If FMS reboots due to a device reboot, upgrade, downgrade, or manual restart, active alarms are closed. Use the `show alarm closed` CLI command to view closed active alarms.

FMS applies correlation procedures based on the configurations specified in the below table:

Table 31. FMS correlation procedures

Correlation type	Description
Generalization	• Groups two or more events into a single alarm. • A generalized alarm will further use one of the correlation types (none, time-bound, counting and compression) for applying correlation logic to the new alarm.
Time-bound	• Stipulates that when the event is received, a timer is started for that event. • While the timer is running, subsequent events of the same type are suppressed. • On the expiry of the timer, an alarm will be raised for that event stating the count for the number of times that event was received in this duration.
Counting	Considers a specified number of similar events as one. In this correlation type, the respective alarm will be raised after the event has occurred for count times.
Compression	Check multiple occurrences of the same event for duplicate/redundant event information,

Table 31. FMS correlation procedures (continued)

Correlation type	Description
	remove the redundancies, and report them as a single alarm.
Severity	Correlates events based on the severity of the events.

Implementation Example

FMS was developed with NodeJS with scripts written in JavaScript with a `*.js` extension and configuration files with a `*.yaml` extension. These files are in the below paths in OcNOS.

Table 32. FMS script and configuration files

`/usr/local/bin/js`	JavaScript files (`*.js` files)
`/usr/local/etc`	Configuration files (`*.yaml` files)

Enabling and Disabling the Fault Management System

Follow the below steps to enable or disable FMS:

Enabling FMS

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#
(config)#fault-management enable
(config)#
```

Disabling FMS

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#
(config)#fault-management disable
(config)#
```

Alarm Configuration File

The alarm configuration file contains the configurations or rules for the alarms that will be referred by FMS to generate alarms upon receiving events. This file is in `*.yaml` format (human readable) in `/usr/local/etc`.

This file can be edited before starting FMS to include correlation rules for specific events.

Alarm Configuration File Template

```
#-------Template-------
#- Event_Group:
#  - ALARM_ID:                        # Integer number identifying alarm
#    ALARM_TYPE_ID:                   # Alarm Type-id(AIS, EQPT, LOS, OTS, OPWR, UNKNOWN)
#    EVENT:                           # Event name(oper_log)
#    GENERALIZED_EVENT_NAME:          # Event name for the Generalization Event Group
#    ALARM_DESC:                      # Alarm string which will be generated
#    CORRELATION_TYPE:                # Correlation logic type(0:No-Correlation, 1:Generalization,
```

```
2:Timebound, 3:Counting, 4:Compression, 5:Drop-Event, 6:Severity)
#    GENERALIZED_CORRELATION_TYPE     # Correlation type, in which generalized event will be sent
#    CORRELATION_COUNTER:             # Counter value that will be considered during counting logic
to raise alarm
#    CORRELATION_TIMER_DURATION:      # Timer duration to be considered for time bound logic
#    CORRELATION_SEVERITY:            # Alarm Severity(0:Critical, 1:Major, 2:Warning, 3:Minor,
4:Unknown)
#    QUALIFIER_STRING_POSITION:       # List of positions where qualifier values present
#      QUALIFIER_POSITION_1_EVENT_1:  # First position of the qualifier value in the first event
#    RESOURCE_STRING_POSITION:        # List of positions where resource values present
#      RESOURCE_POSITION_1_EVENT_1:   # First position of the resource value in the first event
#    SNMP_TRAP:                       # SNMP TRAP (true(1) or false(0))
#    SNMP_OID:                        # OID for SNMP TRAP
#    NETCONF_NOTIFICATION:            # Netconf Notification (true(1) or false(0))
#    CLEAR_ALARM:                     # Clear Alarm (oper_log enum, Status for Alarm will be made In-
active if this event is received)
#    CLEAR_EVENT_PATTERN_VALUES:      # Pattern values which will be searched in event's description
to identify clear event and to clear active alarm (required if both active and clear event types are
same)
#    SNMP_TRAP_CLEAR:                 # true(1) or false(0, if CLEAR_ALARM is null then SNMP_TRAP_
CLEAR will be null)
#    SNMP_CLEAR_OID:                  # OID for SNMP TRAP CLEAR
#    NETCONF_CLEAR_NOTIFICATION:      # Clear Netconf Notification information
```

Auto Generating the Alarm Configuration File

The `auto_yaml_generator.js` file is a NodeJS script that generates the alarm configuration file (`alarm_def_config.yaml`) for the oper logs which are listed in the `oper_logs_list.yaml` file with the default values as shown below.

```
# Integer number identifying alarm
ALARM_ID:  1000
# Event name (oper_log)
EVENT:     oper_log string
# Event name for the Generalization Event Group
GENERALIZED_EVENT_NAME:      null
# Alarm string which will be generated
ALARM_DESC:  oper_log string
# Correlation logic type (0: No-Correlation, 1: Generalization, 2: Time Bound, 3: Counting, 4:
Compression, 5: Drop-Event)
CORRELATION_TYPE:  0
# Correlation type, in which generalized event will be sent
GENERALISED_CORRELATION_TYPE: null
# Counter value that will be considered during counting logic to raise alarm
CORRELATION_COUNTER: 3
# Timer duration to be considered for time bound logic
CORRELATION_TIMER_DURATION:   20000
# Alarm Severity(1:Emergency, 2:Alert, 3:Critical, 4:Error, 5:Warning, 6:Notification,
7:Informational, 8:Debugging, 9:Cli)
CORRELATION_SEVERITY: null
# QUALIFIER_STRING_POSITION
   QUALIFIER_POSITION_1_EVENT_1: null
# RESOURCE_STRING_POSITION
   RESOURCE_POSITION_1_EVENT_1: null
SNMP_TRAP: 0
# OID for SNMP TRAP
SNMP_OID: null
# Netconf Notification (true (1) or false (0))
NETCONF_NOTIFICATION: 1
# Clear Alarm (oper_log enum, Status for Alarm will be made In-active if this event is received)
CLEAR_ALARM: null
# Clear Event's pattern values which will be searched in event's description to identify clear event
CLEAR_EVENT_PATTERN_VALUES: null
# True (1) or False (0, if CLEAR_ALARM is null then SNMP_TRAP_CLEAR will be null)
SNMP_TRAP_CLEAR: 0
# OID for SNMP TRAP CLEAR
```

```
SNMP_CLEAR_OID: null
# Clear Netconf Notification information
NETCONF_CLEAR_NOTIFICATION: 0
```

Alarm Configuration File Generation Steps

1. List all the oper_log enums in the `oper_logs_list.yaml` file and keep the file in the same path with `auto_yaml_generator.js`.
2. Copy `auto_yaml_generator.js` and `oper_logs_list.yaml` files into `/usr/local/bin/js`.
3. Run the `auto_yaml_generator.js` script with the following command.
   `#node auto_yaml_generator.js`
4. After executing the above commands, you will see the `alarm-def-config.yaml` file in the same directory.

Sample oper_logs_list.yaml File

```
EVENT_GROUP:
  IFMGR_IF_DOWN,
  IFMGR_IF_UP,
  STP_SET_PORT_STATE,
  STP_IPC_COMMUNICATION_FAIL,
  STP_ROOTGUARD_PORT_BLOCK,
  :
  :
```

Alarm Descriptions

The table below describes the supported alarms.

Table 33. FMS alarms

Alarm	Description
CMM_DDM_MONITOR_CURRENT	Transceiver Bias Current crossed the threshold limit
CMM_DDM_MONITOR_FREQ	Transceiver Frequency crossed the threshold limit
CMM_DDM_MONITOR_RxPOWER	Transceiver Rx Power crossed the threshold limit
CMM_DDM_MONITOR_TEC	Transceiver Thermoelectric Cooler fault
CMM_DDM_MONITOR_TEMP	Transceiver Temperature crossed the threshold limit
CMM_DDM_MONITOR_TxPOWER	Transceiver Tx Power crossed the threshold limit
CMM_DDM_MONITOR_VOLT	Transceiver Voltage crossed the threshold limit
CMM_DDM_MONITOR_WAVE	Transceiver Wavelength crossed the threshold limit
CMM_FAN_CTRL	Fan insertion, removal, speed, or fault condition alarm
CMM_MONITOR_CPU	CPU load average crossed the threshold limit
CMM_MONITOR_CPU_CORE	CPU core usage crossed the threshold limit
CMM_MONITOR_CURRENT	Current crossed the threshold limit
CMM_MONITOR_DISK_READ_ACTIVITY	Disk read activity crossed the threshold limit
CMM_MONITOR_DISK_REMAIN_LIFE	Disk remaining life crossed the threshold limit

Table 33. FMS alarms (continued)

Alarm	Description
CMM_MONITOR_DISK_WRITE_ACTIVITY	Disk write activity crossed the threshold limit
CMM_MONITOR_FAN	FAN RPM crossed the threshold limit
CMM_MONITOR_PSU_IIN	Power supply unit input current crossed the threshold limit
CMM_MONITOR_PSU_IOUT	Power supply unit output current crossed the threshold limit
CMM_MONITOR_PSU_PIN	Power supply unit input power crossed the threshold limit
CMM_MONITOR_PSU_POUT	Power supply unit output power crossed the threshold limit
CMM_MONITOR_PSU_POWER	Power supply unit insertion, removal, or fault condition
CMM_MONITOR_PSU_PRESENCE	Power supply unit is present
CMM_MONITOR_PSU_TEMP1	Power supply unit temperature 1 crossed the threshold limit
CMM_MONITOR_PSU_TEMP2	Power supply unit temperature 2 crossed the threshold limit
CMM_MONITOR_PSU_VIN	Power supply unit input voltage crossed the threshold limit
CMM_MONITOR_PSU_VOUT	Power supply unit output voltage crossed the threshold limit
CMM_MONITOR_RAM	RAM memory usage crossed the threshold limit
CMM_MONITOR_SDCARD	Hard-disk usage crossed the threshold limit or fault condition
CMM_MONITOR_TEMP	Temperature sensor crossed the threshold limit
CMM_MONITOR_VOLTAGE	Voltage crossed the threshold limit
CMM_TRANSCEIVER	Transceiver on fault condition
HW_PROFILE_MONITOR	TCAM Utilization
IFMGR_IF_DOWN	Interface state down
IFMGR_IF_UP	Interface state up
HW_PROFILE_MONITOR	TCAM group utilization

Event Manager

Overview

The event manager feature facilitates the automatic execution of a particular action item based on the event (operator log messages) that occurred in a device. This feature is configured by command line interface (CLI) and NetConf.

The following are the three parameters in the event manager feature:

- Event: It is a trigger where event manager functionality starts. Once the syslog message with the details mentioned in the event occurs, an action is triggered. Some sample events are as follows:
  - **IFMGR_IF_DOWN**
  - **IFMGR_IF_UP**
  - **STP_SET_PORT_STATE**
  - **STP_IPC_COMMUNICATION_FAIL**
- Action: Once an event has occurred, an action is triggered if there is a match of the event ID in the database. An action is executed by the execution of a Python script consisting of executable OcNOS commands and configurations.

  The sample action script is as follows:

```
import sys,os,time
import subprocess

#MACROS#
########
TIME = 1

#VARIABLES#
##############
cmd_db_lock = "cmlsh -e 'configure terminal force "+str(TIME)+"'"
cli_commands ="cmlsh -e 'configure terminal' -e 'interface xe11' -e 'shutdown' -e 'commit' -
e'end'"

if __name__ == '__main__':
#if name == 'main':
  #Force user out of config mode after X seconds
  os.system (cmd_db_lock)
  #Wait X seconds before running clis
  time.sleep(TIME)

  os.system(cli_commands)
```

- **Policy**[1]: It maps the action with an event.

Feature Characteristics

- The feature creates a database of event IDs and the corresponding actions as configured through CLI. When an event occurs, the event is matched in the database with the existing event ID, severity, and log pattern. If the event matches with the existing event in the database, it triggers a corresponding action automatically. If

[1]A set of rules determining which actions are permitted or denied for a specific user role.

there is no match with the database, then no action is taken.

- Configurable parameters for an event are event ID, severity, and log pattern, which are matched with the incoming log. In order to be unique, the recommendation is to have all these parameters configured for an event. Configuring the event ID is mandatory, while severity and pattern are optional. No manual configuration of severity applies the default severity of **all** (**0-6**).
- Duplicate event configuration with the same value for event ID, severity, and log pattern as an existing event with a new event name is not allowed and displays an error.
- The feature facilitates the configuration of one action for multiple events.
- Place the action script file in the path */usr/local/etc*. A warning message is displayed if the script file is not in the path, but the configuration is accepted.
- The execution count or the trigger count per policy is stored and maintained. When a policy is cleared, the event and the action associated with the policy get cleared. When an action is associated with multiple policies, the action associated with the cleared policy is removed, and the same action associated with other policies remains.
- This feature consumes a certain amount of CPU performance because it matches the logs recorded by the system with every configured event. Hence, a maximum number of 50 events, actions, and policies is configurable.
- The command line shell (cmlsh) uses a locking mechanism. Follow the recommendation when a user or script file gets into the configure mode:
    - Disable the event manager feature while executing manual configuration in the system. This prevents the Python script from interfering with the manual configuration. After executing the manual configuration, enable the event manager feature.
    - There is a possibility of multiple Python scripts executing simultaneously. In order to sequence the configure mode execution, the Python script has the logic to wait for 45 seconds in the configure mode. This prevents the Python script from exiting without executing the commands if another script is still in configure mode.
    - If the script fails to execute, the event manager does not record such failures.

Validation checks

- When the feature is neither enabled nor disabled, the event, action, or policy configuration displays an error.
- The event manager displays an error if an event is edited when associated with a policy.
- The event manager exercises priority-based selection of policies for any incoming logs. When there are more actions associated with the same event with different event IDs, severity levels, and pattern, the priority sequence is as follows:
    1. Matches the incoming log against a policy that has an event configured with all the parameters, which are event ID, severity, and pattern string.
    2. Matches the incoming log against a policy that has an event configured with only event ID and severity.
    3. Matches the incoming log against a policy that has an event configured only with the event ID.

Example 1

For the following configuration, when actual log "**2020 Jan 03 08:46:56.455 : MH2 : NSM : CRITI : [IFMGR_IF_UP_2]: Interface xe3 changed state to up**" is received, event-manager execute **action a2** (file2) than **action a1** as this configuration matches the best.

```
#event-manager event e1 IFMGR_IF_UP severity 2
#event-manager event e2 IFMGR_IF_UP severity 2 pattern “Interface xe3”
#event-manager action a1 script file1
#event-manager action a2 script file2
#event-manager policy p1 event e1 action a1
#event-manager policy p2 event e2 action a2
```

Example 2

For the following configuration, when actual log “**2020 Jan 03 08:46:56.455 : MH2 : NSM : CRITI : [IFMGR_IF_UP_2]: Interface xe3 changed state to up**“ is received, event-manager executes either **action a1** (file1) or **action a2** based on whichever gets hit first during database search. The recommendation is not to mix the same event configuration with a pattern and without a pattern for the same event ID.

```
#event-manager event e1 IFMGR_IF_UP severity 2 pattern “Interface ”
#event-manager event e2 IFMGR_IF_UP severity 2 pattern “Interface xe3”
#event-manager action a1 script file1
#event-manager action a2 script file2
#event-manager policy p1 event e1 action a1
#event-manager policy p2 event e2 action a2
```

- The solution supports the validation of event-id against configurable event-ids. It displays an error if the entered event-id is not supported.

Benefits

The event manager feature allows the execution of an automatic action when a failure or any other priority error occurs.

Configuration

This section shows the configuration of the Event Manager feature.

Configuring Event Manager

Follow the steps to configure the Event Manager feature.

1. Configure the command **event-manager enable** to enable event-manager functionality in the device.

   ```
   (config)#event-manager enable
   ```

2. Follow the steps to configure an event or an action.:
   - To create an event, define the **event** name (**E1**), **type (syslog)**, event ID (**IFMGR_IF_UP**), and optional parameters of **severity (0)** and **pattern (“xe5”)**.

     ```
     (config)#event-manager event E1 type syslog IFMGR_IF_UP severity 0 pattern "xe5"
     ```

   - To create an action, save the python script in the */usr/local/etc* path and define the action name (**A1**), the type (**script**) and the type value (**ifup.py**).

     ```
     (config)#event-manager action A1 type script ifup.py
     ```

3. To map an event to an action, create a policy, specify the policy name (**P1**), and map the event name (**E1**) with the action name (**A1**).

   ```
   (config)#event-manager policy P1 event E1 action A1
   ```

Running configurations

The running configuration is as follows:

```
!
event-manager enable
event-manager action A1 type script ifdown.py
event-manager event E1 type syslog IFMGR_IF_DOWN pattern "xe5"
event-manager policy P1 event E1 action A1
!
```

Validation

Validate the show output after configuration as shown below.

```
#show event-manager event all

Events configured : 1

Event Name                          Type       Type Value   Trigger Cnt    Status     Policy-Mapped
=============================================================================================
E1                                  syslog     IFMGR_IF_U         0        Active     P1

#show event-manager action all

Actions configured : 1

Action Name                              Type       Type Value   Trigger Cnt    Policy-Count   Status
=============================================================================================
==
A1                                       script     ifup.py           0             1        Active

#show event-manager policy all

Policies configured : 1

```

Event Manager Commands

The Event Manager feature introduces the following configuration and show commands.

clear event-manager statistics

Use this command to clear all the policies or a specific policy.

Note: The clear policy removes the action associated with this policy, but the same action associated with other policies remain.

Command Syntax

```
clear event-manager statistics (policy NAME|all|)
```

Parameters

policy NAME
Removes the specific policy.

statistics all
Removes all the configured policies.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below configuration shows how to clear all the policies:

```
OcNOS#configure terminal
OcNOS(config)#clear event-manager statistics all
OcNOS(config)#commit
OcNOS(config)#exit
```

event-manager

Use this command to enable or disable the event manager feature. The event manager intercepts the incoming logs for the configured event when the event and action are mapped to a policy.

Use the **no** command to remove all the event manager configurations.

Command Syntax

```
event-manager (enable|disable)
no event-manager
```

Parameters

enable
Enables the event manager feature to configure events, actions, and policies.

disable
Disables the event manager feature, but the configuration of new events, actions, and policies is allowed, and the existing configuration remains the same.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below configuration shows how to enable the event manager:

```
OcNOS#configure terminal
OcNOS(config)#event-manager enable
OcNOS(config)#commit
OcNOS(config)#exit
```

The below configuration shows how to disable the event manager:

```
OcNOS#configure terminal
OcNOS(config)#event-manager disable
OcNOS(config)#commit
OcNOS(config)#exit
```

event-manager action

Use this command to create an action, configure an action name, and associate a Python script.

Use **no** command to remove an action.

Note: Configuration of an existing action with new parameters overwrites the old configured parameters.

Command Syntax

```
event-manager action NAME type script SCRIPT
no event-manager action NAME
```

Parameters

action NAME
Name of the action that is configured.

script SCRIPT
Name of the Python script associated with the action.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below configuration shows how to configure an action:

```
OcNOS#configure terminal
OcNOS(config)#event-manager action A1 type script ifup.py
OcNOS(config)#commit
OcNOS(config)#exit
```

event-manager event

Use this command to configure an event with the event name and event ID, along with the options to configure the severity and the pattern.

Use no form of the command to remove an event or remove the parameters from an event.

Notes:

- Configuration of an event with a different event name but the same event ID, severity, and pattern is not supported, and an error is displayed.
- Configuration of an existing event with new parameters overwrites the old configured parameters.

Command Syntax

```
event-manager event NAME type syslog EVENT-ID (severity <0-5>|all|) (pattern "PATTERN"|)
no event-manager event NAME (severity|pattern|)
```

Parameters

event NAME
Name of the event that is configured.

syslog EVENT-ID
A problem keyword that gets matched with the incoming logs to trigger the configured action.

severity <0-5>
(Optional) If configured with a severity level, this parameter is matched with the incoming logs to trigger an event with the configured severity level only. The range is from 0 to 5.

severity all
(Optional) If not configured, this parameter is matched with the incoming logs to trigger an event with all the severity levels (from 0 to 5).

pattern "PATTERN"
(Optional) If configured with a sub-string, this parameter matches the sub-string with the incoming log to trigger an event.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below configuration shows how to configure an event:

```
OcNOS#configure terminal
OcNOS(config)#event-manager event E1 type syslog IFMGR_IF_UP severity 0 pattern "xe5"
```

```
OcNOS(config)#commit
OcNOS(config)#exit
```

show event-manager action

Use this command to display the action name, the action type, the Python script name, the number of times the script runs, the number of associated policies, and the status.

Command Syntax

```
show event-manager action (NAME|all|)
```

Parameters

action NAME
Displays the configuration details of a specific action.

action all
Displays the configuration details of all the configured actions.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below configuration displays all the actions configured:

```
#show event-manager action all

Actions configured : 1

Action Name                              Type       Type Value   Trigger Cnt    Policy-Count   Status
=============================================================================================================

A1                                       script     ifup.py           0             1        Active
```

Table 34 explains the show command output fields.

Table 34. show event-manager action

Field	Description
Action Name	Displays the name of the configured action or actions.
Type	Displays the type of the action or actions.
Type Value	Displays the name of the Python script.
Trigger Cnt	Displays the number of time the action runs the script.
Policy[1]-Count	Displays the number of policies associated with the action.

[1]A set of rules determining which actions are permitted or denied for a specific user role.

Field	Description
Status	Displays if the action is active or not. The action remains inactive if not mapped with a policy.

show event-manager event

Use this command to display the event name, the event type, the event ID, the number of times the event was triggered, the event status, and the associated policy.

Command Syntax

```
show event-manager event (NAME|all|)
```

Parameters

event NAME
Displays the configuration details of a specific event.

event all
Displays the configuration details of all the configured events.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below configuration displays all the event configured:

```
OcNOS#show event-manager event all

Events configured : 1

Event Name                          Type       Type Value   Trigger Cnt    Status     Policy-Mapped
=============================================================================================================
E1                                  syslog     IFMGR_IF_U         0        Active     P1
```

Table 35 explains the show command output fields.

Table 35. show event-manager event output fields

Field	Description
Event Name	Displays the name of the configure event or events.
Type	Displays the type of the event or events.
Type Value	Displays the event IDs.
Trigger Cnt	Displays the number of time the event is matched with the incoming log and triggered an action.
Status	Displays if the event is active or not. The event remains inactive if not mapped with a policy.

Field	Description
Policy[1]-Mapped	Displays the policy name associated with the event.

[1]A set of rules determining which actions are permitted or denied for a specific user role.

show event-manager policy

Use this command to display the policy name, number of times the event triggers the action, the event name, the action name, the status of the last action triggered, and the time of last action triggered.

Command Syntax

```
show event-manager policy (NAME|all|)
```

Parameters

policy NAME
Displays the configuration details of a specific policy.

policy all
Displays the configuration details of all the configured policies.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The below configuration displays all the event configured:

```
#show event-manager policy all

Policies configured : 1

Policy Name                       Trigger Cnt      Event      Action     Last Exec Status   Last Exec
Time
=============================================================================================================
==========
P1                                      0          E1         A1            Not-Run         -
```

Table 36. show event-manager policy

Field	Description
Policy[1] Name	Displays the name of the configured policy or policies.
Trigger Cnt	Displays the number of time the action runs the script.
Event	Displays the name of the associated event.
Action	Displays the name of the associated action.
Last Exec Status	Status of the last action triggered.
Last Exec Time	Time of the last action triggered.

[1]A set of rules determining which actions are permitted or denied for a specific user role.

show event-manager system-event-ids

Use this command to display all the event IDs.

Command Syntax

```
show event-manager system-event-ids (all| SUBSTRING)
```

Parameters

system-event-ids all
Displays all the event IDs.

system-event-ids SUBSTRING
Displays the event IDs with this substring.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.1.

Examples

The command below displays all the event IDs supported in OcNOS.

```
OcNOS#show event-manager system-event-ids all

IFMGR_IF_DOWN                    IFMGR_IF_UP
STP_SET_PORT_STATE               STP_IPC_COMMUNICATION_FAIL
STP_ROOTGUARD_PORT_BLOCK         STP_BPDUGUARD_PORT_BLOCK
MCEC_CONF_MISMATCH               BGP_VPLS_CREATE_ERR
BGP_VPLS_SAME_VE_ID_ERR          BGP_VPLS_MTU_MISMATCH_ERR
LDP_INTERNAL_ERR                 LDP_MSG_DECODE_ERR
:::::
:::::
```

The command below displays all the event IDs configured with substring “OSPF” supported in OcNOS.

```
OcNOS#show event-manager system-event-ids ospf
OSPF_OPR_INIT_FAILED                  OSPF_OPR_GRACEFUL_RESTART_FAILED
OSPF_OPR_MEM_EXHAUST                  OSPF_OPR_DUPLICATE_ROUTER_ID
OSPF_OPR_SELF_ORIGINATED_LSA_RECVD    OSPF_OPR_IFMGR_FAIL
OSPF_OPR_SESSION_DOWN                 OSPF_OPR_TERMINATE
OSPF_OPR_SOCK_FAIL                    OSPF_OPR_SPF_EMPTY_RLSA
OSPF_OPR_INACTIVITY_TIMER_EXPIRED     OSPF_OPR_LOWER_LEVEL_DOWN
OSPF_OPR_BFD_SESSION_DOWN             OSPF_OPR_LSDB_OVERFOW
:::
:::
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
Python script	This is a script file containing a sequence of code that executes an action when an event is triggered. This is a text file with ".py" extension.

FAULT MANAGEMENT SYSTEM COMMAND REFERENCE

FMS Command Reference

This chapter describes the fault management system (FMS) commands:

fault-management (enable | disable)

Use this command to enable or disable the fault management system (FMS).

Note: If the loopback interface is down, FMS will not receive logs, preventing it from generating and clearing alarms, resulting in the loss of these logs.

Command Syntax

```
fault-management (enable | disable)
```

Parameters

enable
Enable FMS

disable
Disable FMS

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

1. Enable FMS

```
(config)# fault-management enable
(config)#commit
%% Warning : FMS requires logging level all to be configured to minimum 4, please configure
accordingly
(config)#
```

2. Validation after enabling

```
#show fms status
% FMS Status: Enabled
% FMS Node Application Status: Up
```

3. Disable FMS

```
(config)# fault-management disable
(config)#commit
```

4. Validation after disabling

```
#show fms status
% FMS Status: Disabled
```

fault-management close

Use this command to close an active alarm.

Command Syntax

```
fault-management close ACTIVE-ALARM-ID
```

Parameters

ACTIVE-ALARM-ID
Identifier of an active alarm

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

Ensure that closed alarms do not remain in the active alarm list.

The alarm ID can be found with show alarm history (page 645), specifying the `all` parameter.

1. View Alarm History

```
#show alarm history all
Alarm Count: 1
Severity   Alarm_Type_ID   Alarm_ID          Description
------------------------------------------------------
MAJOR      EQPT            IFMGR_IF_DOWN::ce3/1     2019-02-18T15:07:57.755Z : OcNOS [IFMGR_IF_DOWN]
Interface ce3/1 changed state to down
```

2. View Active Alarms

```
#show alarm active
Active Alarms received:-
Active Alarm Count: 1
Severity    Status    Alarm Description
-----------------------------------------
MAJOR       Active    OcNOS [IFMGR_IF_DOWN] Interface ce3/1 changed state to down
```

3. Close the Alarm

```
#fault-management close IFMGR_IF_DOWN::ce3/1
% FMS Response: IFMGR_IF_DOWN::ce3/1 closed
```

4. Verify Closure

```
#show alarm active
Active Alarms received:-
There are no active alarms present in the Database
```

fault-management flush-db

Use this command to flush the alarms from the database.

Command Syntax

```
fault-management flush-db
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
OcNOS#fault-management flush-db
% FMS Response: Database flush completed
```

Check that after fault-management flush-db, all alarms in the database are flushed:

```
OcNOS#show alarm active
Active Alarms received:-
There are no active alarms present in the Database

OcNOS#show alarm history all
There are no alarms present in the Database

OcNOS#show alarm closed
No alarms are manually closed

OcNOS#show alarm shelved
No alarm-types are shelved

OcNOS#show alarm statistics
There are no alarms present in the Database

OcNOS#show alarm transitions
There are no transition alarms present in the Database
```

fault-management shelve

Use this command to shelve (disable) an alarm type.

Command Syntax

```
fault-management shelve ALARM-TYPE
```

Parameter

ALARM-TYPE
Type of alarm as displayed by show fms supported-alarm-types (page 650)

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Examples

1. Shelve an Alarm Type

```
#fault-management shelve CMM_MONITOR_CPU
% FMS Response: Alarm-type CMM_MONTOR_CPU shelved.
```

```
#fault-management shelve IFMGR_IF_DOWN
% FMS Response: Alarm-type IFMGR_IF_DOWN shelved.
```

2. Validate Shelving: Check that after shelving an alarm type, active alarms of that type are not being raised.

```
#show alarm shelved
Alarm-type Count: 1
Alarm Type
------------------
IFMGR_IF_DOWN
```

3. Simulate Alarm Condition: Make configuration changes, such as shutting down an interface, to trigger the specified alarm type.

```
(config)#interface ce1/1
(config-if)#shutdown
(config-if)#commit
2019 Feb 18 15:21:31.229 : OcNOS : NSM : CRITI : [IFMGR_IF_DOWN_2]: Interface ce1/1 changed state
to down
(config-if)#end
```

4. Verify No New Active Alarms: Run `show alarm history all` and `show alarm active` to confirm no alarms of the shelved type appear in the history or active alarms list, verifying that shelving is effective.

```
#show alarm history all
There are no alarms present in the Database
```

```
#show alarm active
Active Alarms received:-
There are no active alarms present in the Database
```

show alarm active

Use this command to display the current active alarms in the database.

Command Syntax

```
show alarm active
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0 and the output changed in OcNOS version 6.1.0.

Example

```
#show alarm active
Active Alarms received:-
Active-Alarms-Count: 1
Alarm-Date-Time              Severity     Alarm-ID              Alarm-Description
------------------------------------------------------------------------------
2019-02-15T19:57:14.525Z     MAJOR        IFMGR_IF_DOWN::xe8     OcNOS [IFMGR_IF_DOWN] Interface xe8
changed state to down
```

show alarm closed

Use this command to display alarms that are manually closed.

Command Syntax

```
show alarm closed
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

```
#show alarm closed
Alarm Count: 1
Severity   Alarm_Type_ID   Alarm_ID              Description
-------------------------------------------------------------------------------------------
MAJOR      EQPT            IFMGR_IF_DOWN::xe7     FMS [IFMGR_IF_DOWN] Interface xe7 changed state to
down
```

show alarm history

Use this command to show the alarm history.

Command Syntax

```
show alarm history (1-day | 1-hr | 1-week | all)
```

Parameters

1-day
Display alarms in the last 1 day

1-hr
Display alarms in the last 1 hour

1-week
Display alarms in the last 1 week

all
Display all the alarms

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#show alarm history ?
  1-day   Display alarms in the last 1 day
  1-hr    Display alarms in the last 1 hour
  1-week  Display alarms in the last 1 week
  all     Display all the alarms
```

show alarm shelved

Use this command to display shelved (disabled) alarm types.

Command Syntax

```
show alarm shelved
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

```
#show alarm shelved
Alarm-type Count: 1
Alarm Type
-------------------
IFMGR_IF_DOWN
```

show alarm statistics

Use this command to display the alarm statistics.

Command Syntax

```
show alarm statistics
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#show alarm statistics
Alarm Statistics :-
Alarm Count: 1
Current Severity    Count    Alarm ID
-------------------------------------
MAJOR               1        IFMGR_IF_UP::ce3/1
```

show alarm transitions

Use this command to display severity transitions for every alarm in the device.

Command Syntax

```
show alarm transitions
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

```
#show alarm transitions
Alarms received:-
Alarm Count: 3
Transition     From     To       Alarm ID
Downgraded     CRITI    MAJOR    CMM_MONITOR_CPU:1min_load:CPU
Upgraded       MAJOR    CRITI    CMM_MONITOR_CPU:1min_load:CPU
Downgraded     CRITI    MAJOR    CMM_MONITOR_CPU:1min_load:CPU
```

show fms status

Use this command to display the FMS status.

Command Syntax

```
show fms status
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#show fms status
% FMS Status: Enabled
% FMS Node Application Status: Up
```

show fms supported-alarm-types

Use this command to display the supported alarm types.

Command Syntax

```
show fms supported-alarm-types
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

```
#show fms supported-alarm-types
Alarm-types Count: 38

IFMGR_IF_DOWN
IFMGR_IF_UP
CMM_MONITOR_RAM
CMM_MONITOR_CPU
...
```

show running-config fault-management

Use this command to display FMS status in the running configuration.

Command Syntax

```
show running-config fault-management
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#show running-config fault-management
!
fault-management enable
!
```

SNMP CONFIGURATION

Simple Network Management Protocol

Overview

SNMP provides a standardized framework and a common language for monitoring and managing devices in a network. The SNMP framework consists of three parts:

- An SNMP manager: The system used to control and monitor the activities of network devices. This is sometimes called a Network Management System (NMS).
- An SNMP agent: The component within a managed device that maintains the data for the device and reports these data SNMP managers.
- Management Information Base (MIB): SNMP exposes management data in the form of variables which describe the system configuration. These variables can be queried by SNMP managers.

In SNMP, administration groups are known as communities. SNMP communities consist of one agent and one or more SNMP managers. You can assign groups of hosts to SNMP communities for limited security checking of agents and management systems or for administrative purposes. Defining communities provides security by allowing only management systems and agents within the same community to communicate.

A host can belong to multiple communities at the same time, but an agent does not accept a request from a management system outside its list of acceptable community names.

SNMP access rights are organized by groups. Each group is defined with three accesses: read access, write access, and notification access. Each access can be enabled or disabled within each group.

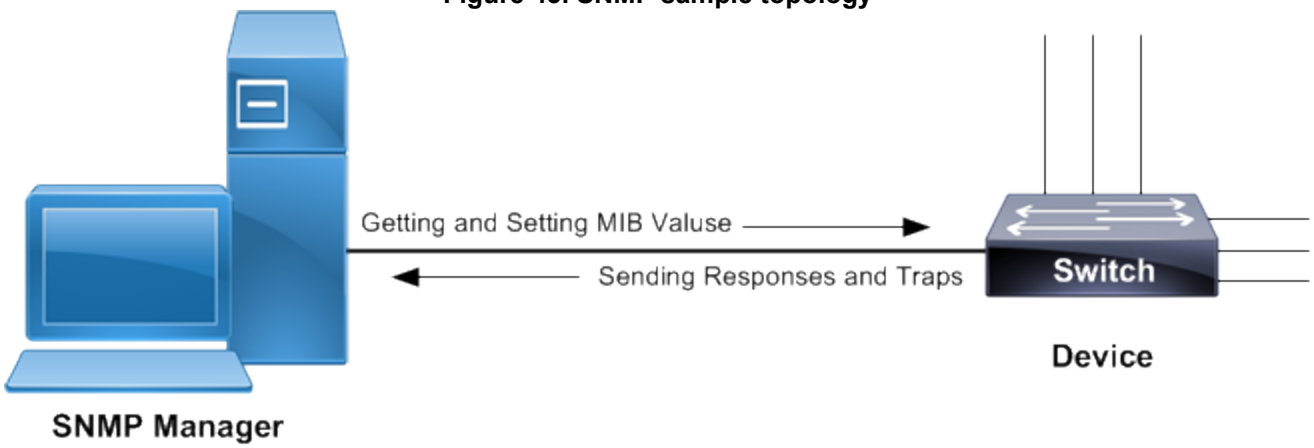
The SNMP v3 security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The security levels are:

- noAuthNoPriv: No authentication or encryption
- authNoPriv: Authentication but no encryption
- authPriv: Both authentication and encryption

SNMP is defined in RFCs 3411-3418.

Topology

Figure 43. SNMP sample topology



VRP Management Standard Configuration

`#configure terminal`	Enter configure mode.
`(config)#snmp-server view all .1 included vrf management`	Creates SNMP view labeled as “all” for OID-Tree as “.1” for vrf management.
`(config)#snmp-server community test group network-operator vrf management`	Set community string as “test” for group of users having “network-operator” privilege.
`(config)#snmp-server host 10.12.6.63 traps version 2c test udp-port 162 vrf management host-vrf management`	Specify host “10.12.6.63” of management vrf to receive SNMP version 2 notifications at udp port number 162 with community string as “test”.
`(config)#snmp-server enable snmp vrf management`	Use this command to start the SNMP agent.
`(config-if)#exit`	Exit interface configure mode
`(config)#commit`	Commit the candidate configuration to the running configuration

User Defined VRF Standard Configuration

OcNOS supports SNMP over the user defined VRFs as well apart from default and management VRFs via in-band interface. Users must be able to enable SNMP service over any user defined vrf however it only runs on one **VRF**[1] at once.

`#configure terminal`	Enter configure mode.
`(config)#ip vrf snmp-vrf`	Creates a user-defined vrf called snmp-vrf
`(config)#commit`	Commit the candidate configuration to the running configuration

[1]Virtual Routing and Forwarding

`(config)# snmp-server view newview 1.3.6.1.2.1.6.13.1.1.127.0.0.1 excluded vrf snmp-vrf`	Creates SNMP view labeled as “newview” for OID-Tree “1.3.6.1.2.1.6.13.1.1.127.0.0.1” excluded for vrf snmp-vrf.
`(config)# snmp-server community newcom group network-operator vrf snmp-vrf`	Set community string as “newcom” for group of users having “network-operator” privilege.
`(config)# snmp-server user newv3user auth sha AuthNewPass@123 priv aes PrivNewPass@123 vrf snmp-vrf`	Creates SNMP V3 user “newv3user” with authentication encryption “sha” and privacy encryption “aes” passwords for added security on the snmp-vrf
`(config)# snmp-server host 172.18.19.22 traps version 2c newcom udp-port 162 vrf snmp-vrf`	Specify host “172.18.19.22” to receive SNMP version 2 notifications at udp port number 162 with community string as “newcom”.
`(config)#snmp-server host 172.18.19.20 informs version 3 auth newv3user udp-port 65535 vrf snmp-vrf`	Specify host “172.18.19.20” to receive SNMP v3 informs at udp-port number 65535 for user “newv3user” if correct authpriv passwords are used
`(config)#snmp-server enable snmp vrf snmp-vrf`	Use this command to start the SNMP agent on the user defined vrf (snmp-vrf)
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

Use the below commands to verify the SNMP configuration:

```
#show running-config snmp
snmp-server view all .1 included vrf management
snmp-server community test group network-operator vrf management
snmp-server host 10.12.6.63 traps version 2c test udp-port 162 vrf management

#show snmp group
--------------------------------------------------------------------------------
community/user    group         version   Read-View   Write-view   Notify-view
--------------------------------------------------------------------------------
test          network-operator    2c/1       all        none           all

#show snmp host
--------------------------------------------------------------------------------
Host                Port   Version   Level          Type           SecName   VRF
--------------------------------------------------------------------------------
10.12.6.63          162    2c        noauth         trap           test      management
```

SNMP GET Command

```
# snmpget -v2c -c test 10.12.45.238 .1.3.6.1.2.1.6.13.1.2.10.12.45.238.22.10.12.6.63.52214

TCP-MIB::tcpConnLocalAddress.10.12.45.238.22.10.12.6.63.52214 = IpAddress: 10.12.45.238
```

SNMP WALK Command

SNMP WALK for particular OID

```
#snmpwalk -v2c -c test 10.12.45.238 .1.3.6.1.2.1.25.3.8.1.8
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.1 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.4 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.5 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.6 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.10 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.12 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.13 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.14 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.15 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.16 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.17 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.18 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.19 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.20 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.21 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.22 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.23 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.24 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.25 = STRING: 0-1-1,0:0:0.0
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.26 = STRING: 0-1-1,0:0:0.0
```

Complete SNMP WALK

```
#snmpwalk -v2c -c test 10.12.45.238 .1
```

SNMP Trap Server Configuration with IPv6 Address

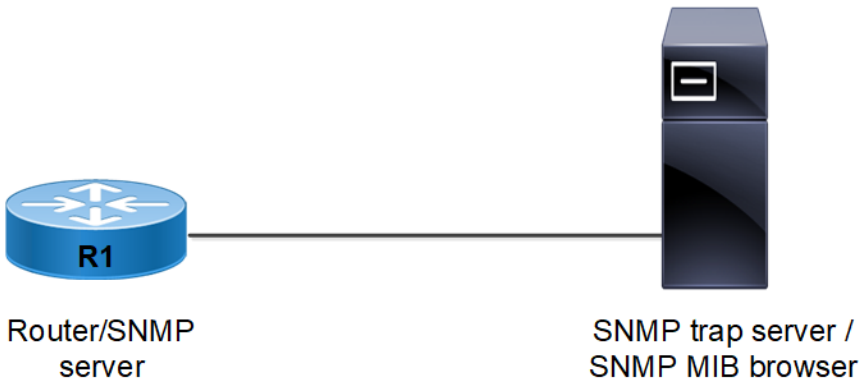
Management VRF Configuration

Snmpwalk is performed by using IPv6 address. SNMP trap server is configured on the Router with IPv6 address.

Topology

Figure 44 shows the sample configuration of SNMP trap server.

Figure 44. SNMP trap server topology



R1

`#configure terminal`	Enter configure mode.
`(config)#snmp-server view all .1 included vrf`	Configure SNMP server view

`management`	
`(config)#snmp-server view test1 1.3.6.1 included vrf management`	Configure SNMP server view
`(config)#snmp-server user test1 network-admin auth md5 test1234 vrf management`	Configure SNMP server user
`(config)#snmp-server user test2 network-admin vrf management`	Configure SNMP server user
`(config)#snmp-server user test3 network-admin auth md5 test1234 priv des test1234 vrf management`	Configure SNMP server user
`(config)#snmp-server community test group network-operator vrf management`	Configure SNMP server community
`(config)#snmp-server host 2001:db8:100::2 traps version 2c test udp-port 162 vrf management host-vrf management`	Configure SNMP trap server with default udp-port 162, the snmp-server running in management vrf as well as the host IP in management vrf
`(config)#snmp-server host 1001:db8:0:2::1 traps version 1 test udp-port 6000 vrf management`	Configure SNMP trap server with udp-port 6000, snmp-server running in management vrf and the host-IP in default vrf (can also mention host-vrf as default which is optional)
`(config)#snmp-server host 8901:DB8:0:1::3 traps version 2c newcom udp-port 1025 vrf management host-vrf snmp-vrf`	Configure SNMP trap server with udp-port 1025, snmp-server running in management vrf and the host-IP in user-defined vrf (snmp-vrf here)
`(config)#interface eth0`	Navigate to the interface mode
`(config-if)#ipv6 address 2001:db8:100::5/64`	Configure IPv6 address on the eth0 interface
`(config-if)#exit`	Exit interface configure mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Validation

Below is the SNMP configuration in Router node:

```
#show running-config snmp
snmp-server view all .1 included vrf management
snmp-server user test1 network-admin auth MD5 encrypt 0xd1fe6acc88856c90 vrf man
agement
snmp-server user test2 network-admin vrf management

bgp              notification     no
```

As mentioned above, perform link down and link up of any interface in Router node. Check that SNMP trap is sent .

SNMP Informs with IPv6 Address over User Defined VRF

Snmpwalk is performed by using IPv6 address. SNMP trap server is configured on the Router with IPv6 address.

Topology

Shows the sample configuration of SNMP trap server.

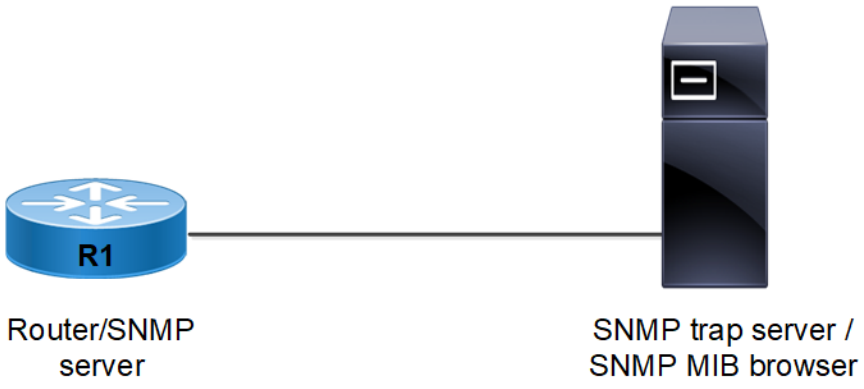

Figure 45. SNMP trap server topology

R1

`#configure terminal`	Enter configure mode.
`(config)#ip vrf snmp-vrf`	Creates a user-defined vrf called snmp-vrf
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#snmp-server view all .1 included vrf snmp-vrf`	Configure SNMP server view
`(config)#snmp-server view test1 1.3.6.1 included vrf snmp-vrf`	Configure SNMP server view
`(config)# snmp-server user newv3user auth sha AuthNewPass@123 priv aes PrivNewPass@123 vrf snmp-vrf`	Configure SNMP server user
`(config)#snmp-server community test group network-operator vrf snmp-vrf`	Configure SNMP server community
`(config)#snmp-server community test1 group network-admin vrf snmp-vrf`	Configure SNMP server community
`(config)# snmp-server host 8901:DB8:0:1::1 informs version 3 auth newv3user udp-port 60000 vrf snmp-vrf host-vrf snmp-vrf`	Configure SNMP informs server with IPV6 address from a user-defined **VRF**[1]
`(config)#interface xe0.6`	Navigate to the interface mode
`(config-if)#ipv6 address 8901:db8:0:1::2/64`	Configure IPv6 address on the xe0.6 sub vlan interface
`(config-if)#exit`	Exit interface configure mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Validation

Below is the SNMP configuration in Router node:

```
#show running-config snmp

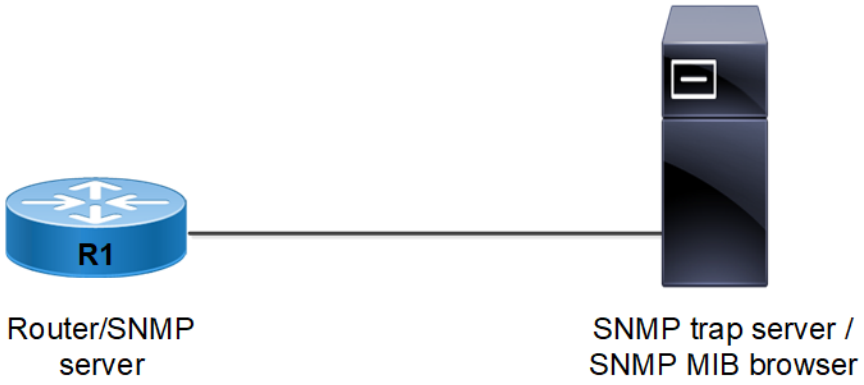
mpls-l3vpn       notification     yes
ospf             notification     yes
ospf6            notification     yes
isis             notification     yes
snmp             authentication   yes
mpls             rsvp             yes
pim              notification     yes
vrrp             notification     yes
rib              notification     yes
bgp              notification     yes
```

As mentioned above, perform link down and link up of any interface in Router node. Check that SNMP trap is sent.

SYSLOG MESSAGES OVER SNMP TRAPS

Topology

Shows the sample configuration of SNMP trap server.



R1

`#configure terminal`	Enter configure mode.
`(config)# snmpserver enable traps syslog`	Enable sending syslog messages over SNMP
`(config)# logging snmp-traps 7`	Configure severity to select syslog messages sent over the SNMP
`(config)# logging remote facility local4`	Configure facility to select syslog messages sent over SNMP
`(config)#snmp-server community test group network-operator vrf snmp-vrf`	Configure SNMP server community
`(config)# snmp-server host 8901:DB8:0:1::1 informs version 3 auth newv3user udp-port 60000 vrf snmp-vrf host-vrf snmp-vrf`	Configure SNMP informs server with IPv4 address from a user-defined VRF
`(config)#interface xe0.6`	Navigate to the interface mode
`(config-if)#ipv6 address 172.18.19.21/64`	Configure IPv6 address on the xe0.6 sub vlan interface
`(config-if)#exit`	Exit interface configure mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Validation

Following is the SNMP configuration in Router node:

```
#show running-config snmp
snmp-server view all .1 included vrf snmp-vrf
snmp-server community test group network-operator vrf snmp-vrf
snmp-server host 172.18.19.20 informs version 2c test udp-port 5555 vrf snmp-vrf host-vrf snmp-vrf
snmp-server enable snmp vrf snmp-vrf
snmp-server enable traps link linkDown
snmp-server enable traps link linkUp
snmp-server enable traps link include-interface-name
snmp-server enable traps vxlan
snmp-server enable traps pwdelete
```

```
snmp-server enable traps pw
snmp-server enable traps mpls
snmp-server enable traps mplsl3vpn
snmp-server enable traps snmp authentication
snmp-server enable traps ospf
snmp-server enable traps bgp
snmp-server enable traps ospf6
snmp-server enable traps vrrp
snmp-server enable traps rsvp
snmp-server enable traps rib
snmp-server enable traps isis
snmp-server enable traps pim
snmp-server enable traps syslog
#show ipv6 interface xe0.6 brief
Interface IP-Address Admin-Status Link-Status
xe0.6 172.18.19.21 up up
```

Perform a config-sync check from node and listen to the SNMP traps on the host via tcpdump:

```
S9600-28DX-1-5B#debug cml enable all
S9600-28DX-1-5B#cml config-sync check
2025 Feb 14 05:24:32 : S9600-28DX-1-5B : CMLSH : INFO : [CML_5]: Checking DB, this may take some time,
please wait...
# tcpdump -i any -n port 5555
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on any, link-type LINUX_SLL (Linux cooked), capture size 262144 bytes

04:35:50.813292 IP 172.18.19.21.37155 > 172.18.19.20.5555: UDP, length 268
```

SNMP Traps Through different VRFs

From OcNOS 6.6.0 release onwards, SNMP traps can sent out through different VRFs.

The following example demonstrates that SNMP is configured in the management VRF, but traps can be sent from both the management and user_vrf1 VRFs. However, SNMP walk/get operations can only be performed on the management VRF.

`#configure terminal`	Enter configure mode.
`(config)#ip vrf user_vrf1`	Creates a user-defined vrf called user_vrf1
`(config)#snmp-server view all .1 included vrf management`	Configure SNMP server view
`(config)#snmp-server enable snmp vrf management`	Enable SNMP on management VRF
`(config)#snmp-server community RegularTest group network-operator vrf management`	Configure SNMP

[1]User Datagram Protocol

	community
(config)#snmp-server location vrf management "Ottawa"	Configure location information
(config)#snmp-server contact vrf management "test@ipinfusion.com +1 819 776 6066"	Configure contact information
(config)#snmp-server host 172.29.7.144 traps version 2c RegularTest udp-port 3062 vrf management host-vrf management	Configure SNMP host on management VRF
(config)#snmp-server host 172.29.8.144 traps version 2c RegularTest udp-port 3062 vrf management host-vrf user_vrf1	Configure SNMP host on user-defined vrf user_ vrf1

Similarly, SNMP service can be enabled on any one VRF, while the SNMP host can be configured on another VRF. SNMP traps/informs can be sent from the VRF configured for the host, but SNMP walk/get operations can only be performed on the VRF where the SNMP service is enabled. This applies to combinations of user-defined VRFs, the default VRF, and the management VRF.

Validation

```
#show running-config snmp
snmp-server view all .1 included vrf management
snmp-server community RegularTest group network-operator vrf management
snmp-server host 172.29.7.144 traps version 2c RegularTest udp-port 3062 vrf management host-vrf
management
snmp-server host 172.29.8.144 traps version 2c RegularTest udp-port 3062 vrf management host-vrf user_
vrf1
snmp-server location vrf management "Ottawa"
snmp-server contact vrf management "test@ipinfusion.com +1 819 776 6066"
snmp-server enable snmp vrf management
snmp-server enable traps link linkDown
snmp-server enable traps link linkUp
#show snmp host

172.29.7.144 3062 2c noauth trap RegularTest management
172.29.8.144 3062 2c noauth trap RegularTest user_vrf1
```

SNMP COMMAND REFERENCE

Simple Network Management Protocol

This chapter is a reference for Simple Network Management Protocol (SNMP) commands.

SNMP provides a standardized framework and a common language for monitoring and managing devices in a network. The SNMP framework consists of three parts:

- An SNMP manager: The system used to control and monitor the activities of network devices. This is sometimes called a Network Management System (NMS).
- An SNMP agent: The component within a managed device that maintains the data for the device and reports these data SNMP managers.
- Management Information Base (MIB): SNMP exposes management data in the form of variables which describe the system configuration. These variables can be queried by SNMP managers.

In SNMP, administration groups are known as *communities*. SNMP communities consist of one agent and one or more SNMP managers. You can assign groups of hosts to SNMP communities for limited security checking of agents and management systems or for administrative purposes. Defining communities provides security by allowing only management systems and agents within the same community to communicate.

A host can belong to multiple communities at the same time, but an agent does not accept a request from a management system outside its list of acceptable community names.

SNMP access rights are organized by groups. Each group is defined with three accesses: read access, write access, and notification access. Each access can be enabled or disabled within each group.

The SNMP v3 security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The security levels are:

- noAuthNoPriv: No authentication or encryption
- authNoPriv: Authentication but no encryption
- authPriv: Both authentication and encryption.

SNMP is defined in RFCs 3411-3418.

Note: The commands below are supported on the “management” and default **VRF**[1].

This chapter contains these commands:

[1]Virtual Routing and Forwarding

debug snmp-server

Use this command to display SNMP debugging information.

Use the **no** form of this command to stop displaying SNMP debugging information.

Command Syntax

```
debug snmp-server
no debug snmp-server
```

Parameters

None

Default

Disabled

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug snmp-server
```

show running-config snmp

Use this command to display the SNMP running configuration.

Command Syntax

```
show running-config snmp
```

Parameters

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config snmp
snmp-server view all .1 included
snmp-server community abc group network-admin
snmp-server enable snmp
```

show snmp

Use this command to display the SNMP configuration, including session status, system contact, system location, statistics, communities, and users.

Command Syntax

```
show snmp
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp
SNMP Protocol:Enabled
sys Contact:
sys Location:
--------------------------------------------------------------------------------
Community Group/Access Context acl_filter
--------------------------------------------------------------------------------
public network-admin

_______________________________________________________________________________
SNMP USERS

_______________________________________________________________________________
User Auth Priv(enforce) Groups

_______________________________________________________________________________
SNMP Tcp-session :Disabled
```

show snmp community

Use this command to display SNMP communities.

Command Syntax

```
show snmp community
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp community

-----------------------------------------------------------------------------------------------------
Community Group/Access view-name version
-----------------------------------------------------------------------------------------------------
test network-operator
testing network-operator ipi 2c
```

Table 37 explains the output fields.

Table 37. show snmp community fields

Entry	Description
Community	SNMP Community string.
Group/Access	Community group name.
View-name	Community view name.
Version	Community version.

show snmp context

Use this command to display SNMP server contexts and associated groups.

Command syntax

```
show snmp context
```

Parameters

None

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 5.1

Example

```
OcNOS#show snmp context
------------------------------------------------------------------------
context groups
------------------------------------------------------------------------
ctx1 grp1,grp2
ctx2 grp3
```

show snmp engine-id

Use this command to exhibit the SNMP engine identifier.

The SNMP engine identifier is a distinctive string employed to recognize the device for administrative purposes. The default engine-id is formulated using the MAC address, but an option for user-configured engine-id is also provided. The **show** command should be employed to retrieve information about the presently configured SNMP engine-id on the device.

Command Syntax

```
show snmp engine-id
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced prior toOcNOS version 1.3 and its display in the **show** output was enhanced inOcNOS version 6.3.2.

Examples

Default SNMP engine-id:

```
#show snmp engine-id
SNMP ENGINE-ID Type: MAC address
SNMP ENGINE-ID : 80 00 1f 88 03 e8 c5 7a 1a 02 1c
```

User-Configured engine-id:

```
#show snmp engine-id
SNMP ENGINE-ID Type: User configured Text
SNMP ENGINE-ID Text: ipinfusion
SNMP ENGINE-ID : 80 00 1f 88 04 69 70 69 6e 66 75 73 69 6f 6e
```

Table 38 explains the output fields.

Table 38. show snmp engine-ip fields

Entry	Description
SNMP ENGINE-ID: 80 00 1f 88 04 69 70 69 6e 66 75 73 69 6f 6e	The SNMP engine identifier is a distinct string utilized to uniquely recognize the device for administrative purposes.

show snmp group

Use this command to display SNMP server groups and associated views.

Command Syntax

```
show snmp group
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp group
-------------------------------------------------------------------------------------------------------------
-----
community/user group version Read-View Write-view Notify-view
-------------------------------------------------------------------------------------------------------------
-----
test network-operator 2c/1 all all all
kedar network-operator 3 all none all
tamil network-operator 3 all none all
```

Table 39 explains the output fields.

Table 39. show snmp group output

Entry	Description
Community/User	Displays the access type of the user for which the notification is generated.
Group	The name of the SNMP group, or collection of users that have a common access policy.
Version	SNMP version number.
Read-View	A string identifying the read view of the group. For further information on the SNMP views, use the show snmp view command.
Write-View	A string identifying the write view of the group.
Notify-View	A string identifying the notify view of the group. The notify view indicates the group for SNMP notifications, and corresponds to the setting of the snmp-server group group-name version notify notify-view command.

show snmp host

Use this command to display the SNMP trap hosts.

Command Syntax

```
show snmp host
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp host
------------------------------------------------------------------------
Host Port Version Level Type SecName
------------------------------------------------------------------------
10.10.26.123 162 2c noauth trap test
```

Table 40 explains the output fields.

Table 40. Show snmp host output

Entry	Description
Host	The IP address of the SNMP host server.
Port	The port being used for SNMP traffic.
Version	SNMP version number.
Level	The security level being used.
Type	The type of SNMP object being sent.
SecName	Secure Name for this SNMP session.

show snmp user

Use this command to display SNMP users and associated authentication, encryption, and group.

Command Syntax

```
show snmp user
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp user
SNMP USERS

_____________________________________________________________________
User Auth Priv(enforce) Groups

_____________________________________________________________________
ntwadmin MD5 AES network-admin
#
```

Table 41 explains the output fields.

Table 41. Show snmp user output

Entry	Description
User	The person attempting to use the SMNMP agent.
Auth	The secure encryption scheme being used.
Priv(enforce)	What enforcement privilege is being used (in this case, it is the Advance Encryption Standard).
Group	The group to which the user belongs.

show snmp view

Use this command to display SNMP views.

Command Syntax

```
show snmp view
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp view
View : all
OID : .1
View-type : included
```

snmp ent-ipi-iftable

Use this command to enable the display of separate physical and logical interface tables in SNMP requests.

Use the `no` form of this command to disable it.

Command Syntax

```
snmp ent-ipi-iftable
no snmp ent-ipi-iftable
```

Parameters

ent-ipi-iftable
Enables the physical and logical interface tables in SNMP requests.

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.5.3.

Examples

```
OcNOS#configure terminal
OcNOS(config)#snmp ent-ipi-iftable
```

snmp restart

Use this command to restart SNMP for a given process.

Command Syntax

```
snmp restart (auth | bfd | bgp | isis | lacp| ldp | lldp | mrib | mstp | nsm | ospf | ospf6 | pim |
rib| rip | rsvp |vrrp)
```

Parameters

auth
Authentication

bfd
Bidirectional Forwarding Detection (BFD)

bgp
Border Gateway Protocol (BGP)

isis
Intermediate System - Intermediate System (IS-IS)

lacp
Link Aggregation Control Protocol (LACP)

ldp
Label Distribution Protocol (LDP)

lldp
Link Layer Discovery Protocol (LLDP)

mrib
Multicast Routing Information Base (MRIB)

mstp
Multiple Spanning Tree Protocol (MSTP)

nsm
Network Service Module (NSM)

ospf
Open Shortest Path First (OSPFv2)

ospf6
Open Shortest Path First (OSPFv3)

pim
Protocol Independent Multicast (PIM)

rib
Routing Information Base (RIB)

rip
Routing Information Protocol (RIP)

rsvp
Resource Reservation Protocol (RSVP)

vrrp
Virtual Router Redundancy Protocol (VRRP)

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#snmp restart nsm
```

snmp-server community

Use this command to create an SNMP community string and access privileges.

Use the **no** form of this command to remove an SNMP community string.

Command Syntax

```
snmp-server community WORD (| (view VIEW-NAME version (v1 | v2c ) ( ro)) |
   (group (network-admin|network-operator)) |( ro) | (use-acl WORD) ) (vrf (NAME|management)|)
   no snmp-server community COMMUNITY-NAME (vrf (NAME|management)|)
```

Parameter

WORD
Name of the community (Maximum 32 alphanumeric characters)

VIEW-NAME
Name of the snmp view (Maximum 32 alphanumeric characters)

version
Set community string and access privileges

v1
SNMP v1

v2c
SNMP v2c

ro
Read-only access

group
Community group

network-admin
System configured group for read-only

network-operator
System configured group for read-only(default)

ro
Read-only access

use-acl
Access control list (ACL) to filter SNMP requests

WORD
ACL name; maximum length 32 characters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

[1]Virtual Routing and Forwarding

Default

None

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#snmp-server community MyComm view MyView1 version v2c ro vrf management
```

snmp-server community-map

Use this command to map the community name with context and SNMPv2 user.

Use **no** form of this command to remove the community mapping.

Note: Community can be mapped with one context and user.

Command Syntax

```
snmp-server community-map WORD context WORD user WORD (vrf (NAME|management)|)
no snmp-server community-map WORD context WORD user WORD (vrf (NAME|management)|)
```

Parameters

WORD
SNMP community name

context
SNMP context name

WORD
Context string

user
SNMP user name

WORD
User string

vrf managementDefines the management **VRF**[1] instance.vrf NAMESpecify the user-defined VRF instance name.

Command Mode

Configure mode

Applicability

This command is introduced inOcNOS version 5.1 MR . Added VRF NAME parameter inOcNOS version 6.5.3.

Examples

```
OcNOS(config)#snmp-server community-map test context ctx2 user testing vrf management
```

[1]Virtual Routing and Forwarding

snmp-server contact

Use this command to set the system contact information for the device (**sysContact** object).

Use the **no** form of this command to remove the system contact information.

Command Syntax

```
snmp-server contact (vrf (NAME|management)|) (TEXT|)
no snmp-server contact (vrf (NAME|management)|) (TEXT|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

TEXT
System contact information; maximum length 1024 characters without spaces

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#snmp-server contact vrf management Irving@555-0150
```

[1]Virtual Routing and Forwarding

snmp-server context

Use this command to create SNMP context.

Use **no** form of this command to remove the context.

Command Syntax

```
snmp-server context WORD (vrf (NAME|management)|)
no snmp-server context WORD (vrf (NAME|management)|)
```

Parameters

context
SNMP context name

WORD
Context string (Maximum 32 alphanumeric characters)

vrf managementDefines the management VRF[1] instance.vrf NAMESpecify the user-defined VRF instance name.

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 5.1MR. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
OcNOS(config)#snmp-server context ctx1 vrf management
```

[1]Virtual Routing and Forwarding

snmp-server disable default

Use this command to disable default instance which is running on OcNOS device. After configuring this command user should not be able to enable default snmp instance. Use no form of this command to unset this after that only user should be able to configure default instance.

Command Syntax

```
snmp-server disable-default
```

Parameter

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced beforeOcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#snmp-server disable-default
```

snmp-server enable snmp

Use this command to start the SNMP agent daemon over **UDP**[1].

Use the **no** form of this command to stop the SNMP agent daemon over UDP.

Command Syntax

```
snmp-server enable snmp (vrf (NAME|management)|)
no snmp-server enable snmp (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[2] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

No default value specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#snmp-server enable snmp vrf management
```

[1]User Datagram Protocol

[2]Virtual Routing and Forwarding

snmp-server enable traps

Use this command to enable or disable SNMP traps and inform requests.

Note: For CMMD, Critical logs in the console are equivalent to Alert traps & Alert logs on the console is equivalent to critical trap in SNMP.

Command Syntax

```
snmp-server enable traps (link(|linkDown|linkUp|include-interface-name)|snmp(|authentication)|
mpls|pw|pwdelete|ospf|bgp|isis|vxlan|vrrp|ospf6|syslog)
no snmp-server enable traps (link(|linkDown|linkUp|include-interface-name)|snmp(|authentication)|
mpls|pw|pwdelete|ospf|bgp|isis|vxlan|vrrp|ospf6|syslog)
```

Parameters

bgp
bgp notification trap

isis
isis notification trap

link
Module notifications enable

linkDown
IETF Link state down notification

linkUp
IETF Link state up notification

snmp
Enable RFC 1157 notifications

syslog
Syslog notification trap

authentication
Send SNMP authentication failure notifications

mpls
mpls notification trap

mplsl3vpn
mpls-l3vpn notification trap

ospf
ospf notification trap

ospf6
ospf6 notification trap

pw
pw notification trap

pwdelete
pwdelete notification trap

rib
rib notification trap

rsvp
rsvp notification trap

vrrp
vrrp notification trap

vxlan
vxlan notification trap

linkDown
IETF link state down notification

linkup
IETF link state up notification

include-interface-name
Enable this option to include interface name in the Linkup/Linkdown trap's varbind

Default

By default, SNMP server traps are enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and was updated inOcNOS version 6.6.0.

Examples

```
(config)#snmp-server enable traps snmp
(config)#snmp-server enable traps mpls
(config)#snmp-server enable traps mplsl3vpn
(config)#snmp-server enable traps rsvp
(config)#snmp-server enable traps ospf
(config)#snmp-server enable traps ospf6
(config)#snmp-server enable traps vrrp
(config)#snmp-server enable traps vxlan
(config)#snmp-server enable traps snmp authentication
(config)#snmp-server enable traps syslog
```

snmp-server engineID

Use this command to establish the SNMPv3 engine ID.

Use the no form of this command to remove the SNMPv3 engine ID.

Command Syntax

```
snmp-server engineID ENGINE_ID_STR
no snmp-server engineID
```

Command Syntax

ENGINE_ID_STR
String of characters that uniquely identifies the SNMP engine ID.

Default

By Default the SNMP Server Engine ID value is automatically generated using the MAC address.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.3.2.

Examples

```
#configure terminal
(config)#snmp-server engineID ipinfusion
```

snmp-server group

Use this command to create a SNMP group.

Use the **no** form of this command to remove the groups.

Command syntax

```
snmp-server group WORD version (1|2c) (context (all|WORD)|) (vrf (NAME|management)|)  snmp-server
group WORD version 3 (auth|noauth|priv) (context (all|WORD)|) (vrf management|)
 no snmp-server group WORD (context (all|WORD)|) (vrf (NAME|management)|)
```

Parameters

WORD
Specify the snmp group name (Maximum 32 alphanumeric characters)

version
SNMP Version

1
SNMP v1

2c
SNMP v2c

3
SNMP v3 security level

noauth
No authentication and no privacy (noAuthNoPriv) security model: messages transmitted as clear text providing backwards compatibility with earlier versions of SNMP

auth
Authentication and no privacy (authNoPriv) security model: use message digest algorithm (MD5) or Secure Hash Algorithm (SHA) for packet authentication; messages transmitted in clear text

priv
Authentication and privacy (authPriv) security model: use authNoPriv packet authentication with Data Encryption Standard (DES) Advanced Encryption Standard (AES) for packet encryption

context
SNMP context name

WORD
SNMP context string (Maximum 32 alphanumeric characters)

all
All context name's allowed for this group.

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

[1]Virtual Routing and Forwarding

Default

None

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 5.1. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
OcNOS#con t
OcNOS(config)#snmp-server context ctx1 vrf management
OcNOS(config)#snmp-server group grp1 version 3 auth context ctx1 vrf management
OcNOS(config)#snmp-server group grp3 version 2c context ctx2 vrf management
```

snmp-server host

Use this command to configure an SNMP trap host. An SNMP trap host is usually a network management station (NMS) or an SNMP manager.

Use the **no** form of this command to remove an SNMP trap host.

Note: The maximum number of SNMP trap hosts is limited to 8.

Command Syntax

```
snmp-server host (A.B.C.D | X:X::X:X | HOSTNAME) ((traps version(( (1 | 2c) WORD ) | (3 (noauth |
auth | priv) WORD))) |(informs version ((2c WORD ) | (3 (noauth | auth | priv) WORD))))(|udp-port <1-
65535>) (vrf (NAME|management)|)
snmp-server host (A.B.C.D | X:X::X:X | HOSTNAME) WORD (|udp-port <1-65535>) (vrf (NAME|management)|)
snmp-server host (A.B.C.D | X:X::X:X | HOSTNAME) (version(( (1 | 2c) WORD ) | (3 (noauth | auth |
priv) WORD)))(|udp-port <1-65535>) (vrf (NAME|management)|)
no snmp-server  host (A.B.C.D|X:X::X:X|HOSTNAME) (vrf (NAME|management)|)
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

HOSTNAME
DNS host name

WORD
SNMP community string or SNMPv3 user name (Maximum 32 alphanumeric characters)

informs
Send notifications as informs

version
SNMP Version. Default notification is traps

<1–65535>
Host **UDP**[1] port number; the default is 162

vrf management
Defines the management **VRF**[2] instance.

vrf NAME
Specify the user-defined VRF instance name.

Virtual Routing and Forwarding name

traps
Send notifications as traps

version
Version

[1]User Datagram Protocol

[2]Virtual Routing and Forwarding

1
SNMP v1

2c
SNMP v2c

WORD
SNMP community string (Maximum 32 alphanumeric characters)

3
SNMP v3 security level

noauth
No authentication and no privacy (noAuthNoPriv) security model: messages transmitted as clear text providing backwards compatibility with earlier versions of SNMP

auth
Authentication and no privacy (authNoPriv) security model: use message digest algorithm 5 (MD5) or Secure Hash Algorithm (SHA) for packet authentication; messages transmitted in clear text

priv
Authentication and privacy (authPriv) security model: use authNoPriv packet authentication with Data Encryption Standard (DES) Advanced Encryption Standard (AES) for packet encryption

WORD
SNMPv3 user name

Default

The default SNMP version is v2c and the default UDP port is 162. Simple Network Management Protocol.

Command Mode

Configure mode

Applicability

This command was introduced beforeOcNOS version 1.3 . Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#snmp-server host 10.10.10.10 traps version 3 auth MyUser udp-port 512
   vrf management
```

snmp-server location

Use this command to set the physical location information of the device (**`sysLocation`** object).

Use the **`no`** form of this command to remove the system location information.

Command Syntax

```
snmp-server location (vrf (NAME|management)|) (TEXT|)
no snmp-server location (vrf (NAME|management)|) (TEXT|)
```

Parameters

vrf managementDefines the management **VRF**[1] instance.vrf NAMESpecify the user-defined VRF instance name.

TEXT
Physical location information; maximum length 1024 characters

Default

No system location string is set.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 . Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#snmp-server location vrf management Bldg. 5, 3rd floor, northeast
```

[1]Virtual Routing and Forwarding

snmp-server smux-port-disable

Use this CLI to disable the SMUX open port.

Command Syntax

```
snmp-server smux-port-disable
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 5.1 release.

Examples

```
#configure terminal
    #snmp-server smux-port-disable
```

snmp ent-ipi-iftable

Use this command to configure the trap caching settings for SNMP.

Use the `no` form of this command to disable caching for SNMP.

Command Syntax

```
snmp-server trap-cache (timeout <timeout> | max-count <max-count> | disable-ping |)
no snmp-server trap-cache
```

Parameter

timeout <timeout>
Specifies the maximum time (in seconds) that traps will be cached before being sent. This sets the trap cache timeout.

max-count <max-trap-count>
Specifies the maximum number of traps that can be cached before they are flushed and sent.

disable-ping
Disables ping check for host availability. If ping is disabled, traps will be sent after the configured timeout.

Default

Disabled

Command Mode

Trap Cache mode

Applicability

This command was introduced inOcNOS version 6.5.3.

Examples

```
OcNOS#configure terminal
OcNOS(config)#snmp-server trap-cache
OcNOS(config-trap-cache)#timeout 60
```

snmp-server user

Use this command to create an SNMP server user.

Use the **no** from of this command to to remove an SNMP server user.

Command Syntax

```
snmp-server user WORD ((network-operator|network-admin| WORD|) ((auth (md5 | sha
)(encrypt|) AUTH-PASSWORD) ((priv (des | aes) PRIV-PASSWORD) |) |) (vrf (NAME|management)|)
no snmp-server user USER-NAME (vrf (NAME|management)|)
```

Parameters

Word
Specify the snmp user name (Min 5 to Max 32 alphanumeric characters)network-operator|network-admin

Word
Name of the group to which the user belongs

auth.
Packet authentication type

md5
Message Digest Algorithm 5 (MD5)

sha
Secure Hash Algorithm(SHA)

priv
Packet encryption type("privacy")

des
Data Encryption Standard (DES)

aes
Advanced Encryption Standard (AES)

PRIV-PASSWORD
Encryption password; length 8-33 characters

encrypt
Specify authentication-password and/or privilege-password in encrypted form. This option is provided for reconfiguring a password using an earlier encrypted password that was available in running configuration display or get-config payload. Users are advised not to use this option for entering passwords generated in any other method.

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

Disabled

[1]Virtual Routing and Forwarding

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

```
#configure terminal
(config)#snmp-server user Fred auth md5 J@u-b;l2e`n,9p_ priv des t41VVb99i8He{Jt vrf management
```

snmp-server view

Use this command to create or update a view entry

Use the **no** from of this command to remove a view entry.

Note: OIDs to be excluded or included need to be specifically mentioned while configuring the SNMP view. Only when the OIDs are included will they be displayed in SNMP-Walk. When an OID is excluded, other OIDs must be explicitly included for the system to function.

Command Syntax

```
snmp-server view VIEW-NAME OID-TREE (included | excluded) (vrf (NAME|management)|)
no snmp-server view VIEW-NAME (vrf (NAME|management)|)
```

Parameters

VIEW-NAME
Name of the snmp view (Maximum 32 alphanumeric characters)

OID-TREE
Object identifier of a subtree to include or exclude from the view; specify a text string consisting of numbers and periods, such as 1.3.6.2.4

included
Include **OID-TREE** in the SNMP view

excluded
Exclude **OID-TREE** from the SNMP view

vrf managementDefines the management VRF[1] instance.vrf NAMESpecify the user-defined VRF instance name.

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added VRF NAME parameter in OcNOS version 6.5.3.

Examples

The following example creates a view named **myView3** that excludes the **snmpCommunityMIB** object (1.3.6.1.6.3.18).

```
#configure terminal
```

[1]Virtual Routing and Forwarding

```
(config)#snmp-server view myView3 1.3.6.1.6.3.18 excluded vrf management
```

LOGGING SERVER CONFIGURATION

Syslog Configuration

Overview

Syslog is a standard for logging program messages. It allows separation of the software that generates messages from the system that stores them and the software that reports and analyzes them. It also provides devices which would otherwise be unable to communicate, a means to notify administrators of problems or performance.

OcNOS supports logging messages to a syslog server in addition to logging to a file or the console (local or ssh/telnet console). OcNOS messages can be logged to a local syslog server (the machine on which OcNOS executes) as well as to one or more remote syslog servers (maximum of 8 remote syslog server is supported). Remote syslog servers can either be configured with IPv4 or IPv6 addresses or host names.

In-band Management over Default VRF

OcNOS supports syslog over the default and management VRFs via in-band management interface and OOB management interface, respectively.

By default, syslog runs on the management **VRF**[1].

Syslog Configuration with IPv4 Address

Logging is performed with IPv4 IP address and verified by logs on remote machine.

Topology

Figure 46. Syslog sample topology

Enabling rsyslog

`#configure terminal`	Enter configure mode.

[1]Virtual Routing and Forwarding

`(config)#feature rsyslog vrf management`	Enable feature on default or management **VRF**[1]. By default this feature runs on the management VRF.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Logging to a File

The below configurations shows how to enable debug logs for a particular protocol. In this case, OSPF is shown.

`#debug ospf all`	This enables the debugging on OSPF.
`#configure terminal`	Enter configure mode
`(config)#router ospf 1`	Enable OSPF process 1
`(config-router)#exit`	Exit router mode
`(config)#feature rsyslog`	Enable syslog feature on default or management **VRF**[2]. By default this feature runs on the management VRF.
`(config)#logging level ospf 7`	This enable debug messages for OSPF module. This is configurable either if default of management VRF.
`(config)#logging logfile ospf1 7`	This creates the log file where the logs will be saved. The path of the file will be in the directory /log/ospf1. Log File size 4096-4194304 bytes.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

To verify this, do some OSPF configuration and view the messages in the log file or with the **`show logging logfile`** command.

Validation

```
#show logging logfile

```

Logging to the Console

Note: For CMMD, Critical logs in the console are equivalent to Alert traps and Alert logs on the console is equivalent to critical trap in SNMP.

`#configure terminal`	Enter configure mode.
`(config)#logging level ospf 7`	This enable debug messages for OSFP module.
`(config)#logging console 7`	This enables the console logs.
`(config)#debug ospf`	This enables the debugging on OSPF configurations.
`(config)#router ospf`	Enabling ospf for process 1.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

To verify this, do some OSPF configuration and view the messages in the console.

Validation

```
#show logging console
Console logging     : enabled Severity: (debugging)

#show logging level

Facility        Default Severity        Current Session Severity

```

Logging to a Remote Server Via Management VRF

Use this command to set a syslog server.

OcNOS supports logging messages to a syslog server in addition to logging to a file or the console (local or SSH/telnet console). OcNOS messages can be logged to a local syslog server (the machine on which OcNOS executes) as well as to one or more remote syslog servers.

Use the **no** form of this command to remove a syslog server.

Note: Maximum 8 remote log servers can be configured.

Logging to Remote Server via User-Defined VRF

`#configure terminal`	Enter configure mode.
`(config)#ip vrf snmp-vrf`	Create a user-defined **VRF**[1] called snmp-vrf.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#logging level bgp 7`	Redirects the log messages to the server configured over the management VRF.
`(config)#logging remote server 10.16.2.1 vrf management`	Redirects the log messages to the server configured over the User defined VRF snmp-vrf.
`(config)#debug bgp all`	This enables the debugging on BGP con-figurations.
`(config)#router bgp 1`	Enabling BGP process 1.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
#show logging server
Remote Servers:
    10.16.2.1
                severity: (debugging)

Syslog Configuration with IPv6 Address

Logging is performed with IPv6 IP and verified by logs on remote PC (Logging server).

Topology

Figure 47 shows the sample configuration of Syslog.

Figure 47. Syslog Configuration topology

Enabling rsyslog

`#configure terminal`	Enter configure mode

(config)#feature rsyslog [vrf management]	Enable feature on default or management **VRF**[1]. By default this feature runs on the management VRF.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode

Logging to a File

The below configurations shows how to enable debug logs for a particular protocol. In this case, OSPF is shown.

#debug ospf all	This enables the debugging on OSPF
#configure terminal	Enter configure mode
(config)#router ospf 1	Enable OSPF process 1
(config-router)#exit	Exit router mode
(config)#feature rsyslog	Enable feature on default or management VRF. By default this feature runs on the management VRF.
(config)#logging level ospf 7	This enable debug messages for OSPF module. This is configurable either if de-fault of management VRF.
(config)#logging logfile ospf1 7	This creates the log file where the logs will be saved. The path of the file will be in the directory /log/ospf1. Log File size 4096- 4194304 bytes
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode

Logging to Remote Server

#configure terminal	Enter configure mode.
(config)#logging level bgp 7	This enable debug messages for BGP module
(config)#logging remote server 10.16.2.1 vrf management	Redirects the log messages to the server configured.
(config)#debug bgp all	This enables the debugging on BGP con-figurations.
(config)#router bgp 1	Enabling BGP process 1.
(config-router)#exit	Exit router mode.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.

Validation

```
#show logging server
Remote Servers:
```

[1]Virtual Routing and Forwarding

```
                2001::1
                severity: (debugging)
                facility: local7
                VRF: management
```

Logging to Remote Server via Management VRF

`#configure terminal`	Enter configure mode.
`(config)#logging level bgp 7`	This enable debug messages for BGP module.
`(config)#logging remote server 10.16.2.1 vrf management`	Redirects the log messages to the server configured.
`(config)#debug bgp all`	This enables the debugging on BGP configurations.
`(config)#router bgp 1`	Enabling BGP process 1.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
#show logging server
  Remote Servers:
                10.16.2.1
                severity: (debugging)

```

Logging to Remote Server via User-Defined VRF

`#configure terminal`	Enter configure mode.
`(config)#ip vrf VRF1`	Create a user-defined **VRF**[1] called VRF1.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#logging level bgp 7`	Redirects the log messages to the server configured over the management VRF.
`(config)#logging remote server 1001:db8:0:1::1 7 vrf VRF1`	Redirects the log messages to the server configured over the User defined VRF snmp-vrf.
`(config)#debug bgp all`	This enables the debugging on BGP con-figurations.
`(config)#router bgp 1`	Enabling BGP process 1.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
#show logging server
Remote Servers:
1001:db8:0:1::1
severity: Operator(debug-detailed)
facility: local7
authpriv: Enabled
    VRF : VRF1
```

[1]Virtual Routing and Forwarding

Custom Syslog Port Configuration

Overview

OcNOS enables the establishment of a Syslog server by designating the logging server as XX.XX.XX.XXX. This configuration sends syslog messages via the default port, which is 514. However, utilizing the default port for the Syslog server is considered a security vulnerability.

Support for In-band Management over default VRF

OcNOS offers support for DNS over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can be enabled to run on default and management **VRF**[1] simultaneously. By default, it runs on management VRF.

Features

- CLI is supported for user to configure custom syslog port.
- Once configured syslog conf file is updated with the configured port value.
- At the rsyslog server side, stop the running rsyslogd daemon using the command “systemctl stop rsyslog.service”
- Update /etc/rsyslog.conf file with syslog client configured port.
- Start the rsyslog daemon –using systemctl start rsyslog.service.
- Logs will redirect to syslog server through configured port.
- After un-configuring, the port logs will be sent to syslog remote server through default port 514, to receive the logs at server side, it also needs to be set back to default.
- Delete the custom Syslog port.

Custom Syslog Configuration with IPv4 Address

Logging is performed with IPv4 IP address and verified by logs on remote machine.

[1]Virtual Routing and Forwarding

Topology

Figure 48. Syslog sample topology

.

Enabling rsyslog

`#configure terminal`	Enter configure mode.
`(config)#feature rsyslog [vrf management]`	Enable feature on default or management **VRF**[1]. By default this feature runs on the management VRF.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode
`(config)# logging remote server 10.12.33.211 7 port 8514 vrf management`	Redirect into the remote server configure the severity and custom port with vrf management (default custom port is 514).
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Validation

```
#show running-config logging
feature rsyslog vrf management
logging remote server 10.12.33.211 7 port 8514 vrf management

ocnos#show logging server
  Remote Servers:
               10.12.33.211
               port: 8514
               severity: Operator (debug-detailed)
               facility: local7
               VRF : management
```

Check the rsyslog messages in server

Server Path: /var/log/OcNOS.log

Custom Syslog Configuration with IPv6 Address

Logging is performed with IPv6 IP and verified by logs on remote PC (Logging server).

Topology

Figure 49. Syslog Configuration topology

Enabling rsyslog

`#configure terminal`	Enter configure mode
`(config)#feature rsyslog [vrf management]`	Enable feature on default or management **VRF**[1]. By default this feature runs on the management VRF.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#logging remote server 200:201::100:10 7 port 8514 vrf management`	Redirect into the remote server configure the severity and custom port with vrf management (default custom port is 514).
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

Validation

```
ocnos#show running-config logging
feature rsyslog vrf management
logging remote server 200:201::100:10 7 port 8514 vrf management

#show logging server
  Remote Servers:
                200:201::100:10
                port: 8514
                severity: Operator (debug-detailed)
                facility: local7
                VRF : management
```

Check the rsyslog messages in server

Server Path:- /var/log/OcNOS.log

LOGGING SERVER COMMAND REFERENCE

Syslog Commands

This chapter is a reference for the **syslog** commands.

Linux applications use the **syslog** utility to collect, identify, time-stamp, filter, store, alert, and forward logging data. The **syslog** utility can track and log all manner of system messages from informational to extremely critical. Each system message sent to a **syslog** server has two descriptive labels associated with it:

- The function (facility) of the application that generated it. For example, an application such as **mail** and **cron** generates messages with a facility names “mail” and “cron”.
- Eight degrees of severity (numbered 0-7) of the message which are explained in Table 42. Syslog severities (page 720).

This chapter contains these commands:

Syslog-Severities

In the example log entries in Table 42. Syslog severities (page 720), the prefixes are removed. For example. this is a complete log entry with the prefix:

```
2020 Apr 12 11:20:27.612 : 17U-18U : PSERV : MERG : !!! hsl Module crashed, System reboot halted as
it rebooted continuosly 2 times
```

This is the same log entry without the prefix:

```
hsl Module crashed,System reboot halted as it rebooted continuosly 2 times
```

Table 42. Syslog severities

Severity Level	Keyword	Description

0	emergency	The whole system is unusable and needs operator intervention to recover. If only a particular port or component is unusable, but the system as a whole is still usable it is not categorized at an emergency level.
		Examples of this type of message:
		`Output Power of PSU XX (psu_no) XX Watt] has exceeded Maximum Output Power Limit[XX Watt]`
		`OSPF Initialization failed.`

1	alert	The operator needs to act immediately or the system might go into emergency state. The system or one of its component's functionality might be critically affected.
		Examples of this type of message:
		`Temperature of sensor is (curr_temp)C. It is nearing Emergency Condition.`
		`OSPF has exceed lsdb limit`
		`OSPF Detected router with duplicate router ID [ID]`

2	critical	A critical system event happened which requires the operator's attention. The event might not require immediate action, but this event can affect functionality or behavior of a system component.
		Examples of this type of message:
		`OSPF Neighbor session went down.`
		`Interface %s changed state to down`

3	error	An error event happened which does not require immediate attention. This log message provides details about error conditions in the system or its components which you can use to troubleshoot problems.
		These events are not logged directly even if the logging level is set to include this level. You also need to enable the protocol debug filters (such as **`debug ospf all`**).
		Examples of this type of message:
		`Device i2c bus open error.!!!`
		`[DECODE] Attr ASPATH: Invalid AS Path value.`
		`OSPF MD5 authentication error`

Table 42. Syslog severities (continued)

Severity Level	Keyword	Description

4	notification	Notifications about important system and protocol events to assure the operator that the system is running properly. If a critical/alert condition has happened and has been corrected, that is also logged at this level.
		Examples of this type of message:
		`OSPF Received link up for interface: xe1`
		`OSPF neighbour [10.1.1.1] Status change Exstart -> Exchange`
		`Interface %s changed state to UP`

5	informational	Detailed informational events happening across the system and protocol modules. These events are not necessarily important and are useful only to find details about the functionality being executed in the system and its components. Some of these events might be periodic events like hello or keep alive messages along with packet dumps. Also, this level includes logs for control packets that are ignored and do not impact the protocol states.
		IP Infusion Inc. recommends to use proper debug filters to log only relevant events and switch off other events; otherwise the logs can get verbose. For example:
		`debug ospf all`
		`no debug ospf packet hello`
		The above enables all OSPF debugging, but disables the periodic hello messages.
		Examples of this type of message:
		`Successfully added dynamic neighbour`
		`[DECODE] KAlive: Received!`
		`[FSM] Ignoring Unsupported event <EVENT> in state <STATE>`
		`Unknown **ICMP**[1] packet type"`
		`OSPF RECV[%s]: From %r via %s: Version number mismatch`
		`OSPF RECV[%s]: From %r via %s: Network address mismatch`

6	debug informational	Developer notification events that might not be readable by an operator. However these logs are useful for debugging by a developer and if required, this level needs to be enabled and provided to technical support for analysis.
7	debug detailed	Developer notification events that might not be readable by an operator. However these logs are useful for debugging by a developer and if required, this level needs to be enabled and provided to technical support for analysis.

Log File Rotation

- Log rotation is important to maintain the stability of the device, because the larger log files are difficult to manipulate and file system would run out of space. The solution to this common problem is log file rotation.
- Log rotation is scheduled to happen for every 5 minutes, here the log file size is used as the condition to perform rotation.

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

- Log rotate operation creates a backup of the current log file, and clears the current log file content. Also these rotated log files are compressed to save disk space. Excluding the current log file, four backup files are maintained in the system, and the older logs are removed as part of the rotation operation.
- Default log file **/var/log/messages** rotated, if the size is greater than 100 MB. The following are the rotated log files generated in the path **/var/log.**

```
root@host:/var/log# ls messages*
messages  messages.1  messages.2.gz  messages.3.gz  messages.4.gz
```

- Manually configured log file **/log/LOG1** gets rotated, if its size is greater than configured size. Here **LOG1** is the manually configured using the command **logging logfile <filename>** and the log file size in bytes can be configured using the command **logging logfile LOG1 <severity> size <4096-419430400>**

```
(config)#logging logfile LOG1 7 size 4096
```

- Here configured logging file **/log/LOG1** is rotated if the size is greater than 4096 bytes. The following are the rotated log files generated in the path **/log**

```
root@host:/log# ls LOG*
LOG1  LOG1.1  LOG1.2.gz  LOG1.3.gz  LOG1.4.gz
```

clear logging logfile

Use this command to clear the existing contents of the configured logging logfile.

Note: If the name of the configured logging log file is “mylogfile”, this command clears only the log file mylogfile. But the other rotated or compressed log files are untouched.

Command Syntax

```
clear logging logfile
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#clear logging logfile
```

feature rsyslog

Use this command to enable the rsyslog server.

Use the **no** form of this command to disable the rsyslog server.

Command Syntax

```
feature rsyslog vrf ( (NAME|management)|)
no feature rsyslog vrf ( (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added `VRF NAME` parameter in OcNOS version 6.5.3.

Example

```
#configure terminal
(config)#feature rsyslog vrf management
```

[1]Virtual Routing and Forwarding

logging console

Use this command to set the severity level that a message must reach before the messages is sent to the console. The severity levels are from 0 to 7 as shown in Table 42. Syslog severities (page 720)

Use the command logging console disable to disable logging console messages.

Use the **no** form of this command to remove logging console configuration and return to the default severity level.

Notes:

- Setting the level above 5 might affect performance and is not recommended in a production network.
- Below message will be displayed if console severity is set to 6 or 7:

  ```
  % Warning : If debug volume is huge it can degrade system performance
  and makes console to be non-responsive
  ```

- For CMMD, Critical logs in the console are equivalent to Alert traps & Alert logs on the console is equivalent tocritical trap in SNMP.

Command Syntax

```
logging console (<0-7>|)
logging console disable
no logging console
```

Parameters

<0-7>
Maximum logging level for console messages as shown in Table 42. Syslog severities (page 720).

disable
Disables the logging console

Default

If not specified, the default logging level is 2 (Critical).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and the command **logging console disable** was introduced in the OcNOS version 5.1.

Example

```
#configure terminal
(config)#logging console 6
(config)#commit
(config)#logging console disable
(config)#commit
```

logging level

Use this command to set the severity level that a message for a specific process must reach before the messages is logged. The severity levels are from 0 to 7 as shown in Table 42. Syslog severities (page 720). Logging happens for the messages less than or equal to the configured severity level.

Use the **no** form of this command to disable logging messages.

Notes:

- Default log level is 2 to report Emergency-0, Alert-1 and Critical-2 level events.
- From OcNOS version 4.2, the behavior of the option **all** for the logging level command has changed for the running-config. Now the command logging level **all** is displayed in the running-config with its respective level defined by the user instead of one command for each process. If the user have some logging level configured for some specific process in the system when the logging level **all** command is executed, the level of process that is already configured stays with the level and all other process are configured with the level defined by the **all** option. This change is necessary to support the option **all** for logging level in the Netconf also.

Command Syntax

```
logging level (all|auth|bgp|dvmrp|hostp|hsl|isis|l2mrib|lacp|lagd|ldp|mrib|
mstp|ndd|nsm|onm|oam|ospf|ospf6|pim|pon|pservd|ptp|rib|rip|ripng|rmon|rsvp|sflow|vrrp) <0-7>
no logging level (all|auth|bgp|dvmrp|hostp|hsl|isis|l2mrib|lacp|lagd|ldp|mrib|
mstp|ndd|nsm|oam|onm|ospf|ospf6|pim|pon|pservd|ptp|rib|rip|ripng|rmon|rsvp|sflow|vrrp)
```

Parameters

all
All messages

auth
Auth messages

bgp
BGP messages

dvmrp
DVMRP messages

hostp
Hostp messages

hsl
HSL messages

isis
ISIS messages

l2mrib
L2MRIB messages

lacp
LACP messages

lagd
LAGD messages

ldp
LDP messages

mrib
MRIB messages

mstp
MSTP messages

ndd
NDD messages

nsm
NSM messages

oam
OAM messages

onm
ONM messages

ospf
OSPF messages

ospf6
OSPF6 messages

pim
PIM messages

pon
PON messages

pservd
PSERVD messages

ptp
PTP messages

rib
RIB messages

rip
RIP messages

ripng
RIPNG messages

rmon
RMON messages

rsvp
RSVP messages

sflow
Sflow messages

vrrp
VRRP messages

<0-7>
Severity level as shown in Table 42. Syslog severities (page 720).

Default

By default, the logging level is 2 (critical).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#logging level all 7
(config)#logging level ospf 3
(config)#logging level hostp 5

(config)#do show running-config logging
logging level ospf 3
logging level hostp 5
logging level all 7
feature rsyslog
```

logging logfile

Use this command to specify the log file controls and where to save the logs in a configuration file. This command enables writing debug output and command history to the disk file in the directory **/log/**.

When logging logfile is enabled, OcNOS log information is stored in user configured logging file which is present in **/log** directory. The log is spread across four files total of these files size is the user configured size.

For example, if the name of the logging log file is `mylogFile` and logging file size configured is 4 MB then each file will be maximum size of 1MB. The logging file names will be `mylogFile, mylogfile.0, mylogfile.1 and mylogfile.2`.

`mylogFile` will have the latest log information. As soon as it's size becomes 1 MB this file is renamed as `mylogFile.0` and newlog information is written to new `mylogFile`. As a result oldest log information stored in mylogfile.2 and is lost in order to accommodate new set of logs in mylogFile.

Use option no to cancel writing to a specific log file.

Note: Changing logfile paramenters (name/size/severity) will be taken into effect for the next OcNOS session.

Command Syntax

```
logging logfile LOGFILENAME <0-7> ((size <4096-419430400>)|)
no logging logfile
```

Parameters

LOGFILENAME
Enter the logfile name (Maximum 200 alphanumeric characters).

<0-7>
Severity level as shown in Table 42. Syslog severities (page 720).

<4096-419430400>
Log file size in bytes.

Default

By default, log file size is 419430400 bytes.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This command is used to log the debug messages of a particular protocol daemon to the specified file.

```
#configure terminal
```

```
(config)#logging logfile test123 7
```

logging monitor

Use this command to set the severity level that a message must reach before a monitor message is logged. The severity levels are from 0 to 7 as shown in Table 42. Syslog severities (page 720).

Use the command logging monitor disable to disable the logging monitor messages.

Use the **no** form of this command to remove logging monitor config and return to the default severity level.

Note: Setting the level above 5 might affect performance and is not recommended in a production network.

Command Syntax

```
logging monitor (<0-7>|)
logging monitor disable
no logging monitor
```

Parameters

<0-7>
Maximum logging level for monitor messages as shown in Table 42. Syslog severities (page 720).

disable
Disables logging monitor

Default

If not specified, the default logging level is 7 (debug-details).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and the command **logging monitor disable** was introduced in the OcNOS version 5.1.

Example

```
#configure terminal
(config)#logging monitor 6
(config)#commit
(config)#logging monitor disable
(config)#commit
```

logging remote facility

Use this command to set a syslog servers facility.

OcNOS supports logging messages to one or more remote syslog servers. but the same facility is used for all the servers.

Use the **no** form of this command to use the default facility value, which is **local7**.

Note: Only one facility is supported for all protocol modules across all the configured logging servers.

Command Syntax

```
logging remote facility (local0|local1|local2|local3|local4|local5|local6|local7|user)
no logging remote facility
```

Parameters

facility
Entity logging the message (user defined); if not specified, the default is local7

local0
Local0 entity

local1
Local1 entity

local2
Local2 entity

local3
Local3 entity

local4
Local4 entity

local5
Local5 entity

local6
Local6 entity

local7
Local7 entity (default)

user
User entity

Default

7

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.1.

Examples

```
#configure terminal
(config)#logging remote facility local 6
(config)#no logging remote facility
```

logging remote server

Use this command to set a syslog server.

OcNOS supports logging messages to a syslog server in addition to logging to a file or the console (local or SSH/telnet console). OcNOS messages can be logged to a local syslog server (the machine on which OcNOS executes) as well as to one or more remote syslog servers.

Use the **no** form of this command to remove a syslog server.

Note: Maximum 8 remote log servers can be configured.

Command Syntax

```
logging remote server (A.B.C.D|X:X::X:X|HOSTNAME) ((0|1|2|3|4|5|6|7)|) (port <1024-65535>|)(vrf
management|)
no logging remote server (A.B.C.D|X:X::X:X|HOSTNAME) ((0|1|2|3|4|5|6|7)|) (port|)(vrf management|)
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

HOSTNAME
Host name; specify localhost to log locally

0
Emergency

1
Alert

2
Critical

3
Error

4
Notification

5
Informational

6
Debug informational

7
Debug detailed

<1024-65535>
Port number Default port is 514

vrf management
Virtual Routing and Forwarding name

Note: Severity at which messages are logged as shown in Table 42. Syslog severities (page 720). If not specified, the default is 7.

Default

If not specified, the default severity at which messages are logged is 7 (debug detailed).

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.

Examples

```
#configure terminal
(config)#logging remote server MyLogHost vrf management
(config)#no feature rsyslog vrf management
(config)# (config)#feature rsyslog
(config)#logging remote server 10.10.10.10 7
```

Note: In the latter configuration, the default **VRF**[1] does not need not to be specified in the command.

[1]Virtual Routing and Forwarding

logging snmp-traps

Use this command to configure the severity of the SYSLOG over the SNMP trap feature, which will be used as a filter to the SYSLOG messages sent over the SNMP trap

Use the **no** form of this command to set the severity back to its default value.

Command Syntax

```
logging snmp-traps (<0-7>)
no logging snmp-traps
```

Parameters

0
emergency

1
alert

2
critical

3
error

4
oper-notify/debug-warn

5
oper-info/debug-notify

6
debug-info

7
debug-details

Default

If not specified, severity will be set to 3 (error).

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0

Examples

```
#configure terminal
(config)#logging snmp-traps 6
(config)#commit
(config)#no logging snmp-traps
(config)#commit
```

logging timestamp

Use this command to set the logging timestamp granularity.

Use the **no** form of this command to reset the logging timestamp granularity to its default (milliseconds).

Notes:

- Any change in timestamp configurations will result in timestamp configured for event logged by protocol modules except for CLI history for the current and active sessions. The timestamp configuration is reflected in CLI history for new CLI sessions.
- Changing logging timestamp will be taken into effect for the next OcNOS session.

Command Syntax

```
logging timestamp (microseconds|milliseconds|seconds|none)
no logging timestamp
```

Parameters

microseconds
Microseconds granularity

milliseconds
Milliseconds granularity

seconds
Seconds granularity

none
No timestamp in log message

Default

By default, logging time stamp granularity is milliseconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#logging timestamp milliseconds
```

show logging

Use this command to display the logging configuration.

Command Syntax

```
show logging (info|level|server|console|timestamp|monitor)
```

Parameters

info
Show server logging configuration

level
Show facility logging configuration

server
Syslog server configuration

console
Console configuration

timestamp
Timestamp configuration

monitor
Monitor configuration

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging console
Console logging     : enabled Severity: Operator (critical) Level : 2

#show logging monitor
Logging monitor     : enabled Severity: Operator (debugging) Level: 7

#show logging server
  Remote Servers:
                1.1.1.1
                severity: Operator (informational)
                facility: local7
                VRF : management

#sh logging info
  Remote Servers:
                1.1.1.1
                severity: Operator (informational)
                facility: local7
                VRF : management
Logging console     : enabled Severity: operator (critical) Level : 2
```

```
Logging monitor     : enabled Severity: Operator (debugging) Level : 7
Logging timestamp   : seconds
File logging        : enabled  File Name   : /log/abc  Severity   : Operator (de
bugging)  Level   : 7  Size   : 4194304
Cli logging         : enabled

Facility        Default Severity        Current Session Severity
nsm                     2                           2
ripd                    2                           2
ripngd                  2                           2
ospfd                   2                           2
ospf6d                  2                           2
isisd                   2                           2

ribd                    2                           2
bgpd                    2                           2
l2mribd                 2                           2
hslrasmgr               2                           2
lagd                    2                           2
pservd                  2                           2
cmmd                    2                           2
```

show logging last

Use this command to display lines from the end of the log file.

Command Syntax

```
show logging last (<1-9999>)
```

Parameters

<1-9999>
Number of lines to display from end of the log file

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging last 100
2016 Mar 03 00:02:32 x86_64-debian NSM-3: AgentX: failed to send open message: Connection refused
2016 Mar 03 00:02:33 x86_64-debian OSPF-3: AgentX: failed to send open message: Connection refused
2016 Mar 03 00:02:33 x86_64-debian OSPFv3-3: AgentX: failed to send open message: Connection refused
2016 Mar 03 00:02:33 x86_64-debian IS-IS-3: AgentX: failed to send open message: Connection refused
2016 Mar 03 00:02:33 x86_64-debian BGP-3: AgentX: failed to send open message: Connection refused
2016 Mar 03 00:02:33 x86_64-debian RIP-3: AgentX: failed to send open message: Connection refused
```

show logging logfile

Use this command to display whether logging is enabled, the log file name, and the logging severity.

Command Syntax

```
show logging logfile
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging logfile
File logging        : enabled  File Name   : /log/abc  Severity   : (7)
2017 Sep 25 17:18:14 :  : CMLSH : CLI_HIST : User root@/dev/ttyS1 : CLI : '

sh logging info '

2017 Sep 25 17:29:02 :  : CMLSH : CLI_HIST : User root@/dev/ttyS1 : CLI : '
sh logging console
```

show logging logfile last-index

Use this command to display the number of line in the log file.

Command Syntax

```
show logging logfile last-index
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging logfile last-index
logfile last-index : 10
```

Here is the explanation of the show command output fields.

Table 43. show logging logfile last-index fields

Entry	Description
logfile last-index	Number of line in the logfile.

show logging logfile start-seqn end-seqn

Use this command to display a range of lines in the log file.

Command Syntax

```
show logging logfile start-seqn (<0-2147483647>) (|(end-seqn <0-2147483647>))
```

Parameters

start-seqn <0-2147483647>
Starting line number

end-seqn <0-2147483647>
Ending line number

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging logfile start-seqn 2 end-seqn 7
2

Here is the explanation of the show command output fields.

Table 44. show logging logfile start-seqn end-seqn fields

Entry	Description
start-seqn	Starting line number
end-seqn	Ending line number

show logging logfile start-time end-time

Use this command to display lines from the log file within a given date-time range.

Command Syntax

```
show logging logfile start-time (<2000-2030> WORD <1-31> WORD) (|(end-time <2000-2030> WORD <1-31>
WORD))
```

Parameters

start-time
Starting date and time:

<2000-2030>
Starting date of the year in YYYY format

WORD
Starting date of the month as **jan**, **feb**, **mar**,..., **oct**, **nov**, or **dec** (maximum length 3 characters)

<1-31>
Starting date of a day of month in DD format

WORD
Starting time in hour, minutes, and seconds in HH:MM:SS format (maximum length 8 characters); range <0-23>:<0-59>:<0-59>

end-time
Ending date and time:

<2000-2030>
Ending date of the year in YYYY format

WORD
Ending date the month as **jan**, **feb**, **mar**,..., **oct**, **nov**, or **dec** (maximum length 3 characters)

<1-31>
Ending date of a day of month in DD format

WORD
Ending time in hour, minutes,and seconds in HH:MM:SS format (maximum length 8 characters); range <0-23>:<0-59>:<0-59>

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sh logging logfile start-time 2019 Jan 04 06:20:49 end-time 2019 Jan 04 06:21:16
2019 Jan 04 06:20:49.611 : NE4-router : CMLSH : CLI_HIST : User root@/dev/ttyS0 : CLI : sh logging
logfile

2019 Jan 04 06:21:08.512 : NE4-router : CMLSH : CLI_HIST : User root@/dev/ttyS0 : CLI : show logging
```

```
logfile last-index

2019 Jan 04 06:21:16.246 : NE4-router : CMLSH : CLI_HIST : User root@/dev/ttyS0 : CLI : show logging
logfile last-index
```

show running-config logging

Use this command to display the logging configuration.

Command Syntax

```
show running-config logging
```

Parameters

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config logging
no Logging console
no Logging monitor
logging timestamp milliseconds
```

VLOG Commands

This chapter describes virtual router log (VLOG) commands.

show vlog all

Use this command to display the output of all virtual router log **show** commands. For column descriptions, refer to descriptions of the individual commands.

Command Syntax

```
show vlog all
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show vlog all

Type     Name     FD  UserVR  AllVrs  VRCnt
tty   /dev/pts/8  12  vr222    ---        1
tty   /dev/pts/4  13  <PVR>    ---        1

VR-Name  VR-Id  PVR-Terms  VR-Terms                  LogFile                      CurSize
<PVR>        0          1         0         /var/local/zebos/log/pvr/my-log       1624320
vr111        1          0         0         n/a                                       n/a
vr222        2          0         1         /var/local/zebos/log/vr222/log-vr222        0
vr333        3          0         0         /var/local/zebos/log/vr333/log-vr333        0

Name  Id  MsgCnt        ConTime             ReadTime
NSM    1       1  Fri May-15 21:05:04  Fri May-15 21:05:04
IMI   19       1  Fri May-15 21:05:02  Fri May-15 21:05:02
```

The following table explains the output:

Table 45. show vlog all details

Name	Name of protocol module
Id	Protocol module identifier
MsgCnt	Number of log messages received from protocol module
ConTime	Time the connection was established
ReadTime	Time the last log message was received

The following table explains the output:

Table 46. show vlog all details

Type	Type of terminal
Name	Device name
FD	File descriptor
UserVR	Name of the Virtual Router where in which the user is logged in
AllVRs	Whether the PVR user requested debug output from all VRs
VRCnt	Number of VRs to which a terminal is attached

The following table explains the output:

Table 47. show vlog all details

VR-Name	Virtual router name
VR-Id	Virtual router identifier
PVR-Terms	Number of attached PVR terminals
VR-Terms	Number of attached VR terminals
LogFile	Name of VR log file (this column is empty if writing to a log file is disabled)
CurSize	Log file current size

show vlog clients

Use this command to display all attached virtual router log clients (protocol modules).

Command Syntax

```
show vlog clients
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show vlog clients

Name  Id  MsgCnt          ConTime               ReadTime
NSM    1       1     Fri May-15 21:05:04  Fri May-15 21:05:04
IMI   19       1     Fri May-15 21:05:02  Fri May-15 21:05:02
```

The following table explains the output fields for show vlog clients details:

Table 48. show vlog clients details

Name	Name of protocol module
Id	Protocol module identifier
MsgCnt	Number of log messages received from protocol module
ConTime	Time the connection was established
ReadTime	Time the last log message was received

show vlog terminals

Use this command to display all active connections where VLOGD is forwarding log output.

Command Syntax

```
show vlog terminals
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show vlog terminals

Type     Name     FD  UserVR  AllVrs  VRCnt
tty   /dev/pts/8  12  vr222    ---        1
tty   /dev/pts/4  13  <PVR>    ---        1
```

The following table explains the output:

Table 49. show virtual router log terminals details

Type	Type of terminal
Name	Device name
FD	File descriptor
UserVR	Name of the Virtual Router where in which the user is logged in
AllVRs	Whether the PVR user requested debug output from all VRs
VRCnt	Number of VRs to which a terminal is attached

show vlog virtual-routers

Use this command to display virtual router statistics such as the number of terminals attached.

Command Syntax

```
show vlog virtual-routers
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show vlog virtual-routers

VR-Name  VR-Id  PVR-Terms  VR-Terms LogFile                                CurSize
<PVR>         0  1          0        /var/local/zebos/log/pvr/my-log       1624320
vr111         1  0          0        n/a                                   n/a
vr222         2  0          1        /var/local/zebos/log/vr222/log-vr222  0
vr333         3  0          0        /var/local/zebos/log/vr333/log-vr333  0
```

The following table explains the output:

Table 50. show vlog virtual-routers details

VR-Name	Virtual router name
VR-Id	Virtual router identifier
PVR-Terms	Number of attached PVR terminals
VR-Terms	Number of attached VR terminals
LogFile	Name of VR log file (this column is empty if writing to a log file is disabled)
CurSize	Log file current size

MONITOR AND REPORTING SERVER CONFIGURATION

Software Monitoring and Reporting

Overview

OcNOS provides a mechanism (called “watchdogging”) to monitor all OcNOS modules and provides the following functions.

1. Periodic heart beat check.
2. Automatic restarts of a module upon a hung state or crash detection.
3. Upon hanging or crashing of a module, a crash report (including system states) is logged.
4. A proprietary SNMP trap is sent to the trap manager, if configured, after a fault is detected in a protocol module. Similarly a trap is sent when the module recovers.

By default, the software watchdog is enabled and the keep-alive time interval is 60 seconds. All OcNOS processes periodically send keep-alive messages to a monitoring module at the configured keep-alive time interval.

This functionality can be disabled for a particular module or all OcNOS modules by using CLI commands. In order to permanently disable software monitoring functionality, the user has to disable the watchdog feature. If, however, software watchdogging is disabled the monitoring module doesn’t take any action upon a hang or crash of any OcNOS module.

Configuration

`#configure terminal`	Enter Configure mode.
`(config)#feature software-watchdog`	Enable software watchdog for all OcNOS modules — This is the default.
`(config)#no software-watchdog imi`	To disable software watchdog for only imi modules.
`(config)#software-watchdog keep-alive-time 100`	The keep-alive time interval in seconds. Default is 60 seconds and applies to all OcNOS modules.
`(config)#show software-watchdog status`	Display the keep-alive time interval and list of OcNOS process names with watchdog status for each OcNOS modules.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configuration

Validation

```
#show software-watchdog status

Configure sFlow for Single Collector

Overview

This chapter provides the steps for configuring Sampled Flow (**sFlow**[1]).

sFlow is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

The sFlow agent samples packets as well as polling traffic statistics for the device it is monitoring. The packet sampling is performed by the switching/routing device at wire speed. The sFlow agent forwards the sampled traffic statistics in sFlow PDUs as well as sampled packets to an sFlow collector for analysis.

Note: sFlow egress sampling for multicast, broadcast, or unknown unicast packets is not supported.

The sFlow agent uses the following forms of sampling:

- Sampling packets: samples one packet out of a defined sampling rate. This sampling is done by hardware at wire speed.
- Sampling counters: polls interface statistics such as generic and Ethernet counters at a defined interval.

You must enable the sFlow feature and collector before enabling sFlow sampling on an interface.

You cannot globally enable sFlow sampling monitoring on all interfaces with a single command. Instead you must enable sFlow sampling on the required interfaces individually.

sFlow feature is supported on physical interface as well as **LAG**[2] interface. Configuring sampling on a LAG interface will enable the same on all member ports part of that LAG interface.

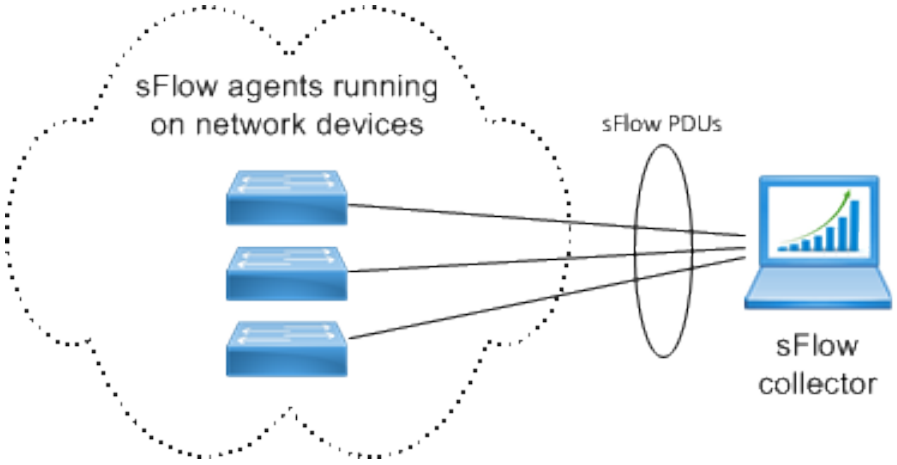
- When sflow sampling is in-progress on high rate, CPU usage spike messages from Chassis monitoring module (cmmd) is expected.
- The Qumran 1 platform is equipped to handle a total of 9 unique sampling rates. Ingress and egress sampling rate is counted separately.
- The Qumran 2 platform is equipped to handle a total of 15 unique sampling rates.
    - For egress, maximum 7 unique sampling rates can be created.
    - If egress sampling is not used, a total of 15 unique ingress sampling rates can be configured.
    - Total ingress sampling = 15 - number of egress sampling rates.

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

[2]Link Aggregation Group

Topology

Figure 51. Basic sFlow topology



Configuration

sFlow Agent

`#configure terminal`	Enter configure mode.
`(config)#feature sflow`	Enable the sFlow feature.
`(config)#sflow collector 2.2.2.2 port 6343 receiver-time-out 0 max-datagram-size 200`	Configure the sFlow collector.The IP address must be reachable via the management **VRF**[1].
`(config)#interface xe1`	Enter interface mode
`(config-if)#sflow poll-interval 5`	Set the counter poll Interval on the interface.
`(config-if)#sflow sampling-rate 1024 direction ingress max-header-size 200`	Set the sFlow sampling interval on the interface in ingress directions.
`(config-if)#sflow sampling-rate 1024 direction egress max-header-size 120`	Set the sFlow sampling interval on the interface in egress directions.
`(config-if)#sflow enable`	Start packet sampling on the interface
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#end`	Exit interface and configure mode.

Configure sFlow for Multiple Collectors

Overview

The **sFlow**[1] feature collects sampled traffic data and counters from configured interfaces. The collected data is sent to a collector using the sFlow protocol. For more information, refer to RFC 3176.

This functionality is enhanced to support multiple collectors with one connections for each, simultaneously.

Feature Characteristics

- Supports maximum of five concurrent sFlow collectors on the system.
- Uses a specific user defined **VRF**[2] interface for each collector. If not specified, the management VRF is used.
- Sends the collected sFlow samples on each interface to the corresponding collector configured on the interface.

Benefits

The sFlow with multiple collectors support provides the capability to do multiple analysis simultaneous in a network.

Prerequisites

Make sure to enable the required interface with sflow data collection and a agent IP address. For example,

```
!
feature sflow
sflow agent-ip 1.2.7.10
!
```

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

[2]Virtual Routing and Forwarding

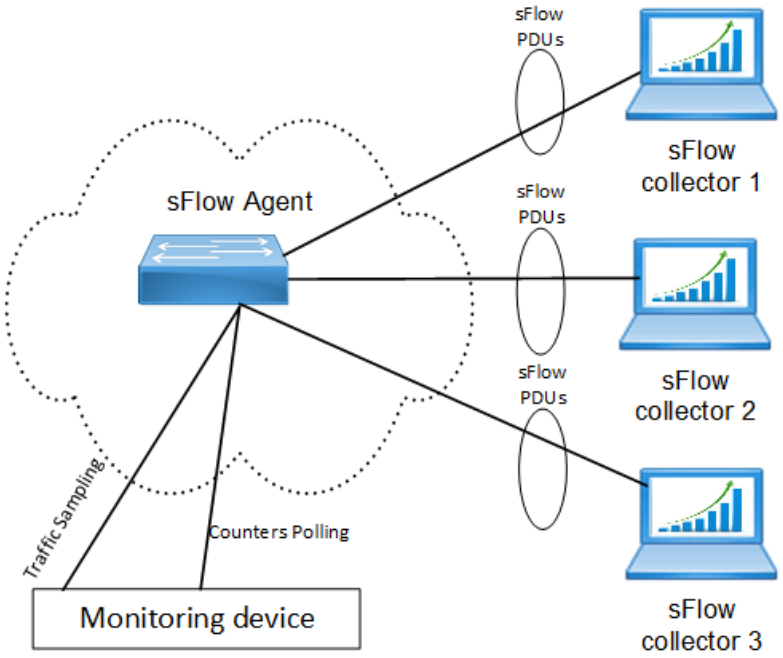
sFlow Configuration

This section provides the configurations required to assign multiple **sFlow**[1] collectors to OcNOS.

Topology

The following topology illustrates the sFlow multiple collectors connected with one sFlow Packet Data Unit (**PDU**[2]):

Figure 52. sFlow with Multiple Collectors



Perform the following configurations:

1. Configure sFlow using the configuration provided in Configure sFlow for Single Collector (page 756) section for single collector.
2. In the interface mode, enable sFlow for a particular interface and specify the collector-id for multiple collectors:

```
OcNOS(config)#interface xe12
OcNOS(config-if)#sflow sampling-rate 1024 direction ingress max-header-size 256
OcNOS(config-if)#sflow sampling-rate 2000 direction egress max-header-size 16
OcNOS(config-if)#sflow enable
OcNOS(config-if)#sflow poll-interval 10
OcNOS(config-if)#sflow collector-id 3
```

Show Running Configurations

The following show output display the sample sflow configuration details.

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

[2]A unit of data transmitted as a composite by a protocol.

sFlow Multiple Collector Commands

The sFlow feature introduces a new parameter `collector-id`.

For additional information about the revised sflow collector (page 829) command, refer to the sFlow Commands section.

sFlow Multiple Collector Commands with user defined vrfs

sFlow Multiple Collector Commands with User Defined VRFs

The sFlow feature introduces a new parameter **`collector-id`**.

- Users can sample packets on an interface mapped to a user-defined **VRF**[1] and send sFlow packets through the same VRF.
- Users can send sampled packets to multiple destinations (collectors) through different VRFs simultaneously.

The following sample configuration demonstrates sFlow using multiple collector-ids with user-defined VRFs:

```
feature sflow
sflow collector-id 3 collector 172.20.1.1 port 6343 receiver-time-out 0 max-datagram-size 200 vrf sys_
mgmt
sflow collector-id 4 collector 192.168.7.2 port 6343 receiver-time-out 1000 max-datagram-size 200 vrf
xe11_vrf
sflow collector-id 5 collector 172.10.1.1 port 65535 receiver-time-out 0 max-datagram-size 200 vrf xe10_

Glossary

Key Terms/Acronym	Description
PDU	A unit of data transmitted as a composite by a protocol.
sFlow	Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

Control Plane Policing Configuration

Control plane policing (CoPP) manages the traffic flow destined to the host router CPU for control plane processing. CoPP limits the traffic forwarded to the host CPU and avoids impact on system performance.

- CoPP has organized the handling of control packets by providing per-protocol hardware CPU queues. So, control packets are queued in different CPU queues based on protocol.
- Per-protocol CPU queue rate limits and buffer allocations are programmed during router initialization, thus, every CPU queue is rate-limited to a default stable and balanced behavior across protocols.
- When control packets are received at a higher rate than the programmed rate, the excess traffic is dropped at the queue level in the packet processor hardware itself.
- All CPU queues are pre-programmed with default rate limits and buffer allocations to ensure a default stable and balanced behavior across protocols.
- Rate limits are in terms of Kbps. Hardware does not support packets per second (PPS).
- Qumran (MX, AX, and UX) supports per-queue rate shaping configurations within a range of 469 Kbps to 483 Gbps. The granularity is 469 Kbps for the low range and 1.56% for the higher range.

Topology

A network traffic simulator device connects to a router (R1) to generate and send various types of network traffic. The router, which has CoPP configured, manages and limits traffic destined for its CPU using multiple CPU queues with specific properties for different control traffic types. Another traffic simulator device connects to the router to generate or receive traffic, testing the router's CPU queues and CoPP configurations to handle different traffic loads and types.

Topology 1. Simple configuration of CPU Queuing

The CPU queue rates are listed for each protocol queue.

Table 51. Default CPU queues

Default queues	Default rate In kbps	Maximum configurable rate in kbps	Default queue length in kbytes	Description
CPU0.q0	900	20000	1024	Unclassified protocols and unknown or destination lookup failure packets are redirected to default CPU queues 0-7 based on the packet's **cos/dscp** values. SSH, TELNET, and SNMP traffic destined to host router CPU is remarked to CPU0.q6. SSH: TCP Source/Destination port 22 TELNET: TCP Source/Destination port 23 SNMP: **UDP**[1] Source/Destination port 161/162
CPU0.q1	900	20000	1024	
CPU0.q2	900	20000	1024	
CPU0.q3	900	20000	1024	
CPU0.q4	900	20000	1024	
CPU0.q5	900	20000	1024	
CPU0.q6	10000	20000	1024	
CPU0.q7	900	20000	1024	

Table 52. Per protocol CPU queues

Control Plane Policing Using ACL

Control Plane Policing (CoPP) is enhanced with Access Control List (ACL) support, enabling more precise classification and management of CPU-bound traffic. This update introduces ACL-based filtering for IPv4, improving security, optimizing traffic handling, and ensuring more efficient control-plane traffic processing.

Feature Characteristics

- **Enhanced Traffic Classification:** Supports ACL-based filtering for IPv4 traffic.
- **Configurable Actions:** Allows packet filtering with actions such as permit, deny, and policing.
- **Granular Control:** Introduces new options under hardware profiles, access lists, class maps, and policy maps to customize CoPP settings.
- **Improved Policy[1] Management:**Enables the application of CoPP policies at the system level to optimize resource management. ACLs are applied to all packets destined for the CPU from **ASIC**[2] hardware, including packets directed to the device's IP address, those trapped due to exceptions, and packets received on an InBand **VRF**[3] interface.

Benefits

- **Stronger Security:** Reduces the risk of DoS attacks by filtering and limiting excessive control-plane traffic.
- **Better Traffic Management:** Offers precise control over different types of traffic reaching the CPU, improving overall system efficiency.
- **Flexible Configuration:** Provides users with more options to define and manage traffic policies.
- **Increased Performance:** Ensures network devices function optimally by reducing unnecessary load on the control plane.

Configuration

Topology

Figure 53. Simple Configuration of CoPP ACL

CoPP IPv4 ACL Configuration

Follow these steps to configure CoPP on the device:

1. Enter Configuration Mode:
   ```
   # configure terminal
   ```
2. Create an IP access list named **`acl`** for CoPP.
   ```
   (config)# ip copp access-list acl
   ```
3. Define ACEs to permit IP packets from **`20.20.20.1`** to any destination and to deny all other IP packets.

[1]A set of rules determining which actions are permitted or denied for a specific user role.

[2]Application Specific Integrated Circuit

[3]Virtual Routing and Forwarding

```
(config-ip-copp-acl)# permit any 20.20.20.1 any
(config-ip-copp-acl)# deny any any any
```

4. Exit access list configuration mode.

```
(config-ip-copp-acl)# exit
```

5. Enable QoS, statistics monitoring, and commit the changes.

```
(config)# qos enable
(config)# qos statistics
(config)# commit
```

6. Create a class-map named **c1** for CoPP.

```
(config)# class-map type copp match-any c1
```

7. Associate the previously created acl with the class-map, and then exit.

```
(config-cmap-copp)# match access-group acl
(config-cmap-copp)# exit
```

8. Create a class-map named **p1** for CoPP.

```
(config)# policy-map type copp p1
```

9. Attach the class-map **(c1)** to the policy-map and then commit.

```
(config-pmap-copp)# class type copp c1
(config-pmap-copp)# commit
```

10. Enable hardware-profile filter for copp.

```
(config)# hardware-profile filter ingress-ipv4-qos-copp enable
(config)# commit
```

11. Install service-policy for the policy-map **p1**.

```
(config)# copp service-policy p1
(config)# commit
(config)# end
```

Configuration Snapshot

```

-------+------------------+
copp
c1 150861 224179446 -
```

Note: Use the command **`clear interface cpu counters`** to clear the cpu counters rate and cpu counters queue-statistics. and **`clear qos statistics`** to clear copp type policy-map statistics.

Verify packets drop in the hardware when they hit deny action by using the show command below:

```
OcNOS#show hardware-discard-counters
Unit :0
+--------------------------------------------------+--------------------+
| Registers |Core 0 |
+--------------------------------------------------+--------------------+
CGM_VOQ_SRAM_ENQ_RJCT_PKT_CTR 88232
CGM_QNUM_NOT_VALID_PKT_CTR 88232
```

CoPP Policer Configuration

Follow these steps to configure CoPP policing:

1. Enter Configuration Mode:

   ```
   # configure terminal
   ```

2. Create an IP access list named **`acl`** for CoPP.

   ```
   (config)# ip copp access-list acl
   ```

3. Define ACEs to permit IP packets to any destination.

   ```
   (config-ip-copp-acl)# permit any any any
   ```

4. Exit access list configuration mode.

   ```
   (config-ip-copp-acl)# exit
   ```

5. Enable QoS, statistics monitoring, and commit the changes.

```
(config)# qos enable
(config)# qos statistics
(config)# commit
```

6. Create a class-map named **c1** for CoPP.

```
(config)# class-map type copp match-any c1
```

7. Associate the previously created acl with the class-map, and then exit.

```
(config-cmap-copp)# match access-group acl
(config-cmap-copp)# exit
```

8. Create a class-map named **p1** for CoPP.

```
(config)# policy-map type copp p1
```

9. Attach the class-map **(c1)** to the policy-map and then commit.

```
(config-pmap-copp)# class type copp c1
(config-pmap-copp)# commit
```

10. Configure the Policer (Rate Limiting).

```
(config-pmap-c-copp)# police cir 100 kbps
(config-pmap-c-copp)# commit
```

Note: CPU queue rate limits take precedence over CoPP policing configurations when the policer rate exceeds the allowed CPU queue limit. The final enforced rate is determined by the lower of the two values.

11. Enable hardware-profile filter for copp..

```
(config)# hardware-profile filter ingress-ipv4-qos-copp enable
(config)# commit
```

12. Install service-policy for the policy-map **p1**.

```
(config)# copp service-policy p1
(config)# commit
(config)# end
```

Configuration Snapshot

```
!
hardware-profile filter ingress-ipv4-qos-copp enable
hardware-profile statistics voq-full-color enable
hardware-profile statistics cfm-ccm enable
!
qos enable
qos statistics
!

```

Implementation Example

- To prevent a specific stream from consuming the CPU queue's allocated bandwidth for any protocol, classify packets based on their source and destination IP addresses. Then, apply a policer in the ACL to enforce rate limits, ensuring traffic is controlled before it impacts CPU queue performance.
- To monitor the traffic volume of each protocol from a specific source IP or involving fragments, CoPP ACLs can be configured with a permit rule and no action. This setup implicitly enables the count action, which records the total amount of classified traffic reaching the CPU. Based on the results, the administrator can apply a policer to control the streams or deny packets from a specific source or destined for a particular L4 port.

IP Flow Information Export

Overview

In OcNOS, the Internet Protocol Flow Information Export (IPFIX) Exporter enables real-time traffic analysis. It achieves this through sampling, which involves selecting a subset of network traffic and exports flow records containing detailed information about the sampled traffic flows. It enables network operators to gain valuable insights into network traffic patterns and behaviors.

IPFIX Exporter Characteristics

The OcNOS router equipped with IPFIX Exporter functionality within the network infrastructure identifies the customer domain (Observation ID), samples ingress traffic, and generates IPFIX flow records. These flow records are transmitted to a designated collector node for further analysis.

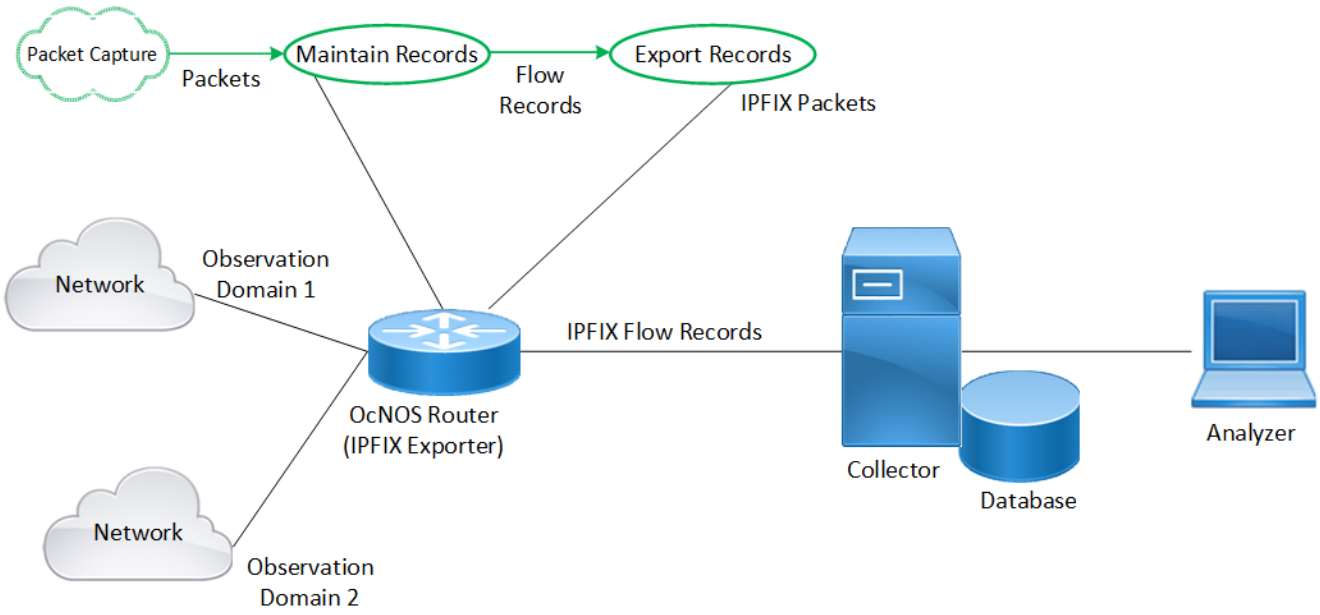
Achieves efficient flow record management and export on the **Jericho2**[1] (Broadcom DNX) platform by leveraging hardware acceleration support and utilizing Application Specific Integrated Circuit (**ASIC**[2]) capabilities, such as the Eventor block. ASIC ensures optimized performance and functionality at the hardware level.

The IPFIX exporter performs three core functions:

1. Selecting flows for sampling
2. Maintaining flow records
3. Exporting flow records

The following diagram illustrates the flow of network (ingress) traffic data in an IPFIX-enabled environment.

Figure 54. IPFIX Exporter



[1]Broadcom DNX Jericho2, a network routing chipset.

[2]Application Specific Integrated Circuit

Here's a breakdown of the process steps:

Packet Capture: Capture network traffic data by the IPFIX Exporter (OcNOS Router) from various sources within the network.

Flow Selection for Sampling: IPFIX enables administrators to selectively sample specific network flows, allowing targeted traffic monitoring based on predefined criteria.

Note: IPFIX supports ingress sampling and only one IPv4 template format.

Maintain Records: IPFIX Exporter maintains detailed flow records using hardware-accelerated functions. These records include comprehensive information such as IPv4 traffic details, source and destination addresses, port numbers, protocol specifics, and timestamps.

Export Records: The IPFIX Exporter aggregates and packages the flow records into IPFIX packets. These packets are then exported to configured collector nodes for centralized traffic analysis and management.

The IPFIX Exporter aggregates and packages flow records into IPFIX packets, which it then exports to configured collector nodes for centralized traffic analysis and management.

Transmission: The IPFIX Exporter sends packets to the designated collector device connected through the in-band network using the default **UDP**[1] port number **`4739`**. The collector IP address must be configured, and the port number is optional. If the port number is not specified, it defaults to **`4739`**.

Collector: Collector nodes receive the IPFIX packets and parse the flow records for further analysis and interpretation

Note: OcNOS does not include an IPFIX Collector.

Analyzer: Specialized software or tools analyze the collected flow records to gain insights into network traffic patterns and behaviors.

Limitations

- IPFIX does not support validating route reachability to collector nodes.
- IPFIX does not support sampling of sub-interfaces, **LAG**[2], and **SVI**[3] interfaces.
- Hardware limitations cause disruptions lasting approximately twelve seconds when changes are made to samples-per-message.
- The **`hardware-profile filter`** command is not integrated with IPFIX. IPFIX allocates its TCAM resources upon configuration of the first IPFIX monitored interface and releases them when the last IPFIX monitored interface is removed. The key size for IPFIX is 320 bits.

Benefits

The IPFIX Exporter has the following benefits:

[1]User Datagram Protocol

[2]Link Aggregation Group

[3]Switched Virtual Interface

- Enhanced Network Visibility: IPFIX provides detailed insights into network traffic, enabling network operators to identify and address issues promptly.
- Efficient Network Management: By collecting and exporting flow records, IPFIX streamlines network management tasks, allowing for more effective monitoring and troubleshooting.
- Optimized Resource Utilization: With targeted flow sampling and detailed flow records, IPFIX helps optimize resource utilization by focusing monitoring efforts on specific network segments or traffic types.

Prerequisites

- Before enabling IPFIX, check if any **`hardware-profile filter`** entries are enabled. If any entries with a key size less than 320 bits are enabled, it is recommended to first disable them. Then, configure the first IPFIX monitored interface, and finally, re-enable the existing entries. This ensures optimal allocation of TCAM resources. If a CRITICAL error message indicating **`No resources for operation`** appears when enabling IPFIX or re-enabling the existing entries, then all these features cannot be enabled simultaneously. Consider disabling other hardware filter entries. For example, on VXLAN Spine nodes, disable the **`vxlan filter`** to free up TCAM resources.
- Before configuring the IPFIX objects, enable the **`hardware-profile statistics cfm-lm enable`** filter statistics loss-measurement command in hardware. This action ensures that the necessary hardware functionality is enabled for seamless integration with the IPFIX configuration. It also ensures IPFIX counters are unused by other modules.
- Assign the IP address of a source and ingress interface configured on the exporter device.

  The following show running output illustrates enabling hardware statistics loss-measurement and assigning the IP address to the required interfaces.

```
hardware-profile statistics cfm-lm enable
!
interface xe4
 ip address 198.51.100.4/24
!
interface xe5
 ip address 192.0.2.88/24
!
```

Notes:

- The maximum number of unique sampling rates supported by IPFIX Exporter depends on the availability of free mirroring profiles in the ASIC.
- Various features like SFLOW, SNIFF, and Mirror utilize each mirroring profile. Qumran-2A series platform supports a maximum of 32 mirror profiles. For every sampling rate configuration, even if it matches an existing rate on another interface, it requires a new mirror-profile. Therefore, the number of ports that can be enabled with IPFIX is limited by the number of mirror-port profiles available in the system.
- The IPFIX Exporter sends template record format to the collector over the in-band, and the ASIC sends data records over the in-band.

Configuration

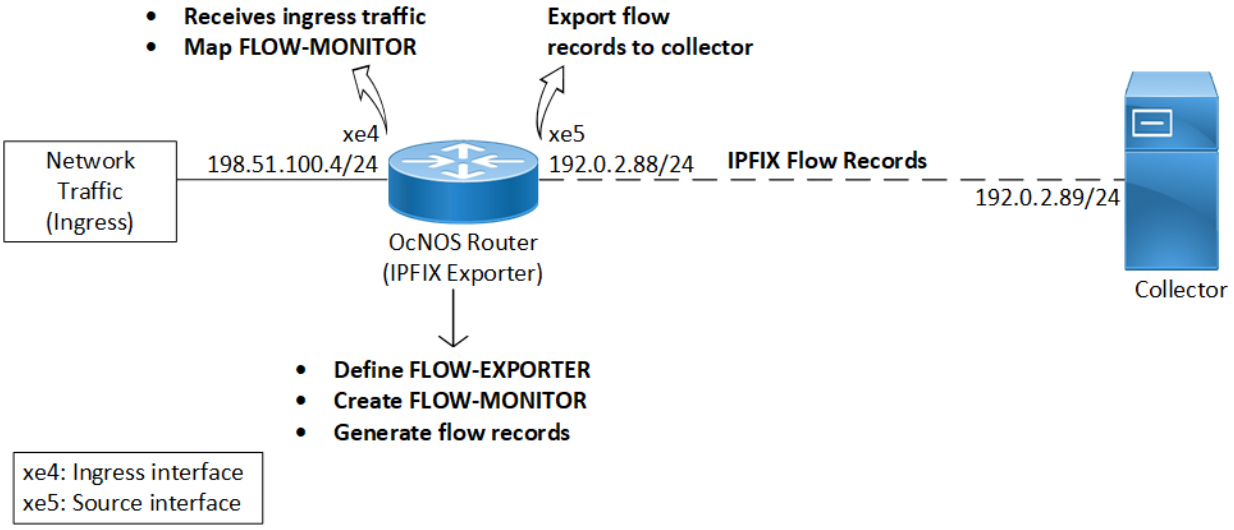
The following configuration enables the IPFIX feature on the OcNOS device, facilitating the collection and export of flow-specific information for network traffic analysis and management.

Topology

In this topology, simulated ingress traffic is routed through an OcNOS device equipped with IPFIX Exporter functionality before being transmitted to the collector.

Note: The collector should be operational and actively listening on the configured IP address and port. Additionally, it should be reachable from the OcNOS node.

Figure 55. IPFIX Exporter



The following commands configure the IPFIX Exporter in OcNOS, enabling the collection and export of flow-specific information for ingress traffic analysis and management. For additional information on each command, refer to the IPFIX Commands (page 781) section.

Note: Ensure all are met before proceeding with the configuration.

1. **Define an IP Flow Exporter for flow records:**

   When configuring the IP flow exporter (`FLOW-EXPORTER`), designate the source interface (**`xe5`**) for generating flow data and specify the destination collector IP address (**`192.0.2.89`**) and **UDP**[1] port (**`90`**) for receiving the exported data. Assign a unique template ID (**`500`**) to ensure proper interpretation of the flow records, with templates refreshed at intervals of **`600`** seconds for accuracy. Also, set the number of flow samples per export message to **`1`** to determine the granularity of the exported data.

   ```
   OcNOS(config)#ip-flow-exporter FLOW-EXPORTER
   ```

[1]User Datagram Protocol

```
OcNOS(ip-flow-exporter)#source xe5
OcNOS(ip-flow-exporter)#collector 192.0.2.89 udp-port 90
OcNOS(ip-flow-exporter)#template-id 500
OcNOS(ip-flow-exporter)#template-refresh-interval 600
OcNOS(ip-flow-exporter)#samples-per-message 1
```

2. **Create an IP Flow Monitor profile:**

   Establish a flow monitor (**FLOW-MONITOR**) to track network flows. Link it with the exporter (**FLOW-EXPORTER**) to transmit monitored flow data. Define a sampling rate **1024** to sample every 1024th packet for flow monitoring. Set the observation domain identifier (**16**) to identify the flow monitoring domain uniquely.

```
OcNOS(config)#ip-flow-monitor FLOW-MONITOROcNOS
OcNOS(ip-flow-monitor)#flow-exporter FLOW-EXPORTER
OcNOS(ip-flow-monitor)#sampling-rate 1024
OcNOS(ip-flow-monitor)#observation-domain-id 16
```

3. **Map the flow monitor to the ingress interface:**

   Associate the IP Flow Monitor profile **FLOW-MONITOR** to the ingress interface **xe4** to monitor traffic.

```
OcNOS(config)#interface xe4
OcNOS(config-if)#ip address 198.51.100.4/24
OcNOS(config-if)#flow-monitor FLOW-MONITOR
```

Validation

1. Verify the IPFIX exporter named **FLOW-EXPORTER** has been configured with the correct parameters using the output of the show ipfix (page 786) command.

```
OcNOS#show ipfix
Exporters:
  Name:                  FLOW-EXPORTER
    Source:              192.0.2.88
    Destination:         192.0.2.89
    Source UDP:          53859
    Destination UDP:     4739
    Template ID:         500

    Data Template Timeout:600
```

2. Check the exported fields in IPFIX data using the output of the show ipfix all (page 788) command. Confirm the template ID and examine the list of fields in the template. These fields define the information captured in the flow records, including source and destination IP addresses, port numbers, and protocol details.

```
OcNOS#show ipfix all
Templates:
  Template ID:           500
    DIRECTON (61), Length:1
    IP_VERSION (60), Length:1
    IPV4_TOS (5), Length:1
    IPV4_PKT_LEN (1), Length:2
    IPV4_FRAG_OFFSET (88), Length:2
    PROTOCOL (4), Length:1
    IPV4_SIP (8), Length:4
    IPV4_DIP (12), Length:4
    L4_SRC_PORT (7), Length:2
    L4_DST_PORT (11), Length:2
    TCP_CONTROL (6), Length:2
    ICMP_TYPE (32), Length:2
    INGRESS_VRF (234), Length:4
    INGRESS_IF (10), Length:2
    EGRESS_VRF (235), Length:4
    EGRESS_IF (14), Length:2
```

```
    SYS_UPTIME (22), Length:4
Exporters:
 Name:                 FLOW-EXPORTER
    Source:              192.0.2.88
    Destination:         192.0.2.89
    Source UDP:          53859
    Destination UDP:     4739
    Template ID:         500

    Data Template Timeout:600
```

3. Confirm the accuracy of the IPFIX-related configurations by examining the output of the show running-config ipfix (page 790) command. Ensure the IP flow exporter and monitor profiles are properly configured with the correct parameters.

```
OcNOS#show running-config ipfix
hardware-profile statistics cfm-lm enable
!
ip-flow-exporter FLOW-EXPORTER
 source xe5
 collector destination 192.0.2.89
 template-id 500
 template-refresh-interval 600
 samples-per-message 1
!
ip-flow-monitor FLOW-MONITOR
 flow-exporter FLOW-EXPORTER
 sampling-rate 1024
 observation-domain-id 16
!
interface xe4
 ip address 198.51.100.4/24
 flow-monitor FLOW-MONITOR
!
interface xe5
 ip address 192.0.2.88/24
!
```

4. Check the association of the IP flow monitor with the ingress interface (**xe4**) of the exporter device by examining the output of the **show running-config interface** command.

```
OcNOS#show running-config interface xe4
!
interface xe4
 ip address 198.51.100.4/24
 flow-monitor FLOW-MONITOR
!
```

Implementation Examples

Billing and Accounting System

Scenario: The Internet Service Provider (**ISP**[1]) aims to implement a billing and accounting system to accurately track and bill customers based on their network usage.

Use Case: Implementing IPFIX exporters in OcNOS routers at the ISP's network edge enables real-time monitoring of traffic flows, collection of usage data, and generation of detailed reports for billing and accounting purposes. This solution empowers the ISP to implement usage-based billing, enhance transparency, optimize revenue, and ensure compliance with regulatory requirements.

[1]Internet Service Provider

Security Monitoring

Scenario: A large enterprise wants to enhance security and compliance monitoring in its network infrastructure.

Use Case: By leveraging IPFIX exporters in OcNOS routers, the enterprise can monitor network traffic in real-time, detect security threats, and ensure compliance with industry regulations. This implementation allows for collecting detailed flow records, analyzing traffic patterns, and responding rapidly to security incidents. Additionally, it facilitates forensic analysis, audit trail generation, and proactive security measures, thereby strengthening the overall security posture of the enterprise network.

IPFIX Commands

The IPFIX exporter introduces the following configuration commands.

collector destination

Use this command to specify the destination IPv4 address and port number for exporting IPFIX flow records to a collector.

Use **no** parameter of this command to remove the specified collector destination address. This command eliminates the previously configured IPv4 address for data collection, effectively disabling the flow export feature for the specified destination.

Command Syntax

```
collector destination (ipv4-address) port <UINT32>  (|vrf <WORD>)
no collector destination (ipv4-address)
```

Parameters

destination (ipv4-address)
Sets the IPv4 address of the collector where IPFIX flow records will be exported.It defines the destination endpoint for sending the flow records.

port <UINT32>
Specifies the port number for sending the IPFIX flow records to the collector. The valid port numbers must fall within the range of **1024 to 65535**. The default port number is **4739**.

vrf <WORD>
(Optional) Specifies the name of the virtual routing and forwarding (**VRF**[1]) instance through which the flow records will be sent.

Default

None

Command Mode

IP flow monitor mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following commands configure the ip-flow-exporter (page 783) (**FLOW-EXPORTER**) profile with the collector destination set to IP address **192.0.2.89** and port **1025**.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-exporter FLOW-EXPORTER
OcNOS(ip-flow-exporter)#collector destination 192.0.2.89 port 1025
```

flow-exporter

Use this command to associate the flow monitor with an ip-flow-exporter (page 783) profile, enabling the flow monitor to export flow data to the specified destination defined in the exporter profile.

Command Syntax

```
flow-exporter <WORD>
```

Parameters

flow-exporter <WORD>
Specifies the name of the ip-flow-exporter (page 783) profile, which must be unique within the device and can contain up to 32 alphanumeric characters, hyphens, and underscores.

Default

None

Command Mode

IP flow monitor mode

Applicability

Introduced in OcNOS version 6.5.1.

[1]Virtual Routing and Forwarding

Example

The following command establishes a connection between an IP flow exporter profile named **FLOW-EXPORTER** and the ip-flow-monitor (page 784) profile, enabling the flow monitor to export flow data using the settings configured in the exporter profile.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-monitor FLOW-MONITOR
OcNOS(ip-flow-monitor)#flow-exporter FLOW-EXPORTER
```

flow-monitor

Use this command to associate flow monitoring on an ingress interface, enabling the monitoring of traffic based on the settings specified in the ip-flow-monitor (page 784) profile.

Use **no** parameter of this command to remove the association of flow monitoring from an ingress interface.

Command Syntax

```
flow-monitor <WORD>
no flow-monitor <WORD>
```

Parameters

flow-monitor <WORD>
Specifies the name of the ip-flow-monitor (page 784) profile, which must be unique within the device and can contain up to 32 alphanumeric characters, hyphens, and underscores.

Default

None

Command Mode

Interface mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following command associates the flow monitoring profile (**FLOW-MONITOR**) with the ingress interface **xe4**.

```
OcNOS#configure terminal
OcNOS(config)#interface xe4
OcNOS(config-if)#flow-monitor FLOW-MONITOR
OcNOS(config-if)#
```

ip-flow-exporter

Use this command to configure an IP flow exporter profile to collect and export flow data from the network device. This data includes traffic statistics and network behavior information, which is then exported to an external collector or monitoring system for analysis and reporting purposes.

Command Syntax

```
ip-flow-exporter <WORD>
```

Parameters

ip-flow-exporter <WORD>
Specifies the name of the flow exporter profile, which must be unique within the device and can contain up to 32 alphanumeric characters, hyphens, and underscores.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following command creates an IP flow exporter profile named **FLOW-EXPORTER**.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-exporter FLOW-EXPORTER
OcNOS(ip-flow-exporter)#
```

ip-flow-monitor

Use this command to create an IP flow monitor profile, defining parameters and settings for monitoring network flows.

Use **no** parameter of this command to remove an existing IP flow monitor profile from the configuration.

Command Syntax

```
ip-flow-monitor <WORD>
no ip-flow-monitor <WORD>
```

Parameters

ip-flow-monitor <WORD>
Specifies the name of the flow monitor profile, which must be unique within the device and can contain up to 32 alphanumeric characters, hyphens, and underscores.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following command configures an IP flow monitor profile named **FLOW-MONITOR**.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-monitor FLOW-MONITOR
OcNOS(ip-flow-monitor)#
```

observation-domain-id

Use this command to specify the Observation Domain Identifier (ODID) for flow monitoring. The ODID uniquely identifies the flow monitoring profile. The ODID helps distinguish flow data from different monitoring domains when exported to a collector.

Command Syntax

```
observation-domain-id <0-4294967295>
```

Parameter

observation-domain-id <0-4294967295>
Sets the observation domain identifier value within the specified range.

Default

None

Command Mode

IP flow monitor mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following command assigns the ODID 16 to the flow monitoring profile.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-monitor FLOW-MONITOR
OcNOS(ip-flow-monitor)#observation-domain-id 16
```

samples-per-message

Use this command to set the number of flow records to be included in each export message.

Use **no** parameter of this command to set the number of flow records to be included in each export message.

Command Syntax

```
samples-per-message (1|8)
```

Parameters

samples-per-message (1|8)
Specifies the number of data records to be included in a single IPFIX message, which controls the granularity of the exported flow data.

Default

None

Command Mode

IP flow monitor mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following command sets the maximum number of data records to be included in each IPFIX message generated by the specified IP flow exporter profile.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-exporter FLOW-EXPORTER
OcNOS(ip-flow-exporter)#samples-per-message 1
```

sampling-rate

Use this command to configure the rate at which packets are sampled for flow monitoring. Every packet sampled at this rate will be sent to the monitor for IPFIX processing.

Use **no** parameter of this command to remove the sampling rate configuration from the device.

Command Syntax

```
sampling-rate <1024-16777215>
no sampling-rate <1024-16777215>
```

Parameters

sampling-rate <1024-16777215>
Specifies the range of sampling rates that determine how frequently packets are selected for inclusion in the flow monitoring process.

Default

None

Command Mode

IP flow monitor mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The following command configures the sampling rate for the specified IP flow monitor profile to **1024** packets per second.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-monitor FLOW-MONITOR
OcNOS(ip-flow-monitor)#sampling-rate 1024
```

show ipfix

Use this command to display detailed information about the configured IPFIX exporters on the device.

Command Syntax

```
show ipfix
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The show command output provides detailed information about the exporters configured on the device, including exporter name, source and destination addresses, **UDP**[1] ports, Template ID, and timeout value.

```
OcNOS#show ipfix
Exporters:
  Name:                  FLOW-EXPORTER
    Source:              192.0.2.88
    Destination:         192.0.2.89
    Source UDP:          53859
    Destination UDP:     4739
    Template ID:         500

    Data Template Timeout:600
```

Gain insights into IPFIX exporters with detailed field descriptions provided in the table.

Table 53. show ipfix fields

Field	Description
Exporter Name	Specifies the name of the IPFIX exporter.
Source	Indicates the source IPv4 address of the exporter.
Destination	Specifies the destination IPv4 address of the exporter.
Source UDP	Indicates the source UDP port used by the exporter.
Destination UDP	Specifies the destination UDP port used by the exporter.
Template ID	Specifies the template ID used by the exporter.
Data Template Timeout	Indicates the timeout interval, in seconds, for sending data templates to the collector.

[1]User Datagram Protocol

show ipfix all

Use this command to display detailed information and comprehensive insights into the IPFIX configured templates and exporters on the device.

Command Syntax

```
show ipfix all
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The show command output displays detailed information about the IPFIX template records sampled on the device.

```
OcNOS#show ipfix all
Templates:
  Template ID:           500
    DIRECTON (61), Length:1
    IP_VERSION (60), Length:1
    IPV4_TOS (5), Length:1
    IPV4_PKT_LEN (1), Length:2
    IPV4_FRAG_OFFSET (88), Length:2
    PROTOCOL (4), Length:1
    IPV4_SIP (8), Length:4
    IPV4_DIP (12), Length:4
    L4_SRC_PORT (7), Length:2
    L4_DST_PORT (11), Length:2
    TCP_CONTROL (6), Length:2
    ICMP_TYPE (32), Length:2
    INGRESS_VRF (234), Length:4
    INGRESS_IF (10), Length:2
    EGRESS_VRF (235), Length:4
    EGRESS_IF (14), Length:2
    SYS_UPTIME (22), Length:4
Exporters:
 Name:                 FLOW-EXPORTER
    Source:              192.0.2.88
    Destination:         192.0.2.89
    Source UDP:          53859
    Destination UDP:     4739
    Template ID:         500

    Data Template Timeout:600
```

Gain insights into IPFIX configurations and exporters with detailed field descriptions provided in the table.

Table 54. show ipfix all

Field	Description
Template ID	Indicates the unique identifier assigned to each IPFIX template.
DIRECTON	Indicates the direction of the network traffic flow, such as ingress or egress. It has a length of 1 byte.
IP_VERSION	Specifies the version of the Internet Protocol (IPv4) used. It has a length of 1 byte.
IPV4_TOS	Indicates the type of service (TOS) field in an IPv4 header. It has a length of 1 byte.
IPV4_PKT_LEN	Specifies the length of the IPv4 packet. It has a length of 2 bytes.
IPV4_FRAG_OFFSET	Indicates the fragment offset value in an IPv4 header. It has a length of 2 bytes.
PROTOCOL	Specifies the protocol used in the packet, such as TCP, **UDP**[1], and **ICMP**[2]. It has a length of 1 byte.
IPV4_SIP	Indicates the source IPv4 address of the IPv4 packet. It has a length of 4 bytes.
IPV4_DIP	Specifies the destination IPv4 address of the IPv4 packet. It has a length of 4 bytes.
L4_SRC_PORT	Specifies the source port number in the transport layer header. It has a length of 2 bytes.
L4_DST_PORT	Specifies the destination port number in the transport layer header. It has a length of 2 bytes.
TCP_CONTROL	Indicates whether the packet is a TCP control packet (e.g., SYN, ACK, FIN). It has a length of 2 bytes.
ICMP_TYPE	Specifies the type of ICMP message, such as echo request or echo reply. It has a length of 2 bytes.
INGRESS_**VRF**[3]	Indicates the identifier of the ingress Virtual Routing and Forwarding (VRF) instance. It has a length of 4 bytes.
INGRESS_IF	Specifies the ingress interface (IF) through which the packet enters the device. It has a length of 2 bytes.
EGRESS_VRF	Indicates the identifier of the egress VRF instance. It has a length of 4 bytes.
EGRESS_IF	Specifies the egress interface through which the packet exits the device. It has a length of 2 bytes.
SYS_UPTIME	Indicates the system uptime or the time the device has been operational since its last reboot. It has a length of 4 bytes.

[1]User Datagram Protocol

[2]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

[3]Virtual Routing and Forwarding

Table 54. show ipfix all (continued)

Field	Description
Exporter Name	Specifies the name of the IPFIX exporter.
Source	Indicates the source IPv4 address of the exporter.
Destination	Specifies the destination IPv4 address of the exporter.
Source UDP	Indicates the source UDP port used by the exporter.
Destination UDP	Specifies the destination UDP port used by the exporter.
Template ID	Specifies the template ID used by the exporter.
Data Template Timeout	Indicates the timeout interval, in seconds, for sending data templates to the collector.

show running-config ipfix

Use this command to display a detailed view of the current IPFIX configurations, including flow exporters, flow monitors, and interface settings applied to the device.

Command Syntax

```
show running-config ipfix
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The show command output displays the current IPFIX configurations applied on the device.

```
OcNOS#show running-config ipfix
hardware-profile statistics cfm-lm enable
!
ip-flow-exporter FLOW-EXPORTER
source xe5
collector destination 192.0.2.89
template-id 500
template-refresh-interval 600
samples-per-message 1
!
ip-flow-monitor FLOW-MONITOR
flow-exporter FLOW-EXPORTER
sampling-rate 100
observation-domain-id 16
```

```
!
interface xe4
ip address 198.51.100.4/24
flow-monitor FLOW-MONITOR
!
interface xe5
ip address 192.0.2.88/24
!
```

source

Use this command to specify the IPv4 source address for the exporter, which is used in the IPFIX message IPv4 header. Enables the export of flow records to the collector.

Use **no** parameter of this command to remove the association of the specified interface as the source address in the IPFIX message IPv4 header.

Command Syntax

```
source IFNAME
no source IFNAME
```

Parameters

source IFNAME
Specifies the interface name from which the IPv4 source address will be derived.

Default

None

Command Mode

IP flow exporter mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The command instructs the system to obtain the IPv4 address associated with **interface xe5** and use it as the source address in the IPFIX message IPv4 header.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-exporter FLOW-EXPORTER
OcNOS(ip-flow-exporter)#source xe5
```

template-id

Use this command to set the ID for the IPFIX template, specifying the structure and format of the data records sent to the collector, serving as a template for the flow record format within the IPFIX message.

Use **no** parameter of this command to remove the specified template ID from the IPFIX configuration.

Command Syntax

```
template-id <256-65535>
no template-id <256-65535>
```

Parameters

template-id <256-65535>
Specifies the unique identifier for the template used in exporting flow records.

Default

None

Command Mode

IP flow exporter mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The command sets the template ID **500** for the IPFIX exporter profile.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-exporter FLOW-EXPORTER
OcNOS(ip-flow-exporter)#template-id 500
```

template-refresh-interval

Use this command to set the time interval for refreshing the IPFIX template, determining how often the template updates and sends to the IPFIX collector.

Use **no** parameter of this command to remove the configured time interval.

Command Syntax

```
template-refresh-interval <60-86400>
no template-refresh-interval <60-86400>
```

Parameters

template-refresh-interval <60-86400>
Specifies the time interval range, in seconds, for refreshing the IPFIX template. The default value is 600 seconds.

Default

None

Command Mode

IP flow exporter mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

The command sets the template-refresh-interval parameter to **600** seconds for the specified IPFIX exporter profile.

```
OcNOS#configure terminal
OcNOS(config)#ip-flow-exporter FLOW-EXPORTER
OcNOS(ip-flow-exporter)#template-refresh-interval 600
```

Troubleshooting

- If the collector isn't operational or isn't running on the assigned port, follow these steps:
  - Check if the IPFIX collector service is active on the designated device.
  - Ensure the IPFIX collector process is running correctly.
  - Review the collector's configuration, including the specified port.
  - Investigate port conflicts or misconfigurations if the collector is running on the wrong port.
  - Monitor system logs for any error messages related to the IPFIX collector.
- To address TCAM resource availability issues on the exporter impacting IPFIX functionality, follow these steps:
  - Identify which features are currently enabled on the exporter.
  - Consider disabling or optimizing features to free up TCAM resources.
  - Monitor the TCAM resource usage periodically to ensure sufficient availability for IPFIX functionality.

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
IPFIX Exporter (Internet Protocol Flow Information Export)[1]	OcNOS feature that facilitates real-time traffic analysis by sampling network traffic and exporting flow records containing detailed information about sampled traffic flows.
Flow Records	Detailed information about network traffic flows, including source and destination addresses, port numbers, protocol specifics, and timestamps.
Mirroring Profile	Profiles are used by various features, such as SFLOW, SNIFF, and Mirror to enable the mirroring of network traffic.
Jericho2[2]	Broadcom DNX Jericho2, a network routing chipset.
Ingress and Egress Interfaces	The interface through which packets enter and exit the network device.
Security Monitoring	Monitoring network traffic for security threats and compliance with regulations.
ASIC[3]	Application Specific Integrated Circuit
SFLOW	Sampling Flow

[1]Oc-NOS feature that facilitates real-time traffic analysis by sampling network traffic and exporting flow records containing detailed information about sampled traffic flows.

[2]Broadcom DNX Jericho2, a network routing chipset.

[3]Application Specific Integrated Circuit

Key Terms/Acronym	Description
SVI[1]	Switched Virtual Interface
LAG[2]	Link Aggregation Group
ICMP[3]	Internet Control Message Protocol
UDP[4]	User Datagram Protocol
VRF[5]	Virtual Routing and Forwarding
ISP[6]	Internet Service Provider
Ternary Content Addressable Memory (TCAM)[7]	TCAM facilitates rapid table lookups based on specific search criteria in networking devices like routers and switches. It performs searches for exact matches, wildcard matches, and ranges swiftly, making it highly efficient for matching patterns against large datasets.

[1]Switched Virtual Interface

[2]Link Aggregation Group

[3]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

[4]User Datagram Protocol

[5]Virtual Routing and Forwarding

[6]Internet Service Provider

[7]TCAM facilitates rapid table lookups based on specific search criteria in networking devices like routers and switches. It performs searches for exact matches, wildcard matches, and ranges swiftly, making it highly efficient for matching patterns against large datasets

MONITOR AND REPORTING SERVER COMMAND REFERENCE

Software Monitoring and Reporting

This document describes software watchdog and reporting related commands.

clear cores

Use this clear command to delete the core files present in `/var/log/crash/cores`.

Command Syntax

```
clear cores (|WORD)
```

Parameters

WORD
Core file name

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show cores
Core location :/var/log/crash/cores
Core-File-Name
--------------
core_hostpd.9581_20190324_222313_signal_11.gz

#clear cores core_hostpd.9581_20190324_222313_signal_11.gz

#show cores
Core location :/var/log/crash/cores
Core-File-Name
--------------
```

copy core

Use this command to copy the core file to another file.

The core filename is in the form: core_PROCESSNAME.PROCID_YYYMMDD_HHMMSS_signal_SIGNUM.gz

Command Syntax

```
copy core FILE (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL) (vrf (NAME|management)|)
```

Parameters

core
Copy Crash core files to remote location. Core file location: **`/var/log/crash/cores/`**

FILE
Source file name

TFTP-URL
Destination: **`tftp:[//server[:port]][/path]`**

FTP-URL
Destination: **`ftp:[//server][/path]`**

SCP-URL
Destination: **`scp:[//server][/path]`**

SFTP-URL
Destination: **`sftp:[//server][/path]`**

NAME
Virtual Routing and Forwarding name

management
Management Virtual Routing and Forwarding

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
# copy core core_hostpd.9581_20190324_222313_signal_11.gz scp scp://10.12.16.17/home/ core core_
hostpd.9581_20190324_222313_signal_11.gz vrf management
Enter Username:root
Enter Password:
  % Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
                                 Dload  Upload   Total   Spent    Left  Speed

```

```
Copy Success
```

copy techsupport

Use this command to copy the contents of a compressed techsupport file (**tar.gz**) to another file.

The default filename is in the form: **tech_support_YYYY_MMM_DD_HH_MM_SS.tar.gz**.

Command Syntax

```
copy (log|techsupport) FILE (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL) (vrf
(NAME|management)|)
```

Parameters

log
Log file storage; on Linux this refers to **/var/log/**

techsupport
Tech support file storage; on Linux this refers to **/var/log/**

FILE
Source file name

TFTP-URL
Destination: **tftp:[//server[:port]][/path]**

FTP-URL
Destination: **ftp:[//server][/path]**

SCP-URL
Destination: **scp:[//server][/path]**

SFTP-URL
Destination: **sftp:[//server][/path]**

NAME
Virtual Routing and Forwarding name

management
Management Virtual Routing and Forwarding

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#copy techsupport tech_support_23_Feb_2019_18_27_00.tar.gz scp scp://10.12.16.17/home/tech_support_
23_Feb_2019_18_27_00.tar.gz vrf management

Enter Username:root
```

```
Enter Password:
% Total % Received % Xferd Average Speed Time Time Time Current

100 72368 0 0 0 72368 0 147k -::- -::- -::- 147k
100 72368 0 0 0 72368 0 147k -::- -::- -::- 147k
Copy Success
#
```

feature software-watchdog

Use this command to enable software watchdog functionality for all OcNOS modules. This feature is enabled by default.

Use the **no** form of this command to disable software watchdog functionality.

Command Syntax

```
feature software-watchdog
no feature software-watchdog
```

Parameters

None

Default

By default, software watchdog is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
#(config)feature software-watchdog
```

remove file (techsupport)

Use this command to remove techsupport files from `/var/log` directory.

Command Syntax

```
remove file (techsupport) (all|FILENAME|)
```

Parameter

techsupport
Tech support option for protocol(s).

all
Remove all files.

FILENAME
Name of the file to be deleted.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 6.4.

Examples

```
OcNOS#remove file techsupport /var/log/   OcNOS_tech_support_all_14_Feb_2019_15_39_34.tar.gz

OcNOS#remove file techsupport all
```

show bootup-parameters

Use this command to show OcNOS kernel bootup parameters.

Command Syntax

```
show bootup-parameters
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bootup-parameters
BOOT_IMAGE=/boot/vmlinuz-3.16.7-g490411a-ec-as7712-32x root=UUID=317567fc-b69e-45d9-ab4e-fa1d9e57b703
console=ttyS1,115200n8 ro
```

show cores

Use this command to list core files in the system or to display information about a given core file.

Note: When cmlsh logged in via non-root user crashes, core files will not get generated. User can further debug the issue based on CLI-history and logs from /var/log/messages.

Command Syntax

```
show cores (|WORD details)
```

Parameters

WORD
Core file name

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show cores
Core location :/var/log/crash/cores
Core-File-Name
--------------
core_nsm.683_20191110_103611_signal_5.gz
core_nsm.712_20191107_171803_signal_11.gz
core_nsm.684_20191112_054937_signal_5.gz
core_yangcli.5695_20191107_171715_signal_11.gz
```

Here is the explanation of the show command output fields.

Table 55. show cores fields

Entry	Description
Core-File-Name	Core dump file name.

show running-config watchdog

Use this command to display watchdog configurations.

Command Syntax

```
show running-config watchdog
```

Parameters

None

Command Mode

Privileged EXEC

Applicability

This command was introduced in OcNOS version 5.0

Examples

```
#show running-config watchdog
software-watchdog keep-alive-time 300
```

show software-watchdog status

Use this command to display the software watchdog status for each OcNOS module.

Command Syntax

```
show software-watchdog status
show software-watchdog status detail
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.4.

Examples

```
#show software-watchdog status
Software Watchdog timeout in seconds : 60
Process name         Watchdog status

cmmd    Enabled  Running     0          1       Fresh bootup
pcepd   Enabled  Running     0          1       Fresh bootup
```

Here is the explanation of the show command output fields.

Table 56. show software-watchdog status output fields

Field	Description
Process Name	The name of a protocol module.
Watchdog Status	Status of a protocol module (Enabled or Disabled).
Process Status	Status of the protocol module Running/Not-running).
Disconnect Count	Number of times the protocol module disconnected from monitoring module.
Connect Count	Number of times the protocol module connected to monitoring module.
Last Restart Reason	Reason why a module disconnected from monitoring module.

show system log

Use this command to display the system's log file.

Command Syntax

```
show system log
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show system log
Syslog              : enabled      File Name   : /var/log/messages
Oct 18 18:10:18 localhost rsyslogd: [origin software="rsyslogd" swVersion="8.4.2
" x-pid="541" x-info="http://www.rsyslog.com"] start
Oct 18 18:10:18 localhost systemd[1]: Started Apply Kernel Variables.

Oct 18 18:10:18 localhost systemd[1]: Starting File System Check on /dev/disk/by
-label/-CONFIG...
Oct 18 18:10:18 localhost systemd[1]: Starting system-ifup.slice.
Oct 18 18:10:18 localhost systemd-fsck[217]: -CONFIG: clean, 85/128016 file
s, 27057/512000 blocks
Oct 18 18:10:18 localhost systemd[1]: Created slice system-ifup.slice.
--More--
```

Here is the explanation of the show command output fields.

Table 57. show system log fields

Entry	Description
Syslog	Status of the protocol (enabled or disabled).
File Name	Specifies the name of the system log files that you configured.

show system login

Use this command to display the system's login history.

Command Syntax

```
show system login
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show system login
eric      ttyS0                        Wed Oct 19 18:31   still logged in
takayuki  ttyS0                        Wed Oct 19 18:14 - 18:25  (00:10)
girish    ttyS0                        Wed Oct 19 16:46 - 17:01  (00:14)

wtmp begins Wed Oct 19 16:46:18 2016
```

show system reboot-history

Use this command to show the device reboot history.

Command Syntax

```
show system reboot-history
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3

Examples

```
#show system reboot-history
DATE-TIME                 REBOOT-REASON
------------------------  --------------------------
Thu Oct 07 12:46:56 2021  Sys-update from NOS shell
Wed Oct 13 09:35:06 2021  Reload from NOS shell
Sat Feb 16 23:19:38 2019  Reload from NOS shell
```

show system resources

Use this command to display the system's current resources.

Command Syntax

```
show system resources (iteration <1-5>|)
```

Parameters

<1-5>
The number of times to check the resources before they are displayed.

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
OcNOS#show system resources
load average: 0.12, 0.22, 0.20
Tasks: 173 total,   1 running, 172 sleeping,   0 stopped,   0 zombie
%Cpu(s):  3.1 us,  1.6 sy,  0.0 ni, 95.3 id,  0.0 wa,  0.0 hi,  0.0 si,  0.0 st
MiB Mem :  15930.2 total,  14277.8 free,   1003.0 used,    649.4 buff/cache
           0 used,        0 free.   252416 cached Mem
```

Here is the explanation of the show command output fields.

Table 58. show system resource fields

Entry	Description
Load Average	Number of processes that are running. The average reflects the system load the past 1, 5, and 15 minutes.
Tasks	Number of processes in the system and how many processes are actually running when the command is issued.
CPU	Displays the CPU utilization information for processes on the device.
KiB Mem	The memory field (Mem) shows the virtual memory used by processes. The value in the memory field is in KB and MB, and is broken down as follows: Total: The total amount of available virtual memory, in kibibytes (KiBs). Used:The total amount of used virtual memory, in kibibytes (KiBs). Free: The total amount of free virtual memory, in kibibytes (KiBs) Buffers: The size of the memory buffer used to hold data recently called from disk.

Table 58. show system resource fields (continued)

Entry	Description
KiB Swap	The Swap field shows the total swap space available and how much is unused and is broken down as follows: Total: The total amount of available swap memory, in kibibytes (KiBs). Used: The total amount of used swap memory, in kibibytes (KiBs). Free: The total amount of free swap memory, in kibibytes (KiBs). Cache Memory: Memory that is not associated with any program and does not need to be swapped before being reused.

show system uptime

Use this command to display how lone the system has been up and running.

Command Syntax

```
show system uptime
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
OcNOS#show system uptime
 19:10:22 up 1 day,  1:01,  1 user,  load average: 0.08, 0.05, 0.05
```

Here is the explanation of the show command output fields.

Table 59. show system uptime fields

Entry	Description
Time and up	Current time, in the local time zone, and how long the router or switch has been operational.
Users	Number of users logged in to the router or switch.
Load Average	Number of processes that are running. The average reflects the system load the past 1, 5, and 15 minutes.

show techsupport

Use this command to collect system data for technical support and save the support information in a compressed tar (.gz) file.

- By default, the **show techsupport** uses the file path **/var/log/** and names the file as **OcNOS_tech_support_protocolname_DD_MMM_YYYY_HH_MM_SS.tar.gz**.
- If this filename already exists, a date and timestamp are appended to differentiate it from previous files.
- When a **show techsupport** command is already running, any subsequent **show techsupport** commands issued are ignored until the current command completes.
- If a **show techsupport** command is in progress and a **show running-config** command is issued, the displayed information is derived from the ongoing **show techsupport** command.
- The techsupport command only provides a route summary, not complete information for all routes.

Command Syntax

```
show techsupport
({all|authd|bgp|cmmd|hostpd|hsl|imi|isis|l2mribd|lag|ldp|mribd|mstp|nd|nsm|oam|onm|ospf|ospf6|pcep|pi
m|ptp|rib|rip|ripng|rsvp|sflow|synce|vrrp|netconf|gnmi})
```

Parameters

all
Specifies the collection of all types of information.

authd
Specifies the collection of authentication-related information.

bgp
Specifies the collection of BGP-related information.

cmmd
Specifies the collection of chassis management related information.

hostpd
Specifies the collection of system management related information.

hsl
Specifies the collection of HSL-related information.

imi
Specifies the collection of IMM-related information.

isis
Specifies the collection of ISIS-related information.

l2mribd
Specifies the collection of Layer 2 Multicast RIB-related information.

lag
Specifies the collection of **LAG**[1] or LACP-related information.

ldp
Specifies the collection of LDP-related information.

[1]Link Aggregation Group

mribd
Specifies the collection of Multicast RIB-related information.

mstp
Specifies the collection of MSTP-related information.

nd
Specifies the collection of Neighbor Discovery related information.

nsm
Specifies the collection of NSM-related information.

oam
Specifies the collection of BFD-related information.

onm
Specifies the collection of ONM or LLDP-related information.

ospf
Specifies the collection of OSPF-related information.

ospf6
Specifies the collection of OSPF6-related information.

pcep
Specifies the collection of PCEP-related information.

pim
Specifies the collection of PIM-related information.

ptp
Specifies the collection of PTP-related information.

rib
Specifies the collection of RIB-related information.

rip
Specifies the collection of RIP-related information.

ripng
Specifies the collection of RIPNG-related information.

rsvp
Specifies the collection of RSVP-related information.

sflow
Specifies the collection of **sFlow**[1]-related information.

synce
Specifies the collection of SYNCE-related information.

vrrp
Specifies the collection of VRRP-related information.

netconf
Specifies the collection of NetConf and Callhome related information.

gnmi
Specifies the collection of gNMI-related information.

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

Default

None

Command Mode

Privileged execution mode

Applicability

Introduced before OcNOS version 1.3. Introduced the **`netconf`** and **`gnmi`** parameters in the OcNOS version 6.5.1.

Example

The following command demonstrates how to use **`show techsupport`** to collect various types of system information.

```
#show techsupport all
#show techsupport bgp
#show techsupport isis
#show techsupport gnmi
#show techsupport netconf
```

show techsupport status

Use this cli to view the status of **`show techsupport`** CLI to generate techsupport archive.

Command Syntax

```
show techsupport status
```

Parameters

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 4.2.

Example

```
#show techsupport status
Tech Support Command Execution Is Complete
##Generated Tech Support File-list
/var/log/OcNOS_tech_support_18_Jun_2021_10_01_38.tar.gz
Tar File is generated at /var/log and file name begins with 'OcNOS_tech_support'
```

software-watchdog

Use this command to enable the software watchdog feature for an OcNOS module.

Use the **no** form of this command to disable the software watchdog feature.

Command Syntax

```
software-watchdog (nsm|authd|bgpd|cmld|hostpd|imi|isisd|lagd|l2mribd|
mstpd|mribd|ndd|oamd|onmd|ospfd|ospf6d|pimd|ribd|ripd|ripngd|sflow|vlogd|vrrpd|
ldpd|rsvpd|udld|hsl|cmmd|pcepd|ptpd|synced)

no software-watchdog (nsm|authd|bgpd|cmld|hostpd|imi|isisd|lagd|l2mribd|
mstpd|mribd|ndd|oamd|onmd|ospfd|ospf6d|pimd|ribd|ripd|ripngd|sflow|vlogd|vrrpd|
ldpd|rsvpd|udld|hsl|cmmd|pcepd|ptpd|synced)
```

Parameters

authd
Software watchdog for AUTH module

bgpd
Software watchdog for BGP module

cmld
Software watchdog for CML module

cmmd
Software watchdog for CMM module

hostpd
Software watchdog for HOSTP module

hsl
Software watchdog for HSL module

imi
Software watchdog for IMI module

isisd
Software watchdog for ISIS module

l2mribd
Software watchdog for L2MRIB module

lagd
Software watchdog for **LAG**[1] module

ldpd
Software watchdog for LDP module

mribd
Software watchdog for MRIB module

mstpd
Software watchdog for MSTP module

ndd
Software watchdog for NDD module

[1]Link Aggregation Group

nsm
Software watchdog for NSM module

oamd
Software watchdog for OAM module

onmd
Software watchdog for ONM module

ospf6d
Software watchdog for OSPF6 module

ospfd
Software watchdog for OSPF module

pcepd
Software watchdog for PCEP module

pimd
Software watchdog for PIM module

ptpd
Software watchdog for PTP module

ribd
Software watchdog for RIB module

ripd
Software watchdog for RIP module

ripngd
Software watchdog for RIPNG module

rsvpd
Software watchdog for RSVP module

sflow
Software watchdog for SFLOW module

synced
Software watchdog for SYNCE module

udld
Software watchdog for UDLD module

vlogd
Software watchdog for VLOG module

vrrpd
Software watchdog for VRRP module

Default

By default, software watchdog is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#no software-watchdog imi
(config)#software-watchdog nsm
```

software-watchdog keep-alive-time

Use this command to set the software watchdog keep-alive time interval in seconds.

Use the **no** form of this command to set default keep-alive time interval.

Command Syntax

```
software-watchdog keep-alive-time <30-1800>
no software-watchdog keep-alive-time
```

Parameters

<30-1800>
Keep-alive time interval in seconds

Default

By default, software watchdog is enabled and the keep-alive time interval is 60 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#software-watchdog keep-alive-time 100
```

sFlow Commands

This chapter describes the Sampled Flow (**sFlow**[1]) commands.

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

clear sflow statistics

Use this command to clear **sFlow**[1] sampling-related counters such as the number of packets sampled and the number of counters sampled.

Command Syntax

```
clear sflow statistics (interface IFNAME|)
```

Parameter

IFNAME
Interface name

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear sflow statistics
```

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

debug sflow

Use this command to display **sFlow**[1] debugging messages.

Command Syntax

```
debug sflow (all|agent|sampling|polling|)
```

Parameters

all
Debug all (agent,sampling,polling)

agent
Debug sFlow agent

sampling
Debug sFlow sampling

polling
Debug sFlow polling

Default

Disabled.

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug sflow all
#debug sflow agent
#configure terminal
(config)#debug sflow agent
```

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

feature sflow

Use this command to enable the **sFlow**[1] feature.

Use the no form to disable the sFlow feature.

Command Syntax

```
feature sflow
no feature sflow
```

Parameters

None

Default

Disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#feature sflow
```

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

sflow agent-ip

Use this command to set the agent IP address for receivers.

Use the **no** form of this or remove an agent IP address.

Command Syntax

```
sflow agent-ip A.B.C.D
no sflow agent-ip
```

Parameter

A.B.C.D
IPv4 address

Default

The default IP address is zero (0).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#sflow agent-ip 10.0.0.12
```

sflow collector

Use this command to configure the collector details such as the collector IPv4 address, port number, receiver time-out and datagram size.

Use the **no** form of this command to disable the **sFlow**[1] collector.

Command Syntax

```
sflow (collector-id <1-5>|) collector A.B.C.D port <1024-65535> receiver-time-out <0-2147483647> max-datagram-size <200-9000> (vrf WORD|)
no sflow collector (A.B.C.D port <1024-65535>|)
```

Parameter

collector-id <1-5>
(Optional) Specifies the name of the Collector instance identifier. If the collector-id is not specified, the ID will be 1.

collector A.B.C.D
Collector IPv4 address. This address must be reachable via the management **VRF**[2].<1024-65535>

port <1024-65535>
Collector **UDP**[3] Port number. The default port number is 6343.

receiver-time-out <0-2147483647>
Receiver time out value in seconds. Zero means no timeout. Upon timeout, value collector information is removed, stopping any ongoing sampling.

max-datagram-size <200-9000>
Maximum datagram size in bytes that can be sent to the collector.

vrf WORD
(Optional) Specifies the User defined VRF to reach the collector.

Default

Disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Introduced the `collector-id` and `vrf` parameters in the OcNOS version 6.5.1.

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

[2]Virtual Routing and Forwarding

[3]User Datagram Protocol

Example

```
#configure terminal
(config)#sflow collector 2.2.2.2 port 1111 receiver time-out 30 max-datagram-size 500

(config)#no sflow collector
```

```
OcNOS(config)#interface xe12
OcNOS(config-if)#sflow sampling-rate 1024 direction ingress max-header-size 256
OcNOS(config-if)#sflow enable
OcNOS(config-if)#sflow poll-interval 10
OcNOS(config-if)#sflow collector-id 3
```

sflow enable

Use this command to enable or disable sampling on an interface after giving the sflow sampling-rate (page 834) command on the same interface.

Command Syntax

```
sflow enable
no sflow enable
```

Parameters

None

Default

Disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#interface xe1
(config-if)#sflow sampling-rate 1024 direction ingress max-datagram-size 200
(config-if)#sflow enable
(config-if)#no sflow enable
```

sflow poll-interval

Use this command to configure the **sFlow**[1] counter polling interval on all interfaces that have command sflow enabled, but do not have sflow poll-interval configured on interface level. This shall be overridden by the interface-specific configuration, see sflow poll-interval configuration on interface level.

Any change in the polling interval restarts ongoing polling of existing data source interfaces, if any.

Use *no* parameter of this command to remove this configuration.

Use show sflow global to verify this configuration.

Command Syntax

```
sflow poll-interval <5-60>
no sflow poll-interval
```

Parameters

<5-60>
Interface counter. Polling interval in seconds

Default

By default, sFlow counter polling interval is disabled.

Command Mode

Interface modeConfigure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#sflow poll-interval 60
OcNOS(config)#sflow sampling-rate 3000 direction ingress max-header-size 35
OcNOS(config)#sflow sampling-rate 2000 direction egress max-header-size 30
OcNOS(config)#
OcNOS(config)#interface eth1
OcNOS(config-if)#sflow enable
OcNOS(config-if)#exit
OcNOS(config)#commit
OcNOS#show sflow brief
sFlow Feature: Enabled
sFlow Port Configuration:
Interface  Collector  Status               Sample Rate               Counter-Polling
           ID         Ingress    Egress    Ingress      Egress       Interval(sec)
---------  ---------  ------------------   ------------------------  ---------------
eth1               0  Enabled    Disabled         3000         2000     60
```

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

sflow rate-limit

Use this command to set the CPU rate limit in packets per second.

Use the **no** form of this command to set the CPU rate limit to its default (0).

Command Syntax

```
sflow rate-limit <2000-100000>
no sflow rate-limit
```

Parameters

<2000-100000>
Rate limit in packets per second

Default

The default rate limit is zero (0).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is not available on Qumran platforms.

Examples

```
#configure terminal
(config)#sflow rate-limit 5000
```

sflow sampling-rate

Use this command to set the sampling rate on all interfaces that have command sflow enabled, but do not have sflow sampling-rate configured on interface level. This shall be overridden by the interface-specific configuration, see sflow sampling-rate configuration on interface level.

Any change in the sampling rate restarts the ongoing sampling of existing data-source interfaces, if any.

Use *no* parameter of this command to remove this configuration.

Use show sflow global to verify this configuration.

Command Syntax

```
sflow sampling-rate <1024-16777215> direction (ingress | egress) max-header-size <16-256>
no sflow sampling-rate direction (ingress | egress)
```

Parameters

<1024-16777215>
Sampling rate

direction
The direction of sampling an interface:

ingress
Ingress traffic

egress
Egress traffic

<16-256>
Maximum header size in bytes

Default

Disabled.

Command Mode

Interface modeConfigure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
cNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#sflow poll-interval 60
OcNOS(config)#sflow sampling-rate 3000 direction ingress max-header-size 35
OcNOS(config)#sflow sampling-rate 2000 direction egress max-header-size 30
OcNOS(config)#
OcNOS(config)#interface eth1
OcNOS(config-if)#sflow enable
OcNOS(config-if)#exit
```

```
OcNOS(config)#commit
OcNOS#show sflow brief
sFlow Feature: Enabled
sFlow Port Configuration:
Interface  Collector  Status               Sample Rate               Counter-Polling
           ID         Ingress    Egress    Ingress      Egress       Interval(sec)
---------  ---------  -------------------  ------------------------  ---------------
eth1               0  Enabled    Disabled         3000         2000     60
```

show sflow

Use this command to display **sFlow**[1] agent configuration along with statistics for all interfaces.

Command Syntax

```
show sflow (brief | detail)
```

Parameters

brief
Display configuration parameters on interfaces along with sampling rate and poll interval.

detail
Same as **`brief`** along with configured and default attributes and values of sFlow agent, sFlow collector, and sampling information.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show sflow
sFlow Feature: Enabled
sFlow Version: 5
sFlow Global Information :
Agent     IP: 10.12.16.38
Collector IP: 2.2.2.2      Port:  6343
Maximum Datagram Size(bytes): 200
Receiver timeout(sec)        : 0

sFlow Port Detailed Information:
Interface  Packet-Sampling           Packet-Sampling            Counter-Polling         Maximum

```

Table 60. Show sflow output

Entry	Description
sFlow feature	Shows whether sFlow is enabled or disabled.
sFlow Version	Displays the sFlow version. Version 5 is the current global standard.
sFlow Global Information	Global Information consists of the Agent IP address, Collector IP, Port number, Maximum Datagram Size, and the Receiver timeout.
Agent IP	IPv4 address of this switch/router.
Collector IP	IPv4 address of the sFlow collector server.
Port	Port number on the sFlow collector server. Standard is port 6343.
Maximum Datagram Size	The maximum size of the datagrams sent by the agent
Receiver timeout	The number of seconds between each sampling – zero means sample continuously.
sFlow Port Interface	The interface of this switch/router on which sFlow is running (e.g. xe1/1).
Packet-Sampling Rate	the number of packets received or transmitted before a sample is taken.
Packet-Sampling Count	The number of sample packets that have been sampled on both the ingress and egress of the interface.
Counter-Polling	Shows the amount of time between polling samples and the count of the total number of polling samples taken.
Maximum Header Size	The maximum header size for both the ingress and egress of the interface.

show sflow interface

Use this command to display the **sFlow**[1] configuration for the input interface.

Command Syntax

```
show sflow interface IFNAME
```

Parameters

IFNAME
Interface name

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Note: For information on the output values of this command, see the show sflow (page 836) command.

```
#show sflow interface xe1
sFlow feature: Enabled
sFlow Version: 5
sFlow Global Information :
Agent     IP: 10.10.26.104
Collector IP: 2.2.2.2      Port:  6343
Maximum Datagram Size(bytes): 200
Receiver timeout(sec)        : 0
sFlow Port Detailed Information:
Interface  Packet-Sampling           Counter-Polling           Maximum Header
           Rate         Count        Interval(sec) Count       Size(bytes)
---------  -----------------------   ------------------------  --------------
xe1              1024            0           6           41      128
```

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

show sflow global

Use this command to display **sFlow**[1] global configuration information along with interface.

Command Syntax

```
show sflow global
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Example

Note: For information on the output values of this command, see the show sflow (page 836) command.

```
OcNOS#show sflow global
sFlow Feature: Enabled
sFlow Version: 5
Agent IP     : 10.16.142.129

sFlow Port Global Information:
Packet-Sampling          Polling     Maximum Header
       Rate              Interval     Size(bytes)
Ingress      Egress       (sec)    Ingress     Egress
----------------------  --------  ------------------
      2000         3000        60       16        30

Interfaces using sFlow global configuration:
Interface  Packet-Sampling  Polling   Maximum Header
                 Rate       Interval       Size
           Ingress  Egress            Ingress  Egress
---------  -------  ------  --------  -------  ------
xe6            yes     yes       yes      yes     yes
```

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

show sflow statistics

Use this command to display **sFlow**[1] counter information.

Command Syntax

```
show sflow statistics (interface IFNAME|)
```

Parameters

IFNAME
Interface name.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Note: For information on the output values of this command, see the show sflow (page 836) command.

```
#show sflow statistics
sFlow Port Statistics:
Interface  Packet-Sampling   Counter-Polling
               Count               Count
---------  ---------------   ---------------
xe1                     0                19
```

[1]Sampled Flow data sFlow (sFlow) is the standard for monitoring high-speed switched and routed networks. The sFlow monitoring system consists of an sFlow Agent which is embedded in a switch or router and an sFlow Collector.

Control Plane Policing Commands

This chapter is a reference for the Control Plane Policing (CoPP) commands.

class-map type

Use this command to create a class map for Control Plane Policing (CoPP), enabling the classification of control plane traffic based on specific matching criteria.

Use the **no** command to remove a class-map.

Command Syntax

```
class-map type copp match-any NAME
no class-map type copp match-any NAME
```

Parameter

NAME
Specify the class map name (maximum length 32 characters).

match-any
Match any parameter (boolean OR)

Default

None

Command Mode

Configure mode

Applicability

This command was introduced OcNOS version 6.6.0 .

Examples

```
#configure terminal
OcNOS(config)#class-map type copp match-any COPP-CM-PERMIT
```

class type copp

Use this command to Use this command to enter to class-mode under copp type policy map.

Use the no command to remove class-mode under copp type policy map..

Command Syntax

```
class type copp <NAME>
no class type copp <NAME>
```

Parameter

NAME
Specify the class map name.

Default

None

Command Mode

Policy[1]-map mode

Applicability

This command was introduced OcNOS version 6.6.0 .

Examples

```
OcNOS(config)#policy-map type copp COPP-PM
OcNOS(config-pmap-copp)#class type copp COPP-CM
OcNOS(config-pmap-c-copp)#police cir 22 kbps
OcNOS(config-pmap-c-copp)#exit
```

s

[1]A set of rules determining which actions are permitted or denied for a specific user role.

clear interface cpu counters

Use this command to clear the CPU queue counters.

Command Syntax

```
clear interface cpu counters
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
OcNOS#clear interface cpu counters
```

copp service-policy

Use this command to install CoPP type service policy in the hardware.

Use the **no** command to uninstall to CoPP type service policy in the hardware.

Command Syntax

```
copp service-policy NAME
no copp service-policy
```

Parameter

NAME

The policy map name that defines how traffic is classified and treated (For example: policing, dropping, or prioritizing).

Default

None

Command Mode

Configure mode

Applicability

This command was introduced OcNOS version 6.6.0 .

Examples

```
OcNOS(config)#copp service-policy CoPP-POLICY
```

cpu-queue

Use this command to set the protocol queue shaper and enable/disable queue monitoring for drop.

Note: Configuring the queue rate for **guest** is not available for Qumran2 devices. Configuring the queue rate for **PTP** is not allowed for Qumran1 and Qumran2 series platforms.

Command Syntax

```
cpu-queue (cpu.q0|cpu.q1|cpu.q2|cpu.q3|cpu.q4|cpu.q5|cpu.q6|cpu.q7|
arp|bfd|bgp|bpdu|cfm|dsp|evpn|guest|icmp|icmp-redirect|igmp|isis|link-local|mgmt-route-
leak|nhop|oamp|ospf|pim|reserved-mc|rsvp-ldp|sflow|vrrp-rip-dhcp)(monitor|no-monitor|rate <0-100000>)
no cpu-queue (cpu.q0|cpu.q1|cpu.q2|cpu.q3|cpu.q4|cpu.q5|cpu.q6|cpu.q7|
arp|bfd|bgp|bpdu|cfm|dsp|evpn|guest|icmp|icmp-redirect|igmp|isis|link- local|mgmt-route-
leak|nhop|oamp|ospf|pim|reserved-mc|rsvp-ldp|sflow|vrrp-rip-dhcp)(monitor|no-monitor|rate <0-100000>)
```

Parameters

cpu.q0
Represents the parameters for CPU queue 0.

cpu.q1
Represents the parameters for CPU queue 1.

cpu.q2
Represents the parameters for CPU queue 2

cpu.q3
Represents the parameters for CPU queue 3

cpu.q4
Represents the parameters for CPU queue 4

cpu.q5
Represents the parameters for CPU queue 5

cpu.q6
Represents the parameters for CPU queue 6

cpu.q7
Represents the parameters for CPU queue 7

arp
Defines the parameters for the ARP queue.

bfd
Defines the parameters for the BFD queue.

bgp
Defines the parameters for the BGP queue.

bpdu
Defines the parameters for the BPDU queue.

cfm
Defines the parameters for the CFM error queue.

dsp
Defines the parameters for the DSP queue.

evpn
Defines the parameters for the EVPN queue.

guest
Defines the parameters for the Guest queue.

icmp
Defines the parameters for the **ICMP**[1] queue.

icmp-redirect
Defines the parameters for the ICMP-redirect queue.

igmp
Defines the parameters for the IGMP queue.

isis
Defines the parameters for the ISIS queue.

link-local
Defines the parameters for the Link-local queue.

mgmt-route-leak
Defines the parameters for the Management route leak queue.

nhop
Defines the parameters for the Next hop queue.

oamp
Defines the parameters for the OAMP queue.

ospf
Defines the parameters for the OSPF queue.

pim
Defines the parameters for the PIM queue.

reserved-mc
Defines the parameters for the Reserved-mc queue.

rsvp-ldp
Defines the parameters for the RSVP/LDP queue.

sflow
Defines the parameters for the Sflow queue.

vrrp-rip-dhcp
Defines the parameters for the VRRP/RIP/**DHCP**[2] queue.

monitor
Monitor CPU queue usage. If the rate is exceeded, packets start dropping in the CPU queue. These drops are reported to the user through notifications.

no-monitor
Disables monitoring of CPU queue usage.

rate
Sets the CPU queue rate within the range of 0 to 100,000.

Default

CPU queues are set with the default values as shown in Default CPU queues and Per protocol CPU queues.

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

[2]Dynamic Host Configuration Protocol

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS-SP version 2.4.

Example

Use the following command to configure rate/monitor/no-monitor for protocol queues:

```
OcNOS#configure terminal
OcNOS(config)#cpu-queue cpu-q0 rate 400
```

Use the following command to verify the rate received on each protocol queue:

```
OcNOS#show int cpu counters rate kbps

Load interval: 30 second
+-------------------+--------------+-------------+--------------+-------------+
|    CPU Queue(%)   |    Rx kbps   |    Rx pps   |    Tx kbps   |    Tx pps   |
+-------------------+--------------+-------------+--------------+-------------+
 CPU0.q0      (100%) -              -             470.63         58
 bpdu         (  0%) -              -             0.54           1
```

Use the following command to verify the maximum, configured, and default configuration values:

```
OcNOS#show cpu-queue details

* - Can not configure the parameter
Cpu queue                    Rate In Kbps                          Monitor
Status          Name          Configured     Default    Max Rate Allowed   Configured    Default
=======       ============   =========  =================  ===========   ==========

```

hardware-profile filter

Use this command to enable or disable hardware-profile filters for Copp.

Command Syntax

```
hardware-profile filter ingress-ipv4-qos-copp (disable|enable)
```

Parameters

ingress-ipv4-qos-copp	Ingress IPv4 group for ACL match QoS and CoPP
enable	Enable filter group.
disable	Disable filter group

Default

By default, all filter groups are disabled.

Command Mode

Configure mode

Applicability

This command was introduced OcNOS version 6.6.0 .

Examples

```
OcNOS(config)#hardware-profile filter ingress-ipv4-qos-copp enable

OcNOS(config)#hardware-profile filter ingress-ipv4-qos-copp disable
```

match access-group

Use this command to classify the packets based on the access group.

Use the **no** command to remove access group match criteria from a class map.

Notes:

- Match access-group is allowed only in “match-any” class type.
- When match access-grp is configured, no more match criteria can be supported in the class-map.

Command Syntax

```
match access-group NAME
no match access-group NAME
```

Parameter

NAME
Specify the access group name.

Default

None

Command Mode

Class-map copp mode

Applicability

This command was introduced OcNOS version 6.6.0 .

Examples

```
(config)#class-map type copp match-any class_acl
(config-copp-match-any)#match access-group my_acl
```

ip copp access-list

Use this command to define access-list of type CoPP .

Use the **no** form of this command to remove an ACL.

Command Syntax

```
ip copp access-list NAME  (<1-268435453>|)
(deny|permit)
(igmp|ipip|ipv6ip|rsvp|gre|esp|ahp|eigrp|ospf|pim|ipcomp|vrrp|any|<0-255>)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
(fragments|)
(ttl <0-255>|)
(ip-options|)
no ip copp access-list NAME (<1-268435453>|)
(deny|permit)
(igmp|ipip|ipv6ip|rsvp|gre|esp|ahp|eigrp|ospf|pim|ipcomp|vrrp|any|<0-255>)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
(fragments|)
(ttl <0-255>|)
(ip-options|)
no ip copp access-list NAME(<1-268435453>)
```

Parameters

<1-268435453>
IPv4 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

<0-255>
IANA assigned protocol number.

any
Any protocol packet.

ahp
Authentication Header packet.

eigrp
Enhanced Interior Gateway Routing Protocol packet.

esp
Encapsulating Security Payload packet.

gre
Generic Routing Encapsulation packet.

ipip
IPv4 over IPv4 encapsulation packet.

ipcomp
IP Payload Compression Protocol packet.

ipv6ip
IPv6 over IPv4 encapsulation packet.

ospf
Open Shortest Path First packet.

pim
Protocol Independent Multicast packet

rsvp
Resource Reservation Protocol packet.

vrrp
Virtual Router Redundancy Protocol packet.

A.B.C.D/M
Source IP prefix and length.

A.B.C.D A.B.C.D
Source IP address and mask.

host A.B.C.D
A single source host IP address.

any
Match any source IP address.

A.B.C.D/M
Destination IP prefix and length.

A.B.C.D A.B.C.D
Destination IP address and mask.

host A.B.C.D
A single destination host IP address.

any
Match any destination IP address.

fragments
Matches fragmented packets..

ttl <0-255>
Filters packets based on Time-To-Live (TTL) value.

ip-options
Matches packets containing IP options (used for security policies).

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0

Examples

```
#configure terminal
```

```
OcNOS(config)#ip copp access-list COPP-ACL
OcNOS(config-ip-copp-acl)#permit any any any 34
```

ip copp access-list icmp

Use this command to permit or deny **ICMP**[1] packets based on the given source and destination IP address.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
 (<1-268435453>|)
(deny|permit)
(icmp)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
<0-255>
(fragments|)
(ttl <0-255>|)
(ip-options|)
no  (<1-268435453>|)
(deny|permit)
(icmp)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
<0-255>
(fragments|)
(ttl <0-255>|)
(ip-options|)
```

Parameters

<1-268435453>
IPv4 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

icmp
Internet Control Message Protocol packet.

A.B.C.D/M
Source IP prefix and length.

A.B.C.D A.B.C.D
Source IP address and mask.

host A.B.C.D
A single source host IP address.

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

any
Match any source IP address.

A.B.C.D/M
Destination IP prefix and length.

A.B.C.D A.B.C.D
Destination IP address and mask.

host A.B.C.D
A single destination host IP address.

any
Match any destination IP address.

fragments
Matches fragmented packets..

ttl <0-255>
Filters packets based on Time-To-Live (TTL) value.

ip-options
Matches packets containing IP options (used for security policies).

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced beforeOcNOS version 6.6.0 .

Examples

```
#configure terminal
(config)#ip copp access-list ip-icmp
(config-ip-copp-acl)#200 permit icmp any any
```

ip copp access-list tcp|udp

Use this command to define a named copp access control list (ACL) that determines whether to accept or drop an incoming TCP or **UDP**[1] IP packet based on the specified match criteria. This form of command filters packets based on source and destination IP address along with protocol (TCP or UDP) and port.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

[1]User Datagram Protocol

Command Syntax

```
(<1-268435453>|)
(deny|permit)
(tcp)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)

(fragments|)
(ttl <0-255>|)
(ip-options|)
```

Parameters

<1-268435453>
IPv4 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

tcp
Transmission Control Protocol.

udp
User Datagram Protocol.

A.B.C.D/M
Source or destination IP prefix and length.

A.B.C.D A.B.C.D
Source or destination IP address and mask.

host A.B.C.D
Source or destination host IP address.

any
Any source or destination IP address.

eq
Source or destination port equal to.

<0-65535>
Source or destination port number.

range
Range of source or destination port numbers:

<0-65535>
Lowest value in the range.

<0-65535>
Highest value in the range.

bgp
Border Gateway Protocol.

chargen
Character generator.

cmd
Remote commands.

daytime
Daytime.

discard
Discard.

domain
Domain Name Service.

drip
Dynamic Routing Information Protocol.

echo
Echo.

exec
EXEC.

finger
Finger.

ftp
File Transfer Protocol.

ftp-data
FTP data connections.

gopher
Gopher.

hostname
NIC hostname server.

ident
Ident Protocol.

irc
Internet Relay Chat.

klogin
Kerberos login.

kshell
Kerberos shell.

login
Login.

lpd
Printer service.

nntp
Network News Transport Protocol.

pim-auto-rp
PIM Auto-RP.

pop2
Post Office Protocol v2.

pop3
Post Office Protocol v3.

smtp
Simple Mail Transport Protocol.

ssh
Secure Shell.

sunrpc
Sun Remote Procedure Call.

tacacs
TAC Access Control System.

talk
Talk.

telnet
Telnet.

time
Time.

uucp
UNIX-to-UNIX Copy Program.

whois
WHOIS/NICNAME

www
World Wide Web.

netconf-ssh
Secure Shell Network Configuration

netconf-tls
Transport Layer Security Network Configuration

nntp
Range of source or destination port numbers:

ack
Match on the Acknowledgment (ack) bit.

established
Matches only packets that belong to an established TCP connection.

fin
Match on the Finish (fin) bit.

psh
Match on the Push (psh) bit.

rst
Match on the Reset (rst) bit.

syn
Match on the Synchronize (syn) bit.

urg
Match on the Urgent (urg) bit.

biff
Biff.

bootpc
Bootstrap Protocol (BOOTP) client.

bootps
Bootstrap Protocol (BOOTP) server.

discard
Discard.

dnsix
DNSIX security protocol auditing.

domain
Domain Name Service.

echo
Echo.

isakmp
Internet Security Association and Key Management Protocol.

mobile-ip
Mobile IP registration.

nameserver
IEN116 name service.

netbios-dgm
Net BIOS datagram service.

netbios-ns
Net BIOS name service.

netbios-ss
Net BIOS session service.

non500-isakmp
Non500-Internet Security Association and Key Management Protocol.

ntp
Network Time Protocol.

pim-auto-rp
PIM Auto-RP.

rip
Routing Information Protocol.

snmp
Simple Network Management Protocol.

snmptrap
SNMP Traps.

sunrpc
Sun Remote Procedure Call.

syslog
System Logger.

tacacs
TAC Access Control System.

talk
Talk.

tftp
Trivial File Transfer Protocol.

time
Time.

who
Who service.

xdmcp
X Display Manager Control Protocol.

fragments
Check non-initial fragments.

ttl <0-255>
Filters packets based on Time-To-Live (TTL) value.

ip-options
Matches packets containing IP options (used for security policies).

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 6.6.0.

Examples

```
#configure terminal
(config)#ip copp access-list ip-acl-02
(config-ip-copp-acl)#deny udp any any eq tftp
(config-ip-copp-acl)#deny tcp any any eq ssh
(config-ip-acl)#end
```

police

Use this command to configure policer to rate limit particular class of traffic.

Use the **no** command to remove a policing configuration.

Command Syntax

```
police (colour-aware|colour-blind) cir <1-2438400000> kbps|mbps|gbps
no police
```

Parameter

colour-blind
Do not police on color.

colour-aware
Do police on color.

cir
Committed information rate.

<1-2438400000>
Excess information rate values 22kbps-2438gbps.

kbps
Specify the units of kilobits per second.

mbps
Specify the units of megabits per second.

gbps
Specify the units of gigabits per second.

Default

colour-blind

Command Mode

Policy[1] map class Type copp mode

Applicability

This command was introduced OcNOS version 6.6.0 .

Examples

```
OcNOS(config)#policy-map type copp COPP-PM
OcNOS(config-pmap-copp)#class type copp COPP-CM
OcNOS(config-pmap-c-copp)#police cir 22 kbps
OcNOS(config-pmap-c-copp)#exit
```

[1]A set of rules determining which actions are permitted or denied for a specific user role.

policy-map

Use this command to create a policy map and enter policy-map mode.

Use the **no** form of the command to remove a policy map.

Command Syntax

```
policy-map type copp  NAME
no policy-map type copp  NAME
```

Parameter

NAME
Specify a policy-map name (maximum 32 characters).

copp NAME
Specify a policy-map name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced OcNOS version 6.6.0 .

Examples

```
OcNOS(config)#policy-map type copp COPP-PM
OcNOS(config-pmap-copp)#class type copp COPP-CM
```

show interface cpu counters queue-stats

Use this command to display the counters of packets destined to the CPU.

Command Syntax

```
show interface cpu counters queue-stats
```

Parameters

None

Default

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS-SP version 2.4.

Example

```
OcNOS#show interface cpu counters queue-stats
E - Egress, I - Ingress, Q-Size is in bytes

```

show cpu-queue details

Use this command to display CPU queue details.

Command Syntax

```
show cpu-queue details
```

Parameters

None

Default

Monitoring is not enabled by default for any queues, but users have the option to enable monitoring for each queue. The default rate for each queue can be found in the show output. Some queues cannot be monitored, as indicated by an asterisk (*) in the show output.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS-SP version 2.4 .

Example

Use the following command to configure rate for protocol queues:

```
OcNOS#configure terminal
OcNOS(config)#cpu-queue cpu-q0 rate 400
```

Use the following command to verify the maximum, configured, and default configuration values:

```
OcNOS#show cpu-queue details

Object Tracking Commands

This chapter describes the Object Tracking commands:

track ip sla reachability

Use this command to configure an Object for tracking using IP SLA.

Use the **no** form of this command to delete to object tracking

Command Syntax

```
track <1-500> ip sla <1-65535> reachability)
no track <1-500> ip sla <1-65535> reachability
```

Parameters

object-number (1-500)
Identifier for the tracked object

ip-sla-number (1-65535)
Ientifier for IP SLA association with tracking object

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
#configure terminal
OcNOS(config)#track 1 ip sla 1 reachability
OcNOS(config-object-track)#commit

OcNOS(config)#no track 1
OcNOS(config)#commit
```

delay up down

Use This command is used to delay the state change notification of object tracking.

Use the **no** form of this command to remove delay the state change notification of object

Command Syntax

```
delay (up <1-9999>|)(down <1-9999>|)
no delay (|up|down)
```

Parameters

<1-999>
Delay in Notification in seconds.

Default

None

Command Mode

Object tracking Mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS(config-object-track)#delay up 10 down 20
OcNOS(config-object-track)#no delay
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#
OcNOS(config-object-track)#delay down 10
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#no delay down
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#
OcNOS(config-object-track)#delay up 10
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#no delay up
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#
```

object tracking

Use this command to configure track IDs and options on the interfaces.

Use the no parameter with this command to remove the configurations.

These commands configure object tracking on interfaces, with specific track IDs and tracked objects set to determine what gets tracked and affects the interface's status.

The object-tracking command provides flexibility, enabling both all and any tracking behaviors for influencing the interface's status. A maximum of 8 track IDs can be configured per interface. It is possible to configure the same track IDs or options on multiple interfaces.

Command Syntax

```
object-tracking <1-500>
object-tracking <all | any>
no object-tracking <1-500>
no object-tracking <all | any>
```

Parameters

<1-500>
Object tracking ID

all
Boolean AND operation. Each object configured on the interface must be in an up state for the interface itself to be in an up state; otherwise, it will be brought down.

any
Boolean OR operation. At least one object configured on the interface must be in an up state; otherwise, the interface will be brought down.

Default

None

Command Mode

Interface mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Here are some example commands for configuring object tracking in the interface mode.

```
OcNOS(config)#int xe5
OcNOS(config-if)#object-tracking 10
OcNOS(config-if)#object-tracking all
OcNOS(config-if)#commit

OcNOS(config-if)#no object-tracking 10
OcNOS(config-if)#no object-tracking all
OcNOS(config-if)#commit
```

```
OcNOS(config-if)#exit
```

show track

Use this command to display Sham link information.

Command Syntax

```
show track <1-500>
show track
```

Parameters

<1-500>
Object identifier

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS#sh track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is DOWN
    0 changes, last change : 2021 Dec 11 05:20:23
OcNOS#
```

```
OcNOS#sh track 2
TRACK Id: 2
  IP SLA 2 reachability
  Reachability is DOWN
    0 changes, last change : 2021 Dec 11 05:29:49
OcNOS#
```

show track summary

Use this command to display the summary of all object tracking.

Command Syntax

```
show track summary
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS#sh track summary
Object Tracking Summary
ID       Type        Type-Identifier       State
-----------------------------------------------------
1      ip-sla             1                DOWN
2      ip-sla             2                DOWN
OcNOS#
```

show running-config track

Use this command to display object tracking running configuration alone.

Command Syntax

```
show running-config track
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS#sh running-config track
track 1 ip sla 1 reachability
 delay up 20
!
track 2 ip sla 2 reachability
!
OcNOS#
```

IP Service Level Agreements Commands

IP Service Level Agreements (SLAs) is a diagnostic method which generates and analyses the traffic between an OcNOS device and your network. IP SLA monitors and reports network performance data which helps you to identify the actual root cause of a problem when the performance level drops.

This chapter describes the commands used to manage the IP SLA for **ICMP**[1] echo.

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

clear ip sla statistics

Use this command to clear the IP SLA statistics.

Command Syntax

```
clear ip sla statistics <1-65535>
```

Parameters

1-65535
IP SLA identifier

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#clear ip sla statistics 1
```

frequency

Use this command to configure the frequency/interval to send **ICMP**[1] echo packets one by one.

Use the **no** form of this command to remove the configured ICMP echo frequency.

Command Syntax

```
frequency <1-60>
no frequency
```

Parameters

1-60
Frequency in seconds

Default

5 seconds

Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1
(config-ip-sla-echo)#frequency 3
```

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

icmp-echo

Use this command to select and configure the **ICMP**[1] echo SLA operation. ICMP echo packets are constructed in the device and sent to the destination address that you specify. These packets are transferred on a specific interface by setting the **`source-interface`** parameter.

Use the **`no`** form of this command to un-configure or remove the configured ICMP echo measurement sessions.

Command Syntax

```
icmp-echo (ipv4 A.B.C.D|ipv6 X:X::X:X|HOSTNAME) (source-interface IFNAME|)
no icmp-echo (ipv4 A.B.C.D | ipv6 X:X::X:X | HOSTNAME)
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

HOSTNAME
Host name

IFNAME
Source interface name

Default

None

Command Mode

IP SLA mode (config-ip-sla)

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1
(config-ip-sla-echo)#
```

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

ip sla

Use this command to create an IP SLA instance. One instance maps to a single SLA operation. You can create multiple SLA operations to perform multiple similar or different SLA operations.

Use the **no** form of this command to remove a configured IP SLA configurations.

Command Syntax

```
ip sla <1-65535>
no ip sla <1-65535>
```

Parameters

1-65535
IP SLA identifier

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#
```

ip sla schedule

Use this command to schedule an IP SLA operation by associating a Time Range Commands object with the IP SLA operation.

Use the **no** form of this command to stop the configured IP SLA measurement.

Command Syntax

```
ip sla schedule <1-65535> time-range WORD (vrf (NAME)|)
```

Parameters

<1-65535>
IP SLA identifier.

time-range
Time Range

TR_NAME
Time range name that you set with the Time Range Commands command.

vrf
VPN Routing/Forwarding instance

NAME
VPN Routing/Forwarding instance name. Maximum limit 32 characters

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#ip sla schedule 1 time-range t1 vrf v1
```

show ip sla statistics

Use this command to display the statistics of IP SLA measurement.

Command Syntax

```
show ip sla statistics (1-65535) detail
```

Parameters

1-65535
IP SLA identifier.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#show ip sla statistics 1 detail
=======================================
            IP SLA Statistics
=======================================
  IP SLA ID                : 1
  Start Time               : 2021 Aug 30 17:40:04
  Elapsed time(milli sec)  : 46015
  Packets Sent             : 23
  Packets Received         : 23
  Packet Loss(%)           : 0.0000
  Invalid Tests            : 0
  Round Trip Delay(usec)
      Minimum              : 1000
      Maximum              : 1000
      Average              : 1000
```

Table 61. show ip sla statistics fields

Field	Description
IP SLA ID	IP SLA Identifier (1-65535)
Start Time	Measurement start time
Elapsed time(milli sec)	Time taken to complete the measurement in milliseconds
Packets Sent	Number of packet sent
Packets Received	Number of packet received

Table 61. show ip sla statistics fields (continued)

Field	Description
Packet Loss(%)	Packet lost in percentage
Invalid Tests	Received **ICMP**[1] echo reply packets after configured threshold limit will be marked as invalid tests
Round Trip Delay(usec)	Round trip delay between ICMP echo request and ICMP echo reply: minimum, maximum and average round trip delay in microseconds

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

show ip sla summary

Use this command to display the summary of all IP SLA measurements.

Command Syntax

```
show ip sla summary
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#show ip sla summary
IPSLAs Latest Operation Summary
Codes: * active, ^ inactive
ID       Type        Destination       Stats       Return      Last
                                       (usec)        Code        Run
---------------------------------------------------------------------
^1      icmp-echo    20.2.2.3           0           OK        2021 Aug 23 13:53:37
```

Table 62. show ip sla summary fields

Field	Description
ID	IP SLA Identifier (1-65535)
Type	Measurement type
Destination	Destination address
Stats (usec)	Round trip time in microseconds for the measurement
Return Code	Measurement status
Last Run	Measurement last run date and time

show running-config ip sla

Use this command to display the IP SLA running configuration alone.

Command Syntax

```
show running-config ip sla
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#show running-config ip sla
ip sla 1
 icmp-echo ipv4 20.2.2.3
  frequency 2
  threshold 2000
  timeout 5000
ip sla schedule 1 time-range t1 vrf v1
```

threshold

Use this command to configure the threshold for every **ICMP**[1] echo packet.

Use the **no** form of this command to remove the configured ICMP echo threshold.

Command Syntax

```
threshold <1000-60000>
no threshold
```

Parameters

1000-60000
Threshold in milliseconds.

Default

10000 milliseconds

Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1
(config-ip-sla-echo)#threshold 5000
```

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

timeout

Use this command to configure the timeout for every **ICMP**[1] echo packet. Any packet arriving beyond this interval is considered to be lost.

Use the **no** form of this command to remove the configured ICMP echo timeout.

Command Syntax

```
timeout <1000-60000>
no timeout
```

Parameters

1000-60000
Timeout in milliseconds.

Default

10000 milliseconds

Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1
(config-ip-sla-echo)#timeout 5000
```

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

HARDWARE SYSTEM DIAGNOSE CONFIGURATION

Show Tech Support Configurations

Overview

IP Infusion Inc. maintains a collection of consolidated information about system configurations and statistics. This information is for debugging and diagnosing system issues, and can be uploaded to a remote server. You generate a file with this information via the **show techsupport** command.

Note: Output is not displayed on the terminal.

The default directory (**/var/log/**) is where the stored information is saved. The filename has the form: **tech_support_YYYY_MMM_DD_HH_MM_SS.tar.gz**. If a file name is specified, the information will be saved to **filename_YYYY_MMM_DD_HH_MM_SS_.tar.gz**. Date stamps are in the **YYYY_MM_DD** form, and time stamps are in the form **HH_MM_SS**.

The collected system data contains the following logs:

- Saved start-up configuration of the system.
- The **running-config**, and statistics for a specified module or all modules.
- The last 100 commands.
- Memory and CPU usage of the process.
- Process Id and process name.
- The user account running the process.

Tech Support Samples

`#show techsupport all`	Collects system configurations and statistics for all modules, and saves it in **tech_support_date_timestamp.tar.gz** in the **/var/log/** directory.
`#show techsupport all log-path /home/filename`	Collects system configurations and statistics for all modules, and saves it in **filename_date_timestamp.tar.gz** in the **/home/ directory.**
`#show techsupport nsm`	Collects **nsm** protocol configurations and statistics, and saves it in **tech_support_date_timestamp.tar.gz** in the **/var/log/** directory.
`#show techsupport nsm log-path /home/filename`	Collects **nsm** protocol configurations and statistics, and saves it at **filename_date_timestamp.tar.gz** in the **/home/directory.**
`#show techsupport hostpd authd imi`	Collects **hostp**, **authd**, and **imi** protocol configurations and statistics and saves it at **tech_support_date_timestamp.tar.gz** in the **/var/log/** directory.
`#show techsupport hostpd authd imi log-path`	Collects **hostp, authd**, **imi** protocol configurations and

`/home/filename`	statistics, saves it as **`filename_date_timestamp.tar.gz`** in the **`/home/`** directory.

Ethernet Interface Loopback Support

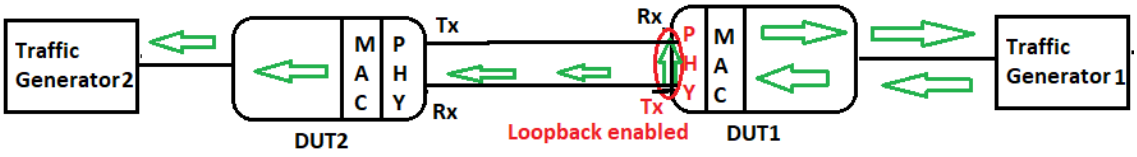
Overview

This feature support is to provide additional hardware diagnostic functionality for physical ports on boards. This feature will enable the user to determine if there are any issues in the physical port at the MAC and the PHY layer.

To achieve this functionality, the Ethernet interfaces can be configured as the loopback interfaces. Looping back the packets are possible either at MAC layer or at PHY layer. Also packets can be looped either from Egress to Ingress or Ingress to Egress. On enabling this feature, if all the TX packets are looped back to RX, it indicates there is no issue with the hardware at the particular layer configured, either MAC or PHY.

Local Loopback

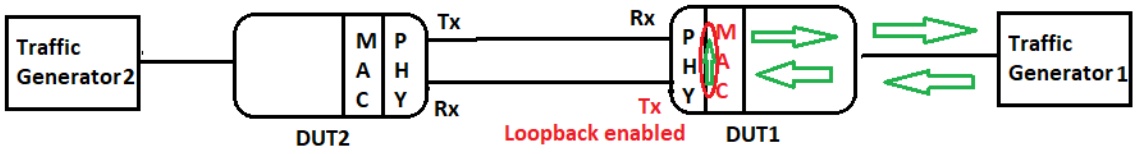
Tx PHY Loopback



When the loopback Tx PHY is enabled on an Ethernet interface, packets that the traffic generator receives on such an interface are loop-backed to the originator and forwarded to the destination.

Because loopback is enabled as the Tx PHY in the diagram above, packets will loop at the physical layer, and the same number of packets will be returned to the traffic generator from the DUT's Egress to Ingress side. Thus, the Tx and Rx counts of receiving and transmitting interfaces are the same. The packets are looped and also forwarded to their next destination.

Tx MAC Loopback

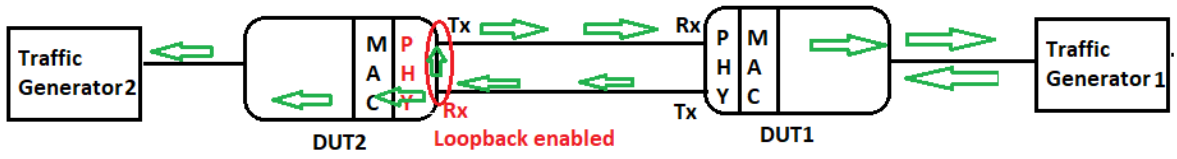


Loopback Tx MAC is enabled on the Ethernet interface, and when packets from the traffic generator arrive on such an interface, they are loop-backed to the originator rather than being forwarded.

In the above diagram, as loopback is enabled as a Tx MAC, the packets will loop at the MAC layer (data link layer), and the same number of packets are returned from the egress side to the ingress side of the DUT to the traffic generator. Thus, the Tx and Rx counts of receiving and transmitting interfaces are the same. The packets are looped but not forwarded further.

Remote Loopback

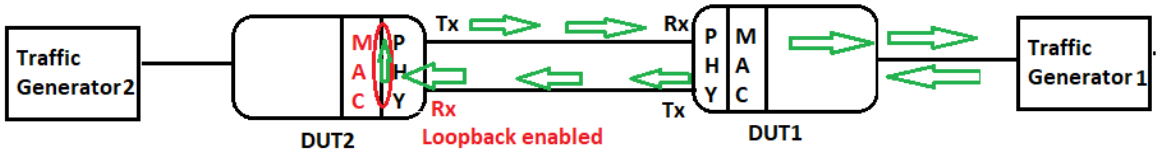
Rx PHY Loopback



Loopback Rx PHY is enabled on the ethernet interface, and when packets from the traffic generator arrive at a remote node via such an interface, they are loop-backed to the originator and forwarded to the next route.

In the above diagram, as loopback is enabled as Rx PHY on DUT2, the packets will loop at the physical layer of the DUT2, and the same number of packets are returned from the ingress to the egress side of the DUT2 to DUT1 and the traffic generator. Thus, the Tx and Rx counts of receiving and transmitting interfaces are the same. The packets are looped back to Traffic Generator1 as well as forwarded to Traffic Generator2.

Rx MAC Loopback



Loopback Rx MAC is enabled on the ethernet interface, and when packets from the traffic generator arrive at a remote node via such an interface, they are loop-backed to the originator but not forwarded to the next route.

In the above diagram, as loopback is enabled as Rx MAC on DUT2, the packets will loop at the MAC layer (data link layer) of the DUT2, and the same number of packets are returned from the ingress to the egress side of the DUT2 to DUT1 and the traffic generator. Thus, the Tx and Rx counts of receiving and transmitting interfaces are the same. The packets are looped back to Traffic Generator1, but not forwarded to Traffic Generator2.

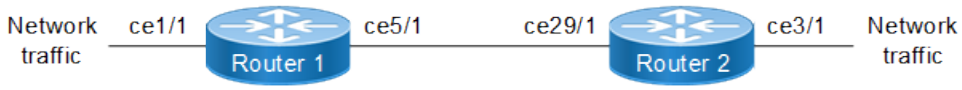
Figure 56. Loopback configuration nodes



Configurations

R1

`#configure terminal`	Enter into the configure terminal mode.

`R1(config)#hostname R1`	Configure the hostname
`R1(config)#commit`	Commit the configuration
`R1(config)#bridge 1 protocol rstp vlan-bridge`	Configure bridge
`R1(config)#vlan database`	Enter into vlan database
`R1(config-vlan)#vlan 2 bridge 1`	Configure vlans
`R1(config-vlan)#exit`	Exit the vlan database mode
`R1(config)#interface ce1/1`	Enter into interface ce1/1
`R1(config-if)#switchport`	Configure switchport
`R1(config-if)#bridge-group 1`	Configure bridge-group
`R1(config-if)#switchport mode trunk`	Configure switchport mode as trunk
`R1(config-if)#switchport trunk allowed vlan add 2`	Add all the vlans to the interface
`R1(config-if)#exit`	Exit the interface mode
`R1(config)#interface ce5/1`	Enter into interface ce1/1
`R1(config-if)#switchport`	Configure switchport
`R1(config-if)#bridge-group 1`	Configure bridge-group
`R1(config-if)#switchport mode trunk`	Configure switchport mode as trunk
`R1(config-if)#switchport trunk allowed vlan add 2`	Add all the vlans to the interface
`R1(config-if)#loopback tx phy`	Configure loopback tx phy
`R1(config-if)#exit`	Exit the interface level
`R1(config)#no mac-address-table learning bridge 1 interface ce1/1`	Disable the mac-learning on the device
`R1(config)#no mac-address-table learning bridge 1 interface ce5/1`	Disable the mac-learning on the device
`R1(config)#commit`	Commit the configuration
`R1(config)#exit`	Exit from configuration mode

R2

`#configure terminal`	Enter into the configure terminal mode.
`R2(config)#hostname R2`	Configure the hostname
`R2(config)#commit`	Commit the configuration
`R2(config)#exit`	Come out of configuration mode
`R2#conf terminal`	Enter into the configure terminal mode
`R2(config)#bridge 1 protocol rstp vlan-bridge`	Configure bridge
`R2(config)#vlan database`	Enter into vlan database
`R2(config-vlan)#vlan 2 bridge 1`	Configure vlans
`R2(config-vlan)#exit`	Exit the vlan database mode
`R2(config)#interface ce3/1`	Enter into interface ce3/1

`R2(config-if)#switchport`	Configure switchport
`R2(config-if)#bridge-group 1`	Configure bridge-group
`R2(config-if)#switchport mode trunk`	Configure switchport mode as trunk
`R2(config-if)#switchport trunk allowed vlan add 2`	Add the vlan to the interface
`R2(config-if)#exit`	Exit the interface mode
`R2(config-if)#interface ce29/1`	Enter into interface ce29/1
`R2(config-if)#switchport`	Configure switchport
`R2(config-if)#bridge-group 1`	Configure bridge-group
`R2(config-if)#switchport mode trunk`	Configure switchport mode as trunk
`R2(config-if)#switchport trunk allowed vlan add 2`	Add the vlan to the interface
`R2(config-if)#exit`	Exit from interface level
`R2(config)#no mac-address-table learning bridge 1 interface ce3/1`	Disable the mac-learning on the device
`R2(config)#no mac-address-table learning bridge 1 interface ce29/1`	Disable the mac-learning on the device
`R2(config)#commit`	Commit the configuration
`R2(config)#exit`	Exit from configuration mode

HARDWARE SYSTEM DIAGNOSE COMMAND REFERENCE

Chassis Management Module Commands

This chapter provides a description, syntax, and examples of CMM feature commands:

You can retrieve the same set of information through SNMP that these commands display. This MIB is defined in **`CMM-CHASSIS-MIB.txt:`**

IP Infusion Inc. enterprise identifier	36673
Chassis MIB identifier	100

The MIB definition is available here:

https://github.com/IPInfusion/OcNOS/branches

Navigate to the directory for the version of OcNOS that you are using.

Note: Critical logs in the console are equivalent to alert traps and alert logs on the console is equivalent to critical trap in SNMP.

cpu-core-usage

Use this command to set threshold percentage values for monitoring CPU core use.

Use the **no** form of this command to set the default thresholds.

Command Syntax

```
cpu-core-usage warning <51-100> alarm <91-100>
no cpu-core-usage
```

Parameters

<51-100>
Warning threshold percentage

<91-100>
Alarm threshold percentage

Default

Check the default thresholds using the show system-information (page 924) command with the **cpu-load** parameter.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Example

```
(config)#cpu-core-usage warning 56 alarm 97
(config)#end

#show system-information cpu-load

System CPU-Load Information
===========================

Uptime                    : 64 Days 18 Hours 20 Minutes 12 Seconds

Load Average(1 min)       : 4.24% (Crit Thresh : 40%, Alert Thresh : 50%)
Load Average(5 min)       : 2.87% (Crit Thresh : N/A, Alert Thresh : 50%)
Load Average(15 min)      : 3.37% (Crit Thresh : N/A, Alert Thresh : 50%)

Avg CPU Usage             : 2.02%
CPU core 1 Usage          : 0.89% (Crit Thresh : 56%, Alert Thresh : 97%)
CPU core 2 Usage          : 0.00% (Crit Thresh : 56%, Alert Thresh : 97%)
CPU core 3 Usage          : 5.41% (Crit Thresh : 56%, Alert Thresh : 97%)
CPU core 4 Usage          : 2.68% (Crit Thresh : 56%, Alert Thresh : 97%)

#con t
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#no cpu-core-usage
(config)#end
```

```
#show system-information cpu-load

System CPU-Load Information
===========================

Uptime                    : 64 Days 18 Hours 21 Minutes 46 Seconds

Load Average(1 min)       : 2.44% (Crit Thresh : 40%, Alert Thresh : 50%)
Load Average(5 min)       : 2.49% (Crit Thresh : N/A, Alert Thresh : 50%)
Load Average(15 min)      : 3.27% (Crit Thresh : N/A, Alert Thresh : 50%)

Avg CPU Usage             : 1.82%
CPU core 1 Usage          : 0.00% (Crit Thresh : 50%, Alert Thresh : 90%)
CPU core 2 Usage          : 0.00% (Crit Thresh : 50%, Alert Thresh : 90%)
CPU core 3 Usage          : 4.59% (Crit Thresh : 50%, Alert Thresh : 90%)
CPU core 4 Usage          : 1.82% (Crit Thresh : 50%, Alert Thresh : 90%)
#
```

debug cmm

Use this command to enable or disable debugging for CMM.

Command Syntax

```
debug cmm
no debug cmm
```

Parameters

None

Default

By default, CMM debugging is disabled.

Command Mode

Configure mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug cmm
(config)#no debug cmm
```

disk-activity-monitoring interval

Use this command to set the disk activity monitoring interval in seconds.

Use the **no** form of this command to set the disk activity monitoring interval to its default value of 600 seconds.

Command Syntax

```
disk-activity-monitoring interval <30-1200>
no disk-activity-monitoring interval
```

Parameters

<30-1200>
Monitoring interval in seconds.

Default

The default monitoring interval is 600 seconds.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.2.

Example

```
(config)#disk-activity-monitoring interval 60
(config)#commit
#
```

disk-activity-monitoring threshold

Use this command to set the threshold activity value for disk reads or writes. When the device reaches the threshold level, operator logs, SNMP traps, and NetConf notifications are displayed/sent. A threshold value of zero means that the monitoring is disabled.

Use the **no** form of this command to set the threshold activity for reads or writes in the default value of zero.

Command Syntax

```
disk-activity-monitoring threshold (read <1-20000> | write <1-20000>)
no disk-activity-monitoring threshold (read | write)
```

Parameters

read
Threshold level for reads.

<1-20000>
Threshold level in KBps.

write
Threshold level for writes.

<1-20000>
Threshold level in KBps.

Default

The default threshold activity value for reads and writes is zero (disabled).

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.2.

Example

```
(config)#disk-activity-monitoring threshold read 3000
(config)#commit
#

(config)#disk-activity-monitoring threshold write 4500
(config)#commit
```

locator led

Use this command to turn on the locator LED.

Use the **no** form of this command to turn off the locator LED.

Command Syntax

```
locator-led on
no locator-led
```

Parameters

None

Default

By default, the locator LED is turned off.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#locator-led on
(config)#no locator-led
```

show hardware-information

Use this command to display hardware information.

Command Syntax

```
show hardware-information (memory|fan|temperature|led|power (|monitoring-
thresholds)|transceiver|system-status|all)
```

Parameters

all
Hardware details of all modules.

fan
Fan status of the boards.

led
LED status of the boards.

memory
Memory information of the boards.

power
PSU information.

monitoring-thresholds
Monitoring thresholds (if provided by hardware).

temperature
Temperature sensor information of the boards.

transceiver
Transceiver presence status and supported list of transceivers.

system-status
System fault status.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3. The monitoring-thresholds and system-status parameters were added in OcNOS version 5.2.

Example

```
#show hardware-information all
-------------------------------------------------------
                RAM INFORMATION
-------------------------------------------------------
```

```

Table 63 explains the show command output fields.

Table 63. show hardware-information all output

Field	Description
Ram Information	Used memory, free memory, shared, buffers, total swap, and free swap memory.
Hard Disk Information	Hard drive serial number, model, firmware revision, cylinders, heads, and sectors, as well as revision number and total size.
Fans	Fan tray numbers, numbers of fans per tray, and their speed in RPM.
Board Temp Sensors Temperature	Sensor type, current temperature, and operating range.
BCM Chip Internal Temperature	Broadcom chip current internal temperature, Operating range and average temperature.

Table 63. show hardware-information all output (continued)

Field	Description
System Power Information	System power Information. Shows Voltage on all rails, and whether the power is up or has failed.
PSU	Main power supply statistics: Volts in, volts out, current in and out amperes, power in and out in watts, temperature of each power supply, and fan speed in RPM.
LED	What the LEDs represent, what state the LEDs mean, and a description of what the LEDs current color means.
Transceiver DDM support list	Transceivers: type, vendor name, part number, and whether Digital Diagnostic Monitoring (DDM) is supported.
Port Number	Port numbers, port type (SFP, QSFP, etc) and whether a transceiver is in the port.

Table 66 explains the show hardware-information system-status command output fields.

Table 66. show hardware-information system-status output fields

Field	Description
System Over all status	Self explanatory
Components status	Status of CPU, RAM, disk, fan, power, and software
Component	Component name
Fault	Type of fault: H-Mi- High Minor

Table 66. show hardware-information system-status output fields (continued)

Field	Description
	H-Ma- High Major L-Mi- Low Minor L-Ma- Low Major
Timestamp	Date and time of the fault
Thresh	Threshold limit
Violation-Status	Explanation of violation

show system fru

Use this command to display Field Replaceable Unit (FRU) information controlled by the baseboard management controller (BMC).

Command Syntax

```
show system fru
```

Parameter

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#show system fru
--------------System FRUs------------------
FRU Device Description : MAINBOARD_FRU
Board Mfg Date        : 2018-09-17 13:34:00
Board Mfg             : UFISPACE
Board Product         : S9500-30XS-Board
Board Serial          : WB2N9470004
Product Manufacturer  : UFISPACE
Product Name          : S9500-30XS
Product Version       : PVT
Product Serial        : WE61A47S00016
Product Asset Tag     : 00

FRU Device Description : PSU0_FRU
Product Manufacturer  : FSPGROUP
Product Name          : VICTO451AM
Product Part Number   : YNEB0450
Product Version       : BM-2R01P10
Product Serial        : T0A060Y322009000053
Product extra 1       : P3H800A03
Product extra 2       : A

FRU Device Description : PSU1_FRU
Product Manufacturer  : FSPGROUP
Product Name          : VICTO451AM
Product Part Number   : YNEB0450
Product Version       : BM-2R01P10
Product Serial        : T0A060Y322009000052
Product extra 1       : P3H800A03
Product extra 2       : A
```

show system-information

Use this command to display system information.

Command Syntax

```
show system-information (all|fan|psu|os|cpu|bios|cpu-load|board-info)
```

Parameter

all
System information of all modules.

bios
BIOS information.

board-info
Board EEPROM details.

cpu
Processor information.

cpu-load
CPU load information.

fan
Fan Field Replaceable Units (FRU) EEPROM information.

os
OS and Kernel version information.

psu
Power Supply Field Replaceable Units (FRU) EEPROM information.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show system-information psu
System PSU FRU Information
=========================
PSU 2 Country of Origin          : CN
PSU 2 PPID Part Number           : 0T9FNW
PSU 2 PPID Part Number Rev       : A00
PSU 2 Manufacturer ID            : 28298
PSU 2 Date Code                  : 52R
PSU 2 Serial Number              : 0298
```

```
PSU 2 Part Number               : 0T9FNW
PSU 2 Part Number Revision      : A00
PSU 2 Number of Fans in the tray : 1
PSU 2 Type                      : AC Normal
PSU 2 Service Tag               : AEIOU
```

The following tables explain the show command output fields.

Table 67. show system-information topics

Topic	Description
all	Show all topics of system information.
bios	Display BIOS information.
board-info	Display information related to the board.
cpu	Displays Central Processing Unit information
cpu-load	Displays the load on the system's CPU.
fan	Displays fan information contain in the EEPROM.
os	Displays information regarding the host operating system
psu	Displays information regarding Field Replaceable Units (FRU).

Table 68. Show fan topic displays

System Fan FRU Information	Description
Fan Tray "#" PPID Part Number	The vendor's part number for the fan.
Fan Tray Serial Number	As stated
Service Tag	The Service Tag can help identify your device for on-line support and upgrading drivers
Vendor Name	As stated

Table 69. Show system BIOS information

BIOS Information	Description
# dmidecode	The dmidecode is a tool for dumping a computer's DMI table contents in a human-readable format. This table contains a description of the system's hardware components, as well as other useful pieces of information such as serial numbers and BIOS revisions.
SMBIOS	The System Management BIOS (SMBIOS) defines data structures (and access methods) that can be used to read management information produced by the BIOS of a computer. Also, it is involved with the DMI Address –
Handle 0x0000, DMI type 0, 24 bytes	Handle of the Desktop Management Interface (DMI) and the DMI type, where type value identifies what the DMI contains. DMI = 0 indicates the following information is specific to BIOS properties, and is 24 bytes long.
BIOS Physical Information	• Vendor – The manufacture of the BIOS.

Table 69. Show system BIOS information (continued)

BIOS Information	Description
	• Version – The Version number. • Release Date – as stated. • Address – starting address (in memory) of the BIOS.
Characteristics	• Is PCI supported. • Is BIOS upgradeable. • Is boot from a CD supported. • Is selectable boot devices supported. • Is BIOS ROM socketed. • Is Enhanced Disk Drive (EDD) vectoring supported. • Is 5.25"/1.2 MB floppy services supported (int 13h) • Is 3.5"/720 kB floppy services supported (int 13h) • Is 3.5"/2.88 MB floppy services supported (int 13h) • Is Print screen service supported (int 5h) • Is 8042 keyboard services supported (int 9h) • Is Serial services supported (int 14h) • Is Printer services supported (int 17h) • Is Advanced Configuration and Power Interface (ACPI) supported • Is USB legacy supported • Is BIOS boot specification supported • Is Targeted content distribution supported • Is Unified Extensible Firmware Interface (UEFI) supported
BIOS Revision	The BIOS revision number.
Handle 0x0043, DMI type 13, 22 bytes	Handle of the Desktop Management Interface (DMI) and the DMI type, where type value identifies what the DMI contains. DMI = 13 indicates the following information is specific to BIOS language information, and is 22 bytes long.
BIOS Language Informantion	• Language Description Format – A term that describes the number of bits used to represent the BIOS Language information parameters. • Installable Languages – The number of languages that can be used by the BIOS at any time. • Currently Installed Language – United States English (or Latin-1) as described by the ISO standard, en|US|iso8859-1.

Table 70. Show CPU information

System CPU Information	Description
processor	The processor number of each CPU
model name	Details about each CPU. For example, Intel(R) Atom(TM) CPU C2538 @ 2.40GHz.

Table 71. Show system CPU load information

Load Information	Description
Uptime	As stated in days, hours, minutes, and seconds.
Load Average for past 1min	As stated in percent.
Load Average for past 5 min	As stated in percent.
Load Average for past 15 min	As stated in percent.
CPU Usage at this instant	As stated in percent.
Max threshold for CPU-usage	As stated in percent.

Table 72. Show system board information

System Information	Description
Product Name	Model number of the device.
Serial Number	As stated
Base MAC Address	As stated
Manufacture Date	As state
Platform Name	The platform on which the product is based.
ONIE Version	The version of the Open Network Install Environment (ONIE).
MAC addresses	Number of MAC addresses related to the device.
Manufacture	As stated
Country Code	The code that represents the country of manufacture. For example, US = United States, TW = Taiwan, and so on.
Diag Version	As stated
CRC-32	Cyclic Redundancy Check value.
Switch Chip Revision	As stated
MAIN BOARD REVISION	As stated
CPU CPLD VERSION	The version of the Complex Programmable Logic Device (CPLD) use by the CPU.
SW CPLD VERSION	The version of the Complex Programmable Logic Device (CPLD) use by the switch.
MAIN BOARD TYPE	An identifying string for the main board.
CPU BOARD ID	An identifying string for the CPU board.
CPU BOARD VERSION	As stated
SW BOARD ID	NA
SW BOARD VERSION	As stated
VCC 5V	The state of the VCC 5V power rail (Enabled \ Disabled)
MAC 1V	The state of the MAC 1V power rail Enabled \ Disabled
VCC 1.8V	The state of the VCC 1.8V power rail (Enabled \ Disabled)

Table 72. Show system board information (continued)

System Information	Description
MAC AVS 1V	The state of the MAC AVS 1V power rail (Enabled \ Disabled)
HOT SWAP1	Enabled \ Disabled
HOT SWAP2	Enabled \ Disabled

Table 73. Show host system details

Host Information	Description
OS Distribution	The operating system on which the device is to run.
Kernel Version	A string that identifies the operating kernel.

show system sensor

Use this command to display the system sensors controlled by the baseboard management controller (BMC).

Command Syntax

```
show system sensor
```

Parameter

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#show system sensor
-------------------------------------------------System Sensors-----------------------------------------
------------------
Codes: LNR - Lower Non-Recoverable
LCR - Lower Critical
LNC - Lower Non-Critical
UNC - Upper Non-Critical
UCR - Upper Critical
UNR - Upper Non-Recoverable
Note: For discrete sensor, thresholds and value columns are not applicable.
SENSOR           | VALUE      | UNITS      | LNR        | LCR        | LNC        | UNC        |

```

system-load-average

Use this command to set threshold percentage values for monitoring the system load average for the last 1 minute, 5 minutes, and 15 minutes.

Use the **no** form of this command to set the default thresholds.

Command Syntax

```
system-load-average (1min warning <41-100> alarm <51-100> 5min alarm <51-100> 15min alarm <51-100>)
no system-load-average
```

Parameters

1min warning
Load average for last 1 minute

<41-100>
Warning threshold in percent

alarm
Alarm

<51-100>
Alarm threshold in percent

5min alarm
Load average for last 5 minutes

<51-100>
Alarm threshold in percent

15min alarm
Load average for last 15 minutes

<51-100>
Alarm threshold in percent

Default

Check the default thresholds using the show system-information (page 924) command with the **cpu-load** parameter.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Example

```
(config)#system-load-average 1min warning 45 alarm 55 5min alarm 65 15min alarm 75
(config)#end

#show system-information cpu-load
```

```
System CPU-Load Information

```

Modifying Temperature Sensor Threshold Value

Overview

Typically, the temperature policies of hardware equipments are predefined and enforced through hardware or software by hardware vendors. However, for hardwares without baseboard management controller (BMC) built-in, the temperature policies are managed through software from Network Operating System (NOS) vendors.

OcNOS is enhanced to manage the hardware temperature through new commands line interfaces from 6.5.3 release. These newly defined software policy based temperature control CLIs are compliance to the hardware vendor standards. However, to satisfy some users who wants to modify the present threshold values at their convenience can do so. They are willing to take risks by stretching the predefined threshold values by the hardware vendor.

However, IPI strongly recommends not to modify the default policy as it may lead to hardware component failure.

Feature Characteristics

Using this feature users can control both or any one of them based on the requirement.

- the threshold values for each severity level and temperature sensor,

and

- the system action upon a violation to either HALT, REBOOT or NONE.

The hardware's default policy is applied if no user configuration exists or is removed.

A warning message alerts users if they set thresholds beyond the “Emergency Max/Min” values or configure the policy to “none,” emphasizing the potential risks involved.

These commands are applicable only to EdgeCore and UfiSpace hardwares without BMC built-in.

Benefits

This feature enables an exceptional control for users. With the current default hardware temperature policy, when OcNOS detects the temperature threshold value violation, it shuts down the system to prevent hardware damage. Some customers have deployed the units in far remote areas, and whenever this happens it becomes troublesome for them to switch the units back ON. In such exceptional cases, enables the user to modify the predefined thresholds value and change the behaviors of the system to either REBOOT or NONE instead of HALT.

Prerequisites

The hardware should be up and active.

temperature threshold

Use this command to set temperature threshold for each severity level of the sensor.

Use the **no** form of this command to set the default thresholds.

Command Syntax

```
temperature threshold <1-15>
```

```
no temperature threshold <1-15>
```

Parameters

<1-15>

Specifies the sensor number to be configured. Refer to temperature threshold (page 934) temperature CLI command section to view the available sensor types.

Default

Check the default temperature thresholds using the **`show hardware-information`** temperature command.

Command Mode

Configuration Mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the hardware device temperature threshold value, execute:

```
OcNOS(config)#temperature threshold 1
OcNOS(config-temperature-threshold)#
```

The mode changes to temperature threshold mode.

```
#(config-temperature-threshold)#emer-min 5
#(config-temperature-threshold)#commit
```

To remove the configuration, execute:

OcNOS(config)#no temperature threshold 1

To view the current hardware temperature, execute

```
#show running-config |include temperature | emer-min
temperature threshold 1
    emer-min 5

OcNOS#show hardware-information temperature

```

emer-max

Use this command to configure hardware emergency temperature threshold maximum value.

Use **no** parameter to remove the replace the configured emergency temperature maximum value to default threshold value.

Command Syntax

```
emer-max <-50-150>
no emer-max
```

Parameters

<-50-150>
Specifies the emergency temperature-threshold maximum range value.

Default

None

Command Mode

Temperature-threshold

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the hardware device temperature threshold value, execute:

```
OcNOS(config)#temperature threshold 2
OcNOS(config-temperature-threshold)#
```

The mode changes, to configure the emergency temperature sensor's maximum threshold value, execute:

```
OcNOS(config-temperature-threshold)#emer-max 78
```

The hardware threshold is over-written with user configured threshold. To unconfigure the user defined threshold values, execute:

```
OcNOS(config-temperature-threshold)#no emer-max
```

emer-min

Use this command to configure hardware emergency temperature threshold minimum value.

Use **no** parameter to remove the replace the configured emergency temperature minimum value to default threshold value.

Command Syntax

```
emer-min <-50-150>
no emer-min
```

Parameters

<-50-150>
Specifies the emergency temperature-threshold minimum range value.

Default

None

Command Mode

Temperature-threshold

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the hardware device temperature threshold value, execute:

```
OcNOS(config)#temperature threshold 2
OcNOS(config-temperature-threshold)#
```

The mode changes, to configure the emergency temperature sensor's minimum threshold value, execute:

```
OcNOS(config-temperature-threshold)#emer-min 1
```

The hardware threshold is over-written with user configured threshold. To unconfigure the user defined threshold values, execute:

```
OcNOS(config-temperature-threshold)#no emer-min
```

alrt-max

Use this command to configure hardware alert temperature threshold maximum value.

Use **no** parameter to remove the replace the configured alert temperature maximum value to default threshold value.

Command Syntax

```
alrt-max <-50-150>
no alrt-max
```

Parameters

<-50-150>
Specifies the alert Temperature-threshold maximum range value.

Default

None

Command Mode

Temperature-threshold

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the hardware device temperature threshold value, execute:

```
OcNOS(config)#temperature threshold 2
OcNOS(config-temperature-threshold)#
```

The mode changes, to configure the alert temperature sensor's maximum threshold value, execute:

```
OcNOS(config-temperature-threshold)#alrt-max 73
```

The hardware threshold is over-written with user configured threshold. To unconfigure the user defined threshold values, execute:

```
OcNOS(config-temperature-threshold)#no alrt-max
```

alrt-min

Use this command to configure hardware alert temperature threshold minimum value.

Use **no** parameter to remove the replace the configured alert temperature minimum value to default threshold value.

Command Syntax

```
alrt-min <-50-150>
no alrt-min
```

Parameters

<-50-150>
Specifies the alert Temperature-threshold minimum range value.

Default

None

Command Mode

Temperature-threshold

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the hardware device temperature threshold value, execute:

```
OcNOS(config)#temperature threshold 2
```

```
OcNOS(config-temperature-threshold)#
```

The mode changes, to configure the alert temperature sensor's minimum threshold value, execute:

```
OcNOS(config-temperature-threshold)#alrt-min 11
```

The hardware threshold is over-written with user configured threshold. To unconfigure the user defined threshold values, execute:

```
OcNOS(config-temperature-threshold)#no alrt-min
```

crit-max

Use this command to configure hardware critical temperature threshold maximum value.

Use **no** parameter to remove the replace the configured critical temperature maximum value to default threshold value.

Command Syntax

```
crit-max <-50-150>
no crit-max
```

Parameters

<-50-150>
Specifies the critical temperature-threshold maximum range value.

Default

None

Command Mode

Temperature-threshold

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the hardware device temperature threshold value, execute:

```
OcNOS(config)#temperature threshold 2
OcNOS(config-temperature-threshold)#
```

The mode changes, to configure the critical temperature sensor's maximum threshold value, execute:

```
OcNOS(config-temperature-threshold)#crit-max 69
```

The hardware threshold is over-written with user configured threshold. To unconfigure the user defined threshold values, execute:

```
OcNOS(config-temperature-threshold)#no crit-max
```

crit-min

Use this command to configure hardware critical temperature threshold minimum value.

Use **no** parameter to remove the replace the configured critical temperature minimum value to default threshold value.

Command Syntax

```
crit-min <-50-150>
no crit-min
```

Parameters

<-50-150>	Specifies the critical Temperature-threshold minimum range value.

Default

None

Command Mode

Temperature-threshold

Applicability

Introduced in OcNOS version 6.5.3.

Example

To configure the hardware device temperature threshold value, execute:

```
OcNOS(config)#temperature threshold 2
OcNOS(config-temperature-threshold)#
```

The mode changes, to configure the critical temperature sensor's minimum threshold value, execute:

```
OcNOS(config-temperature-threshold)#crit-min 15
```

The hardware threshold is over-written with user configured threshold. To unconfigure the user defined threshold values, execute:

```
OcNOS(config-temperature-threshold)#no crit-min
```

temperature policy (sys-reboot | sys-halt | none)

Use this command to configure the temperature policy.

Use **no** parameter to remove the configured temperature policy.

Command Syntax

```
temperature policy (sys-reboot | sys-halt | none)
no temperature policy
```

Parameters

none	None
sys-halt	System halt
sys-reboot	System reboot

Default

None

Command Mode

Configuration Mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

Execute the following command to apply the temperature policy and reboot the system.

```
(config)#temperature policy sys-reboot
(config)#commit
(config)#no temperature policy
(config)#commit
```

temperature policy (sys-reboot | sys-halt | none)

Use this command to configure the temperature policy.

Use **no** parameter to remove the configured temperature policy.

Command Syntax

```
temperature policy (sys-reboot | sys-halt | none)
no temperature policy
```

Parameters

1000-60000
Threshold in milliseconds.

none
none

sys-halt
System halt

sys-reboot
System reboot

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.5.3.

Examples

Execute the following command to apply the temperature policy and reboot the system.

```
(config)#temperature policy sys-reboot
(config)#commit
(config)#no temperature policy
(config)#commit
```

Digital Diagnostic Monitoring Commands

This chapter is a reference for Digital Diagnostic Monitoring (DDM) commands:

clear ddm transceiver alarm

Use this command to clear the transceiver alarm in the DDM monitor interface.

Command Syntax

```
clear ddm transceiver alarm
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#clear ddm transceiver alarm
(config-if)#exit
```

clear ddm transceiver alarm all

Use this command to clear the transceiver DDM alarm for all interface.

Command Syntax

```
clear ddm transceiver alarm all
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
# clear ddm transceiver alarm all
```

ddm monitor

Use this command to enable or disable DDM monitoring for interfaces which have a supported transceiver.

Use the **no** form of this command to remove DDM monitoring for all transceivers.

Command Syntax

```
ddm monitor (disable|enable)
no ddm monitor
```

Parameters

enable
Enable DDM monitoring.

disable
Disable DDM monitoring.

Default

By default, DDM monitoring is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#ddm monitor enable
(config-if)#ddm monitor disable
(config-if)#exit
(config)#interface xe1
(config-if)#no ddm monitor
(config-if)#exit
```

ddm monitor all

Use this command to enable DDM monitoring for all transceiver.s

Use the **no** form of this command to disable DDM monitoring for all transceivers.

Command Syntax

```
ddm monitor all
no ddm monitor all
```

Parameters

None

Default

By default, DDM monitoring is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ddm monitor all
(config)#no ddm monitor all
```

ddm monitor interval

Use this command to set the monitoring interval for the transceiver.

Use no form with this command to set the monitoring interval to its default.

Command Syntax

```
ddm monitor interval <60-3600>
no ddm monitor interval
```

Parameters

<60-3600>
Interval period in seconds.

Default

The default monitoring interval is 60 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ddm monitor interval 60
```

ddm raise

Use this command to raise a false alarm on the remote smart SFP.

Use this command to clear the false alarm on the remote smart SFP.

Command Syntax

```
ddm raise false alarm IFNAME (((temperature|voltage|voltage2|current|rxpower|txpower|frequency-
error|wavelength-error|snr|resisi|leveltrans|teccurrent|prefecber|
  uncorrectedber|lasertemp) VALUE)| tec-fault) (remote|)
no ddm raise false alarm IFNAME (temperature|voltage|voltage2|current|rxpower|txpower|frequency-
error|wavelength-error|tec-fault|snr|resisi|leveltrans|teccurrent|prefecber|
uncorrectedber|lasertemp) (remote|)
```

Parameters

None

Default

By default, the debug command is not configured.

Command Mode

Configuration mode Configure mode

Applicability

This command was introduced before OcNOS version 6.2.0.

Example

The following command displays detailed information ddm raise.

```
OcNOS(config)#conf t
OcNOS(config)#ddm raise false alarm xe1 temperature +95.00 remote
OcNOS(config)#ddm raise false alarm xe1 voltage +3.50 remote
```

debug ddm

Use this command to enable or disable debugging for DDM.

Command Syntax

```
debug ddm
no debug ddm
```

Parameters

None

Default

By default, debug command is not configured.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ddm
(config)#no debug ddm
```

service unsupported-transceiver

Use this command to allow an unsupported transceiver to be enabled for DDM monitoring.

Use the **no** form of this command to disable DDM on an unsupported transceiver.

Command Syntax

```
service unsupported-transceiver
no service unsupported-transceiver
```

Parameters

None

Default

By default, DDM on an unsupported transceiver is disabled.

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#service unsupported-transceiver
(config)#no service unsupported-transceiver
```

show controller details

Use this command to display the EEPROM details of transceivers.

Command Syntax

```
show interface (IFNAME|) controllers
```

Parameters

IFNAME
Interface name. If not specified, this command displays details of all connected transceivers.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe52/1 controllers
Port Number             : 52

cc_ext                  : 0x28
DDM Support             : yes
```

show interface all transceiver detail

Use this command to display EDFA module input power, output power, pump bias and gain threshold and current values from all ports.

Command Syntax

```
show interface transceiver detail
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced before OcNOS version 6.3.0.

Example

```
OcNOS>show interface transceiver detail
Codes:  * Not Qualified By IP Infusion,  ** Not Supported By Module,  -- No Power,  - Not Applicable

show interface controller details

Use this command to display the EEPROM details.

Command Syntax

```
show interface (IFNAME|) controllers (remote)
```

Parameters

IFNAME
Interface name. If not specified, this command displays details of all connected transceivers.

remote
Interface name

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0

Example

The following command displays detailed information of smart SFP.

```
OcNOS#show interface controllers remote
Codes: SMF - Single Mode Fiber, MMF - Multi Mode Fiber, FC - Fiber Channel
       OM1 - 62.5 Micron MMF [200MHzkm @ 850nm & 500MHzkm @ 1310nm]

```

show interface frequency grid

Use this command to display channel-number and wavelength mapping.

Command Syntax

```
show interface (IFNAME) frequency-grid
```

Parameters

IFNAME
Interface name.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 4.1.

Example

```
#show interface xe7 frequency-grid

#
```

show interface transceiver details

Use this command to display details of transceivers and threshold violations.

Command Syntax

```
show interface (IFNAME|) transceiver (detail|threshold violation|(protocol (stats|))|)(remote|)
```

Parameters

IFNAME
Interface name. If not specified, this command displays details of all connected transceivers.

detail
Transceiver information such as voltage, temperature, power, and current.

threshold violation
Transceiver threshold violations.

Codes
* Not Qualified By IP Infusion, ** Not Supported By Module.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 6.2.0.

Example

The following command displays detailed information of interface transceiver details.

```
OcNOS#sh int transceiver detail

Here is the explanation of the show command output fields.

Table 74. show interface transceiver details output

Field	Description
Port	The number of the transceiver port.
Temp	Temperature in degrees Celsius of the transceiver.
Voltage	Voltage in Volts on the transceiver.
Current	Current in Milliamperes used by the transceiver.
Rx Power	Power received in Decibel-milliwatts (dBm) by the transceiver.
Tx Power	Power being transmitted in milliWatts by the transceiver.
High Alarm	The level that is needed to be reached to trigger a high alarm.
High Warn	The level that is needed to be reached to trigger a high warning.
Low Warn	The level that is needed to be reached to trigger a low warning.
Low Alarm	The level that is needed to be reached to trigger a low alarm.
Codes *	Not Qualified By IP Infusion, ** Not Supported By Module

show interface transceiver detail remote

Use this command to display all the threshold values for volt, temperature, and power for the remote transceiver.

Command Syntax

```
show interface (IFNAME|) transceiver detail remote
```

Parameters

IFNAME
Interface name. If not specified, this command displays details of all connected transceivers.

remote
Interface name

detail
Remote transceivers information

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of interface transceiver detail remote.

```
OcNOS#show interface transceiver detail remote

      Intf       DDM        Temp       AlertMax   CritMax    CritMin    AlertMin
                            (Celsius)  (Celsius)  (Celsius)  (Celsius)  (Celsius)
      ------------------------------------------------------------------------------

      Intf       DDM        Volt       AlertMax   CritMax    CritMin    AlertMin
                            (Volts)    (Volts)    (Volts)    (Volts)    (Volts)
-------------------------------------------------------------------------
```

show interface transceiver protocol

Use this command to display the OAM protocol status and module status of the local module.

Command Syntax

```
show interface (IFNAME|) transceiver protocol
```

Parameters

IFNAME
Interface name. If not specified, this command displays details for all connected transceivers.

protocol
OAM protocol status, and module status of local module.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of interface transceiver protocol.

```
OcNOS#show interface transceiver protocol

      ############################################################
      Port Number                   : 2
      OAM status                    : On
      Local status                  : Link failure
```

show interface transceiver protocol remote

Use this command to display the OAM protocol status and module status of the remote module.

Command Syntax

```
show interface (IFNAME|) transceiver protocol remote
```

Parameters

IFNAME
Interface name. If not specified, this command displays details of all connected transceivers.

protocol
OAM protocol status, and module status of the remote module.

remote
Remote transceiver information

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of interface transceiver protocol remote.

```
OcNOS#show interface transceiver protocol remote

      ############################################################
      Port Number                   : 2
      Remote status                 : Remote TCVR Ready
```

show interface transceiver protocol stats

Use this command to display the protocol frame statistics.

Command Syntax

```
show interface (IFNAME|) transceiver protocol stats
```

Parameters

IFNAME
Interface name. If not specified, this command displays details for all connected transceivers.

protocol
OAM protocol status, and module status of local module.

stats
Protocol frame statistics

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of interface transceiver protocol stats.

```
OcNOS#show interface transceiver protocol stats

      ############################################################
      Port Number                  : 2
      OAM frames Sent              : 1583
      OAM frames received corretly  : 1
      OAM frames received with error: 2
```

show interface transceiver remote

Use this command to display the remote transceiver information.

Command Syntax

```
show interface (IFNAME|) transceiver remote
```

Parameters

IFNAME
Interface name. If not specified, this command displays details for all connected transceivers.

remote
Remote transceiver information.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of interface transceiver remote

```
OcNOS#show interface transceiver remote

      Intf       DDM        Temp       Voltage    Lane       Tx         Rx-Los     Tx-
      Los     Current    TxPower    RxPower    Freq-Err   Wave-Err
                           (Celsius)  (volt)
              (mA)       (dBm)      (dBm)      (GHZ)      (nm)
      ------------------------------------------------------------------------------
      ----------------------------------------------------------------
```

show interface transceiver threshold violations remote

Use this command to display the details of remote transceivers and threshold violations.

Command Syntax

```
show interface (IFNAME|) transceiver (detail|threshold violation|) remote
```

Parameters

IFNAME
Interface name. If not specified, this command displays details of all connected transceivers.

detail
Transceiver information, such as voltage, temperature, power, and current.

threshold violation
Transceiver threshold violations.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of interface transceiver threshold violations remote.

```
OOcNOS#show interface transceiver threshold violations remote
       Intf       Lane       Timestamp            Type of alarm
       ----       ----       ---------            -------------
```

show supported-transceiver

Use this command to display supported transceivers.

Command Syntax

```
show supported-transceiver
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show supported-transceiver
-----------------------------------------------------
          Transceiver DDM support list
-----------------------------------------------------
Type                      :SFP
Vendor Name               :FINISAR CORP
Vendor Part Number        :FTLF8519P2BNL
DDM Supported             :Yes
Type                      :SFP
Vendor Name               :EVERTZ
Vendor Part Number        :SFP10G-TR13S
DDM Supported             :Yes
Type                      :QSFP
Vendor Name               :AVAGO
Vendor Part Number        :AFBR-79E4Z
DDM Supported             :Yes
```

tx-disable

Use this command to disable the transceiver tx-power (disable laser).

Use the **no** form of this command to enable tx-power (enable laser).

Command Syntax

```
tx-disable
no tx-disable
```

Parameters

None

Default

By default, **tx-disable** is false.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 4.2.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#tx-disable
(config-if)#exit
(config)#interface xe1
(config-if)#no tx-disable
(config-if)#exit
```

xcvr <IFNAME> tx-disable <1-256> remote

Use this command to laser off the remote transceiver for <1-256> seconds and to turn the laser ON.

Command Syntax

```
xcvr <IFNAME> tx-disable <1-256> remote
```

Parameters

IFNAME
Interface name.

remote
Remote transceiver.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of xcvr <IFNAME> tx-disable <1-256> remote.

```
OcNOS#xcvr xe2 tx-disable 2 remote
```

xcvr <IFNAME> reset remote

Use this command to reset the remote transceiver.

Command Syntax

```
xcvr <IFNAME> reset remote
```

Command Syntax

IFNAME
Interface name.

remote
Remote transceiver.

reset
Reset remote transceiver

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of xcvr <IFNAME> reset remote.

```
OcNOS#xcvr xe2 reset remote
```

xcvr loopback

Use this command to loopback Tx and Rx Input loop back for remote.

Use this command to loopback Tx and Rx Output loop back for remote.

Command Syntax

```
xcvr loopback (in|out) remote
no xcvr loopback (in|out) remote
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

The following command displays detailed information of xcvr loopback.

```
OcNOS(config)#int xe2
     OcNOS(config-if)#xcvr loopback in remote
     OcNOS(config-if)#commit
     OcNOS(config-if)#end
     OcNOS#conf t
     OcNOS(config)#int xe2
     OcNOS(config-if)#xcvr loopback out remote
     OcNOS(config-if)#commit
     OcNOS(config-if)#end
```

wavelength

Use this command to set the transceiver wavelength using the channel-number or the wavelength for interfaces having a supported transceiver.

Use the no form of this command to remove the wavelength configuration.

Command Syntax

```
wavelength ((channel-number <1-96>) | (update <1528773-1566723>))
```

Parameters

channel-number
Sets wavelength corresponding to the channel number

update
Sets wavelength value

Default

By default, the interface comes up with a random wavelength chosen by autotuning.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 4.1.

Example

```
(config)#int xe7
(config-if)#wavelength channel-number 10
(config-if)#no wavelength
(config-if)#
(config-if)#wavelength update 1528773
(config-if)#no wavelength
(config-if)#
```

LINK CONFIGURATION GUIDE

Trigger Failover Configuration

This chapter contains Trigger Failover (TFO) configuration examples.

This example shows the complete configuration to enable TFO in a simple network topology. TFO complements NIC teaming functionality supported on blade servers. TFO allows a switch module to monitor specific uplink ports to detect link failures. When the switch module detects a link failure, it disables the corresponding downlink ports automatically.

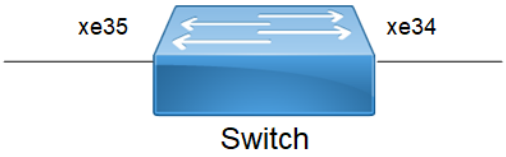
TFO uses these components:

- A Fail Over Group (FOG) contains a Monitor Port Group (MPG) and a Control Port Group (CPG).
- An MPG contains only uplink ports.
- A CPG contains only downlink ports.

- TFO is supported in STP or RSTP bridge mode.
- TFO can be configured on a **LAG**[1] interface.

Basic Configuration

Figure 57. Basic topology



Switch

`#configure terminal`	Enter configure mode.
`(config)#tfo enable`	Enable TFO globally.
`(config)#fog 1 enable`	Create a Fail over group (FOG) and enable it.
`(config)#interface xe35`	Enter interface mode
`(config-if)#link-type uplink`	Specify the link-type as Uplink.
`(config-if)#fog 1 type mpg`	Specify the MPG member for FOG 1.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe34`	Enter interface mode
`(config-if)#link-type downlink`	Specify the link-type as Downlink.

[1]Link Aggregation Group

`(config-if)#fog 1 type cpg`	Specify the CPG member for FOG 1.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#end`	Exit interface and configure mode

Validation

```
OcNOS#show tfo

TFO : Enable

Failover Group 1 : Enable
Failover Status : NONE
No. of links to trigger failover : 0

MPG Port          Status
--------------------
xe10              UP

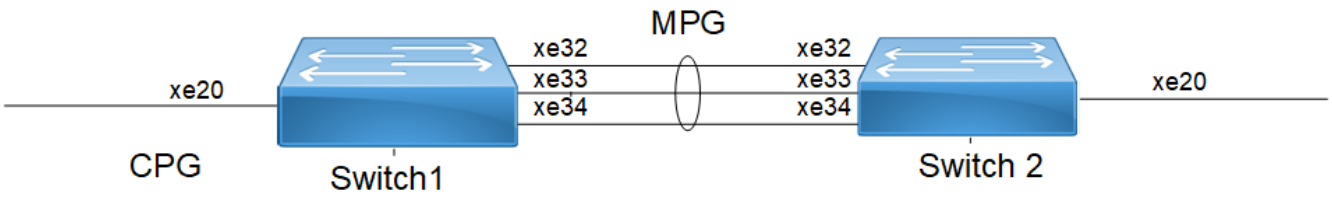
CPG Port          Status
--------------------
xe11              UP

No. of times MPG link failure : 0
No. of times MPG link recovered : 0
No. of times CPG got auto disabled : 0
No. of times CPG got auto enable : 0
```

Port-Channel Configuration

Topology

Figure 58. TFO with port-channel



Switch 1

`#configure terminal`	Enter configure mode.
`(config)#tfo enable`	Enable TFO globally.
`(config)#fog 1 enable`	Create a Fail over group (FOG) and enable it.
`(config)#interface po1`	Enter interface mode
`(config-if)#switchport`	Make the interface Layer2.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running

	configuration
(config)#interface xe32	Enter interface mode
(config-if)#switchport	Make the interface Layer2.
(config-if)#link-type uplink	Specify the link-type as Uplink.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#interface xe33	Enter interface mode
(config-if)#switchport	Make the interface as Layer2.
(config-if)#link-type uplink	Specify the link-type as Uplink.
(config-if)#channel-group 1 mode active	Specify the channel group in interface
(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#interface xe34	Enter interface mode
(config-if)#switchport	Make the interface as Layer2.
(config-if)#link-type uplink	Specify the link-type as Uplink.
(config-if)#channel-group 1 mode active	Specify the channel group in interface
(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#interface xe20	Enter interface mode
(config-if)#link-type downlink	Specify the link-type as Downlink.
(config-if)#fog 1 type cpg	Specify the CPG member for FOG 1
(config-if)#fog 1 type mpg	Specify the MPG member for FOG 1.
(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#interface po1	Enter port-channel mode
(config-if)#link-type uplink	Specify the link-type as Uplink.
(config-if)#fog 1 type mpg	Specify the MPG member for FOG 1.
(config-if)#fog 1 type cpg	Specify the CPG member for FOG 1.
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#end	Exit interface and configure mode

Switch 2

#configure terminal	Enter configure mode.

`(config)#interface po1`	Enter interface mode
`(config-if)#switchport`	Make the interface as Layer2.
`(config-if)#exit`	Exit interface mode
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe32`	Enter interface mode
`(config-if)#switchport`	Make the interface as Layer2.
`(config-if)#channel-group 1 mode active`	Specify the channel group in interface
`(config-if)#exit`	Exit interface mode
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe33`	Enter interface mode
`(config-if)#switchport`	Make the interface as Layer2.
`(config-if)#channel-group 1 mode active`	Specify the channel group in interface
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe34`	Enter interface mode
`(config-if)#switchport`	Make the interface as Layer2
`(config-if)#channel-group 1 mode active`	Specify the channel group in interface
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation

```
#show interface brief | include up

Link Detection Debounce Timer

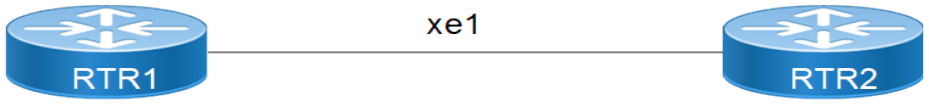
The link debounce timer avoids frequent updates (churn) to higher layer protocols during flapping of an interface. The initial link state is UP. The link goes DOWN. If the Link comes UP and goes DOWN, The link DOWN AND link UP timer is started and being restarted on each flap (link comes up and goes down again). For each link DOWN, link down timer will start and it restarts on flap within the link debounce interval. For each link UP, link up timer will start and it restarts on flap within the link debounce interval.

Notes: Keep the following in mind when using the Link detection debounce timer:

- Link debounce timer is supported only for physical L2 and L3 interfaces.
- When debounce timer is configured we won't be able to configure the link-debounce-timer config and viceversa.
- The link debounce flap-count refers to the number of flaps OcNOS receives while the debounce timer is running:
  - The flap-count is only updated if the timer is still running and OcNOS receives a link status event for the interface.
  - The flap-count is reset at the subsequent start of the link debounce timer.
- Protocol-specific timers such as BFD which depend on the link status should be configured to minimum of 1.5 times the value of the link-debounce time. Otherwise it could affect the protocol states if the link debounce timer is still running.
- Protocols such as PO, OSPF, BFD, ISIS, BGP which depends on the link status, in this case we should ensure on both the connected interfaces we need to configure the link-debounce timer.
- The debounce timer must be configured on both ends of the network link.
- Enabling the debounce timer delays the detection of link up and down status, resulting in traffic loss during that period and impacting the convergence of some protocols.

Topology

Figure 59. Link detection debounce timer topology



Configuration

RTR1

`#configure terminal`	Enter configure mode.
`(config)#interface xe1`	Enter interface mode
`(config-if)#link-debounce-time 4000 5000`	Configure link-debounce-time where link-up timer is

	4000 ms and link-down timer is 5000 ms
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode

RTR2

`#configure terminal`	Enter configure mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#link-debounce-time 4000 5000`	Configure link-debounce-time where link-up timer is 4000 ms and link-down timer is 5000 ms
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.

Validation

```
#show interface xe1 | i Debounce Link Debounce timer: enable
    Linkup Debounce time 4000 ms Linkdown Debounce time 5000 ms
    Linkup Debounce status : idle
    Linkdown Debounce status : idle
```

RTR1 and RTR2 outputs after interface flap:

```
#show interface xe1 | i debounce Link Debounce timer: enable
Linkup Debounce time 4000 ms Linkdown Debounce time 5000 ms
Flap Count: 1
Last Debounce Flap :
Linkup Debounce status : idle
Linkdown Debounce status : idle

#show interface xe1 | i debounce
  Link Debounce timer: enable
    Linkup Debounce time 4000 ms Linkdown Debounce time 5000 ms
    Flap Count: 1
    Last Debounce Flap :    Linkup Debounce status : idle
 Linkdown Debounce status : idle
```

Log Messages

The following is a configuration example to log link debounce timer activity

`#configure terminal`	Enter Configure mode
`(config)#logging level nsm 7`	Enable operational log to display debounce start and end.

Example Log Messages

```
2019 Feb 28 02:50:40.761 : OcNOS : NSM : INFO : Start UP->DOWN Link Debounce Timer on interface xe1

(initiated transition down->up), prev_state UP, new_state UP
```

LINK COMMAND REFERENCE

Trigger Failover Commands

This chapter describes the trigger failover (TFO) commands.

clear tfo counter

Use this command to clear the TFO counters. If you do not specify a parameter, this command clears counters for all FOG indexes.

Command Syntax

```
clear tfo counter
clear tfo counter fog <1-64>
```

Parameters

<1-64>
Clear counters for this Failover Group Index

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear tfo counter
```

fog

Use this command to:

- Create or delete a failover group (FOG)
- Enable or disable an exisitng FOG

Even if FOG index do not exit, FOG can be created as enabled with “enable” option in CLI.

If the FOG index already exists:

- When the FOG status is disabled and Control Port Group (CPG) links are previously disabled (because of TFO), then the links are enabled. If a particular CPG member belongs to multiple CPGs, then this CPG member is enabled only if all corresponding Monitor Port Groups (MPG) are enabled.
- When the FOG status is enabled and MPG is down, then the corresponding CPG links are disabled.

Use the **no** form of this command to delete a FOG.

Command Syntax

```
fog <1-64> (enable|disable)
no fog <1-64>
```

Parameters

<1-64>
Failover Group Index

enable
Enable Failover Group

disable
Disable Failover Group

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#fog 5 enable
```

fog tfc

Use this command to set the number of links to trigger failover for a Monitor Port Groups (MPG).

Use the no form of this command to remove the configuration and use default value of 0.

Command Syntax

```
fog <1-64> tfc <0-63>
no fog <1-64> tfc
```

Parameters

<1-64>
Failover Group index

<0-63>
Trigger failover count

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. The **no** version of the command was introduced in OcNOS version 4.0.

Example

```
#configure terminal
(config)#fog 5 tfc 7
(config)# no fog 5 tfc
```

fog type

Use this command to map upstream/downstream links in a FOG as a Monitor Port Group (MPG) or Control Port Group (CPG).

Use the **no** form of this command to unmap upstream/downstream links.

Command Syntax

```
fog <1-64> type (mpg|cpg)
no fog <1-64> type (mpg|cpg)
```

Parameters

<1-64>
Failover Group Index

mpg
Map the interface to an MPG

cpg
Map the interface to a CPG

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
#interface eth1
(config-if)#fog 5 type mpg
```

link-type

Use this command to make a port an uplink or downlink.

Use the **no** form of this command to remove the configuration.

Command Syntax

```
link-type (uplink|downlink)
no link-type
```

Parameters

uplink
Make the port an uplink

downlink
Make the port a downlink

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
#interface eth1
(config-if)#link-type downlink
```

show tfo

Use this command to display FOG configuration and statistics.

Command Syntax

```
show tfo
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show tfo

TFO : Enable

Failover Group 1 : Enable
Failover Status : MPG Link Failure
No. of links to trigger failover : 0
MPG Port(s) :
xe9   Status : DOWN
xe12   Status : DOWN
CPG Port :
xe4   Status : DOWN
No. of times MPG link failure : 1
No. of times MPG link recovered : 0
No. of times CPG got auto disabled : 1
No. of times CPG got auto enable : 0
```

Table 75 Explains the show command output fields.

Table 75. show tfo output fields

Field	Description
Failover Group	Enable the failover group.
Failover Status	Display the failover status.
No. of links to trigger failover	Number of links to trigger the failover group.

Field	Description
MPG Port	Details of the monitor port group.
CPG Port	Details of the control port group.

tfo

Use this command to enable or disable trigger failover (TFO).

Command Syntax

```
tfo (enable|disable)
```

Parameters

enable
Enables Trigger failover

disable
Disables Trigger failover

Default

By default, TFO is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#tfo enable
```

QSFP-DD CONFIGURATION GUIDE

QSFP-DD Configuration

Overview

QSFP-DD[1] is a new module developed but with the same form factor as the current QSFP, to support high-speed solutions. It provides eight lanes electrical interface. Each lane can operate up to 25Gbps NRZ modulation or 50Gbps PAM4 modulation. QSFP modules are designed to be backward compatible with the existing QSFP modules.

System Description

Basically, the system will be developed to support 400Gbps data transmission. This will enable us to support the high-speed solution. The management interface will be used to get the status and control of the module.

CMIS modules have two physical interfaces for signal transmission:

Host Interface (Device to device interconnection)

The host interface is the high-speed electrical interface between the module and the host system. The host interface carries signals traveling from host to module (transmitter input signals) and signals traveling from module to host (receiver output signals). All electrical signals carried over the host interface are transmitted over the wire pairs, each of which is called host lanes.

Media Interface (Device to media interconnection)

The media interface is the high-speed electrical/optical interface between the module and the interconnecting media. The media interface carries signals that travel from module to media (transmitter output signals) and signals that travel from media to module (receiver input signals). Media interface signals are carried either over electrical wire pairs (Copper cables) or over optical wavelengths on physical fibers, which are called media lanes.

Objectives

The objective of this document is to provide a high-speed solution using QSFP-DD. The management characteristics, status, and control of QSFP-DD.

Topology

Figure 60. QSFP-DD Sample Topology

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

Loopback

Use this command to configure the loopback type (input, output, both) on the **QSFP-DD**[1] module host/media side. If the loopback type is supported by the QSFP-DD module this will enable the loopback function.

Media Input Loopback

Use this command to configure the input loopback type on the QSFP-DD module media side. If the loopback type is supported by the QSFP-DD module this will enable the loopback function.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)# qsfp-dd 0`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#loopback in media`	Configure input media Loopback.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation of Media Input Loopback

```
OcNOS#show qsfp-dd 0 diagnostics media loopback

Port Number                    : 0

------------------------------
  User Config  |  H/W Config  |
------------------------------
 Input         | Input        |
```

Media Output Loopback

Use this command to configure the output loopback type on the QSFP-DD module media side. If the loopback type is supported by the QSFP-DD module this will enable the loopback function.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 0`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#loopback out media`	Configure output media Loopback.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation of Media Output Loopback

```
OcNOS#show qsfp-dd 0 diagnostics media loopback

Port Number                    : 0

------------------------------
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

```
  User Config  |  H/W Config  |
-------------------------------
 Output         | Output       |
```

Media Both Loopback

Use this command to configure the both loopback type on the QSFP-DD module media side. If the loopback type is supported by the QSFP-DD module this will enable the loopback function.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 0`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#loopback both media`	Configure both input & output media Loopback.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation of Media Both Loopback

```
OcNOS#show qsfp-dd 0 diagnostics media loopback

Port Number                    : 0

-------------------------------
  User Config  |  H/W Config  |
-------------------------------
 Input/Output         | Input/Output     |
```

Host Input Loopback

Use this command to configure the input loopback type on the QSFP-DD module host side. If the loopback type is supported by the QSFP-DD module this will enable the loopback function.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 0`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#loopback in host`	Configure input host Loopback.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation of Host Input Loopback

```
OcNOS#show qsfp-dd 0 diagnostics Host loopback

Port Number                    : 0

-------------------------------
  User Config  |  H/W Config  |
-------------------------------
 Input         | Input        |
```

Host Output Loopback

Use this command to configure the output loopback type on the QSFP-DD module host side. If the loopback type is supported by the QSFP-DD module this will enable the loopback function.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 0`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#loopback out host`	Configure output host Loopback.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation of Host Output Loopback

```
OcNOS#show qsfp-dd 0 diagnostics Host loopback

Port Number                    : 0

--------------------------------
  User Config  |  H/W Config  |
--------------------------------
Output         | Output        |
```

Host Both Loopback

Use this command to configure the both loopback type on the QSFP-DD module Host side. If the loopback type is supported by the QSFP-DD module this will enable the loopback function.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 0`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#loopback both host`	Configure both input & output host Loopback.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation of Host Both Loopback

```
OcNOS#show qsfp-dd 0 diagnostics Host loopback

Port Number                    : 0

--------------------------------
  User Config  |  H/W Config  |
--------------------------------
Input/Output        | Input/Output       |
```

PRBS

Use these commands to configure the PRBS pattern generator/checker type to be used for diagnostics of the **QSFP-DD**[1] module host/media side and to configure the PRBS pattern generator/checker location (pre-fec/post-fec) on the QSFP-DD module host/media side. If the generator/checker pattern type and location are supported by the QSFP-DD module this will enable the selected function.

Use the no parameter to remove this configuration and disable the generator/checker function.

PRBS Host Checker & Generator

ROUTER1 (checker)

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 3`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#prbs checker type 15 host`	Configure PRBS checker type.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

ROUTER2 (generator)

`ROUTER2#configure terminal`	Enter configure mode.
`ROUTER2(config)#qsfp-dd 3`	Entering to QSFP-DD mode.
`ROUTER2(config-qsfp-dd)#prbs generator type 15 host`	Configure PRBS generator type.
`ROUTER2(config-qsfp-dd)#commit`	Commit the configuration.

Validation

Max SMF Link Length            : 630.0 Kilometer
Wavelength Nominal             : 1547.70 nm
Wavelength Tolerance           : 166.55 nm
```

Application

Use this command to select the application ID to be configured for this **QSFP-DD**[1] module.

Notes:

- Only 400G application modes are supported.
- For checking the supported applications modes **`show qsfp-dd <port no.> advertisement applications`** command.

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

Configuration

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)# qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#application 2`	Select the application ID to be configured for this QSFP-DD module
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation

```
OcNOS#sh qsfp-dd 49 application

```

Custom Application

Overview

Custom Application feature provides support to extend the current limitation of 15 applications imposed by the Common Management Interface Specification (CMIS) standard. The transceiver vendor provides support for the additional applications as a customized CMIS extension and in order to provide access to this custom extension the following new CLIs are introduced:

```
custom-app-host-id <1-32>
custom-app-media-id <1-32
```

Note: Use show qsfp-dd <port no> advertisement applications custom CLI to view the supported custom applications mode.

Configurations

Perform the following configurations to configure QSFP DD custom application on the router.

1. Enter the config mode and configure the QSFP DD.

```
#configure terminal
(config)# qsfp-dd 0
```

2. Select the Custom application ID to be configured for this **QSFP-DD**[1] module.

```
(config-qsfp-dd)#application 15
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

```
(config-qsfp-dd)# custom-app-host-id 1
(config-qsfp-dd)# custom-app-media-id 2
(config-qsfp-dd)#commit
```

Validation

```
Port Number                          : 0
----------------------------------------
              | User Config | H/W Config
----------------------------------------
 Application  | 15 (custom) | 15 (custom)
 Host ID      | 1           | 1
 Media ID     | 2           | 2
```

Implementation Examples

1. Media interface ID bandwidth should be compatible with the host interface ID bandwidth requirements.

    a. Example of valid combinations:

```
400GAUI-8 <--> ZR400-OFEC-16QAM ==> (1x400G breakout)
200GAUI-4 <--> PKT-MAX-200G-SFEC-60 ==> (1x200G breakout)
100GAUI-2 <--> OTN-STD-100G-OFEC-31 ==> (1x100G breakout)
100GAUI-4 <--> ZR400-OFEC-16QAM ==> (4x100G breakout)
```

    b. Example of invalid combinations:

```
400GAUI-8 <--> PKT-MAX-200G-SFEC-60
200GAUI-4 <--> OTN-STD-100G-OFEC-31
```

2. When host interface ID bandwidth is lower than media interface ID bandwidth, for some cases only one breakout interface is possible.

    a. Example of valid combinations:

```
100GAUI-2 <--> ZR400-OFEC-16QAM ==> (4x100G breakout is possible)
100GAUI-2 <--> PKT-MAX-200G-SFEC-60 ==> (2x100G breakout is possible)
100CAUI-4 <--> ZR400-OFEC-16QAM ==> (2x100G breakout is possible. Only 2 interfaces because CAUI-4
uses 4 lanes and only 8 lanes are physically available).
```

    b. Example of invalid combinations.

```
200GAUI-4 <--> ZR400-OFEC-16QAM ==> (2x200G breakout is not possible)
```

```

Laser Tuning

Laser Tuning only supports for tunable Transceivers.

Laser Grid Configuration

Use this command to configure the Laser Grids in the **QSFP-DD**[1] port. These commands only supports for modules which supports for laser Tuning Transceivers.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#laser grid 100`	Configure Laser Grid at QSFP-DD level.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

Validation

```
ROUTER-1#show qsfp-dd 49 laser status

Port Number          : 49

-------------------------------------------------
       Attribute      | Lane |    Value    | Unit |
-------------------------------------------------
 Grid Spacing         |  1   | 100.000     | GHz  |
 Laser Frequency      |  1   | 193.100000  | THz  |
 Channel Number       |  1   | 0           | --   |
 Wavelength           |  1   | 1552.52     | nm   |

-------------------------------------
        Flag        | Lane | Status |
-------------------------------------
 Tuning in progress |  1   | No     |
 Wavelength locked  |  1   | Yes    |

-----------------------------------------------
           Flag           | Lane | Status (L) |
-----------------------------------------------
 Target output power OOR  |  1   | No         |
 Fine tuning out of range |  1   | Yes        |
 Tuning accepted          |  1   | No         |
 Channel number valid     |  1   | No         |
```

Laser Grid Unconfiguration

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#no laser grid`	Unconfigure Laser Grid at QSFP-DD level.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Laser Channel Configuration

Use this command to configure the Laser Channel in the QSFP-DD port. Using Channel Number we can set different Frequency and Wavelength for that port .Every Laser Grid have their own Channel Numbers. These commands only supports for modules which supports for laser Tuning Transceivers.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#laser channel 20`	Configure Laser Channel at QSFP-DD level.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation

```
ROUTER-1#show qsfp-dd 49 laser status

Port Number          : 49
```

```
-------------------------------------------------
       Attribute      | Lane |    Value   | Unit |
-------------------------------------------------
 Grid Spacing         |  1   | 100.000    | GHz  |
 Laser Frequency      |  1   | 195.100000 | THz  |
 Channel Number       |  1   | 20         | --   |
 Wavelength           |  1   | 1536.61    | nm   |

-------------------------------------
        Flag        | Lane | Status |
-------------------------------------
 Tuning in progress |  1   | No     |
 Wavelength locked  |  1   | Yes    |

-----------------------------------------------
           Flag           | Lane | Status (L) |

 Fine tuning out of range |  1   | Yes        |
 Tuning accepted          |  1   | Yes        |
 Channel number valid     |  1   | No         |
```

Laser Channel Unconfiguration

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#no laser channel`	Unconfigure Laser Channel at QSFP-DD level.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Laser Fine-tune-freq Configuration

Use this command to configure the Laser fine-tune-freq in the QSFP-DD port. These commands only supports for modules which supports for laser Tuning Transceivers.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#laser fine-tune-freq 5`	Configure laser fine-tune-freq at QSFP-DD level.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation

```
ROUTER-1#show qsfp-dd 49 laser status

Port Number          : 49

-------------------------------------------------
       Attribute      | Lane |    Value   | Unit |
-------------------------------------------------
 Grid Spacing         |  1   | 100.000    | GHz  |
 Laser Frequency      |  1   | 195.104000 | THz  |
 Channel Number       |  1   | 20         | --   |
```

```
 Wavelength           |  1   | 1536.58    | nm   |

 Target output power OOR  |  1   | No         |
 Fine tuning out of range |  1   | Yes        |
 Tuning accepted          |  1   | Yes        |
 Channel number valid     |  1   | Yes        |
```

Laser Fine-tune-freq Unconfiguration

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#no laser fine-tune-freq`	Unconfigure laser fine-tune-freq at QSFP-DD level.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Laser Output-power Configuration

Use this command to configure the Laser output-power in the QSFP-DD port. These commands only supports for modules which supports for laser Tuning Transceivers.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#laser output-power 2`	Configure laser output-power at QSFP-DD level.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Validation

```
ROUTER-1#show qsfp-dd 49 laser status

Port Number          : 49

-------------------------------------------------
       Attribute      | Lane |    Value   | Unit |
-------------------------------------------------
 Grid Spacing         |  1   | 100.000    | GHz  |
 Laser Frequency      |  1   | 195.104000 | THz  |
 Channel Number       |  1   | 20         | --   |
 Wavelength           |  1   | 1536.58    | nm   |

 Fine tuning out of range |  1   | No         |
 Tuning accepted          |  1   | Yes        |
 Channel number valid     |  1   | Yes        |
```

Laser Output-power Unconfiguration

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#no laser output-power`	Unconfigure laser output-power at QSFP-DD level.
`ROUTER1(config-qsfp-dd)#commit`	Commit the configuration.

Laser Grid at Media-lane Configuration

Use this command to configure the Laser Grids in the media-lane. These commands only supports for modules which supports for laser Tuning Transceivers.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#media-lane 1`	Entering to **Media lane**[1].
`ROUTER1(config-qsfp-dd-media)#laser grid 100`	Configure laser grid at Media level.
`ROUTER1(config-qsfp-dd-media)#commit`	Commit the configuration.

Validation

```
ROUTER-1#show qsfp-dd 49 laser status

Port Number          : 49

-------------------------------------------------
       Attribute      | Lane |    Value   | Unit |
-------------------------------------------------
 Grid Spacing         |  1   | 100.000    | GHz  |
 Laser Frequency      |  1   | 193.100000 | THz  |
 Channel Number       |  1   | 0          | --   |
 Wavelength           |  1   | 1552.52    | nm   |

 Tuning accepted          |  1   | No         |
 Channel number valid     |  1   | No         |
```

Laser Grid at Media-lane Unconfiguration

ROUTER1 (checker)

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#media-lane 1`	Entering to Media lane.
`ROUTER1(config-qsfp-dd-media)#no laser grid`	Unconfigure laser grid at Media level.
`ROUTER1(config-qsfp-dd-media)#commit`	Commit the configuration.

Laser Channel at Media-lane Configuration

Use this command to configure the Laser Channel in the media-lane. Using Channel Number we can set different Frequency and Wavelength for that port .Every Laser Grid have their own Channel Numbers. These commands only supports for modules which supports for laser Tuning Transceivers.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#media-lane 1`	Entering to Media lane.
`ROUTER1(config-qsfp-dd-media)#laser channel 20`	Configure laser channel at Media level.
`ROUTER1(config-qsfp-dd-media)#commit`	Commit the configuration.

Validation

```
ROUTER-1#show qsfp-dd 49 laser status

Port Number          : 49

-------------------------------------------------
       Attribute      | Lane |    Value   | Unit |
-------------------------------------------------
 Grid Spacing         |  1   | 100.000    | GHz  |
 Laser Frequency      |  1   | 195.100000 | THz  |
 Channel Number       |  1   | 20         | --   |

 Channel number valid     |  1   | No         |
```

Laser Channel at Media-lane Unconfiguration

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#media-lane 1`	Entering to Media lane.
`ROUTER1(config-qsfp-dd-media)#no laser channel`	Unconfigure laser channel at Media level.
`ROUTER1(config-qsfp-dd-media)#commit`	Commit the configuration.

Laser Fine-tune-freq at Media-lane Configuration

Use this command to configure the Laser fine-tune-freq in the media-lane. These commands only supports for modules which supports for laser Tuning Transceivers.

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#media-lane 1`	Entering to Media lane.
`ROUTER1(config-qsfp-dd-media)#laser fine-tune-freq 5`	Configure laser fine-tune-freq at Media level.
`ROUTER1(config-qsfp-dd-media)#commit`	Commit the configuration.

Validation

```
ROUTER-1#show qsfp-dd 49 laser status

Port Number          : 49

-------------------------------------------------
       Attribute      | Lane |    Value   | Unit |

Laser Output-power at Media-lane Unconfiguration

ROUTER1

`ROUTER1#configure terminal`	Enter configure mode.
`ROUTER1(config)#qsfp-dd 49`	Entering to QSFP-DD mode.
`ROUTER1(config-qsfp-dd)#media-lane 1`	Entering to Media lane.
`ROUTER1(config-qsfp-dd-media)#no laser output-power`	Unconfigure laser output-power at Media level.
`ROUTER1(config-qsfp-dd-media)#commit`	Commit the configuration.

QSFP-DD Monitored Alarms

Table 76. QSFP-DD[1] Monitored Alarms

Alarms	
Module	
S.No.	Name
1	Temperature
2	Voltage
3	TEC Current Magnitude
4	Laser temperature
Host	
S.No.	Name
1	Tx LOS
2	Tx Cdr Loss of Lock
3	Tx Adapttive Eq Failure
4	Rx Output Status
5	**FEC**[2] Excessive Degrade(**FED**[3])
6	FEC Detected Degrade(**FDD**[4])
7	Remote Degrade
8	Local Degrade
9	Flexe Loss of pad block
10	Flexe loss of Multiframe

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

[2]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

[3]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[4]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

Alarms	
11	Flexe loss of frame
12	Flexe instance ID mismatch
13	Flexe calender mismatch
14	Flexe instance map mismatch
15	Flexe GID mismatch
16	Tx local fault
17	Tx remote fault
18	Tx loss of alignment

Remote Fault and Local Fault Alarms

Overview

Local Fault: A local fault occurs when there is an issue with the line port, indicating a problem detected at the local end, such as bad data or signal.

Remote Fault: A remote fault is triggered when a port receives a remote fault frame from the far end (the port experiencing the local fault).

To address these faults, perform the "Shut/No Shut" operation at the interface level after enabling logging levels on the DUT (Device Under Test). Configure the "create-subscription" in the Netconf terminal, and to generate SNMP traps, connect the DUT to an MIB browser or a Linux server. Once configured, the "Shut" operation can be executed to generate alarms, and the "No Shut" operation can be used to recover from those alarms. Below, we have highlighted some alarms and their corresponding recovery processes in CLMSH mode, Netconf mode, and via SNMP traps.

Validation

Perform the Shut operation on the interface level to generate the alarms. To validate the remote fault and local fault alarms, use the following commands.

```
Ocnos#con t
```

Enter configuration commands, one per line. End with CNTL/Z.

```
Ocnos(config)#int cd1
Ocnos(config-if)#shutdown
Ocnos (config-if)#commit

Signal Integrity in QSFP-DD

Overview

The Signal integrity in the context of Quad Small Form Factor Pluggable Double Density (**QSFP-DD**[1]) refers to the maintenance of the quality of electrical signals transmitted and received by the QSFP-DD module. QSFP-DD is a high-speed, high-density interface used primarily in data center applications to interconnect switches, servers, and other networking equipment.

Maintaining signal integrity is crucial in high-speed data transmission because any degradation or distortion of the signals can lead to errors, reduced performance, or even complete failure of communication between devices. In the case of QSFP-DD, which supports data rates of up to 400 Gbps per port, ensuring signal integrity is particularly challenging due to the high data rates and the compact form factor of the module.

Feature Characteristics

The signal integrity involves addressing various factors such as impedance matching, jitter, noise, reflections, and equalization to ensure the accurate and reliable transmission of electrical signals in electronic systems.

Benefits

Optimizing signal integrity in QSFP-DD modules offers numerous benefits:

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

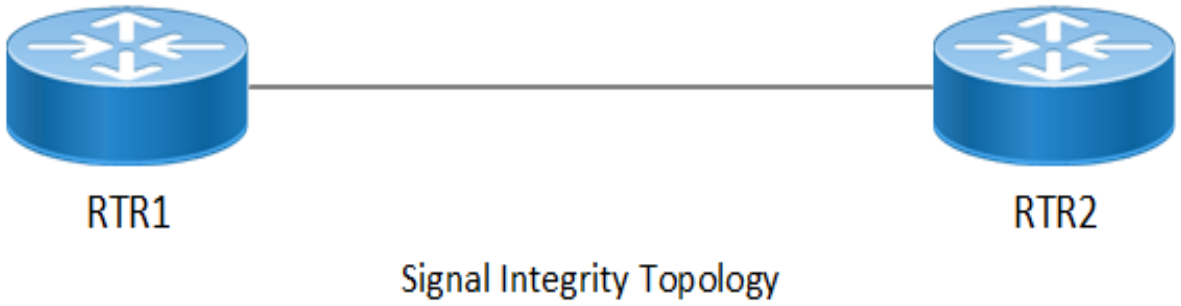
- Enhanced reliability
- High-speed data transmission
- Reduced latency
- Compatibility
- Longer reach
- Scalability
- Cost-efficiency
- Compliance assurance

Configuration

To configure Signal Integrity (**SI**[1]) parameters like Rx Pre-Cursor Equalization, Rx Post-Cursor Equalization, Tx Equalization, and Rx Amplitude on a **QSFP-DD**[2] module, you usually interact with the management interface or CLI provided by the networking equipment hosting the module. This involves accessing the configuration settings specific to the QSFP-DD module within the device's interface.

Topology

In this topology, the Signal Integrity RTR1 to RTR2 interface configuration in QSFP-DD.



Signal Integrity Topology

R1 Tx Equalization

For the Tx equalization configuration in R1 route, follow these steps:

1. To configure Tx equalization, execute the following command in the config mode.

```
R1(config)#qsfp-dd 11
R1(config-qsfp-dd)# tx-input eq-target 5
```

2. To configure, execute the following command.

```
R1(config-qsfp-dd)#commit
```

[1]Signal integrity in networking refers to the reliability and fidelity of electrical signals as they propagate through various components of a network infrastructure.

[2]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

Validation

To validate the Tx equalization configuration, use the following command.

```
OcNOS#show qsfp-dd 11 si status

Port Number                    : 11

-----------------------------------------------------------

```

R2 Tx Equalization

For the Tx equalization configuration in R2 route, follow these steps:

1. To configure Tx equalization, execute the following command in the config mode.

   ```
   R2(config)#qsfp-dd 11
   R2(config-qsfp-dd)# tx-input eq-target 5
   ```

2. To configure, execute the following command.

```
R2(config-qsfp-dd)#commit
```

Validation

To validate the Tx equalization configuration, use the following command.

```
OcNOS#show qsfp-dd 11 si status
Port Number                    : 11
-----------------------------------------------------

```

Tx Equalization Unconfiguration

For the Tx equalization unconfiguration in R2 route, follow these steps:

1. To unconfigure Tx equalization, execute the following command in the config mode.

```
R2(config)#qsfp-dd 11
R2(config-qsfp-dd)# no tx-input eq-target 5
```

2. To unconfigure, execute the following command.

```
R2(config-qsfp-dd)#commit
```

Tx Equalization Unconfiguration Validation

To validate the Tx equalization unconfiguration, use the following command.

```
OcNOS#show qsfp-dd 11 si status

Port Number                    : 11

-----------------------------------------------------------
```

To configure the Tx Equalization on any specific host lanes, do the following configuration.

R1 Tx Equalization

For the Tx equalization configuration on any specific host lanes, follow these steps:

1. To configure Tx equalization on any specific host lanes, execute the following command in the config mode.

```
R1(config)#qsfp-dd 11
R1(config-qsfp-dd)# host-lane 1
R1(config-qsfp-dd)# tx-input eq-target 7
```

2. To configure, execute the following command.

```
R1(config-qsfp-dd)#commit
```

Validation

To validate the Tx equalization configuration, use the following command.

```
OcNOS#show qsfp-dd 11 si status

Port Number                    : 11

-----------------------------------------------------------
      Parameter      | Lane | User Config | H/W Config |

```

R2 Tx Equalization

For the Tx equalization configuration in R2 route, follow these steps:

1. To configure Tx equalization, execute the following command in the config mode.

   ```
   R2(config)#qsfp-dd 11R2(config-qsfp-dd)# host-lane 1
   R2(config-qsfp-dd)# tx-input eq-target 7
   ```

2. To configure, execute the following command.

   ```
   R2(config-qsfp-dd)#commit
   ```

Validation

To validate the Tx equalization configuration, use the following command.

```
OcNOS#show qsfp-dd 11 si status

Port Number                    : 11

-----------------------------------------------------------
      Parameter      | Lane | User Config | H/W Config |
-----------------------------------------------------------
 Tx Equalization     | 1    | 7           | 7          |
                     | 2    | 5           | 5          |
                     | 3    | 5           | 5          |

```

Tx Equalization Unconfiguration

For the Tx equalization unconfiguration on any specific host lanes, follow these steps:

1. To unconfigure Tx equalization on any specific host lanes, execute the following command in the config mode.

```
R1(config)#qsfp-dd 11
R1(config-qsfp-dd)# host-lane 1
R1(config-qsfp-dd)# no tx-input eq-target 7
```

2. To unconfigure, execute the following command.

```
R1(config-qsfp-dd)#commit
```

Tx Equalization Unconfiguration Validation

To validate the Tx equalization unconfiguration, use the following command.

```
OcNOS#show qsfp-dd 11 si status

Port Number                    : 11

-----------------------------------------------------------

```

R1 Rx Amplitude

Use this command to configure the Rx Amplitude on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To configure Rx amplitude, execute the following command in the config mode:

   ```
   R1(config)#qsfp-dd 11
   R1(config-qsfp-dd)# rx-output amp-target 2
   ```

2. To configure, execute the following command.

   ```
   R1(config-qsfp-dd)#commit
   ```

Validation

To validate the Rx amplitude configuration, use the following command.

```
OcNOS#show qsfp-dd 11 si status

Port Number                    : 11

R2 Rx Amplitude

Use this command to configure the Rx Amplitude on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To configure Rx amplitude, execute the following command in the config mode.

   ```
   R2(config)#qsfp-dd 11
   R2(config-qsfp-dd)# rx-output amp-target 2
   ```

2. To configure, execute the following command.

   ```
   R2(config-qsfp-dd)#commit
   ```

Validation

To validate the Rx amplitude configuration, use the following command.

```
OcNOS#show qsfp-dd 11 si status

Port Number                    : 11

OcNOS#
```

Rx Amplitude Unconfiguration

For the Rx amplitude unconfiguration, follow these steps.

1. To unconfigure Rx amplitude, execute the following command in the config mode.

   ```
   R2(config)#qsfp-dd 11
   R2(config-qsfp-dd)# no rx-output amp-target 2
   ```

2. To configure, execute the following command.

   ```
   R2(config-qsfp-dd)#commit
   ```

Rx Amplitude Unconfiguration Validation

To validate the Rx amplitude unconfiguration, use the following command.

```
OcNOS#sh qsfp-dd 11 advertisement si

To configure the Rx Amplitude on any specific host lanes, do the following configuration.

R1 Rx Amplitude

Use this command to configure the Rx Amplitude on the **QSFP-DD**[1] module on any specific host lanes, follow these steps.

1. To configure Rx amplitude, execute the following command in the config mode.

   ```
   R1(config)#qsfp-dd 11
   R1(config-qsfp-dd)# host-lane 1
   R1(config-qsfp-dd-host)# rx-output amp-target 3
   ```

2. To configure, execute the following command.

   ```
   R1(config-qsfp-dd)#commit
   ```

Validation

To validate the Rx amplitude configuration, use the following command.

```
OcNOS#show qsfp-dd 11 si status
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

R2 Rx Amplitude

Use this command to configure the Rx Amplitude on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To configure Rx amplitude, execute the following command in the config mode.

   ```
   R2(config)#qsfp-dd 11
   R2(config-qsfp-dd)# host-lane 1
   R2(config-qsfp-dd-host)# rx-output amp-target 3
   ```

2. To configure, execute the following command.

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

```
R2(config-qsfp-dd)#commit
```

Validation

To validate the Rx amplitude configuration, use the following command.

```
OcNOS#show qsfp-dd 11 si status

Port Number                    : 11

Rx Amplitude Unconfiguration

For the Rx amplitude unconfiguration, follow these steps.

1. To unconfigure Rx amplitude, execute the following command in the config mode.

```
R2(config)#qsfp-dd 11
R2(config-qsfp-dd)# host-lane 1
R2(config-qsfp-dd)# no rx-output amp-target 3
```

2. To configure, execute the following command.

```
R2(config-qsfp-dd)#commit
```

Rx Amplitude Unconfiguration Validation

To validate the Rx amplitude unconfiguration, use the following command.

```
OcNOS#sh qsfp-dd 11 advertisement si

R1 Rx Pre-Cursor Eq

Use this command to configure the Rx Pre-Cursor Eq on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To configure Rx Pre-Cursor Eq, execute the following command in the config mode.

```
R1(config)#qsfp-dd 0
R1(config-qsfp-dd)# rx-output eq-pre-cursor-target 4
```

2. To configure, execute the following command.

```
R1(config-qsfp-dd)#commit
```

Validation

To validate the Rx Pre-Cursor Eq configuration, use the following command.

```
OcNOS#show qsfp-dd 0 si status

-------------------------------------------------------
```

R2 Rx Pre-Cursor Eq

Use this command to configure the Rx Pre-Cursor Eq on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To configure Rx Pre-Cursor Eq, execute the following command in the config mode.

   ```
   R2(config)#qsfp-dd 0
   R2(config-qsfp-dd)# rx-output eq-pre-cursor-target 4
   ```

2. To configure, execute the following command.

   ```
   R2(config-qsfp-dd)#commit
   ```

Validation

To validate the Rx Pre-Cursor Eq configuration, use the following command.

```
OcNOS#show qsfp-dd 0 si status

Port Number                    : 0

Rx Pre-Cursor Eq Unconfiguration

Use this command to unconfigure the Rx Pre-Cursor Eq on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To unconfigure Rx Pre-Cursor Eq, execute the following command in the config mode.

   ```
   R1(config)#qsfp-dd 0
   R1(config-qsfp-dd)# no rx-output eq-pre-cursor-target 4
   ```

2. To unconfigure, execute the following command.

   ```
   R1(config-qsfp-dd)#commit
   ```

Rx Pre-Cursor Eq Unconfiguration Validation

To validate the Rx Pre-Cursor Eq Unconfiguration, use the following command.

```
OcNOS#sh qsfp-dd 11 si status

Port Number                    : 11

To configure the Rx Pre-Cursor Eq on any specific host lanes, do the following configuration.

R1 Rx Pre-Cursor Eq

Use this command to configure the Rx Pre-Cursor Eq on the **QSFP-DD**[1] module on any specific host lanes, follow these steps.

1. To configure Rx Pre-Cursor Eq, execute the following command in the config mode.

   ```
   R1(config)#qsfp-dd 0
   R1(config-qsfp-dd)# host-lane 1
   R1(config-qsfp-dd-host)# rx-output eq-pre-cursor-target 3
   ```

2. To configure, execute the following command.

   ```
   R1(config-qsfp-dd)#commit
   ```

Validation

To validate the Rx Pre-Cursor Eq configuration, use the following command.

```
OcNOS#show qsfp-dd 0 si status

Port Number                    : 0

R2 Rx Pre-Cursor Eq

Use this command to configure the Rx Pre-Cursor Eq on the **QSFP-DD**[1] module on any specific host lanes, follow these steps.

1. To configure Rx Pre-Cursor Eq, execute the following command in the config mode.

   ```
   R2(config)#qsfp-dd 0
   R2(config-qsfp-dd)# host-lane 1
   R2(config-qsfp-dd-host)# rx-output eq-pre-cursor-target 3
   ```

2. To configure, execute the following command.

   ```
   R2(config-qsfp-dd)#commit
   ```

Validation

To validate the Rx Pre-Cursor Eq configuration, use the following command.

```
OcNOS#show qsfp-dd 0 si status

Port Number                    : 0
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

```

```

Rx Pre-Cursor Eq Unconfiguration

Use this command to unconfigure the Rx Pre-Cursor Eq on the **QSFP-DD**[1] module on any specific host lanes, follow these steps.

1. To unconfigure Rx Pre-Cursor Eq, execute the following command in the config mode.

```
R1(config)#qsfp-dd 0
R1(config-qsfp-dd)# host-lane 1
R1(config-qsfp-dd-host)# no rx-output eq-pre-cursor-target 3
```

2. To unconfigure, execute the following command.

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

```
R1(config-qsfp-dd)#commit
```

Rx Pre-Cursor Eq Validation

To validate the Rx Pre-Cursor Eq unconfigure, use the following command.

```
OcNOS#show qsfp-dd 0 si status

Port Number                    : 0

R1 Rx Post-Cursor Eq

Use this command to configure the Rx Post-Cursor Eq on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To configure Rx Post-Cursor Eq, execute the following command in the config mode.

```
R1(config)#qsfp-dd 0
R1(config-qsfp-dd)# rx-output eq-pre-cursor-target 4
```

2. To configure, execute the following command.

```
R1(config-qsfp-dd)#commit
```

Validation

To validate the Rx Post-Cursor Eq configuration, use the following command.

```
OcNOS#show qsfp-dd 0 si status

Port Number                    : 0

R2 Rx Post-Cursor Eq

Use this command to configure the Rx Post-Cursor Eq on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To configure Rx Post-Cursor Eq, execute the following command in the config mode.

```
R2(config)#qsfp-dd 0
R2(config-qsfp-dd)# rx-output eq-pre-cursor-target 4
```

2. To configure, execute the following command.

```
R2(config-qsfp-dd)#commit
```

Validation

To validate the Rx Post-Cursor Eq configuration, use the following command.

```
OcNOS#show qsfp-dd 0 si status

R1 Rx Post-Cursor Eq Unconfiguration

Use this command to unconfigure the Rx Post-Cursor Eq on the **QSFP-DD**[1] module on all eight host lanes, follow these steps.

1. To unconfigure Rx Post-Cursor Eq, execute the following command in the config mode.

```
R1(config)#qsfp-dd 0
R1(config-qsfp-dd)# rx-output eq-pre-cursor-target 4
```

2. To unconfigure, execute the following command.

```
R1(config-qsfp-dd)#commit
```

R1 Rx Post-Cursor Eq Unconfiguration Validation

To validate the Rx Post-Cursor Eq unconfigure, use the following command.

```
OcNOS#show qsfp-dd 0 advertisement si

OcNOS#

To configure the Rx Post-Cursor Eq on any specific host lanes, do the following configuration.
```

R1 Rx Post-Cursor Eq

Use this command to configure the Rx Post-Cursor Eq on the **QSFP-DD**[1] module on any specific host lanes, follow these steps.

1. To configure Rx Post-Cursor Eq, execute the following command in the config mode.

   ```
   R1(config)#qsfp-dd 0
   R1(config-qsfp-dd)# host-lane 1
   R1(config-qsfp-dd-host)# rx-output eq-pre-cursor-target 3
   ```

2. To configure, execute the following command.

   ```
   R1(config-qsfp-dd)#commit
   ```

Validation

To validate the Rx Post-Cursor Eq configuration, use the following command.

```
OcNOS#show qsfp-dd 0 si status

R2 Rx Post-Cursor Eq

Use this command to configure the Rx Post-Cursor Eq on the **QSFP-DD**[1] module on any specific host lanes, follow these steps.

1. To configure Rx Post-Cursor Eq, execute the following command in the config mode.

```
R2(config)#qsfp-dd 0
R2(config-qsfp-dd)# host-lane 1
R2(config-qsfp-dd-host)# rx-output eq-post-cursor-target 3
```

2. To configure, execute the following command.

```
R2(config-qsfp-dd)#commit
```

Validation

To validate the Rx Post-Cursor Eq configuration, use the following command.

```
OcNOS#show qsfp-dd 0 si status

Port Number                    : 0

-----------------------------------------------------------
      Parameter      | Lane | User Config | H/W Config |
-----------------------------------------------------------
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

R1 Rx Post-Cursor Eq Unconfiguration

Use this command to unconfigure the Rx Post-Cursor Eq on the **QSFP-DD**[1] module on any specific host lanes, follow these steps.

1. To unconfigure Rx Post-Cursor Eq, execute the following command in the config mode.

```
R1(config)#qsfp-dd 0
R1(config-qsfp-dd)# host-lane 1
R1(config-qsfp-dd-host)# rx-output eq-pre-cursor-target 3
```

2. To unconfigure, execute the following command.

```
R1(config-qsfp-dd)#commit
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

R1 Rx Post-Cursor Eq Unconfiguration Validation

To validate the Rx Post-Cursor Eq unconfiguration, use the following command.

```
OcNOS#show qsfp-dd 0 advertisement si

400G PM Alarm

Overview

The 400G PM alarm monitors and detects performance issues like the bit error rate and signal power in the network. This feature extends OcNOS performance-related monitoring capabilities and provides additional performance monitors and alarms.

400G coherent module[1] is a high-speed optical transceiver capable of transferring data long-distance with high performance. Its compatibility with single-mode optical fiber makes a robust combination in delivering a high-quality network transmission.

Feature Characteristics

Access the additional set of 400G performance monitoring parameters, such as Transmitter **FEC**[2] Detected Degrade (Tx **FDD**[3]), Transmitter FEC Excessive Degrade (Tx **FED**[4]), Receiver FEC Detected Degrade (Rx FDD), and Receiver FEC Excessive Degrade (Rx FED), to receive an automatic alarm notification on the CLI interface, via an SNMP trap, or thorugh the Netconf interface. The automatic alarm is triggered when the monitored parameter crosses the configured value.

For 400G coherent modules, use this feature to configure custom thresholds for Tx FDD, Tx FED, Rx FDD, Rx FED, Tx Power, Rx Total Power, and Rx Signal Power through a new set of CLI configuration commands and Netconf interface.

Note: Configuration of the threshold value is not possible through SNMP.

Benefits

The capability of this feature to configure the alarm threshold allows customization based on the network requirements and expected error rates. If the signal power exceeds the configured threshold value, it sends a notification to take action that prevents the receiving devices from potential damage.

Prerequisites

The availability of specific parameters or flags is vendor-specific, so read the 400G transceiver data-sheet to determine the available parameters or flags.

[1]400G coherent module is a high-speed optical transceiver capable of transferring data long-distance with high performance. Its compatibility with single-mode optical fiber makes a robust combination in delivering a high-quality network transmission.

[2]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

[3]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[4]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

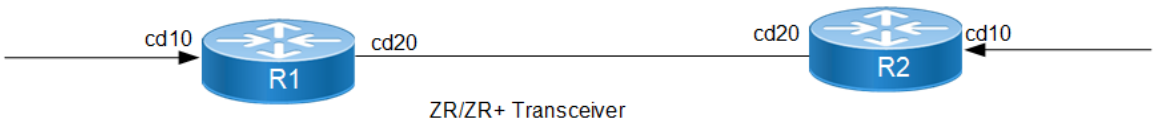
Configuration

This section shows the configuration of the 400G PM Alarm.

Topology

R1 is connected to the R2 by 400G ZR/ZR+ transceiver. The interface cd 10 and cd20 are 400G interfaces where the 400G ZR/ZR+ transceiver is connected. Cd10 is the host interface and here the configuration of the threshold value for the host-lane occurs. In cd20 interface, we can configure the media-lane threshold value.

Figure 61. 400G PM alarm



Media-lane Configuration

The below configuration is to set up the threshold value for the media lane.

R1

`R1#configure terminal` `R1(config)#qsfp-dd 20`	Enter configure mode. Enter **QSFP-DD**[1] module configuration.
`R1(config-qsfp-dd)#media-lane 1`	Enter the **Media lane**[2] configuration
`R1(config-qsfp-dd-media)#threshold rx-fdd`	Enter the BER threshold for **FDD**[3] under Threshold configuration
`R1(config-qsfp-dd-media-thresh)#ha 0.365`	Configure the **High alarm threshold**[4]
`R1(config-qsfp-dd-media-thresh)#la 0.165`	Configure the low alarm threshold
`R1(config-qsfp-dd-media-thresh)#exit`	Exit threshold Configure mode.
`R1(config-qsfp-dd-media)#threshold rx-fed`	Enter the BER threshold for **FED**[5] under Threshold configuration
`R1(config-qsfp-dd-media-thresh)#ha 0.365`	Configure the High alarm threshold
`R1(config-qsfp-dd-media-thresh)#la 0.165`	Configure the low alarm threshold
`R1(config-qsfp-dd-media-thresh)#exit`	Exit threshold Configure mode.
`R1(config-qsfp-dd-media)#threshold rx-signal-power`	Enter the threshold for Rx Signal Power under

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

[2]Media lanes are the electrical wire pairs (copper cables) or optical fibers that carry signals from the module to the other router and vice-versa.

[3]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[4]This is the highest parameter value for the 400G transceiver to operate safely. When a given parameter value crosses this threshold, the transceiver operation is unreliable, or the transceiver hardware could get damaged.

[5]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

`R1#configure terminal`	Enter configure mode. Threshold configuration
`R1(config-qsfp-dd-media-thresh)#ha 4`	Configure the High alarm threshold
`R1(config-qsfp-dd-media-thresh)#la -3`	Configure the low alarm threshold
`R1(config-qsfp-dd-media-thresh)#hw 5`	Configure the **High warning threshold**[1]
`R1(config-qsfp-dd-media-thresh)#lw -5`	Configure the low warning threshold
`R1(config-qsfp-dd-media-thresh)#exit`	Exit threshold Configure mode.
`R1(config-qsfp-dd-media)#threshold rx-total-power`	Enter the threshold for Rx Total Power under Threshold configuration
`R1(config-qsfp-dd-media-thresh)#ha 2`	Configure the High alarm threshold
`R1(config-qsfp-dd-media-thresh)#la -2`	Configure the low alarm threshold
`R1(config-qsfp-dd-media-thresh)#hw 3`	Configure the High warning threshold
`R1(config-qsfp-dd-media-thresh)#lw -3`	Configure the low warning threshold
`R1(config-qsfp-dd-media-thresh)#exit`	Exit threshold Configure mode.
`R1(config-qsfp-dd-media)#exit`	Exit media Configure mode.
`R1(config-qsfp-dd)#commit`	Commit the candidate configuration to the running configuration

Host-lane Configuration

The below configuration is to set up the threshold value for the host lane.

R1

`R1#configure terminal` `R1(config)#qsfp-dd 10`	Enter Configure mode Enter **QSFP-DD**[2] module configuration
`R1(config-qsfp-dd)#Host-lane 1`	Enter the **Media lane**[3] configuration
`R1(config-qsfp-dd-host)#threshold tx-fdd`	Enter the BER threshold for **FDD**[4] under Threshold configuration
`R1(config-qsfp-dd-host-thresh)#ha 0.365`	Configure the **High alarm threshold**[5]
`R1(config-qsfp-dd-host-thresh)#la 0.165`	Configure the low alarm threshold
`R1(config-qsfp-dd-host-thresh)#exit`	Exit threshold Configure mode.

[1]This is the highest parameter value that limits the optimal operation zone. The transceiver can operate after a parameter crosses this threshold, but performance and operational issues can occur.

[2]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

[3]Media lanes are the electrical wire pairs (copper cables) or optical fibers that carry signals from the module to the other router and vice-versa.

[4]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[5]This is the highest parameter value for the 400G transceiver to operate safely. When a given parameter value crosses this threshold, the transceiver operation is unreliable, or the transceiver hardware could get damaged.

`R1#configure terminal`	Enter Configure mode
`R1(config-qsfp-dd-host)#threshold tx-fed`	Enter the BER threshold for **FED**[1] under Threshold configuration
`R1(config-qsfp-dd-host-thresh)#ha 0.765`	Configure the High alarm threshold
`R1(config-qsfp-dd-host-thresh)#la 0.665`	Configure the **Low alarm threshold**[2]
`R1(config-qsfp-dd-host-thresh)#exit`	Exit threshold Configure mode.
`R1(config-qsfp-dd-media)#exit`	Exit media Configure mode.
`R1(config-qsfp-dd)#commit`	Commit the candidate configuration to the running configuration

Validation

R1

The below is the show output of media lane threshold parameter:

```
qsfp-dd 20
 media-lane 1
  threshold rx-fdd
   ha 0.365500
   la 0.165000
  threshold rx-fed
   ha 0.365000
   la 0.165000
  threshold rx-total-power
   ha 2.000000
   la -2.000000
   hw 3.000000
   lw -3.000000
  threshold rx-signal-power
   ha 4.000000
   la -3.000000
   hw 5.000000
   lw -5.000000
!
!
end
```

Verify the user-threshold media-lane:

```
#show qsfp-dd 20 user-threshold status media
Codes: [HA : High Alarm], [LA : Low Alarm], [HW : High Warning], [LW : Low Warning]
Port Number                    : 20
-------------------------------------------------------------------------------------
      Threshold      | Lane | User Config | H/W Config | Minimum  | Maximum  | Unit |
-------------------------------------------------------------------------------------
 Rx FDD Active       | 1    | 3.65e-01    | 3.65e-01   | 0.00e+00 | 1.00e+00 | NA   |
 Rx FDD Clear        | 1    | 1.65e-01    | 1.65e-01   | 0.00e+00 | 1.00e+00 | NA   |

```

New CLI Commands

ha

Use this command to set the high alarm threshold value for the Tx **FDD**[1], Tx **FED**[2], Rx FDD, Rx FED, Tx power, Rx Total Power, and Rx Signal Power performance monitoring parameters. **High alarm threshold**[3] is the highest parameter value for the 400G transceiver to operate safely and reliably. For **FEC**[4] Detected Degrade (FDD) and FEC Excessive Degrade (FED) monitoring, this command sets the active threshold. FDD suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

Command Syntax

```
ha VALUE
no ha
```

Parameters

VALUE
high alarm value

Command Mode

Global threshold mode, host-lane threshold mode, and media-lane threshold mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the high warning threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold tx-fdd
OcNOS(config-qsfp-dd-thresh)#ha 0.9876
OcNOS(config-qsfp-dd-thresh)#commit
OcNOS(config-qsfp-dd-thresh)#no ha
OcNOS(config-qsfp-dd-thresh)#commit
```

[1]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]This is the highest parameter value for the 400G transceiver to operate safely. When a given parameter value crosses this threshold, the transceiver operation is unreliable, or the transceiver hardware could get damaged.

[4]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

hw

Use this command to set the high warning threshold value for Tx power, Rx Total Power, and Rx Signal Power. **High warning threshold**[1] is the highest parameter value for the 400G transceiver, exceeding which the transceiver performance and operational issues can occur.

Note: This command has no effect for **FED**[2] and **FDD**[3] thresholds.

Command Syntax

```
hw VALUE
no hw
```

Parameters

VALUE
high warning value

Command Mode

Global threshold mode, host-lane threshold mode, and media-lane threshold mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the high warning threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold rx-total-power
OcNOS(config-qsfp-dd-thresh)#threshold rx-total-power
OcNOS(config-qsfp-dd-thresh)#hw 3.0
OcNOS(config-qsfp-dd-thresh)#commit
OcNOS(config-qsfp-dd-thresh)#no hw
OcNOS(config-qsfp-dd-thresh)#commit
```

[1]This is the highest parameter value that limits the optimal operation zone. The transceiver can operate after a parameter crosses this threshold, but performance and operational issues can occur.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

la

Use this command to set the low alarm threshold value based on the vendor-specific threshold for all the performance monitoring parameters Tx **FDD**[1], Tx **FED**[2], Rx FDD, Rx FED, Tx power, Rx Total Power, and Rx Signal Power threshold value. **Low alarm threshold**[3] is the lowest parameter value for the 400G transceiver to operate with reliability. For FDD and FED monitoring this command sets the clear threshold.

Command Syntax

```
la VALUE
no ha
```

Parameters

VALUE
low alarm value

Command Mode

Global threshold mode, host-lane threshold mode, and media-lane threshold mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the low alarm threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold rx-fed
OcNOS(config-qsfp-dd-thresh)#la 0.001234
OcNOS(config-qsfp-dd-thresh)#commit
OcNOS(config-qsfp-dd-thresh)#no la
OcNOS(config-qsfp-dd-thresh)#commit
```

[1]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]This is the lowest parameter value for the 400G transceiver to operate safely. When a given parameter value crosses this threshold, the transceiver operation is unreliable.

lw

Use this command to set the low warning threshold value. **Low warning threshold**[1] is the lowest parameter value for the 400G transceiver, below which the transceiver performance and operational issues can occur.

Note: This command has no effect for **FED**[2] and **FDD**[3] thresholds.

Command Syntax

```
lw VALUE
no lw
```

Parameters

lw
low warning value

Command Mode

Global threshold mode, host-lane threshold mode, and media-lane threshold mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the low warning threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold rx-total-power
OcNOS(config-qsfp-dd-thresh)#lw -1.0
OcNOS(config-qsfp-dd-thresh)#commit
OcNOS(config-qsfp-dd-thresh)#no lw
OcNOS(config-qsfp-dd-thresh)#commit
```

[1]This is the lowest parameter value that limits the optimal operation zone. The transceiver can operate after a parameter crosses this threshold, but performance and operational issues can occur.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

show qsfp-dd user-threshold status

Use this command to show the current configuration status of user thresholds.

Command Syntax

```
show qsfp-dd <PORT> user-threshold status (host|media)
```

Parameters

PORT
The front panel port number of the device where the transceiver is connected

host
Host side config status

media
Media side config status

Command Mode

Execution mode andPrivileged execution mode mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

```
This below show command displays the hardware state of the programmed user thresholds.
OcNOS#show qsfp-dd 48 user-threshold status host

Port Number                    : 48

-------------------------------------------------------------------------------
      Threshold      | Lane | User Config | H/W Config | Minimum  | Maximum  |
-------------------------------------------------------------------------------
 Tx FDD Active       | 1    | 9.88e-01    | 9.87e-01   | 0.00e+00 | 1.00e+00 |
 Tx FDD Clear        | 1    | 5.43e-03    | 5.43e-03   | 0.00e+00 | 1.00e+00 |
 Tx FED Active       | 1    | 5.43e-01    | 5.43e-01   | 0.00e+00 | 1.00e+00 |
 Tx FED Clear        | 1    | 9.88e-03    | 9.87e-03   | 0.00e+00 | 1.00e+00 |

OcNOS#show qsfp-dd 48 user-threshold status media

Codes: [HA : High Alarm], [LA : Low Alarm], [HW : High Warning], [LW : Low Warning]

Port Number                    : 48

-------------------------------------------------------------------------------
      Threshold      | Lane | User Config | H/W Config | Minimum  | Maximum  |
-------------------------------------------------------------------------------
 Rx FDD Active       | 1    | 1.23e-01    | 1.23e-01   | 0.00e+00 | 1.00e+00 |
 Rx FDD Clear        | 1    | 6.79e-03    | 6.78e-03   | 0.00e+00 | 1.00e+00 |

 Rx Signal Power LW  | 1    | -1.00       | -1.00      | -26.00   | 9.00     |
 Rx Signal Power LA  | 1    | -2.00       | -2.00      | -26.00   | 9.00     |
```

Table 78. show qsfp-dd 48 user-threshold status host output details

Field	Description
Threshold	The parameters that are monitored.
Lane	Displays the channel number where the thresholds are applied.
User Config	Displays what the user has configured.
H/W Config	Displays what is programmed in the transceiver hardware.
Minimum	The lowest values that are allowed to be used for this configuration.
Maximum	The highest values that are allowed to be used for this configuration.

threshold (host-lane mode)

Use this command to enter host lane level user threshold configuration mode. **Host lane**[1] mode is a configuration mode that allows configuring specific values for the host lanes.Host lanes are wires that carry the electrical signal from the host interface to the module and vice-versa.

Command Syntax

```
threshold (tx-fdd|tx-fed)
```

Parameters

tx-fdd
Tx **FDD**[2]

tx-fed
Tx **FED**[3]

Command Mode

Host-lane mode[4]

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the host-lane threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#host-lane 1
OcNOS(config-qsfp-dd-host)#threshold tx-fdd
OcNOS(config-qsfp-dd-host-thresh)#ha 0.9876
OcNOS(config-qsfp-dd-host-thresh)#la 0.005432
OcNOS(config-qsfp-dd-host-thresh)#threshold tx-fed
OcNOS(config-qsfp-dd-host-thresh)#ha 0.5432
OcNOS(config-qsfp-dd-host-thresh)#la 0.009876
OcNOS(config-qsfp-dd-host-thresh)#commit
```

[1]Host lanes are wires that carry the electrical signal from the host interface to the module and vice-versa.

[2]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[3]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[4]Host lane mode is a configuration mode that allows configuring specific values for the host lanes. Contrary to the global mode level that configures the same value across all host lanes.

threshold (media-lane mode)

Use this command to enter media lane level user threshold configuration mode. **Media lane**[1] mode is a configuration mode that allows configuring specific values for each media lane. Media lanes are the electrical wire pairs (copper cables) or optical fibers that carry signals from the module to the other router and vice-versa.

Command Syntax

```
threshold (rx-fdd|rx-fed|rx-total-power|rx-signal-power)
```

Parameters

rx-fdd
Rx **FDD**[2]

rx-fed
Rx **FED**[3]

rx-total-power
Rx Total Power

rx-signal-power
Rx Signal Power

Command Mode

Media-lane mode[4]

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the media-lane threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#media-lane 1
OcNOS(config-qsfp-dd-media)#threshold rx-fdd
OcNOS(config-qsfp-dd-media-thresh)#ha 0.1234
OcNOS(config-qsfp-dd-media-thresh)#la 0.006789
OcNOS(config-qsfp-dd-media-thresh)#threshold rx-fed
OcNOS(config-qsfp-dd-media-thresh)#ha 0.6789
OcNOS(config-qsfp-dd-media-thresh)#la 0.001234
OcNOS(config-qsfp-dd-media-thresh)#threshold rx-total-power
OcNOS(config-qsfp-dd-media-thresh)#ha 4
OcNOS(config-qsfp-dd-media-thresh)#hw 3
OcNOS(config-qsfp-dd-media-thresh)#lw -3
OcNOS(config-qsfp-dd-media-thresh)#la -4
OcNOS(config-qsfp-dd-media-thresh)#threshold rx-signal-power
```

[1]Media lanes are the electrical wire pairs (copper cables) or optical fibers that carry signals from the module to the other router and vice-versa.

[2]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[3]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[4]Media lane mode is a configuration mode that allows configuring specific values for each media lane (per fiber cable physical channel). Contrary to the global mode level that configures the same value across all media lanes.

```
OcNOS(config-qsfp-dd-media-thresh)#ha 2
OcNOS(config-qsfp-dd-media-thresh)#hw 1
OcNOS(config-qsfp-dd-media-thresh)#lw -1
OcNOS(config-qsfp-dd-media-thresh)#la -2
OcNOS(config-qsfp-dd-media-thresh)#commit
```

threshold (QSFP-DD mode)

Use this command to enter global level user threshold configuration mode.In global mode, configure the same threshold value across all host or media lanes.

Command Syntax

```
threshold (tx-fdd|tx-fed|rx-fdd|rx-fed|rx-total-power|rx-signal-power)
```

Parameters

tx-fdd
Tx **FDD**[1]

tx-fed
Tx **FED**[2]

rx-fdd
Rx FDD

rx-fed
Rx FED

rx-total-power
Rx Total Power

rx-signal-power
Rx Signal Power

Command Mode

QSFP-DD[3] mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the threshold in global mode:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold tx-fdd
OcNOS(config-qsfp-dd-thresh)#ha 0.9876
OcNOS(config-qsfp-dd-thresh)#la 0.005432
OcNOS(config-qsfp-dd-thresh)#threshold tx-fed
OcNOS(config-qsfp-dd-thresh)#ha 0.5432
OcNOS(config-qsfp-dd-thresh)#la 0.009876
OcNOS(config-qsfp-dd-thresh)#threshold rx-fdd
OcNOS(config-qsfp-dd-thresh)#ha 0.1234
OcNOS(config-qsfp-dd-thresh)#la 0.006789
OcNOS(config-qsfp-dd-thresh)#threshold rx-fed
```

[1]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

```
OcNOS(config-qsfp-dd-thresh)#ha 0.6789
OcNOS(config-qsfp-dd-thresh)#la 0.001234
OcNOS(config-qsfp-dd-thresh)#threshold rx-total-power
OcNOS(config-qsfp-dd-thresh)#ha 4
OcNOS(config-qsfp-dd-thresh)#hw 3
OcNOS(config-qsfp-dd-thresh)#lw -3
OcNOS(config-qsfp-dd-thresh)#la -4
OcNOS(config-qsfp-dd-thresh)#threshold rx-signal-power
OcNOS(config-qsfp-dd-thresh)#ha 2
OcNOS(config-qsfp-dd-thresh)#hw 1
OcNOS(config-qsfp-dd-thresh)#lw -1
OcNOS(config-qsfp-dd-thresh)#la -2
OcNOS(config-qsfp-dd-thresh)#commit
```

Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

Acronym	Description
BER	Bit Error Rate
FDD[1]	**FEC**[2] detected degrade
FEC	Forward error correction
PM	Performance Monitoring
FED[3]	FEC excessive degrade
Rx	Receiver
Tx	Transmitter
SNMP	Simple Network Management Protocol

[1]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[2]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

[3]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

QSFP-DD COMMAND REFERENCE

QSFP-DD Commands

This chapter is a reference for the **QSFP-DD**[1] configuration and status commands:

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

application

Use this command to select the application ID to be configured for this **QSFP-DD**[1] module.

Use the **no** parameter with this command to remove this configuration. If no application is configured then application ID 1 will be selected as per module default.

Notes: Only 400G application modes are supported.

For checking the supported applications modes **show qsfp-dd <port no.> advertisement applications** command, see the example.

Example

```
OcNOS#show qsfp-dd 49 application

Port Number                     : 49
-----------------------------------
   User Config    |   H/W Config
-----------------------------------
   Application 2  |   Application 2

OcNOS#sh qsfp-dd 49 advertisement applications

Port Number                   : 49
> Application 1:
    | Host |
         Interface            : 400GAUI-8 C2M

        Bits Per Unit Intvl  : 4.000000
        Lane Assigned        : Lane-1
```

Command Syntax

```
application <2-15>
```

Parameters

<2-15>
Configurable application IDs

Command Mode

QSFP-DD mode

Default

By default, application ID 1 is selected.

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
#configure terminal
```

```
(config)#qsfp-dd 0
(config-qsfp-dd)#application 8
(config-qsfp-dd)#commit
(config-qsfp-dd)#no application
(config-qsfp-dd)#commit
(config-qsfp-dd)#
```

ha

Use this command to set the high alarm threshold value for the Tx **FDD**[1], Tx **FED**[2], Rx FDD, Rx FED, Tx power, Rx Total Power, and Rx Signal Power performance monitoring parameters. **High alarm threshold**[3] is the highest parameter value for the 400G transceiver to operate safely and reliably. For **FEC**[4] Detected Degrade (FDD) and FEC Excessive Degrade (FED) monitoring, this command sets the active threshold. FDD suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

Command Syntax

```
ha VALUE
no ha
```

Parameters

VALUE
high alarm value

Command Mode

Global threshold mode, host-lane threshold mode, and media-lane threshold mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the high warning threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold tx-fdd
OcNOS(config-qsfp-dd-thresh)#ha 0.9876
OcNOS(config-qsfp-dd-thresh)#commit
OcNOS(config-qsfp-dd-thresh)#no ha
OcNOS(config-qsfp-dd-thresh)#commit
```

[1]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]This is the highest parameter value for the 400G transceiver to operate safely. When a given parameter value crosses this threshold, the transceiver operation is unreliable, or the transceiver hardware could get damaged.

[4]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

hw

Use this command to set the high warning threshold value for Tx power, Rx Total Power, and Rx Signal Power. **High warning threshold**[1] is the highest parameter value for the 400G transceiver, exceeding which the transceiver performance and operational issues can occur.

Note: This command has no effect for **FED**[2] and **FDD**[3] thresholds.

Command Syntax

```
hw VALUE
no hw
```

Parameters

VALUE
high warning value

Command Mode

Global threshold mode, host-lane threshold mode, and media-lane threshold mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the high warning threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold rx-total-power
OcNOS(config-qsfp-dd-thresh)#threshold rx-total-power
OcNOS(config-qsfp-dd-thresh)#hw 3.0
OcNOS(config-qsfp-dd-thresh)#commit
OcNOS(config-qsfp-dd-thresh)#no hw
OcNOS(config-qsfp-dd-thresh)#commit
```

[1]This is the highest parameter value that limits the optimal operation zone. The transceiver can operate after a parameter crosses this threshold, but performance and operational issues can occur.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

la

Use this command to set the low alarm threshold value based on the vendor-specific threshold for all the performance monitoring parameters Tx **FDD**[1], Tx **FED**[2], Rx FDD, Rx FED, Tx power, Rx Total Power, and Rx Signal Power threshold value. **Low alarm threshold**[3] is the lowest parameter value for the 400G transceiver to operate with reliability. For FDD and FED monitoring this command sets the clear threshold.

Command Syntax

```
la VALUE
no ha
```

Parameters

VALUE
low alarm value

Command Mode

Global threshold mode, host-lane threshold mode, and media-lane threshold mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the low alarm threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold rx-fed
OcNOS(config-qsfp-dd-thresh)#la 0.001234
OcNOS(config-qsfp-dd-thresh)#commit
OcNOS(config-qsfp-dd-thresh)#no la
OcNOS(config-qsfp-dd-thresh)#commit
```

[1]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]This is the lowest parameter value for the 400G transceiver to operate safely. When a given parameter value crosses this threshold, the transceiver operation is unreliable.

laser channel

Use this command to configure the laser channel number for the **QSFP-DD**[1] module.

Command Syntax

```
laser channel NUMBER
no laser channel
```

Parameters

NUMBER
channel number

Default

None

Command Mode

QSFP-DD mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Examples

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#laser channel 10
(config-qsfp-dd)#commit
(config-qsfp-dd)#no laser channel
(config-qsfp-dd)#commit
(config-qsfp-dd)#
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

laser grid

Use this command to configure the laser grid spacing frequency for the **QSFP-DD**[1] module.

> **Note:**
> If the module supports the 100 GHz grid, using the "no" command will configure the grid to 100 GHz.
> If the module does not support 100 GHz, the previous value will remain unchanged.

Command Syntax

```
laser grid (3p125|6p25|12p5|25|33|50|75|100)
no laser grid
```

Parameters

3p125
3.125 GHz

6p25
6.25 GHz

12p5
12.5 GHz

25
25 GHz

33
33 GHz

50
50 GHz

75
75 GHz

100
100 GHz

Default

100 GHz

Command Mode

QSFP-DD mode

Applicability

This command was introduced in OcNOS version 6.2.0.

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

Examples

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#laser grid 50
(config-qsfp-dd)#commit
(config-qsfp-dd)#no laser grid
(config-qsfp-dd)#commit
(config-qsfp-dd)#
```

laser fine-tune-freq

Use this command to configure the laser fine tune frequency offset for the **QSFP-DD**[1] module.

Command Syntax

```
laser fine-tune-freq VALUE
no laser fine-tune-freq
```

Parameters

VALUE
Fine tune frequency offset in GHz

Default

None

Command Mode

QSFP-DD mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Examples

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#laser fine-tune-freq 1.5
(config-qsfp-dd)#commit
(config-qsfp-dd)#no laser fine-tune-freq
(config-qsfp-dd)#commit
(config-qsfp-dd)#
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

laser output-power

Use this command to configure the laser target output power for the **QSFP-DD**[1] module.

Command Syntax

```
laser output-power VALUE
no laser output-power
```

Parameters

VALUE
Laser target output power

Default

None

Command Mode

QSFP-DD mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Examples

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#laser output-power -9.2
(config-qsfp-dd)#commit
(config-qsfp-dd)#no laser output-power
(config-qsfp-dd)#commit
(config-qsfp-dd)#
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

loopback

Use this command to configure the loopback type (input, output, both) on the **QSFP-DD**[1] module host/media side. If the loopback type is supported by the QSFP-DD module this will enable the loopback function.

Use the **no** parameter to remove this configuration and disable the loopback function.

Command Syntax

```
loopback (in|out|both) (host|media)
no loopback (host|media)
```

Parameters

in
Configure input loopback

out
Configure output looback

both
Configure input and output loopback

host
Configure host side

media
Configure media side

Command Mode

QSFP-DD mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
(config)#qsfp-dd 0
(config-qsfp-dd)#loopback in host
(config-qsfp-dd)#loopback out media
(config-qsfp-dd)#commit
(config-qsfp-dd)#loopback both media
(config-qsfp-dd)#no loopback host
(config-qsfp-dd)#commit
(config-qsfp-dd)#
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

lw

Use this command to set the low warning threshold value. **Low warning threshold**[1] is the lowest parameter value for the 400G transceiver, below which the transceiver performance and operational issues can occur.

Note: This command has no effect for **FED**[2] and **FDD**[3] thresholds.

Command Syntax

```
lw VALUE
no lw
```

Parameters

lw
low warning value

Command Mode

Global threshold mode, host-lane threshold mode, and media-lane threshold mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the low warning threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold rx-total-power
OcNOS(config-qsfp-dd-thresh)#lw -1.0
OcNOS(config-qsfp-dd-thresh)#commit
OcNOS(config-qsfp-dd-thresh)#no lw
OcNOS(config-qsfp-dd-thresh)#commit
```

[1]This is the lowest parameter value that limits the optimal operation zone. The transceiver can operate after a parameter crosses this threshold, but performance and operational issues can occur.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

prbs

Use these commands to configure the PRBS pattern generator/checker type to be used for diagnostics of the **QSFP-DD**[1] module host/media side and to configure the PRBS pattern generator/checker location (pre-fec/post-fec) on the QSFP-DD module host/media side. If the generator/checker pattern type and location are supported by the QSFP-DD module this will enable the selected function.

Use the **no** parameter to remove this configuration and disable the generator/checker function.

Command Syntax

```
prbs (generator|checker) type (31q|31|23q|23|15q|15|13q|13|9q|9|7q|7|ssprq) (host|media)
prbs (generator|checker) (pre-fec|post-fec) (host|media)
no prbs (generator|checker) type (host|media)
no prbs (generator|checker) (host|media)
```

Parameters

generator
Configure the pattern generator

checker
Configure the pattern checker

31q
Configure PRBS-31Q type

31
Configure PRBS-31 type

23q
Configure PRBS-23Q type

23
Configure PRBS-23 type

15q
Configure PRBS-15Q type

15
Configure PRBS-15 type

13q
Configure PRBS-13Q type

13
Configure PRBS-13 type

9q
Configure PRBS-9Q type

9
Configure PRBS-9 type

7q
Configure PRBS-7q type

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

7
Configure PRBS-7 type

ssprq
Configure SSPRQ type

pre-fec
Configure to generate before the **FEC**[1] encoder / check before the FEC decoder

post-fec
Configure to generate after the FEC encoder / check after the FEC decoder

host
Configure host side

media
Configure media side

Command Mode

QSFP-DD mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#prbs generator type 15 host
(config-qsfp-dd)#prbs checker type 23q host
(config-qsfp-dd)#prbs generator type 7q media
(config-qsfp-dd)#prbs checker type ssprq media
(config-qsfp-dd)#commit
(config-qsfp-dd)#no prbs generator type host
(config-qsfp-dd)#no prbs checker type media
(config-qsfp-dd)#commit
(config-qsfp-dd)#
```

[1]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

qsfp-dd

Use this command to select a **QSFP-DD**[1] port to configure and enter the **`qsfp-dd`** command mode. Use the **`exit`** command to quit from this mode.

Command Syntax

```
qsfp-dd PORTNUM
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

rx-output eq-pre-cursor-target

Use this command to configure the Rx output equalizer pre-cursor target override value.

Use the no form of this command to remove the Rx output equalizer pre-cursor target override value.

Command Syntax

```
rx-output eq-pre-cursor-target <1-15>
no rx-output eq-pre-cursor-target
```

Parameters

<1-15>
Output equalizer pre-cursor target value

Default

None

Command Mode

QSFP-DD[1] mode and QSFP-DD host-lane mode modes

Applicability

This command was introduced before OcNOS version 6.5.1.

Example

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#rx-output eq-pre-cursor-target 4
(config-qsfp-dd)#commit
(config-qsfp-dd)#no rx-output eq-pre-cursor-target
(config-qsfp-dd)#commit
(config-qsfp-dd)#host-lane 2
(config-qsfp-dd-host)#rx-output eq-pre-cursor-target 1
(config-qsfp-dd-host)#commit
(config-qsfp-dd-host)#no rx-output eq-pre-cursor-target
(config-qsfp-dd-host)#commit
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

rx-output eq-post-cursor-target

Use this command to configure the Rx output equalizer post-cursor target override value.

Use the no form of this command to remove the Rx output equalizer post-cursor target override value..

Command Syntax

```
rx-output eq-post-cursor-target <1-15>
no rx-output eq-post-cursor-target
```

Parameters

<1-15>
Output equalizer post-cursor target value

Default

None

Command Mode

QSFP-DD[1] mode and QSFP-DD host-lane mode

Applicability

This command was introduced before OcNOS version 6.5.1.

Example

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#rx-output eq-post-cursor-target 2
(config-qsfp-dd)#commit
(config-qsfp-dd)#no rx-output eq-post-cursor-target
(config-qsfp-dd)#commit
(config-qsfp-dd)#host-lane 7
(config-qsfp-dd-host)#rx-output eq-post-cursor-target 6
(config-qsfp-dd-host)#commit
(config-qsfp-dd-host)#no rx-output eq-post-cursor-target
(config-qsfp-dd-host)#commit
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

rx-output amp-target

Use this command to configure the Rx output amplitude target override value.

Use the no form of this command to remove the Rx output amplitude target override value.

Command Syntax

```
rx-output amp-target <0-15>
no rx-output amp-target
```

Parameters

<1-15>
Output amplitude target value

Default

None

Command Mode

QSFP-DD[1] mode and QSFP-DD host-lane mode

Applicability

This command was introduced before OcNOS version 6.5.1.

Example

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#rx-output amp-target 0
(config-qsfp-dd)#commit
(config-qsfp-dd)#no rx-output amp-target
(config-qsfp-dd)#commit
(config-qsfp-dd)#host-lane 3
(config-qsfp-dd-host)#rx-output amp-target 1
(config-qsfp-dd-host)#commit
(config-qsfp-dd-host)#no rx-output amp-target
(config-qsfp-dd-host)#commit
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

rx cdr-bypass

Use this command to enable the Rx CDR bypass.

Use the no form of this command to disable the Rx CDR bypass.

Command Syntax

```
rx cdr-bypass
no rx cdr-bypass
```

Parameters

None

Command Mode

QSFP-DD[1] mode and QSFP-DD host-lane mode

Applicability

This command was introduced before OcNOS version 6.5.1.

Example

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#rx cdr-bypass
(config-qsfp-dd)#commit
(config-qsfp-dd)#no rx cdr-bypass
(config-qsfp-dd)#commit
(config-qsfp-dd)#host-lane 2
(config-qsfp-dd-host)#rx cdr-bypass
(config-qsfp-dd-host)#commit
(config-qsfp-dd-host)#no rx cdr-bypass
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement applications

Use this command to show **QSFP-DD**[1] module advertised applications.

Command Syntax

```
show qsfp-dd PORTNUM advertisement applications
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement applications

        Application BR       : 120.277094
```

```
        Lane Count           : 1
        Lane Sig BR          : 30.069273
        Modulation Format    : DP-QPSK
        Bits Per Unit Intvl  : 4
        Lane Assigned        : Lane-1
```

show qsfp-dd advertisement controls

Use this command to show **QSFP-DD**[1] module advertised controls.

Command Syntax

```
show qsfp-dd PORTNUM advertisement controls
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement controls

Port Number                    : 0
Wavelength Control             : Yes
Tunable Transmitter            : Yes
Tx Output Squelching           : Not Supported
Forced Tx Output Squelching    : No
Tx Output Squelching Disable   : No
Tx Output Disable              : Yes
Input Polarity Flip Tx         : Yes
Rx Output Squelching Disable   : Yes
Rx Output Disable              : Yes
Output Polarity Flip Rx        : Yes
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement diagnostics host

Use this command to show **QSFP-DD**[1] module advertised host side diagnostics.

Command Syntax

```
show qsfp-dd PORTNUM advertisement diagnostics host
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement diagnostics host

Port Number                    : 0
| Supported Loopback Modes |
     Output                    : Yes
     Input                     : Yes
     Per Lane                  : Yes
| Reporting Capabilities |
     Input SNR                 : No
     FEC                       : Yes
| PRBS Checker |
     Post FEC                  : Yes
     Pre FEC                   : Yes
     Types                     : PRBS-31Q, PRBS-31, PRBS-23Q, PRBS-23, PRBS-15Q, PRBS-15, PRBS-13Q,
PRBS-13, PRBS-9Q, PRBS-9, PRBS-7Q, PRBS-7
| PRBS Generator |
     Post FEC                  : Yes
     Pre FEC                   : Yes
     Types                     : PRBS-31Q, PRBS-31, PRBS-23Q, PRBS-23, PRBS-15Q, PRBS-15, PRBS-13Q,
PRBS-13, PRBS-9Q, PRBS-9, PRBS-7Q, PRBS-7
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement diagnostics media

Use this command to show **QSFP-DD**[1] module advertised media side diagnostics.

Command Syntax

```
show qsfp-dd PORTNUM advertisement diagnostics media
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement diagnostics media

Port Number                    : 0
| Supported Loopback Modes |
     Output                    : Yes
     Input                     : No
     Per Lane                  : Yes
| Reporting Capabilities |
     Input SNR                 : Yes
     FEC                       : Yes
| PRBS Checker |
     Post FEC                  : Yes
     Pre FEC                   : No
     Types                     : PRBS-31, PRBS-23, PRBS-15, PRBS-7
| PRBS Generator |
     Post FEC                  : Yes
     Pre FEC                   : Yes
     Types                     : PRBS-31, PRBS-23, PRBS-15, PRBS-7
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement diagnostics module

Use this command to show **QSFP-DD**[1] module advertised diagnostics.

Command Syntax

```
show qsfp-dd PORTNUM advertisement diagnostics module
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement diagnostics module

Port Number                    : 0
| Supported Loopback Modes |
     Simul. Host & Media Side  : Yes
| Reporting Capabilities |
     Bit Error Ratio           : Yes
     Bits & Errors Counting    : Yes
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement durations

Use this command to show module advertised durations

Command Syntax

```
show qsfp-dd PORTNUM advertisement durations
```

Parameters

PORTNUM
QSFP-DD[1] front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement durations

Port Number                    : 0
ModSel Wait                    : 4 us
DP Init Max                    : 10 s <= t < 1 min
DP Deinit Max                  : 1 s <= t < 5 s
DP Tx Turn On Max              : 50 ms <= t < 100 ms
DP Tx Turn Off Max             : 1 ms <= t < 5 ms
Module Power Up Max            : 10 s <= t < 1 min
Module Power Down Max          : 1 s <= t < 5 s
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement laser

Use this command to show **QSFP-DD**[1] module advertised laser controls.

Command Syntax

```
show qsfp-dd PORTNUM advertisement laser
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement laser

Port Number                       : 0
Supported Grids                   : 6.25 GHz, 12.5 GHz, 25 GHz, 50 GHz, 100 GHz, 75 GHz
   6.25 GHz Channels              : Low=191.275 THz, High=196.125 THz, Total=776
   12.5 GHz Channels              : Low=191.275 THz, High=196.125 THz, Total=388
   25 GHz Channels                : Low=191.275 THz, High=196.125 THz, Total=194
   50 GHz Channels                : Low=191.300 THz, High=196.100 THz, Total=96
   100 GHz Channels               : Low=191.300 THz, High=196.100 THz, Total=48
   75 GHz Channels                : Low=191.300 THz, High=196.100 THz, Total=64
Fine Tuning Support               : Yes
   Fine Tuning Resolution         : 0.001 GHz
   Fine Tuning Low Offset         : -6.000 GHz
   Fine Tuning High Offset        : 6.000 GHz
Output Power Programmable Per Lane : Yes
   Min Output Power Programmable  : -22.90 dBm
   Max Output Power Programmable  : 4.00 dBm
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement monitors host

Use this command to show **QSFP-DD**[1] module advertised host side monitors.

Command Syntax

```
show qsfp-dd PORTNUM advertisement monitors host
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement monitors host

Port Number                       : 0
Pre-FEC BER Minimum Input         : Yes [Lane 1, Lane 3, Lane 5, Lane 7]
Pre-FEC BER Maximum Input         : Yes [Lane 1, Lane 3, Lane 5, Lane 7]
Pre-FEC BER Average Input         : Yes [Lane 1, Lane 3, Lane 5, Lane 7]
Pre-FEC BER Current Value Input   : Yes [Lane 1, Lane 3, Lane 5, Lane 7]
FERC Minimum Input                : Yes [Lane 1, Lane 3, Lane 5, Lane 7]
FERC Maximum Input                : Yes [Lane 1, Lane 3, Lane 5, Lane 7]
FERC Average Input                : Yes [Lane 1, Lane 3, Lane 5, Lane 7]
FERC Current Value Input          : Yes [Lane 1, Lane 3, Lane 5, Lane 7]

| Link Performance |
     Tx FDD                       : Yes
     Tx FED                       : Yes
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement monitors media

Use this command to show **QSFP-DD**[1] module advertised media side monitors.

Command Syntax

```
show qsfp-dd PORTNUM advertisement monitors media
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement monitors media

Port Number                         : 0
Rx Optical Power                    : Yes
Tx Optical Power                    : Yes
Tx Bias                             : Yes
Rx Los                              : Yes
Tx Failure                          : Yes
Rx CDR LOL                          : Yes
Laser Age                           : Yes [Lane 1]
Pre-FEC BER Minimum Input           : Yes [Lane 1]
Pre-FEC BER Maximum Input           : Yes [Lane 1]
Pre-FEC BER Average Input           : Yes [Lane 1]
Pre-FEC BER Current Value Input     : Yes [Lane 1]
FERC Minimum Input                  : Yes [Lane 1]
FERC Maximum Input                  : Yes [Lane 1]
FERC Average Input                  : Yes [Lane 1]
FERC Current Value Input            : Yes [Lane 1]
Modular Bias X/I                    : Yes [Lane 1]
Modular Bias X/Q                    : Yes [Lane 1]
Modular Bias Y/I                    : Yes [Lane 1]

```

show qsfp-dd advertisement monitors module

Use this command to show **QSFP-DD**[1] module advertised monitors

Command Syntax

```
show qsfp-dd PORTNUM advertisement monitors module
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 advertisement monitors module

Port Number                    : 0
Voltage                        : Yes
Temperature                    : Yes
TEC Current                    : Yes
Laser Temperature              : Yes
Laser Temperature [2]          : No

Rx Power                       : Yes
Rx Signal Power                : Yes
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement pages

Use this command to show **QSFP-DD**[1] module advertised supported pages.

Command Syntax

```
show qsfp-dd PORTNUM advertisement pages
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 application

Port Number                    : 0
-----------------------------------
   User Config    |   H/W Config
-----------------------------------
   None           |   Application 1
OcNOS>show qsfp-dd 0 advertisement pages

Port Number                    : 0
Network Path                   : No
VDM                            : Yes
VDM Support                    : Groups 1-2 (Page 20h-21h, 24h-25h, 28h-29h, first 1/2 of 2Ch, 2Dh)
Diagnostics                    : Yes
User(Page 03h)                 : Yes
Banks(Page 10h-1Fh)            : Bank 0 (8 Lanes)
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd advertisement si

Use this command to display which signal integrity configuration capabilities the transceiver supports.

Command Syntax

```
show qsfp-dd <port> advertisement si
```

Parameters

PORTNUM
QSFP-DD[1] front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.5.1.

Example

```
#show qsfp-dd 0 advertisement si

-------------------------------------------------
                  Codes
-------------------------------------------------
Tx Equalization     >  1 - 12  : 1dB - 12db
                       13 - 15 : Vendor Specific
-------------------------------------------------

Port Number                    : 0

Manual Tx Input Eq.            : No

Rx Output Eq. Type             : P-P with constant amplitude/NA/Unknown

Rx Output Amplitude            : No

Rx Output Eq.                  : Pre and post-cursor
Rx Output Eq. Pre-Cursor Max   : Code 7(3.5dB)
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

```
Rx Output Eq. Post-Cursor Max  : Code 7(7dB)

Tx CDR Supported               : Yes
Tx CDR Bypass Supported        : No

Rx CDR Supported               : Yes
Rx CDR Bypass Supported        : No
```

show qsfp-dd si status

Use this command to display what is the current signal integrity configuration status. It displays what is the current user configuration and what are the values programmed in the transceiver hardware.

Command Syntax

```
show qsfp-dd <port> si status
```

Parameters

PORTNUM
QSFP-DD[1] front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.5.1.

Example

```
#show qsfp-dd 0 si status

Port Number                    : 0

-----------------------------------------------------------
```

show qsfp-dd application

Use this command to show **QSFP-DD**[1] module current selected application.

Command Syntax

```
show qsfp-dd PORTNUM application
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 application

Port Number                    : 0
-----------------------------------
   User Config    |   H/W Config
-----------------------------------
   None           |   Application 1
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd diagnostics host

Use this command to show **QSFP-DD**[1] module host side diagnostics information.

Command Syntax

```
show qsfp-dd PORTNUM diagnostics host
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 diagnostics host

Port Number                    : 0
-------------------------------------------------
       Attribute      | Lane |        Value        |

Error Count(G)        |  1   | 0                    |
Bit Count(G)          |  1   | 0                    |
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd eeprom

Use this command to show **QSFP-DD**[1] module EEPROM information.

Command Syntax

```
show qsfp-dd PORTNUM eeprom
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 eeprom

Port Number                   : 0
Identifier                    : QSFP-DD Double Density 8X Pluggable Transceiver
Name                          : SmartOptics
OUI                           : 0x0 0x53 0x4f
Part No                       : SO-TQSFPDD4CCZRP
Revision Level                : A
Serial_Number                 : 214156190
Manufacturing Date            : 220318   (yymmddvv, v=vendor specific)
Module Power Class            : 8
Module Max Power              : 23.75 Watt
Cooling Implemented           : Yes
Module Temperature Max        : 80 Celsius
Module Temperature Min        : 0 Celsius
Operating Voltage Min         : 3.12 Volt
Optical Detector              : PIN
Rx Power Measurement          : Average Power
Tx Disable Module Wide        : No
Cable Assembly Link Length    : Separable Media
Connector Type                : LC (Lucent Connector)
Media Interface Technology    : 1550 nm DFB
CMIS Revision                 : 4.1
Memory Model                  : Paged
MCI Max Speed                 : 1000 kHz
Active Firmware Revision      : 61.20
Inactive Firmware Revision    : 61.20
Hardware Revision             : 49.48
Media Type                    : Optical SMF
Max SMF Link Length           : 630.0 Kilometer
Wavelength Nominal            : 1547.70 nm
Wavelength Tolerance          : 166.55 nm
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd laser grid

Use this command to show **QSFP-DD**[1] module laser grid spacing information for frequencies of 3.125, 6.25 12.5 25, 33, 50, 75 and 100 GHz.

Command Syntax

```
show qsfp-dd PORTNUM laser grid (3p125|6p25|12p5|25|33|50|75|100)
```

Parameters

PORTNUM
QSFP-DD front panel port number

3p125
3.125 GHz

6p25
6.25 GHz

12p5
12.5 GHz

25
25 GHz

33
33 GHz

50
50 GHz

75
75 GHz

100
100 GHz

Default

None

Command Mode

Execution mode and Privileged execution mode.

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

```
show qsfp-dd 0 laser grid 100
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

        28       195.900000             1530.334
        29       196.000000             1529.553
        30       196.100000             1528.773
```

show qsfp-dd laser status

Use this command to show **QSFP-DD**[1] module current laser configuration status and alarm flags.

Command Syntax

```
show qsfp-dd PORTNUM laser status
```

Parameters

PORTNUM
QSFP-DD front panel port number

Default

None

Command Mode

Execution mode and Privileged execution mode.

Applicability

This command was introduced in OcNOS version 6.2.0.

Example

```
show qsfp-dd 0 laser status

Port Number          : 0

-------------------------------------------------
       Attribute      | Lane |    Value   | Unit |
-------------------------------------------------
 Grid Spacing         |  1   | 100.000    | GHz  |
 Laser Frequency      |  1   | 191.900000 | THz  |
 Channel Number       |  1   | -12        | --   |
 Wavelength           |  1   | 1562.23    | nm   |

-------------------------------------
        Flag        | Lane | Status |
-------------------------------------
 Tuning in progress |  1   | No     |
 Wavelength locked  |  1   | Yes    |

-----------------------------------------------
           Flag           | Lane | Status (L) |
-----------------------------------------------
 Target output power OOR  |  1   | No         |
 Fine tuning out of range |  1   | No         |
 Tuning accepted          |  1   | Yes        |
 Channel number valid     |  1   | Yes        |
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd monitors host

Use this command to show **QSFP-DD**[1] module host side monitors information.

Command Syntax

```
show qsfp-dd PORTNUM monitors host
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 monitors host

Alarm Codes: FDD - FEC Detected Degrade, FED - FEC Excessive Degrade
             LD - Local Degrade, RD - Remote Degrade
             FLOPB - Flexe Loss of Pad Block, FLOMF - Flexe Loss of Multi-Frame
             FLOF - Flexe Loss of Frame, FIIDM - Flexe Instance Id Mismatch
             FCM - Flexe Calendar Mismatch, FIMM - Flexe Instance Map Mismatch
             FGIDM - Flexe GID Mismatch, TLF - Transmit Local Fault
             TRF - Transmit Remote Fault, TLOA - Transmit Loss of Alignment
             RLF - Receive Local Fault, RRF - Receive Remote Fault
             RLOA - Receive Loss of Alignment

```

show qsfp-dd monitors module

Use this command to show **QSFP-DD**[1] module monitors information.

Command Syntax

```
show qsfp-dd PORTNUM monitors module
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 monitors module

Codes: [HA : High Alarm], [LA : Low Alarm], [HW : High Warning], [LW : Low Warning]

Port Number                   : 0
-------------------------------------------------------------------------------------------------------
-----------
Attribute                   | Value        | High Alarm   | High Warning | Low Warning  | Low
Alarm    | Units

```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd state

Use this command to show **QSFP-DD**[1] module current state information.

Command Syntax

```
show qsfp-dd PORTNUM state
```

Parameters

PORTNUM
QSFP-DD front panel port number

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Example

```
show qsfp-dd 0 state

Port Number                   : 0
Module Fault State            : No fault
Module State                  : Ready
    Data Path State               : Activated [Starting On : Lane-1]
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

show qsfp-dd user-threshold status

Use this command to show the current configuration status of user thresholds.

Command Syntax

```
show qsfp-dd <PORT> user-threshold status (host|media)
```

Parameters

PORT
The front panel port number of the device where the transceiver is connected

host
Host side config status

media
Media side config status

Command Mode

Execution mode andPrivileged execution mode mode.

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

```
This below show command displays the hardware state of the programmed user thresholds.
OcNOS#show qsfp-dd 48 user-threshold status host

Port Number                    : 48

-------------------------------------------------------------------------------
      Threshold      | Lane | User Config | H/W Config | Minimum  | Maximum  |

```

Table 79. show qsfp-dd 48 user-threshold status host output details

Field	Description
Threshold	The parameters that are monitored.
Lane	Displays the channel number where the thresholds are applied.
User Config	Displays what the user has configured.
H/W Config	Displays what is programmed in the transceiver hardware.
Minimum	The lowest values that are allowed to be used for this configuration.
Maximum	The highest values that are allowed to be used for this configuration.

tx-input eq-target

Use this command to configure the Tx input equalizer target override value.

Use the no form of this command to remove the Tx input equalizer target override value.

Command Syntax

```
tx-input eq-target <1-15>
no tx-input eq-target
```

Parameters

<1-15>
Input equalizer target value

Default

None

Command Mode

QSFP-DD[1] mode and QSFP-DD host-lane mode

Applicability

This command was introduced before OcNOS version 6.5.1.

Example

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#tx-input eq-target 1
(config-qsfp-dd)#commit
(config-qsfp-dd)#no tx-input eq-target
(config-qsfp-dd)#commit
(config-qsfp-dd)#host-lane 3
(config-qsfp-dd-host)#tx-input eq-target 5
(config-qsfp-dd-host)#commit
(config-qsfp-dd-host)#no tx-input eq-target
(config-qsfp-dd-host)#commit
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

tx cdr-bypass

Use this command to enable the Tx CDR bypass.

Use the no form of this command to disable the Tx CDR bypass.

Command Syntax

```
tx cdr-bypass
no tx cdr-bypass
```

Parameters

None

Command Mode

QSFP-DD[1] mode and QSFP-DD host-lane mode modes

Applicability

This command was introduced before OcNOS version 6.5.1.

Example

```
#configure terminal
(config)#qsfp-dd 0
(config-qsfp-dd)#tx cdr-bypass
(config-qsfp-dd)#commit
(config-qsfp-dd)#no tx cdr-bypass
(config-qsfp-dd)#commit
(config-qsfp-dd)#host-lane 2
(config-qsfp-dd-host)#tx cdr-bypass
(config-qsfp-dd-host)#commit
(config-qsfp-dd-host)#no tx cdr-bypass
(config-qsfp-dd-host)#commit
```

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

threshold (host-lane mode)

Use this command to enter host lane level user threshold configuration mode. **Host lane**[1] mode is a configuration mode that allows configuring specific values for the host lanes.Host lanes are wires that carry the electrical signal from the host interface to the module and vice-versa.

Command Syntax

```
threshold (tx-fdd|tx-fed)
```

Parameters

tx-fdd
Tx **FDD**[2]

tx-fed
Tx **FED**[3]

Command Mode

Host-lane mode[4]

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the host-lane threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#host-lane 1
OcNOS(config-qsfp-dd-host)#threshold tx-fdd
OcNOS(config-qsfp-dd-host-thresh)#ha 0.9876
OcNOS(config-qsfp-dd-host-thresh)#la 0.005432
OcNOS(config-qsfp-dd-host-thresh)#threshold tx-fed
OcNOS(config-qsfp-dd-host-thresh)#ha 0.5432
OcNOS(config-qsfp-dd-host-thresh)#la 0.009876
OcNOS(config-qsfp-dd-host-thresh)#commit
```

[1]Host lanes are wires that carry the electrical signal from the host interface to the module and vice-versa.

[2]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[3]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[4]Host lane mode is a configuration mode that allows configuring specific values for the host lanes. Contrary to the global mode level that configures the same value across all host lanes.

threshold (media-lane mode)

Use this command to enter media lane level user threshold configuration mode. **Media lane**[1] mode is a configuration mode that allows configuring specific values for each media lane. Media lanes are the electrical wire pairs (copper cables) or optical fibers that carry signals from the module to the other router and vice-versa.

Command Syntax

```
threshold (rx-fdd|rx-fed|rx-total-power|rx-signal-power)
```

Parameters

rx-fdd
Rx **FDD**[2]

rx-fed
Rx **FED**[3]

rx-total-power
Rx Total Power

rx-signal-power
Rx Signal Power

Command Mode

Media-lane mode[4]

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the media-lane threshold:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#media-lane 1
OcNOS(config-qsfp-dd-media)#threshold rx-fdd
OcNOS(config-qsfp-dd-media-thresh)#ha 0.1234
OcNOS(config-qsfp-dd-media-thresh)#la 0.006789
OcNOS(config-qsfp-dd-media-thresh)#threshold rx-fed
OcNOS(config-qsfp-dd-media-thresh)#ha 0.6789
OcNOS(config-qsfp-dd-media-thresh)#la 0.001234
OcNOS(config-qsfp-dd-media-thresh)#threshold rx-total-power
OcNOS(config-qsfp-dd-media-thresh)#ha 4
OcNOS(config-qsfp-dd-media-thresh)#hw 3
```

[1]Media lanes are the electrical wire pairs (copper cables) or optical fibers that carry signals from the module to the other router and vice-versa.

[2]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[3]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[4]Media lane mode is a configuration mode that allows configuring specific values for each media lane (per fiber cable physical channel). Contrary to the global mode level that configures the same value across all media lanes.

```
OcNOS(config-qsfp-dd-media-thresh)#lw -3
OcNOS(config-qsfp-dd-media-thresh)#la -4
OcNOS(config-qsfp-dd-media-thresh)#threshold rx-signal-power
OcNOS(config-qsfp-dd-media-thresh)#ha 2
OcNOS(config-qsfp-dd-media-thresh)#hw 1
OcNOS(config-qsfp-dd-media-thresh)#lw -1
OcNOS(config-qsfp-dd-media-thresh)#la -2
OcNOS(config-qsfp-dd-media-thresh)#commit
```

threshold (QSFP-DD mode)

Use this command to enter global level user threshold configuration mode.In global mode, configure the same threshold value across all host or media lanes.

Command Syntax

```
threshold (tx-fdd|tx-fed|rx-fdd|rx-fed|rx-total-power|rx-signal-power)
```

Parameters

tx-fdd
Tx **FDD**[1]

tx-fed
Tx **FED**[2]

rx-fdd
Rx FDD

rx-fed
Rx FED

rx-total-power
Rx Total Power

rx-signal-power
Rx Signal Power

Command Mode

QSFP-DD[3] mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

The below configuration shows to configure the threshold in global mode:

```
OcNOS#configure terminal
OcNOS(config)#qsfp-dd 48
OcNOS(config-qsfp-dd)#threshold tx-fdd
OcNOS(config-qsfp-dd-thresh)#ha 0.9876
OcNOS(config-qsfp-dd-thresh)#la 0.005432
OcNOS(config-qsfp-dd-thresh)#threshold tx-fed
OcNOS(config-qsfp-dd-thresh)#ha 0.5432
OcNOS(config-qsfp-dd-thresh)#la 0.009876
```

[1]FEC Detected Degrade suggests that the FEC has detected errors in data transmission. The alarm notification is triggered if the average BER exceeds the configured FDD value.

[2]FEC Excessive Degrade suggests that the FEC has detected very high errors in data transmission. FED is a more severe error condition than FDD and needs more attention. The alarm notification is triggered if the average BER exceeds the configured FED value.

[3]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

```
OcNOS(config-qsfp-dd-thresh)#threshold rx-fdd
OcNOS(config-qsfp-dd-thresh)#ha 0.1234
OcNOS(config-qsfp-dd-thresh)#la 0.006789
OcNOS(config-qsfp-dd-thresh)#threshold rx-fed
OcNOS(config-qsfp-dd-thresh)#ha 0.6789
OcNOS(config-qsfp-dd-thresh)#la 0.001234
OcNOS(config-qsfp-dd-thresh)#threshold rx-total-power
OcNOS(config-qsfp-dd-thresh)#ha 4

OcNOS(config-qsfp-dd-thresh)#la -2
OcNOS(config-qsfp-dd-thresh)#commit
```

EDFA CONFIGURATION GUIDE

Erbium-Doped Fiber Amplifier (EDFA) Configuration

Overview

Before the development of optical amplifiers, optical signals had to be converted into electrical signals, then amplified, and subsequently transformed back into optical signals. This was a very complicated and expensive process. To avoid this complexity, optical amplifiers are developed, enabling the direct amplification of optical signals without the need for conversion. This streamlined approach significantly reduced costs.

Various types of optical amplifiers include:

- Semiconductor Optical Amplifier (SOA)
- Raman Amplifiers
- Brillouin Amplifiers
- Erbium-Doped Fiber Amplifier (EDFA)

Erbium-Doped Fiber Amplifier (EDFA) uses erbium-doped fiber as an amplification medium and are extensively deployed in Wavelength Division Multiplexing (WDM) systems. It can amplify multiple optical signals simultaneously and is commonly used in the C-band and L-band.

System Description

Basically, the system will be developed to combine the input signal with the pump light using a WDM coupler. This combined signal is then directed into the EDF. Within the EDF, the pump light initiates a process called population inversion, and the input signal undergoes amplification through stimulated emission.

To ensure stable signal amplification and prevent undesired back reflections from the output port, isolators are strategically placed at both the input and output ends. Additionally, the presence of isolators prevents the amplifier from functioning as a laser.

The wavelength of the pump LD is precisely controlled and maintained close to 980nm.

These optical and communication systems operate in two different modes.

Automatic Power Control

In Automatic Power Control (APC) mode, the microprocessor controls the output power by adjusting the pump laser to maintain a predefined reference output power level. This control mechanism ensures the output power remains constant, even when the input power fluctuates within the dynamic range.

Automatic Gain Control

In Automatic Gain Control (AGC) mode, the microprocessor controls the output power to maintain the specified gain relative to the input power. The expected output power cannot be guaranteed, if the input power falls below the minimum assured input power range.

Objectives

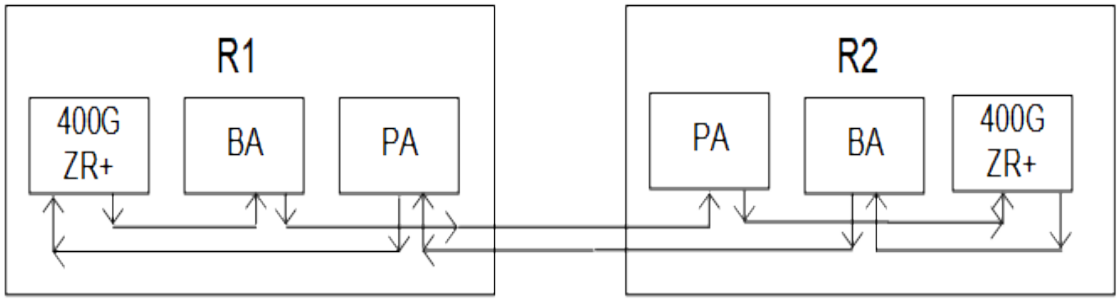
The objective of this document is to provide the application of EDFA as a booster amplifier, Inline amplifier, and pre-amplifier.

- Booster Amplifier: The booster amplifier (BA) is placed just after the transmitter to increase the optical power launched to the transmission line. It's not always required in single-channel links but is an essential part of the DWDM link where the multiplexer attenuates the signal channels. It has high input power, high output power, and medium optical gain.
- Inline Amplifier: The inline amplifiers are placed in the transmission line, compensating for the attenuation induced by the optical fiber. The in-line EDFA is designed for optical amplification between two network nodes on the main optical link. In-line EDFAs are placed every 80-100 km to ensure that the optical signal level remains above the noise floor. It features medium to low input power, high output power, high optical gain, and a low noise figure.
- Pre-Amplifier: The pre-amplifier (PA) is placed just before the receiver, such that sufficient optical power is launched to the receiver. It has relatively low input power, medium output power, and medium gain.

Support added for the DDM parameters specific to the EDFA available in the QSFP28 form factor. This application supports the reading of In-power, Out-power, pump BIAS, and gain. Additionally, it will enable the configuration of the target out-power and the continuous monitoring of these attributes in accordance with the specified thresholds.

Topology

Figure 62. EDFA Sample Topology



Configuration

R1

`#configure terminal`	Enter into configure mode.
`(config)#interface ce15`	Enter into interface mode.
`(config-if)#edfa operating-mode agc`	Enable the EDFA operating mode AGC.
`(config-if)#edfa target-gain 5`	Specify the desired EDFA gain value.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit the router mode.
`(config)#interface ce15`	Enter into interface mode.
`(config-if)#edfa operating-mode apc`	Enable the EDFA operating mode APC.
`(config-if)# edfa target-outpwr 10`	Specify the desired EDFA output power value.

`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit the router mode.

Validation

Verify R1 Router for AGC Mode

```
R1#show running-config interface ce15
!
interface ce15
 edfa operating-mode agc
 edfa target-gain 5.000
!
```

Verify if the gain value is applied after configuring.

```
R1#show interface ce15 transceiver detail

ce15       Active*    +19.85     +26.00     +25.00     +8.00      +7.00

*NOTE : after unconfiguring the edfa the value of output power and gain should be in default value.
Provide the following:
o   Include a Topology diagram.
o   Document configuration steps. Ensure the topology and configuration steps match.
o   Request a show running-config for the new feature.
o   Provide verification steps to demonstrate that the configuration has taken effect.
o   Add a reference to any relevant information in the existing Configuration Guide.
Note:   Request a "test report" before importing QA scenarios into your doc. Ensure you only include
configurations samples that "Pass".
```

EDFA COMMAND REFERENCE

Erbium-doped Fiber Amplifier Commands

This chapter is a reference for Erbium-doped fiber amplifier (EDFA) commands:

edfa operating-mode

Use this command to configure EDFA interface operating-mode.

Command Syntax

```
edfa operating-mode (agc | apc)
```

Parameters

agc
Specifies the Automatic Gain Control (AGC) operating-mode.

apc
Specifies the Automatic Power Control (APC) operating-mode.

Default

None

Command Mode

Interface mode

Applicability

Introduced before OcNOS version 6.3.0.

Example

```
OcNOS(config)#interface xe2
OcNOS(config-if)#edfa operating-mode agc
OcNOS(config-if)#commit
```

edfa target-gain

Use this command to configure EDFA interface target gain.

Command Syntax

```
edfa target-gain VALUE
```

Parameters

VALUE
Specifies the target gain value.

Default

None

Command Mode

Interface mode

Applicability

Introduced in OcNOS version 6.3.0.

Example

```
OcNOS(config)#interface xe2
OcNOS(config-if)#edfa target-gain 15
OcNOS(config-if)#commit
```

edfa target-outpwr

Use this command to configure EDFA interface target output power.

Command Syntax

```
edfa target-outpwr VALUE
```

Parameters

VALUE
Specifies the target output power value.

Default

None

Command Mode

Interface mode

Applicability

Introduced before OcNOS version 6.3.0.

Example

```
OcNOS(config)#interface xe2
OcNOS(config-if)#edfa target-outpwr 7
OcNOS(config-if)#commit
```

show edfa operating-mode

Use this command to display the EDFA operating-mode summary.

Command Syntax

```
show edfa operating-mode
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced before OcNOS version 6.3.0.

Example

```
OcNOS>show edfa operating-mode

Default Operating Mode     : AGC
Default Target OutPwr(BA)  : 17.000
Default Target OutPwr(PA)  : 7.000
Default Target Gain        : 17.000

--------------------------------------
Interface               Operating-Mode
--------------------------------------
ce5/1                       AGC
ce7/1                       AGC
ce11/1                      AGC
```

show interface transceiver detail

Use this command to display EDFA attributes and their thresholds from a from a specific port.

Command Syntax

```
show interface IFNAME transceiver detail
```

Parameters

IFNAME
Specifies an interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced before OcNOS version 6.3.0.

Example

```
OcNOS>show interface ce9/1 transceiver detail
Codes:  * Not Qualified By IP Infusion,  ** Not Supported By Module,  -- No Power,  - Not Applicable

...

Intf       DDM        InPwr      AlertMax   CritMax    CritMin    AlertMin
                      (dBm)      (dBm)      (dBm)      (dBm)      (dBm)

Intf       DDM        Gain       AlertMax   CritMax    CritMin    AlertMin
                      (dB)       (dB)       (dB)       (dB)       (dB)
-------------------------------------------------------------------------
ce9/1      Inactive*  +12.00      +26.00     +25.00     +8.00      +7.00
```

Here is the explanation of the show command output fields.

Table 80. show interface transceiver details output

Field	Description
Intf	Interface where the EDFA is present.
DDM	Digital diagnostics monitor status for that particular interface.
Inpwr	Input power to the EDFA
OutPwr	Output power from EDFA
PumpBias	Pump Bias
Gain	The total gain over the input power.

show interface transceiver threshold violations

Use this command to display the EDFA module input power, output power, pump bias and gain thresholds violations from a specific port.

Command Syntax

```
show interface IFNAME transceiver threshold violations
```

Parameters

IFNAME
Specifies an interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced before OcNOS version 6.3.0.

Example

```
OcNOS>show interface ce11/1 transceiver threshold violations
Intf       Lane       Timestamp            Type of alarm
----       ----       ---------            -------------
ce11/1     1          02-14-2019 12:39:04  Pump Bias low alarm, value 0.000A threshold 0.000A
                      02-14-2019 12:38:04  Gain low warning, value 7.500dB threshold 8.000dB
                      02-14-2019 12:38:04  Output power low warning, value -11.000dBm threshold -
10.000dBm
                      02-14-2019 12:38:04  Input power low warning, value -21.000dBm threshold -
20.969dBm
```

show interface transceiver

Use this command to display the EDFA module input power, output power, pump bias and gain current values from a specific port.

Command Syntax

```
show interface IFNAME transceiver
```

Parameters

IFNAME
Specifies an interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced before OcNOS version 6.3.0.

Example

```
OcNOS>show interface ce9/1 transceiver
Codes:  * Not Qualified By IP Infusion,  ** Not Supported By Module,  -- No Power,  - Not Applicable

Intf       DDM        InPwr      OutPwr     PumpBias   Gain
                      (dBm)      (dBm)      (Amp)       (dB)

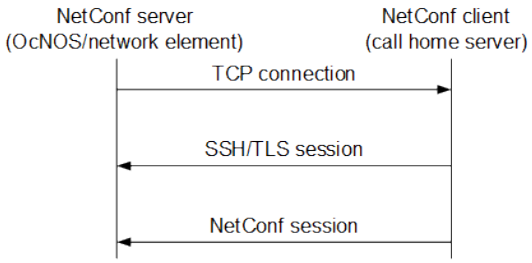
20.000dBm
                      03-05-2019 08:53:31  Input power high alarm, value 100.000dBm threshold
5.000dBm
```

NETCONF CONFIGURATION

NetConf Call Home Configuration

By default, in the NetConf protocol (RFC 6241), a NetConf client application initiates the connection towards the NetConf server in the network element (OcNOS device). However, for certain use cases such as in the presence of firewalls or NAT, it is useful to have “call home” functionality where the connection process is reversed and the NetConf server initiates the connection to the NetConf client. This process, as shown in Figure 63, is standardized by IETF in RFC 8071.

Figure 63. RFC 8071 NetConf call home functionality



OcNOS supports the call home feature (only for SSH) at the NetConf server side. You can use any standard NetConf client application which supports call home functionality. (Call home support in the NetConf client application [Yangcli] is not supported.)

Call home is generally useful for both the initial deployment and ongoing management of networking elements.

User Management VRF Configuration

`(config)#netconf callhome`	Enter call home mode
`(netconf-callhome)#feature netconf callhome enable`	Enable the call home feature
`(netconf-callhome)#reconnect enable`	Enable the reconnect feature
`(netconf-callhome)#retry-max-attempts 10`	Set the number of connect retries
`(netconf-callhome)#retry-interval 20`	Set the retry interval
`(netconf-callhome)#callhome server test-ch-server 192.168.56.1`	Configure the call home server
`(netconf-callhome)#management-port enp0s3`	Set the call home management port
`(netconf-callhome)#debug callhome`	Debugging
`(netconf-callhome)#commit`	Commit the candidate configuration to the running configuration
`(netconf-callhome)#exit`	Exit call home mode

Validation

```
(config)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 management-port enp0s3
```

```
 reconnect enable
 retry-max-attempts 10
 retry-interval 20
 callhome server test-ch-server 192.168.56.1
!
(config)#
(config)#do show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

            Line        User               Idle         Location/Session  PID     TYPE   Role

(#)(*) 130 vty 0    [C]root               0d00h00m     pts/0             2730    Local  network-
admin

(config)#
```

User Defined VRF Configuration

`(netconf-callhome)#feature netconf callhome`	Enter callhome feature
`(netconf-callhome)#callhome enable vrf user-defined-vrf`	Netconf callhome for user defined vrf
`(netconf-callhome)#reconnect enable`	Enable the reconnect feature
`(netconf-callhome)#retry-max-attempts 10`	Set the number of connect retries
`(netconf-callhome)#retry-interval 20`	Set the retry interval
`(netconf-callhome)#callhome server test-ch-server 192.168.56.1`	Configure the call home server
`(netconf-callhome)#debug callhome`	Debugging
`(netconf-callhome)#exit`	Exit call home mode
`(netconf-callhome)#commit`	Commit the candidate configuration to the running configuration

Validation

```
(config)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 management-port enp0s3
 reconnect enable
 retry-max-attempts 10
 retry-interval 20
 callhome server test-ch-server 192.168.56.1
!
(config)#
(config)#do show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

            Line        User               Idle         Location/Session  PID     TYPE   Role

(#)(*) 130 vty 0    [C]root               0d00h00m     pts/0             2730    Local  network-
admin
```

```
(config)#
```

Start the Call Home Server

After you start the call home server, the **show users** command displays a NetConf user.

```
2022 May 18 15:32:55.989 : OcNOS : CML : INFO : [CML_5]: Client [netconf (192.168.56.1)] established
connection with CML server

(config)#do show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

            Line        User               Idle         Location/Session  PID     TYPE   Role

(#)(*) 130 vty 0    [C]root               0d00h00m     pts/0             2730    Local  network-
admin
       NA           [N]root               0d00h00m    192.168.56.1      2118    Local  network-admin

(config)#
```

NetConf sget Output

While the NetConf client is running, the **sget** command returns the session-specific data:

```
(config)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 management-port enp0s3
 reconnect enable
 retry-max-attempts 10
 retry-interval 20
 callhome server test-ch-server 192.168.56.1
!
(config)#
(config)#do show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

            Line        User               Idle         Location/Session  PID     TYPE   Role

(#)(*) 130 vty 0    [C]root               0d00h00m     pts/0             2730    Local  network-
admin

(config)#
```

Stop the Call Home Server

After you stop the call home server, the **show users** command no longer displays a NetConf user.

```
2022 May 18 15:33:20.028 : OcNOS : CML : NOTIF : [CML_4]: Client [netconf (192.168.56.1)] has closed
connection with CML server

(config)#
(config)#do show users
```

```
Current user          : (*).  Lock acquired by user : (#).

```

NetConf Port Access Control

Overview

NetConf is a software tool that provides a mechanism to configure and manage remote network devices seamlessly. It uses a simple Remote Procedure Call (RPC) mechanism to facilitate communication between a client and a server.

During the OcNOS installation, the NetConf subsystem called “netconf” is installed. It runs on the default access port 830 over SSH and port 6513 over TLS.

Typically, these default access ports are not configurable and controlled. The NetConf port access control feature enhancement ensures that the Netconf-SSH and NetConf-TLS port access can be controlled and configurable.

Feature Characteristics

- This feature allows access control capabilities for the NetConf-SSH and NetConf-TLS ports.
- Enabling/disabling the port.
- Changing the default port.
- Accessing and controlling the NetConf services through Inband and Outband.
- Applying ACL rules to the NetConf port to control its access.

Benefits

This feature enables the user to control the NetConf port access and change the default port.

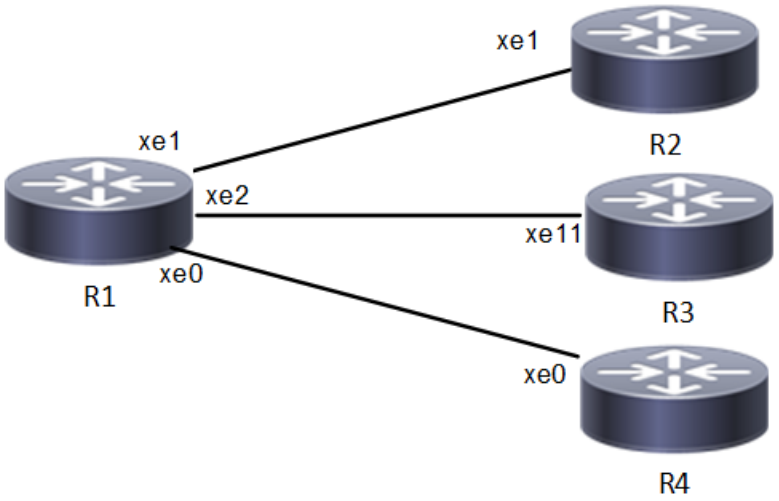
Configuration

To configure either NetConf-SSH port or the NetConf-TLS port, perform the following steps. After completing the steps you will be configured with a port for NetConf.

1. Disable **`netconf-ssh`** and **`netconf-tls`** feature
2. Configure port for **`netconf-ssh`** and **`netconf-tls`**
3. Enable **`netconf-ssh`** and **`netconf-tls`** feature

Topology

Figure 64. NetConf Access Port Topology



Enable Netconf-ssh on the default and vrf management port

R1

`#configure terminal`	Enter Configuration mode.
`R1(config)#feature netconf-ssh`	Enable netconf-ssh via default port.
`R1(config)#feature netconf-ssh vrf management`	Enable netconf-ssh via vrf management port.
`R1(config)#commit`	Commit all the transactions.

Enable Netconf-tls on the default and vrf management port

R1

`#configure terminal`	Enter Configuration mode
`R1(config)#feature netconf-tls`	Enable netconf-tls via default port
`R1(config)#feature netconf-tls vrf management`	Enable netconf-tls via vrf management port
`R1(config)#commit`	Commit all the transactions

Validation

Execute the below commands to verify the NetConf port is enabled on **VRF**[1] Management.

Following is the output of the NetConf server status and port.

[1]Virtual Routing and Forwarding

```
#show netconf server
VRF Management
        Netconf SSH Server: Enabled
        SSH-Netconf Port : 830
        Netconf TLS Server: Enabled
        TLS-Netconf Port : 6513
VRF Default
        Netconf SSH Server: Enabled
        SSH-Netconf Port : 830
        Netconf TLS Server: Enabled
        TLS-Netconf Port : 6513
```

Following is the output of NetConf server configurations.

```
#show running-config netconf-server
!
feature netconf-ssh vrf management
feature netconf-tls vrf management
netconf server ssh-port 2000 vrf management
netconf server tls-port 60000 vrf management
feature netconf-ssh
feature netconf-tls
netconf server ssh-port 1060
netconf server tls-port 5000
!
```

Following is the output of the NetConf server configuration in XML format.

```
#show xml running-config
<netconf-server xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-management-serve
r">

……..
```

Disable netconf-ssh via default and vrf management port

R1

`#configure terminal`	Enter Configuration mode
`R1(config)#no feature netconf-ssh`	Disable netconf-ssh via default port
`R1(config)#no feature netconf-ssh vrf management`	Disable netconf-ssh via vrf management
`R1(config)#commit`	Commit all the transactions

Disable netconf-tls via default port and vrf management port

R1

`#configure terminal`	Enter Configuration mode
`R1(config)#no feature netconf-tls`	Disable netconf-tls via default
`R1(config)#no feature netconf-tls vrf management`	Disable netconf-tls via vrf management port
`R1(config)#commit`	Commit all the transactions

Validation

Execute the below commands to verify the NetConf port is disabled on VRF Management.

Following is the output of the NetConf server status and port.

```
#show netconf server
VRF Management
        Netconf Server: Disabled
VRF Default
        Netconf Server: Disabled
```

Configuring NetConf Port

R1

`#configure terminal`	Enter Configuration mode
`R1(config)#no feature netconf-ssh`	Disable netconf-ssh via default port
`R1(config)#no feature netconf-ssh vrf management`	Disable netconf-ssh via vrf management port
`R1(config)#no feature netconf-tls`	Disable netconf-tls via default port
`R1(config)#no feature netconf-tls vrf management`	Disable netconf-tls via vrf management port
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#netconf server ssh-port 1060`	Configure port for netconf-ssh default
`R1(config)#netconf server ssh-port 2000 vrf management`	Configure port for netconf-ssh vrf management

`R1(config)#netconf server tls-port 5000`	Configure port for netconf-tls default
`R1(config)#netconf server tls-port 60000 vrf management`	Configure port for netconf-tls vrf management
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#feature netconf-ssh`	Enable netconf-ssh via default port
`R1(config)#feature netconf-ssh vrf management`	Enable netconf-ssh via vrf management port
`R1(config)#feature netconf-tls`	Enable netconf-tls via default port
`R1(config)#feature netconf-tls vrf management`	Enable netconf-tls via vrf management port
`R1(config)#commit`	Commit all the transactions

Validation

Following is the output of the NetConf server status and port.

```
#show netconf server
VRF Management
        Netconf SSH Server: Enabled
        SSH-Netconf Port : 2000
        Netconf TLS Server: Enabled
        TLS-Netconf Port : 60000
VRF Default
        Netconf SSH Server: Enabled
        SSH-Netconf Port : 1060
        Netconf TLS Server: Enabled
        TLS-Netconf Port : 5000
```

Following is the output after login to the NetConf interface (YangCLI) on R1 node via the user defined NetConf port:

```

Ping between two nodes via Yang CLI

Perform the following configurations to verify the reachability among R1, R2 and R3 routers via NetConf-SSH and NetConf-TLS port.

R1

`#configure terminal`	Enter Configuration mode
`R1(config)#no feature netconf-ssh`	Disable netconf-ssh via default
`R1(config)#no feature netconf-ssh vrf management`	Disable netconf-ssh via vrf management port
`R1(config)#no feature netconf-tls`	Disable netconf-tls via default port
`R1(config)#no feature netconf-tls vrf management`	Disable netconf-tls via vrf management port
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#netconf server ssh-port 1060`	Configure port for netconf-ssh default
`R1(config)#netconf server ssh-port 2000 vrf management`	Configure port for netconf-ssh vrf management
`R1(config)#netconf server tls-port 5000`	Configure port for netconf-tls default
`R1(config)#netconf server tls-port 60000 vrf management`	Configure port for netconf-tls vrf management
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#feature netconf-ssh`	Enable netconf-ssh via default port
`R1(config)#feature netconf-ssh vrf management`	Enable netconf-ssh via vrf management port
`R1(config)#feature netconf-tls`	Enable netconf-tls via default port
`R1(config)#feature netconf-tls vrf management`	Enable netconf-tls via vrf management port
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#interface xe1`	Enter interface mode
`R1(config)#ip address 10.10.10.1/24`	Configure ipv4 address on the interface xe1.
`R1(config)#commit`	Commit all the transactions

R2

`#configure terminal`	Enter Configuration mode
`R2(config)#no feature netconf-ssh`	Disable netconf-ssh via default
`R2(config)#no feature netconf-ssh vrf management`	Disable netconf-ssh via vrf management
`R2(config)#no feature netconf-tls`	Disable netconf-tls via default
`R2(config)#no feature netconf-tls vrf management`	Disable netconf-tls via vrf management port
`R2(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R2(config)#netconf server ssh-port 1060`	Configure port for netconf-ssh default
`R2(config)#netconf server ssh-port 2000 vrf management`	Configure port for netconf-ssh vrf management
`R2(config)#netconf server tls-port 5000`	Configure port for netconf-tls default
`R2(config)#netconf server tls-port 60000 vrf management`	Configure port for netconf-tls vrf management
`R2(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R2(config)#feature netconf-ssh`	Enable netconf-ssh via default port
`R2(config)#feature netconf-ssh vrf management`	Enable netconf-ssh via vrf management port
`R2(config)#feature netconf-tls`	Enable netconf-tls via default port
`R2(config)#feature netconf-tls vrf management`	Enable netconf-tls via vrf management port
`R2(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R2(config)#interface xe1`	Enter interface mode
`R2(config)#ip address 10.10.10.2/24`	Configure ipv4 address on the interface xe1.
`R2(config)#commit`	Commit all the transactions

Validation

Following is the output of the configured NetConf port.

```
#show netconf server
VRF Management
        Netconf SSH Server: Enabled
        SSH-Netconf Port : 2000

ACL Rule with IPv4 Configuration

Perform the following configurations to apply an ACL rule to allow or deny traffic from R1 to other nodes via NetConf port.

R1

`#configure terminal`	Enter Configuration mode
`R1(config)#no feature netconf-ssh`	Disable netconf-ssh via default
`R1(config)#no feature netconf-ssh vrf management`	Disable netconf-ssh via vrf management port
`R1(config)#no feature netconf-tls`	Disable netconf-tls via default port
`R1(config)#no feature netconf-tls vrf management`	Disable netconf-tls via vrf management port
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#netconf server ssh-port 1060`	Configure port for netconf-ssh default
`R1(config)#netconf server ssh-port 2000 vrf management`	Configure port for netconf-ssh vrf management
`R1(config)#netconf server tls-port 5000`	Configure port for netconf-tls default
`R1(config)#netconf server tls-port 60000 vrf management`	Configure port for netconf-tls vrf management
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#feature netconf-ssh`	Enable netconf-ssh via default port
`R1(config)#feature netconf-ssh vrf management`	Enable netconf-ssh via vrf management port
`R1(config)#feature netconf-tls`	Enable netconf-tls via default port
`R1(config)#feature netconf-tls vrf management`	Enable netconf-tls via vrf management port
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#interface xe1`	Enter interface mode
`R1(config)#ip address 10.10.10.1/24`	Configure ipv4 address on the interface xe1.
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#interface xe2`	Enter interface mode
`R1(config)#ip address 20.20.20.1/24`	Configure ipv4 address on the interface xe2.
`R1(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R1(config)#ip access-list ACL1`	Create ip access list
`R1(config)#permit any host 10.1.1.1 any`	Create an acl rule to permit
`R1(config)#deny any host 20.1.1.1 any`	Create an acl rule to deny
`R1(config)#commit`	Commit all the transactions

R2

Perform the following configurations to apply an ACL rule to allow or deny traffic from R2 to other nodes via NetConf port

`#configure terminal`	Enter Configuration mode
`R2(config)#no feature netconf-ssh`	Disable netconf-ssh via default
`R2(config)#no feature netconf-ssh vrf management`	Disable netconf-ssh via vrf management
`R2(config)#no feature netconf-tls`	Disable netconf-tls via default
`R2(config)#no feature netconf-tls vrf management`	Disable netconf-tls via vrf management port
`R2(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R2(config)#netconf server ssh-port 1060`	Configure port for netconf-ssh default
`R2(config)#netconf server ssh-port 2000 vrf management`	Configure port for netconf-ssh vrf management
`R2(config)#netconf server tls-port 5000`	Configure port for netconf-tls default
`R2(config)#netconf server tls-port 60000 vrf management`	Configure port for netconf-tls vrf management
`R2(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R2(config)#feature netconf-ssh`	Enable netconf-ssh via default port
`R2(config)#feature netconf-ssh vrf management`	Enable netconf-ssh via vrf management port
`R2(config)#feature netconf-tls`	Enable netconf-tls via default port
`R2(config)#feature netconf-tls vrf management`	Enable netconf-tls via vrf management port
`R2(config)#commit`	Commit all the transactions
`#configure terminal`	Enter Configuration mode
`R2(config)#interface xe1`	Enter interface mode
`R2(config)#ip address 10.10.10.2/24`	Configure ipv4 address on the interface xe1.
`R2(config)#commit`	Commit all the transactions

R3

Perform the following configurations to apply an ACL rule to allow or deny traffic from R3 to other nodes via NetConf port.

`#configure terminal`	Enter Configuration mode
`R3(config)#no feature netconf-ssh`	Disable netconf-ssh via default
`R3(config)#no feature netconf-ssh vrf management`	Disable netconf-ssh via vrf management port

R3(config)#no feature netconf-tls	Disable netconf-tls via default port
R3(config)#no feature netconf-tls vrf management	Disable netconf-tls via vrf management port
R3(config)#commit	Commit all the transactions
#configure terminal	Enter Configuration mode
R3(config)#netconf server ssh-port 1060	Configure port for netconf-ssh default
R3(config)#netconf server ssh-port 2000 vrf management	Configure port for netconf-ssh vrf management
R3(config)#netconf server tls-port 5000	Configure port for netconf-tls default
R3(config)#netconf server tls-port 60000 vrf management	Configure port for netconf-tls vrf management
R3(config)#commit	Commit all the transactions
#configure terminal	Enter Configuration mode
R3(config)#feature netconf-ssh	Enable netconf-ssh via default port
R3(config)#feature netconf-ssh vrf management	Enable netconf-ssh via vrf management port
R3(config)#feature netconf-tls	Enable netconf-tls via default port
R3(config)#feature netconf-tls vrf management	Enable netconf-tls via vrf management port
R3(config)#commit	Commit all the transactions
#configure terminal	Enter Configuration mode
R3(config)#interface xe11	Enter interface mode
R3(config)#ip address 20.20.20.2/24	Configure ipv4 address on the interface xe11.
R3(config)#commit	Commit all the transactions

Validation

Following is the output to verify the user defined NetConf port.

```
R1#show running-config netconf-server
!
feature netconf-ssh vrf management
feature netconf-tls vrf management
netconf server ssh-port 2000 vrf management
netconf server tls-port 60000 vrf management
feature netconf-ssh
feature netconf-tls
netconf server ssh-port 1060
netconf server tls-port 5000
!

R1#show netconf server
VRF Management
        Netconf SSH Server: Enabled
        SSH-Netconf Port : 2000
        Netconf TLS Server: Enabled
        TLS-Netconf Port : 60000
VRF Default
        Netconf SSH Server: Enabled
        SSH-Netconf Port : 1060
        Netconf TLS Server: Enabled
        TLS-Netconf Port : 5000
```

Following is the output of the show running-config in XML format.

```

Implementation Examples

The below examples are based on the topology given in Topology section.

Accessing R1 from R2 with default port

Below is an example to access R1 from R2 with default port.

From OcNOS CLI:

```
feature netconf-ssh
feature netconf-ssh vrf management
feature netconf-tls
feature netconf-tls vrf management
```

From Yang CLI:

```
root@OcNOS:~# ip netns exec zebosfib0 yangcli --server=127.1 --user=ocnos --password=ocnos
```

Accessing R1 from R2 with user defined port

Below is an example to access R1 from R2 via user defined port.

From OcNOS CLI:

```
netconf server ssh-port 1060
netconf server ssh-port 2000 vrf management
netconf server tls-port 5000
netconf server tls-port 60000 vrf management
```

From Yang CLI:

```
root@OcNOS:~#ip netns exec zebosfib1 yangcli --server=10.10.10.1 --user=ocnos --password=ocnos
ncport=2000
```

Applying ACL rule to permit or deny any Node

Below is an example to permit any traffic originating from IP address 10.1.1.1. and deny any traffic originating from 20.1.1.1.

From OcNOS CLI:

```
ip access-list ACL1
permit any host 10.1.1.1  any
deny any host   20.1.1.1 any
Permitting R2 and denying R3
```

From Yang CLI:

```
root@OcNOS:~# ip netns exec zebosfib1 yangcli --server=10.10.10.2 --user=ocnos -- password=ocnos
ncport=2000
```

New CLI Commands

feature netconf-ssh

Use this command to enable or disable the netconf-ssh feature specific to the management **VRF**[1]. When netconf feature-ssh is enabled, it allows the logins through the default netconf-ssh port or through default ssh port if feature SSH is also enabled.

Command Syntax

```
feature netconf-ssh (vrf management|)
no feature netconf-ssh (vrf management|)
```

Parameters

vrf management
Specifies the management Virtual Routing and Forwarding

Default

Disabled by default.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following example shows you how to enable NetConf SSH on either the VRF management port or the default port. The no parameter disables the same.

```
(config)#feature netconf-ssh vrf management
(config)#feature netconf-ssh
(config)#no feature netconf-ssh vrf management
(config)#no feature netconf-ssh
#
```

[1]Virtual Routing and Forwarding

feature netconf-tls

Use this command to enable or disable the NetConf TLS feature specific to a **VRF**[1]. When netconf feature-ssh is enabled, it allows the logins through the default netconf-tls port and allows login through a default TLS port when the TLS feature is also enabled.

Command Syntax

```
feature netconf-tls (vrf management|)
no feature netconf-tls (vrf management|)
```

Parameters

vrf management
Specifies management Virtual Routing and Forwarding.

Default

Disabled by default.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following example shows how to execute the CLI:

```
(config)#feature netconf-tls vrf management
(config)#feature netconf-tls
(config)#no feature netconf-tls vrf management
(config)#no feature netconf-tls
```

If either NetConf SSH or NetConf TLS are disabled one after the other, the following error message will be displayed, **% Disabling this will stop the netconf service that is running in management vrf"** as shown below.

Management VRF Configuration

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#no feature netconf-ssh vrf management
(config)#commit
(config)#no feature netconf-tls vrf management
(config)#commit
% Disabling this will stop the netconf service that is running in management vrf.
```

Default VRF Configuration

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#no feature netconf-ssh vrf management
(config)#commit
```

[1]Virtual Routing and Forwarding

```
(config)#no feature netconf-tls vrf management
(config)#commit
% Disabling this will stop the netconf service that is running in defualt vrf.
```

netconf-ssh port

Use this command to either configure or unconfigure the custom NetConf SSH port.

Command Syntax

```
netconf-server ssh-port <1024-65535> (vrf management|)
no netconf-server ssh-port (vrf management|)
```

Parameters

<1024-65535>
Port range values

Default
By default, the netconf-ssh port value is 830.

vrf
Specifies the management Virtual Routing and Forwarding name

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following example shows how to execute the CLI:

```
(config)#netconf server ssh-port ?
  <1024-65535>  port
(config)#netconf server ssh-port 1024 vrf management
(config)#netconf server ssh-port 2000
(config)#no netconf server ssh-port
(config)#no netconf server ssh-port vrf management
```

netconf-tls port

Use this command to either configure or unconfigure the indicated NetConf TLS port.

Command Syntax

```
netconf-server tls-port <1024-65535> (vrf management|)
no netconf-server tls-port (vrf management|)
```

Parameters

<1024-65535>
Port range values

Default
By default, the netconf-tls port value is 6513.

vrf
Specifies the management Virtual Routing and Forwarding name

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
(config)#netconf server tls-port ?
  <1024-65535>  port
(config)#netconf server tls-port 5000 vrf management
(config)#netconf server tls-port 3000
(config)#no netconf server tls-port vrf management
(config)#no netconf server tls-port
```

show netconf server

Use this command to display netconf server status.

Command Syntax

```
show netconf server
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 6.4.1.

Examples

The following example shows the output of the CLI:

```
OcNOS#show netconf server
VRF MANAGEMENT
Netconf Server: Enabled
SSH-Netconf Port : 1000
TLS-Netconf Port : 7000
VRF DEFAULT
Netconf Server: Enabled
SSH-Netconf Port : 4500
TLS-Netconf Port : 3000
```

show running-config netconf server

Use this command to display the NetConf server settings that appear in the running configuration.

Command Syntax

```
show running-config netconf-server
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

The following example shows the output of the CLI:

```
OcNOS#show running-config netconf-server
feature netconf vrf management
netconf server ssh-port 1000 vrf management
netconf server tls-port 7000 vrf management
feature netconf
netconf server ssh-port 4500
netconf server tls-port 3000
!
```

Revised CLI Commands

ip access-list tcp|udp

The existing **`ip access-list tcp|udp`** CLI is updated with the following two options to support the Access List (ACL) rules on the NetConf port. The ACL defines a set of rules to control network traffic and reduce network attacks.

netconf-ssh
Secure Shell Network Configuration

netconf-tls
Transport Layer Security Network Configuration

For the complete command reference, refer to ip access-list tcp|udp (page 1356) CLI in Access Control List Commands (page 1325) section.

Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

Acronym	Description
ACL	Access control list
RPC	Remote Procedure Call
SSH	Secure Shell
TLS	Transport Layer Security

NETCONF COMMAND REFERENCE

NetConf Call Home Commands

This chapter describes these commands:

callhome server

Use this command to add a call home server. A maximum 5 servers can be configured.

Use the **no** form of this command to delete a call home server. If the specified call home server is already connected with the OcNOS NetConf server, deleting it will not disconnect it.

Command Syntax

```
callhome server WORD (A.B.C.D|X:X::X:X|HOSTNAME)
callhome server WORD (A.B.C.D|X:X::X:X|HOSTNAME) port <1-65535>
no callhome server WORD
```

Parameters

WORD
An arbitrary name for the NetConf listen endpoint. Any valid string with length 1-64 can be used.

A.B.C.D
IPv4 address of the call home server

X:X::X:X
IPv4 address of the call home server

HOSTNAME
Host name of the call home server

<1-65535>
Callhome server listening port

Notes: The same address can be configured with different endpoint names, so use a different port number in those cases. For example:

```
callhome server name-1 1.1.1.1
callhome server name-3 1.1.1.1 port 5555
```

Avoid the redundant configuration: **`callhome server name-2 1.1.1.1`**

Default

Default value for the port is IANA assigned port 4334.

Command Mode

NetConf call home mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

The below configuration example illustrates how to define and manage callhome servers for NetConf communication.

1. Check the existing NetConf Callhome configuration usingthe **`show running-config netconf-callhome`** command.

```
(config)#netconf callhome
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
!
```

2. Configure the Callhome server.

```
(netconf-callhome)#callhome server name-1 169.154.45.12
(netconf-callhome)#callhome server name-2 192.168.56.1 port 12234
(netconf-callhome)#commit
```

3. Check the current NetConf Callhome configurations using the **`show running-config netconf-callhome`** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
callhome server name-1 169.154.45.12
  callhome server name-2 192.168.56.1 port 12234
!
```

4. Remove the configured **`name-2`** Callhome server.

```
(netconf-callhome)#no callhome server name-2
(netconf-callhome)#commit
```

5. Check the current NetConf Callhome configurations using the **`show running-config netconf-callhome`** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 callhome server name-1 169.154.45.12
!
(netconf-callhome)#exit
```

debug callhome

Use this command to enable debugging for the call home module. Once enabled, all debugging related information will be logged in the system logger file.

Use the **no** form of this command to disable debugging for the call home module.

Command Syntax

```
debug callhome
no debug callhome
```

Parameters

None

Default

By default, debugging is disabled (only critical message are enabled).

Command Mode

NetConf call home mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

The below configuration example illustrates how to enable or disable debugging for the Callhome module.

1. Check the existing NetConf Callhome configuration using the **show running-config netconf-callhome** command.

   ```
   (config)#netconf callhome
   (netconf-callhome)#do show running-config netconf-callhome
   !
   netconf callhome
   !
   ```

2. Enable debug command for the Callhome module.

   ```
   (netconf-callhome)#debug callhome
   (netconf-callhome)#commit
   ```

3. Check the current NetConf Callhome configurations using the **show running-config netconf-callhome** command.

   ```
   (netconf-callhome)#do show running-config netconf-callhome
   !
   netconf callhome
    debug callhome
   !
   ```

4. Remove the configured debug command to disable debugging for the call home module.

```
(netconf-callhome)#no debug callhome
(netconf-callhome)#commit
```

5. Check the current NetConf Callhome configurations using the **`show running-config netconf-callhome`** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
!

(netconf-callhome)#exit
```

feature netconf callhome

Use this command to enable or disable the NetConf call home feature. When the feature is disabled, all other configurations are removed except debug callhome (page 1209).

Enabling the call home feature is required before doing any other call home configurations.

Command Syntax

```
feature netconf callhome (enable|disable)
```

Parameters

enable
Enable the call home feature

disable
Disable the call home feature

Default

By default, the call home feature is disabled.

Mode

NetConf call home mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

The below configuration example illustrates how to enable or disable the NetConf Callhome feature.

1. Check the existing NetConf Callhome configuration using the **`show running-config netconf-callhome`** command.
   ```
   (config)#do show running-config netconf-callhome
   (config)#
   ```
2. Enable the NetConf Callhome feature.
   ```
   (config)#netconf callhome
   (netconf-callhome)#feature netconf callhome enable
   (netconf-callhome)#commit
   ```
3. Check the current NetConf Callhome configurations using the **`show running-config netconf-callhome`** command.
   ```
   (netconf-callhome)#do show running-config netconf-callhome
   !
   netconf callhome
    feature netconf callhome enable
   !
   ```
4. Disable the NetConf callhome feature.
   ```
   (netconf-callhome)#feature netconf callhome disable
   (netconf-callhome)#commit
   ```

5. Check the current NetConf Callhome configurations using the **`show running-config netconf-callhome`** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
!
(netconf-callhome)#exit
```

management-port

Use this command to add an interface to use to connect to a call home server. This is useful when in-band (front panel) ports are used as management ports.

Use the **no** form of this command to use eth0 as the management port.

Command Syntax

```
management-port IFNAME
no management-port
```

Parameters

IFNAME
Interface used to connect to the call home server.

Default

By default, eth0 (out-of-band management port) is used as the management port.

Command Mode

NetConf call home mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

The below configuration example illustrates how to enable or disable the NetConf Callhome feature.

1. Check the existing NetConf Callhome configuration using the **show running-config netconf-callhome** command.

   ```
   (netconf-callhome)#do show running-config netconf-callhome
   !
   netconf callhome
    feature netconf callhome enable
   !
   ```

2. Using the management port command, add an interface **xe4** to connect to the call home server.

   ```
   (netconf-callhome)#management-port xe4
   (netconf-callhome)#commit
   ```

3. Check the current NetConf Callhome configuration using the **show running-config netconf-callhome** command.

   ```
   (netconf-callhome)#do show running-config netconf-callhome
   !
   netconf callhome
    feature netconf callhome enable
    management-port xe4
   !
   ```

4. Remove the connected interface **xe4** using the no command, and by default, **eth0** is used as the management port.

```
(netconf-callhome)#no management-port
(netconf-callhome)#commit
```

5. Check the current NetConf Callhome configuration using the **show running-config netconf-callhome** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
!
(netconf-callhome)#exit
```

netconf callhome

Use this command to enter NetConf call home configuration mode. All call home configurations are done in this mode.

Command Syntax

```
netconf callhome
```

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

1. The below configuration example illustrates how to enter the NetConf Callhome configuration mode.

   ```
   #configure terminal
   (config)#netconf callhome
   ```

2. Check the NetConf Callhome configuration using the **`show running-config netconf-callhome`** command.

   ```
   (netconf-callhome)#do show running-config netconf-callhome
   !
   netconf callhome
   !
   (netconf-callhome)#exit
   ```

reconnect

Use this command to enable or disable the reconnect feature in OcNOS, allowing users to control whether the system attempts to re-establish a connection if it fails. When enabled, OcNOS will make repeated connection attempts if the initial connection fails. If disabled, OcNOS will make only a single connection attempt; if it fails, it will not re-attempt the connection.

Command Syntax

```
reconnect (enable|disable)
```

Parameters

enable
Enable reconnect

disable
Disable reconnect

Default

By default, the reconnect feature is not enabled.

Command Mode

NetConf call home mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

1. Check the existing NetConf Callhome configuration using the **`show running-config netconf-callhome`** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
!
```

2. Enable Reconnect:

```
(netconf-callhome)#reconnect enable
(netconf-callhome)#commit
```

3. Check the current NetConf Callhome configuration using the **`show running-config netconf-callhome`** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 reconnect enable
!
```

4. Configure Retry Attempts and Interval for the system to re-establish a connection after failing a maximum number of attempts with a specified time interval.

```
(netconf-callhome)#retry-max-attempts 10
(netconf-callhome)#retry-interval 30
(netconf-callhome)#commit
```

5. Check the current NetConf Callhome configuration using the **`show running-config netconf-callhome`** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 reconnect enable
 retry-max-attempts 10
 retry-interval 30
!
```

6. Disable Reconnect:

```
(netconf-callhome)#reconnect disable
(netconf-callhome)#commit
```

7. Check the current NetConf Callhome configuration using the **`show running-config netconf-callhome`** command.

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
!
(netconf-callhome)#
```

retry-interval

Use this command to specify the number of seconds to wait after a connect attempt to the call home server fails.

Use the **no** form of this command to reset the retry interval to its default (300 seconds).

Command Syntax

```
retry-interval <1-86400>
no retry-interval
```

Parameters

<1-86400>
Retry interval in seconds

Default

By default, when the reconnect (page 1216) feature is enabled, the default retry interval is 300 seconds.

Mode

NetConf call home mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

1. Enable the NetConf callhome feature and reconnect commands:

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 reconnect enable
!
```

2. Configure retry interval:

```
(netconf-callhome)#retry-interval 100
(netconf-callhome)#commit
(netconf-callhome)#
```

3. Check the NetConf callhome show output:

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 reconnect enable
 retry-interval 100
!
```

4. Reset the interval:

```
(netconf-callhome)#no retry-interval
(netconf-callhome)#commit
```

5. Check the NetConf callhome show output:

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 reconnect enable
!
(netconf-callhome)#exit
```

retry-max-attempts

Use this command to specify the number of retries the OcNOS should attempt to the call home server before giving up.

Use the **no** form of this command to reset the maximum attempts to its default value (3).

Command Syntax

```
retry-max-attempts <0-255>
no retry-max-attempts
```

Parameters

<0-255>
Number of retries; specify zero (0) to retry infinitely.

Default

By default, when the reconnect (page 1216) feature is enabled, 3 attempts will be made.

Command Mode

NetConf call home mode

Applicability

This command was introduced in OcNOS version 6.0.0.

When users update the reconnect parameters, note the following:

- Servers that haven't completed the configured retry count with the updated configurations will be included in the new count.
- Servers for which the configured retry count has already been completed will restart the retrial process with the new configuration.

Example

1. Enable the NetConf callhome feature and reconnect commands:
```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 reconnect enable
!
```
2. Configure retry maximum attempts:
```
(netconf-callhome)#retry-max-attempts 10
(netconf-callhome)#commit
(netconf-callhome)#
```
3. Check the NetConf callhome show output:
```
(netconf-callhome)#do show running-config netconf-callhome
```

```
!
netconf callhome
 feature netconf callhome enable
 reconnect enable
 retry-max-attempts 10
!
```

4. Reset the attempts to its default value:

```
(netconf-callhome)#no retry-max-attempts
(netconf-callhome)#commit
```

5. Check the NetConf callhome show output:

```
(netconf-callhome)#do show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 reconnect enable
!
(netconf-callhome)#exit
```

show (xml|) running-config netconf-callhome

Use this command to display call home configurations.

Command Syntax

```
show (xml|) running-config netconf-callhome
```

Parameters

xml
Display the output in XML format

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

The below show command displays the running configuration of the Netconf Callhome feature in a normal format.

```
#show running-config netconf-callhome
!
netconf callhome
 feature netconf callhome enable
 management-port xe10
 reconnect enable
 retry-max-attempts 10
 retry-interval 100
 callhome server local-nc 192.168.56.1
 debug callhome
!
```

The below show command displays the running configuration of the Netconf Callhome feature in XML format.

```
#show xml running-config netconf-callhome
<netconf-server xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-management-server">
  <callhome>
    <feature-enabled></feature-enabled>
    <management-port>xe10</management-port>
    <netconf-client>
      <name>local-nc</name>
      <address>192.168.56.1</address>
    </netconf-client>
    <reconnect>
      <enable></enable>
      <retry-max-attempts>10</retry-max-attempts>
      <retry-interval>100</retry-interval>
    </reconnect>
  </callhome>
  <debug>
    <callhome-debug></callhome-debug>
  </debug>
</netconf-server>
```

SECURITY MANAGEMENT CONFIGURATION

Access Control Lists Configurations

This chapter contains a complete example of access control list (ACL) configuration.

Overview

An Access Control List is a list of Access Control Entries (ACE). Each ACE in ACL specifies the access rights allowed or denied.

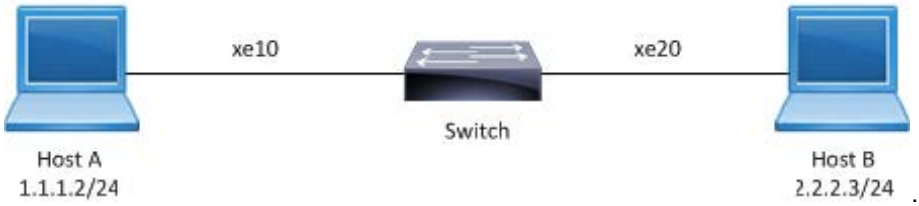
Each packet that arrives at the device is compared to each ACE in each ACL in the order they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

Note: If there is no match, the packet is dropped (implicit deny). Therefore, an ACL intended to deny a few selected packets should have at least one permit filter of lower priority; otherwise, all traffic is dropped because of the default implicit deny filter.

Topology

Figure 65. ACL sample topology



IPv4 ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list T1`	Create an IP access list named T1.
`(config-ip-acl)#deny any host 1.1.1.1 any`	Create an access rule to deny IP packets with source address 1.1.1.1.
`(config-ip-acl)#permit any host 1.1.1.2 any`	Create an access rule to permit IP packets with source address 1.1.1.2.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#hardware-profile filter ingress-ipv4 enable`	Enable hardware profile for the ACL.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe10`	Enter interface mode.

`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 1.1.1.3/24`	Assign an IP address.
`(config-if)#ip access-group T1 in`	Apply access group T1 for inbound traffic to the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IP packets reach interface xe10 with source address 1.1.1.1, then the match count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists T1
IP access list T1
        10 deny any host 1.1.1.1 any [match=200]
        20 permit any 1.1.1.2 any
        default deny-all
```

When inbound IP packets reach interface xe10 with a source address 1.1.1.2, then the match count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists T1
IP access list T1
    10 deny any host 1.1.1.1 any
    20 permit any 1.1.1.2 any [match=2000]
    default deny-all
```

Note: Use the command **`clear ip access-list counters`** to clear the statistics of all ACLs or **`clear ip access-list <access-list name>counters`** to clear statistics of a particular ACL.

ICMP ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list icmp-acl-01`	Create an IP access list named icmp-acl-01.
`(config-ip-acl)#10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11`	Create an access rule with sequence number 10 to deny **ICMP**[1] packets from a specific source towards a specific destination with a DSCP value of af11. Note: The sequence number is optional.
`(configip-acl)#20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash`	Create an access rule with sequence number 20 to permit ICMP packets from a specific source towards a specific destination with precedence as flash.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

`(config)#interface xe10`	Enter interface mode.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 1.1.1.3/24`	Assign an IP address.
`(config-if)#ip access-group icmp-acl-01 in`	Apply access group icmp-acl-01 for inbound traffic to the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IP packets reach interface xe10 with source address 1.1.1.X, destination address 2.2.2.X, DSCP value af11, and are fragmented, then the count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists icmp-acl-01
IP access-list icmp-acl-01
    10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 [match=200]
    20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
    default deny-all
```

When inbound IP packets reach interface xe10 with source address as 1.1.1.X, destination address 2.2.2.X, and precedence value flash, then the count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists icmp-acl-01
IP access-list icmp-acl-01
    10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11
    20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash [match=200]
    default deny-all
```

Note: Use the command **`clear ip access-list counters`** to clear statistics of all ACLs configured or **`clear ip access-list <access-list name> counters`** to clear statistics of a particular ACL.

Access List Entry Sequence Numbering

You can change the sequence numbers of rules in an access list.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

`#configure terminal`	Enter configure mode.
`(config)#ip access-list icmp-acl-01`	Enter access list mode for ACL icmp-acl-01.
`(config-ip-acl)#resequence 100 200`	Re-sequence the access list, starting with sequence number 100 and incrementing by 200.
`(config-ip-acl)#1000 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11`	Re-sequencing specific access rule 100 with sequence number 1000

`(config-ip-acl)#exit`	Exit access list mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation

Before re-sequencing:

```
#show access-lists icmp-acl-01
IP access list icmp-acl-01
        10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 log
        20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
        default deny-all
```

After re-sequencing the access list, starting with sequence number 100 and incrementing by 200

```
#show access-lists icmp-acl-01
IP access list icmp-acl-01
        100 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 log
        300 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
        default deny-all
```

After re-sequencing specific access rule 100 with sequence number 1000

```
#show access-lists icmp-acl-01
IP access list icmp-acl-01
300 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
1000 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 log
default deny-all
```

IPv6 ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ipv6 access-list ipv6-acl-01`	Create an IPv6 access list named as icmp-acl-01.
`(config-ipv6-acl)#11 deny ipipv6 any any`	Create access rule sequence number 11 to deny IPv4 encapsulated packets in IPv6 with any source address to any destination address.
`(config-ipv6-acl)#default permit-all`	Update the default rule to permit all.
`(config-ipv6-acl)#exit`	Exit access list mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe10`	Enter interface mode.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ipv6 address 1:1::1:3/64`	Assign an IPv6 address.
`(config-if)#ipv6 access-group ipv6-acl-01 in`	Apply access group ipv6-acl-01 for inbound traffic to the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IPv6 packets reach interface xe10 with IPv4, then count for access rule 11 increases equal to the number of packets sent.

```
#show ipv6 access-lists ipv6-acl-01
IPv6 access-list ipv6-acl-01
11 deny ipipv6 any any [match=1000]
    default permit all
```

For all other IPv6 packets, access rule 100 is invoked and the match counts increase equal to the number of packets sent.

```
#show ipv6 access-lists ipv6-acl-01
IPv6 access-list ipv6-acl-01
11 deny ipipv6 any any
    default permit-all [match=2000]
```

Note: Use the command **`clear ipv6 access-list counters`** to clear statistics of all IPv6 ACLs configured or **`clear ipv6 access-list <ipv6 access-list name> counters`** to clear statistics of the particular IPv6 ACL.

IPv6 ACL Configuration for 128-Bit Support

Configuration for Physical, PO, SA and MLAG Interfaces

Enable **`hardware-profile ingress-ipv6-ext`**:

`(config)#hardware-profile filter ingress-ipv6-ext enable`	Enable ingress IPv6 group for 128-bit address qualification on physical interfaces.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#ipv6 access-list test1`	Create an IPv6 access list named **`test1`**.
`(config-ipv6-acl)#permit any 2001::1/128 2002::1/128`	Create an access rule to permit any IPv6 packet from 2001::1/128 to 2002::1/128.
`(config-ipv6-acl)#commit`	Commit the candidate configuration to the running configuration.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ipv6 access-group test1 in`	Attach IPv6 access list **`test1`** to the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

Validation

Use the commands below to verify the hardware-profile configurations.

```
#show hardware-profile filters

Note: Shared count is the calculated number from available resources.
```

```
      Dedicated count provides allocated resource to the group.
      If group shares the dedicated resource with other groups, then dedicated
      count of group will reduce with every resource usage by other groups.

+-------------------------+---------+---------------+----------------------------+
|                         | Free    |     Used      |       Total Entries        |
| Unit - TCAMS            | Entries |---------------|----------------------------|
|                         |         |  %  | Entries | Total | Dedicated | shared |
+-------------------------+---------+-----+---------+-------+-----------+--------+
0 INGRESS IPV6-ACL-EXT      1280      0     0         1280    0           1280

#
```

Use the commands below to verify the running configurations.

```
#show running-config ipv6 access-list
ipv6 access-list test1
 10 permit any 2001::1/128 2002::1/128
!
#show running-config interface xe1
!
interface xe1
 ipv6 access-group test1 in
!
#
```

Use the commands below to verify the match count.

```
#show ipv6 access-lists test1
IPv6 access list test1
        10 permit any 2001::1/128 2002::1/128  [match=1000]
        268435453 permit icmpv6 any any
        default deny-all
#
```

Note: Use the command **`clear ipv6 access-list counters`** to clear statistics of all IPv6 ACLs configured or **`clear ipv6 access-list NAME counters`** to clear statistics of the particular IPv6 ACL.

MAC ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#mac access-list mac-acl-01`	Create a MAC access list named mac-acl-01.
`(config-mac-acl)#22 permit host 0000.0011.1212 host 0000.1100.2222 vlan 2`	Create an access rule with sequence number 22 to permit packets from a host with a specific MAC towards a host with a specific MAC with VLAN 2.
`(config-mac-acl)#exit`	Exit access list mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#bridge 1 protocol rstp vlan-bridge`	Create a VLAN-aware RSTP bridge.
`(config)#vlan 2 bridge 1 state enable`	Create VLAN 2.
`(config)#interface xe10`	Enter interface mode.

`(config-if)#switchport`	Configure the interface as Layer 2.
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`(config-if)#switchport trunk allowed vlan all`	Enable all VLAN identifiers on this interface.
`(config-if)#mac access-group mac-acl-01 in`	Applies the MAC access list mac-acl-01 to ingress traffic.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound packets reach interface xe10 with the specific source and destination MAC with the VLAN as 2, then the count for access rule 22 increases equal to the number of packets sent.

```
#show mac access-lists
MAC access list mac-acl-01
    22 permit mac host 0000.0011.1212 host 0000.1100.2222 vlan 2 [match=3000]
    default deny-all
```

For all other packets, default rule is invoked and the match counts increases equal to the number of packets sent.

```
#show mac access-lists mac-acl-01
MAC access list mac-acl-01
    22 permit mac host 0000.0011.1212 host 0000.1100.2222 vlan 2
    default deny-all [match=2000]
```

Notes: As per the present design, ARP/ND packets will be filtered based on the source MAC address only (host mac address).

Use the command **`clear mac access-list counters`** to clear statistics of all MAC ACLs or **`clear mac access-list <mac access-list name> counters`** to clear statistics of a particular MAC ACL.

Management ACL Overview

Management Port ACL can be used to provide basic level of security for accessing the management network. ACLs can also be used to decide which types of management traffic to be forwarded or blocked at the management port.

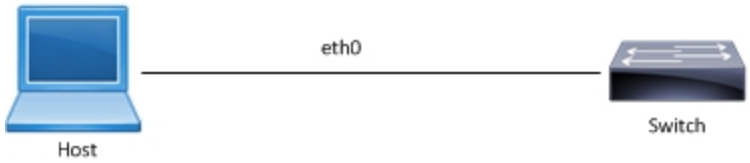
When configuring access list on a router or a switch, each access list needs to be identified by a unique name or a number. Each access list entry can have permit or deny actions. Each entry will be associated with a sequence number in the range of <1-268435453>. Lower the sequence number, higher the priority.

User should be able to configure the system to allow certain IP address for a protocol and don’t allow any other IP address matching for that protocol.

Note: If there is no match, the packet is dropped (implicit deny). Therefore, an ACL intended to deny a few selected packets should have at least one permit filter of lower priority; otherwise, all traffic is dropped because of the default implicit deny filter.

Topology

Figure 66. Management ACL Sample Topology



Management ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list mgmt`	Create an IP access list named mgmt
`(config-ip-acl)#permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh`	Create an access rule to permit TCP connection with source address 10.12.45.57 with destination address 10.12.29.49 on destination port equal to SSH.
`(config-ip-acl)#permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet`	Create an access rule to permit TCP connection with source address 10.12.45.58 with Destination address 10.12.29.49 on destination port equal to Telnet.
`(config-ip-acl)#permit udp any host 10.12.29.49 eq snmp`	Create an access rule to permit **UDP**[1] packet with any source address with Destination address 10.12.29.49 on destination port equal to SNMP.
`(config-ip-acl)#permit udp any host 10.12.29.49 eq ntp`	Create an access rule to permit UDP packet with any source address with Destination address 10.12.29.49 on destination port equal to NTP.
`(config-ip-acl)#permit udp host 10.12.29.49 any eq snmptrap`	Create an access rule to permit UDP packet with source address 10.12.29.49 with any Destination address on destination port equal to SNMPTrap.
`(config-ip-acl)#permit tcp host 10.12.29.49 eq ssh host 10.12.45.57`	Create an access rule to permit TCP connection with source address 10.12.29.49 on source port equal to ssh with Destination address 10.12.45.57 .
`(config-ip-acl)#deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh`	Create an access rule to deny TCP connection with source address 10.12.45.58 with Destination address 10.12.29.49 on destination port equal to SSH.
`(config-ip-acl)#deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet`	Create an access rule to deny TCP connection with source address 10.12.45.57 with Destination address 10.12.29.49 on destination port equal to Telnet.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#hardware-profile filter egress-ipv4 enable`	Enable hardware profile for the ACL.
`(config)#commit`	Commit the candidate configuration to the running configuration

[1]User Datagram Protocol

`(config)#interface eth0`	Enter interface mode of Management Interface.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 10.12.29.49/24`	Assign an IP address.
`(config-if)#ip access-group mgmt in`	Apply access group mgmt for inbound traffic to the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When a TCP connection for Destination Port SSH reach interface eth0 with source address 10.12.45.57, then the match count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh [match=9]
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
        30 permit udp any host 10.12.29.49 eq snmp
        40 permit udp any host 10.12.29.49 eq ntp
        50 permit udp host 10.12.29.49 any eq snmptrap
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
        80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
        default deny-all
```

When a TCP connection for Destination Port Telnet reach interface eth0 with source address 10.12.45.58, then the match count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet [match=10]
        30 permit udp any host 10.12.29.49 eq snmp
        40 permit udp any host 10.12.29.49 eq ntp
        50 permit udp host 10.12.29.49 any eq snmptrap
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
        80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
        default deny-all
```

When a UDP packet for Destination Port SNMP reach interface eth0 with any source address, then the match count for access rule 30 increases equal to the number of packets sent. Prior to this SNMP should be configured on Device (10.12.29.49).

```
Example:
snmp-server community SNMPTEST group network-admin vrf management
snmp-server host 10.12.6.86 traps version 2c SNMPTEST udp-port 162 vrf management
snmp-server enable snmp  vrf management

#show ip access-lists mgmt
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
        30 permit udp any host 10.12.29.49 eq snmp [match=50]
        40 permit udp any host 10.12.29.49 eq ntp
        50 permit udp host 10.12.29.49 any eq snmptrap
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
```

```
        80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
        default deny-all
```

When a UDP packet for Destination Port NTP reach interface eth0 with any source address, then the match count for access rule 40 increases equal to the number of packets sent. Prior to this NTP should be configured on Device (10.12.29.49).

```
Example:
ntp enable vrf management
ntp authenticate vrf management
ntp authentication-key 123 md5 swwx 7 vrf management
ntp trusted-key 123 vrf management
ntp server 10.12.45.36 vrf management
ntp server 10.12.16.16 prefer vrf management
ntp server 10.12.16.16 key 123 vrf management

#show ip access-lists mgmt
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
        30 permit udp any host 10.12.29.49 eq snmp
        40 permit udp any host 10.12.29.49 eq ntp [match=1]
        50 permit udp host 10.12.29.49 any eq snmptrap
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
        80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
        default deny-all
```

When a TCP connection request for Destination Port SSH reach interface eth0 with source address 10.12.45.58, this should deny the connection and the match count for access rule 70 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
        30 permit udp any host 10.12.29.49 eq snmp
        40 permit udp any host 10.12.29.49 eq ntp
        50 permit udp host 10.12.29.49 any eq snmptrap
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh [match=1]
        80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
        default deny-all
```

When a TCP connection request for Destination Port Telnet reach interface eth0 with source address 10.12.45.57, this should deny the connection and the match count for access rule 80 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
        30 permit udp any host 10.12.29.49 eq snmp
        40 permit udp any host 10.12.29.49 eq ntp
        50 permit udp host 10.12.29.49 any eq snmptrap
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
        80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet[match=1]
        default deny-all
```

To enable SNMPTRAPS, apply the ACL outbound to the Management interface.

`#configure terminal`	Exit access list mode.

`(config)#interface eth0`	Enter interface mode of Management Interface.
`(config-if)#ip access-group mgmt out`	Apply access group mgmt for outbound traffic to the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#end`	Exit interface and configure mode.

When a UDP packet for Destination Port SNMPTrap sends out of interface eth0 with any Destination address, then the match count for access rule 50 increases equal to the number of packets received. Prior to this SNMPTrap should be configured on Device (10.12.29.49) to listen to port 162.

```
Example:
snmp-server community SNMPTEST group network-admin vrf management
snmp-server host 10.12.6.86 traps version 2c SNMPTEST udp-port 162 vrf management
snmp-server enable snmp  vrf management

#show ip access-lists mgmt
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
        30 permit udp any host 10.12.29.49 eq snmp
        40 permit udp any host 10.12.29.49 eq ntp
        50 permit udp host 10.12.29.49 any eq snmptrap [match=5]
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
        80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
        default deny-all
```

When an ACL is applied on interface eth0 outbound and inbound together, then we must configure an ACL to establish a TCP connection between source 10.12.29.49 with source Port SSH to destination address 10.12.45.57. When a TCP connection is established on port SSH, then the match count for access rule 10 and 60 increases equal to the number of packets sent and received.

```
#show ip access-lists mgmt
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh [match=9]
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
        30 permit udp any host 10.12.29.49 eq snmp
        40 permit udp any host 10.12.29.49 eq ntp
        50 permit udp host 10.12.29.49 any eq snmptrap
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57[match=9]
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
        80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
        default deny-all
```

Note: Use the command **`clear ip access-list counters`** to clear the statistics of all ACLs or **`clear ip access-list <access-list name> counters`** to clear statistics of a particular ACL.

```
#show access-lists
IP access list mgmt
        10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
        20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
        30 permit udp any host 10.12.29.49 eq snmp
        40 permit udp any host 10.12.29.49 eq ntp
        50 permit udp host 10.12.29.49 any eq snmptrap
        60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
```

```
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh

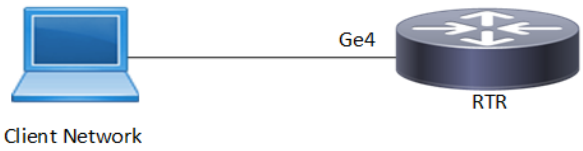
ARP ACL Overview

ARP ACL can be used to permit or deny the ARP packets, based on the ARP request or response option configured.

Topology

Figure 67. ARP ACL Sample Topology



ARP ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge4`	Enter interface mode
`(config-if)#ip address 11.11.11.11/24`	Assign IPv4 address.
`(config-if)#exit`	Exit access list mode.
`(config)#commit`	Commit the candidate configurations to the running configurations
`(config)#mac access-list m1`	Enter mac access list mode.
`(config-mac-acl)#permit any any vlan 6`	Create an access rule to permit any IPv6 packet
`(config-mac-acl)#permit 0000.0215.2151 0000.0000.0011 any vlan 3`	Create an access rule to permit specific ARP response.
`(config-mac-acl)#exit`	Exit access list mode.

`(config)#commit`	Commit the candidate configurations to the running configurations
`(config)#interface ge4`	Enter interface mode.
`(config-if)#mac access-group m1 in`	Apply access group mac1 for inbound traffic to the interface.
`(config-if)#commit`	Commit the candidate configurations to the running configurations
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to assign IP address on IXIA and ping from IXIA.

```
#show mac access-lists
MAC access list mac1
        10 permit host 0000.3AE0.456D any arp request [match=1]
        20 permit host 0000.3AE0.456D any arp response [match=1]
        30 permit any any ipv4 [match=1]
        default deny-all
```

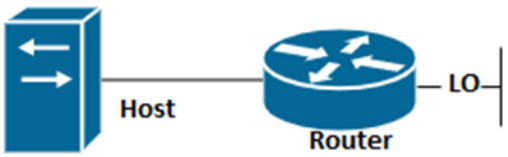
ACL over Loopback

The loopback interface ACL feature provides basic security for management applications accessible through In-band interfaces.

Note: Refer to the command reference section for limitations, default behavior, and unsupported features.

Topology

Figure 68. ACL Loopback Topology



`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 4.4.4.4/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 5.5.5.5/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 6.6.6.6/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 7.7.7.7/32 secondary`	Assign the IPv4 secondary address.
`(config-if)# exit`	Exit interface mode.

`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#ip access-list loopback`	Create loopback access list
`(config-ip-acl)# 10 permit tcp any host 3.3.3.3 eq telnet`	Permit telnet session from any source with specific destination.
`(config-ip-acl)# 20 deny tcp any host 4.4.4.4 eq telnet`	Deny telnet session from any source with specific destination.
`(config-ip-acl)# 30 permit tcp any host 5.5.5.5 eq ssh`	Permit ssh session from any source with specific destination.
`(config-ip-acl)# 40 deny tcp any host 6.6.6.6 eq ssh`	Deny ssh session from any source with specific destination.
`(config-ip-acl)# 50 deny udp any host 6.6.6.6 eq snmp`	Deny udp from any source with specific destination.
`(config-ip-acl)# 60 deny udp any host 7.7.7.7 eq ntp`	Deny udp from any source with specific destination.
`(config-ip-acl)#exit`	Exit interface acl mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface lo`	Enter interface lo mode
`(config-if)#ip access-group loopback in`	Associate loopback acl over lo interface
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit config mode

Validation

```
#sh access-lists
IP access list loopback
        10 permit tcp any host 3.3.3.3 eq telnet [match=12]
        20 deny tcp any host 4.4.4.4 eq telnet [match=12]
        30 permit tcp any host 5.5.5.5 eq ssh
        40 deny tcp any host 6.6.6.6 eq ssh
        50 deny udp any host 6.6.6.6 eq snmp  [match=6]
        60 deny udp any host 7.7.7.7 eq ntp

#sh ip access-lists summary

!
```

ACL OVER Virtual Terminal (VTY)

When a Telnet/SSH/NetConf connection is established in the OcNOS, it associates the connection with a virtual terminal (VTY) line. The ACL over VTY feature provides security for management features associated with VTY.

Users can create Standard and Extended ACL rules and attach them to a virtual teletype (VTY) command line interface. These ACL rules are applied on both Management and Default virtual routing forwarding (VRFs).

OcNOS supports both IPv4 and IPv6 access lists for VTY lines, providing flexibility for network configurations.

Applying a standard ACL rule on a VTY line permits or denies only management access protocols such as SSH, Telnet, and SSH-Netconf protocols (port numbers 22,23,830)).

Extended ACL rules are applied as configured by the user, and it is not limited to management protocols only, unlike Standard ACLs.

When a user configures a rule with 'deny any any any' and attaches it to the VTY, it effectively blocks only the Telnet, SSH, and NetConf protocols on the control plane

For example, when a user configures a rule as below and attach them to VTY, If the deny ACL rule includes ’any’ value in protocol, only Telnet/SSH/SSH-NetConf protocols are denied.

```
ip access-list ssh-access
10 permit tcp 10.12.43.0/24 any eq ssh
20 deny any any any
```

Note: To deny any protocols other than Telnet/SSH/SSH-Netconf, create a deny rule with the specific protocol access on VTY. For example: To deny OSPF protocol from all the source and destination address, apply the rule, **`10 deny ospf any any`**.

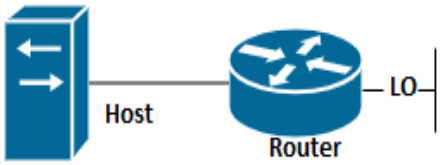
In general, the VTY ACLs are more specific to management protocols. Hence, the Extended ACL “any” rule translation is enhanced to allow management protocols as follows:

- If the deny ACL rule includes any value in protocol, only Telnet/SSH/SSH-Netconf protocols are denied.
- The permit ACL rule is unchanged.

Note: Refer to the command reference section for limitations, default behavior, and unsupported features.

Topology

Figure 69. ACL VTY Topology



VTY ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Assign the IPv4 secondary address.
`(config-if)# exit`	Exit interface mode.
`(config)#ip access-list vty`	Create loopback access list
`(config-ip-acl)# 10 permit tcp any host 3.3.3.3 eq telnet`	Permit telnet session from any source with specific destination.
`(config-ip-acl)#exit`	Exit interface acl mode
`(config)#line vty`	Enter interface vty mode
`(config-all-line)#ip access-group vty in`	Associate acl over
`(config-if)#exit`	Exit interface mode
`(config)#exit`	Exit config mode

Validation

```
OcNOS#sh access-lists
IP access list vty
       10 permit tcp any host 3.3.3.3 eq telnet

OcNOS#sh ip access-lists summary
IPV4 ACL vty
       statistics enabled
       Total ACEs Configured: 1
       Configured on interfaces:
       Active on interfaces:
       Configured on line vty:
       all vty lines - ingress

OcNOS#sh running-config access-list
ip access-list vty
10 permit tcp any host 3.3.3.3 eq telnet
!
line vty
ip access-group vty in
```

Implementation Examples

```
OcNOS#show running-config aclmgr
ip access-list ssh-access
 10 permit tcp 10.12.43.0/24 any eq ssh
 20 deny tcp 10.12.33.0/24 any eq 6513
 30 deny any 10.12.34.0/24 any
 40 deny any any any
!
line vty
 ip access-group ssh-access in

#####iptables o/p######

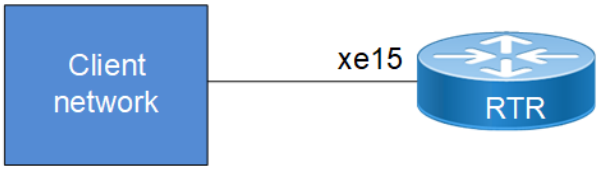
root@OcNOS:~# iptables -L
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
ACCEPT     tcp  --  10.12.43.0/24        anywhere             tcp dpt:ssh
DROP       tcp  --  10.12.33.0/24        anywhere             tcp dpt:tls_netconf
DROP       tcp  --  10.12.34.0/24        anywhere             multiport dports ssh,telnet,ssh_netconf
DROP       tcp  --  anywhere             anywhere             multiport dports ssh,telnet,ssh_netconf
```

Timed ACL Configuration

The time range feature was introduced to be able to add a timing boundary for specified activities. The activity would start, end and repeat at the specific times set by the user. This time-range feature will enable creating "Timed ACLs". This will help service providers to customize the internet data to customers based on time to increase the video traffic during weekends and reduce data traffic, restrict the internet traffic in school or college non-working hours etc.

Topology

Figure 70. Timed acl sample topology



Configuration with IPv4 Address

`#configure terminal`	Enter configure mode.
`(config)#time-range TIMER1`	Configure a timer
`(config-tr)#start-time 10:00 03 nov 2021`	Configure start time
`(config-tr)#end-time 18:00 03 nov 2021`	Configure end time
`(config-tr)#exit`	Exit timer
`(config)#ip access-list ACL1`	Create ip access list
`(config-ip-acl)# deny icmp host 10.1.1.1 host 10.1.2.2`	Create an acl rule to deny icmp
`(config-ip-acl)#exit`	Exit Acl mode

(config)#commit	Commit the candidate configuration to the running configuration
(config)#hardware-profile filter egress-ipv4 enable	Hardware profile enable for the acl
(config)#int xe15	Enter into the interface mode
(config-if)#ip access-group ACL1 out time-range TIMER1	Apply the acl along with the timer.
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit

Configuration with IPv6 Address

(config)#ipv6 access-list ACL1v6	Create ipv6 access list
(config-ipv6-acl)# deny any any any	Create an acl rule to deny
(config-ipv6-acl)#exit	Exit Acl mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)# hardware-profile filter ingress-ipv6 enable	Hardware profile enable for the acl
(config)#int xe12	Enter into the interface mode
(config-if)# ipv6 access-group ACL1v6 in time-range TIMER1	
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit

Configuration with mac

(config)# mac access-list ACL1mac	Create ip access list
(config-mac-acl)# deny 0000.0000.0000 1111.2222.3333 0000.0000.0000 4444.5555.6666	Create an acl rule to deny icmp
(config-mac-acl)#exit	Exit Acl mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)# hardware-profile filter ingress-l2 enable	Hardware profile enable for the acl
(config)#int xe13	Enter into the interface mode
(config-if)# mac access-group ACL1mac in time-range TIMER1	
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit

Validation

```
#sh running-config in xe15
!
interface xe15
 ip access-group ACL1 out time-range TIMER1
!
#sh running-config in xe12
!
interface xe12
 ipv6 access-group ACL1v6 in time-range TIMER1
!
#sh running-config in xe13
!
interface xe13
 mac access-group ACL1mac in time-range TIMER1

ACL on IRB Interface over MPLS EVPN

Applying ACLs to an Integrated Routing and Bridging (IRB) interface or switchport enables control over packet flow, whether ingress or egress the interface. This capability is essential for maintaining security, managing bandwidth, and ensuring effective routing and bridging.

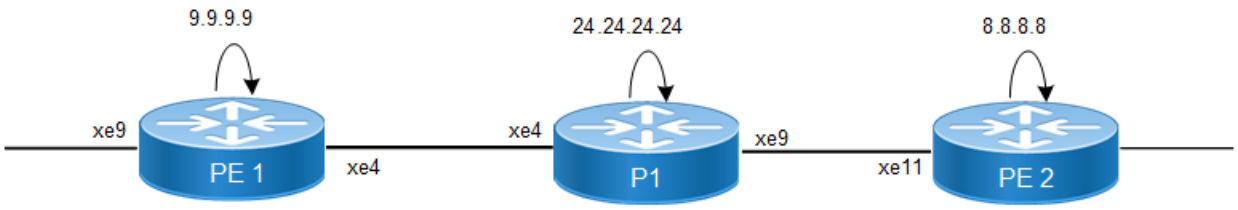
Topology

In this topology, PE1 and PE2 routers have IRB interfaces configured. The IRB interfaces bridge VLAN traffic and route between VLANs, enabling communication between Layer 2 and Layer 3.

ACLs are applied on the IRB interfaces to filter traffic, ensuring only authorized traffic passes through. The P1 router acts as a transit router, forwarding traffic between PE1 and PE2. The P1 router provides core functionality but does not handle IRB interfaces directly.

This configuration ensures that while traffic flows across the network, ACL policies can be enforced at both PE1 and PE2 over the IRB interfaces, securing communication between VLANs and controlling access between external networks.

Figure 71. ACL on IRB sample topology



ACLs Configuration on IRB

Perform the following steps to enable EVPN MPLS on an IRB interface while applying ACLs to control ingress or egress traffic:

Note: The required configuration for ACL on IRB is added in the Configuration section, for the detailed configuration on IRB symmetric and asymmetric refer to the *Configurations* section in *EVPN MPLS IRB Configuration* in the *OcNOS MPLS Guide*.

1. Enable Hardware Profiles for both IPv4 and IPv6 traffic at the ingress and egress of the interface:

```
PE1(config)#hardware-profile filter ingress-ipv4-subif enable
PE1(config)#hardware-profile filter ingress-ipv6-ext-subif enable
PE1(config)#hardware-profile filter egress-ipv4-ext enable
PE1(config)#hardware-profile filter egress-ipv6 enable
PE1(config)#hardware-profile filter evpn-mpls-mh enable
PE1(config)#commit
```

2. Enable EVPN MPLS:

```
PE1(config)#evpn mpls enable
PE1(config)#evpn mpls irb
PE1(config)#evpn mpls multihoming enable  # Only if multihoming is required
PE1(config)#commit
```

3. Configure an anycast MAC address for the gateway in a multihoming scenario, allowing multiple devices to share the same MAC address for redundancy:

```
PE1(config)#evpn irb-forwarding anycast-gateway-mac 0011.3333.5555
PE1(config)#commit
```

4. Define a MAC **VRF**[1] for isolating MAC address routing within the EVPN framework:

```
PE1(config)#mac vrf vrfirb
PE1(config-vrf)# rd 9.9.9.9:2001
PE1(config-vrf)# route-target both 2001:2001
```

Note: Ensure to provide `<RD value>` with a value different from PE1's RD of `9.9.9.9` to maintain proper routing table separation and avoiding conflicts between the two PE devices.

5. Define an IP VRF for routing L3 traffic within the EVPN framework:

```
PE1(config)#ip vrf ip_vrfirb
PE1(config-vrf)# rd 9.9.9.9:200
PE1(config-vrf)# route-target both 200:200
```

[1]Virtual Routing and Forwarding

```
PE1(config-vrf)# l3vni 20000
PE1(config-vrf)#commit
```

Note: Ensure to provide `<rd value>` with a value different from PE1's RD of `9.9.9.9` to maintain proper routing table separation and avoiding conflicts between the two PE devices.

6. Configure EVPN MPLS for host reachability and specify the IRB interface:

```
PE1(config-evpn-mpls)#evpn mpls id 200
PE1(config-evpn-mpls)#host-reachability-protocol evpn-bgp vrfirb
PE1(config-evpn-mpls)#evpn irb irb100
PE1(config-evpn-mpls)#commit
```

7. Configure a po interface for VLAN encapsulation and map it to the EVPN instance:

```
PE1(config)#interface po1000.200 switchport
PE1(config-if)# encapsulation dot1q 200
PE1(config-if)# rewrite pop
PE1(config-if)# load-interval 30
PE1(config-if)# access-if-evpn
PE1(config-acc-if-evpn)#  map vpn-id 200
PE1(config-acc-if-evpn)#commit
```

8. Create ACL to filter outgoing traffic:

```
PE1(config)#interface po1000.200 switchport
PE1(config-if)# encapsulation dot1q 200
PE1(config-if)# rewrite pop
PE1(config-if)# load-interval 30
PE1(config-if)# access-if-evpn
PE1(config-acc-if-evpn)#  map vpn-id 200
PE1(config-acc-if-evpn)#commit
```

9. Configure the IRB interface with IP addresses, associate it with the VRF, and apply the ACL:

```
PE1(config)#interface irb100
PE1(config-irb-if)# ip vrf forwarding ip_vrfirb
PE1(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac
PE1(config-irb-if)# ip address 80.80.1.1/24 anycast
PE1(config-irb-if)# ipv6 address 80:80::1/48 anycast
PE1(config-irb-if)# ip access-group asy-egress out
PE1(config-irb-if)#commit
```

Validation

Verify that after applying ACL traffic is not egressing out:

```
PE1#show interface counters rate mbps
+-------------------+--------------+-------------+--------------+-------------+
|     Interface     |    Rx mbps   |    Rx pps   |    Tx mbps   |    Tx pps   |
+-------------------+--------------+-------------+--------------+-------------+
 xe4                  6.53           6169          0.01           0
 xe9                  0.02           1             0.01           0

PE1#show ip access-lists
IP access list asym-egress
        120 deny any host 70.70.1.2 80.80.1.0 0.0.0.255 [match=220847]
        default deny-all
```

Verify that the ACL rule is matching and counters are incremented accordingly:

```
PE1#show ip access-lists
IP access list allow-1
       IP access list asym-egress
        120 deny any host 70.70.1.2 80.80.1.0 0.0.0.255 [match=242780]

PE1#show ip access-lists
IP access list asym-egress
        120 deny any host 70.70.1.2 80.80.1.0 0.0.0.255 [match=257475]
        default deny-all

PE1#show ip access-lists
IP access list asym-egress
        120 deny any host 70.70.1.2 80.80.1.0 0.0.0.255 [match=272097]
        default deny-all
```

ACL on IRB Interface over VXLAN EVPN

Applying ACLs to an Integrated Routing and Bridging (IRB) interface or switchport enables control over packet flow, whether ingress or egress the interface. This capability is essential for maintaining security, managing bandwidth, and ensuring effective routing and bridging.

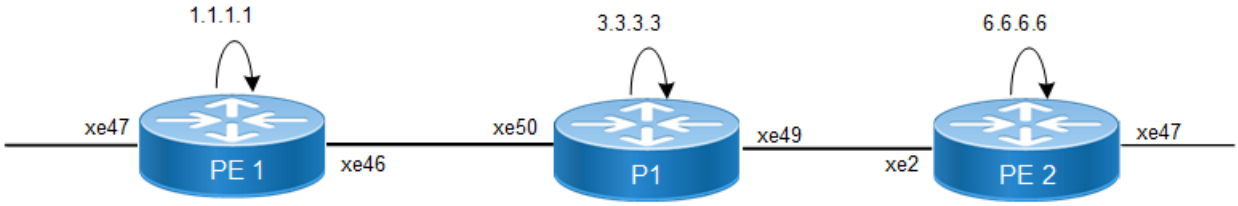
Topology

In this topology, PE1 and PE2 routers have IRB interfaces configured. The IRB interfaces bridge VLAN traffic and route between VLANs, enabling communication between Layer 2 and Layer 3.

ACLs are applied on the IRB interfaces to filter traffic, ensuring only authorized traffic passes through. The P1 router acts as a transit router, forwarding traffic between PE1 and PE2. The P1 router provides core functionality but does not handle IRB interfaces directly.

This configuration ensures that while traffic flows across the network, ACL policies can be enforced at both PE1 and PE2 over the IRB interfaces, securing communication between VLANs and controlling access between external networks

Figure 72. ACL on IRB sample topology



ACLs Configuration on IRB

Perform the following steps to enable EVPN VXLAN on an IRB interface while applying ACLs to control ingress or egress traffic:

Note: The required configuration for ACL on IRB is added in the Configuration section, for the detailed configuration on IRB symmetric and asymmetric refer to the *Base Configuration - L2 VxLAN* sub-section in the*VxLAN-EVPN with IRB* section of the *OcNOS VXLAN Guide*.

1. Enable Hardware Profiles for both IPv4 and IPv6 traffic at the ingress and egress of the interface:

```
PE1(config)#hardware-profile filter ingress-ipv4-subif enable
PE1(config)#hardware-profile filter ingress-ipv6-ext-subif enable
PE1(config)#hardware-profile filter egress-ipv4-ext enable
PE1(config)#hardware-profile filter egress-ipv6 enable
PE1(config)#hardware-profile filter vxlan enable
PE1(config)#hardware-profile filter vxlan-mh enable
PE1(config)#commit
```

2. Enable EVPN VXLAN:

```
PE1(config)#nvo vxlan enable
PE1(config)#nvo vxlan irb
PE1(config)#evpn vxlan multihoming enable # Only if multihoming is required
PE1(config)#commit
```

3. Configure an anycast MAC address for the gateway in a multihoming scenario, allowing multiple devices to share the same MAC address for redundancy:

```
PE1(config)#evpn irb-forwarding anycast-gateway-mac 0000.0000.1111
PE1(config)#commit
```

4. Define a MAC **VRF**[1] for isolating MAC address routing within the EVPN framework:

[1]Virtual Routing and Forwarding

```
PE1(config)#mac vrf vxlan_l2_elan_sh
PE1(config-vrf)#rd 1.1.1.1:101
PE1(config-vrf)#route-target both 101:101
```

Note: Ensure to provide `<RD value>` with a value different from PE1's RD of 1.1.1.1 to maintain proper routing table separation and avoiding conflicts between the two PE devices.

5. Define an IP VRF for routing L3 traffic within the EVPN framework:

```
PE1(config)#ip vrf vxlan_l3_elan_mhsh
PE1(config-vrf)#rd 1111:701
PE1(config-vrf)#route-target both 701:701
PE1(config-vrf)#l3vni 10050
PE1(config-vrf)#commit
```

Note: Ensure to provide `<rd value>` with a value different from PE1's RD of 1.1.1.1 to maintain proper routing table separation and avoiding conflicts between the two PE devices.

6. Configure EVPN VXLAN for host reachability and specify the IRB interface:

```
PE1(config)#nvo vxlan id 100 ingress-replication
PE1(config-nvo)# vxlan host-reachability-protocol evpn-bgp vxlan_l2_elan_mhsh
PE1(config-nvo)# evpn irb100
```

7. Configure a **`xe7`** interface for VLAN encapsulation and map it to the EVPN instance:

```
PE1(config)#interface xe7.100 switchport
PE1(config-if)# encapsulation dot1q 100
PE1(config-if)# rewrite pop
PE1(config-if)# access-if-evpn
PE1(config-acc-if-evpn)# map vpn-id 100
PE1(config-acc-if-evpn)#commit
```

8. Create ACL to filter outgoing traffic:

```
PE1(config)#
PE1(config)#ip access-list irb_100_nw
PE1(config-ip-acl)# 50 permit any 100.1.1.0/24 any
PE1(config-ip-acl)# 51 permit any 101.1.1.0/24 any
PE1(config-ip-acl)# default deny-all
PE1(config-ip-acl)# exit
PE1(config-ip-acl)#ipv6 access-list irb_100_v6
PE1(config-ipv6-acl)# 150 permit any 1001::/48 any
PE1(config-ipv6-acl)# default permit-all
PE1(config-ipv6-acl)#commit
```

9. Configure the IRB interface with IP addresses, associate it with the VRF, and apply the ACL:

```
PE1(config)#interface irb100
PE1(config-irb-if)# ip vrf forwarding vxlan_l3_elan_mhsh
PE1(config-irb-if)# evpn irb-if-forwarding anycast-gateway-mac
PE1(config-irb-if)# ip address 100.1.1.1/24 anycast
PE1(config-irb-if)# ip address 101.1.1.1/24 secondary anycast
PE1(config-irb-if)# ipv6 address 1001::1/48 anycast
PE1(config-irb-if)# ipv6 address 1002::1/48 anycast
PE1(config-irb-if)# ip access-group irb_100_nw in
PE1(config-irb-if)# ipv6 access-group irb_100_v6 in
PE1(config-irb-if)#commit
```

        default permit-all
```

Dynamic ARP Inspection

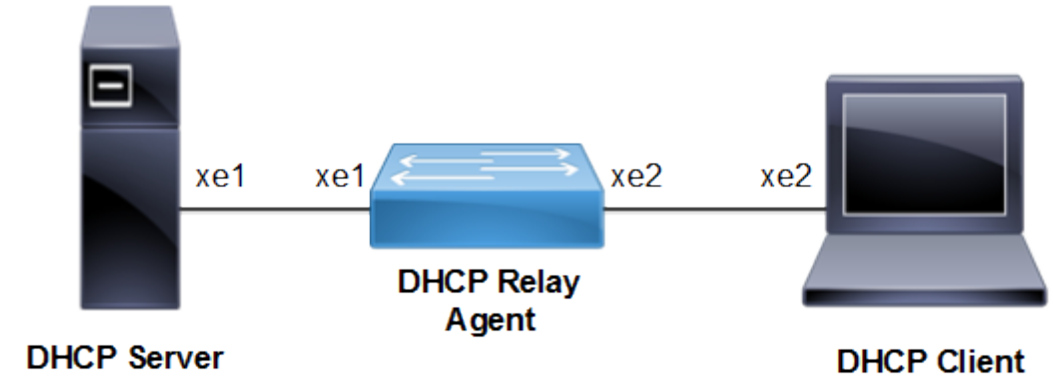
Overview

DAI (Dynamic ARP Inspection) is a security features that validates ARP packet in network by intercepting ARP packet and validating IP-to-MAC address binding learnt from **DHCP**[1] SNOOP.

DAI (Dynamic ARP Inspection) is a security measures which allows user to intercept, log and discard ARP packets with invalid MAC address to IP address binding. Once the DAI feature is enabled on the system, ARP packets are re-directed to software and validated against the MAC to IP binding data base before getting forwarded. ARP coming on untrusted port is inspected, validated and forwarded/dropped appropriately.

Topology

Figure 73. DAI Topology



Enable/Disable the Ingress DHCP-snoop TCAM group

`#configure terminal`	Enter Configure mode.
`(config)#hardware-profile filter dhcp-snoop enable`	Enable the ingress DHCP-snoop TCAM group
`(config)#commit`	Commit Candidate config to running-config
`(config)#hardware-profile filter dhcp-snoop disable`	Disable the ingress DHCP-snoop TCAM group
`(config)#commit`	Commit Candidate config to running-config

[1]Dynamic Host Configuration Protocol

Enable/Disable the Ingress DHCP-snoop-IPv6 TCAM group

#configure terminal	Enter Configure mode.
(config)#hardware-profile filter dhcp-snoop-ipv6 enable	Enable the ingress DHCP-snoop-IPv6 TCAM group
(config)#commit	Commit Candidate config to running-config
(config)#hardware-profile filter dhcp-snoop-ipv6 disable	Disable the ingress DHCP-snoop-IPv6 TCAM group
(config)#commit	Commit Candidate config to running-config

Enable DHCP Snooping and DAI Globally

#configure terminal	Enter Configure mode.
(config)#bridge 1 protocol mstp	Create MSTP or IEEE VLAN-bridge.
(config)#ip dhcp snooping bridge 1	Enable DHCP Snooping on the bridge
(config)#ip dhcp snooping arp-inspection bridge 1	Enable DAI on bridge
(config)#commit	Commit Candidate config to running-config

Enable DHCP Snooping and DAI on a VLAN

#configure terminal	Enter Configure mode.
(config)#vlan 2 bridge 1	Configure a VLAN for the bridge.
(config)#ip dhcp snooping vlan 2 bridge 1	Enable DHCP Snooping on the VLAN 2
(config)#ip dhcp snooping arp-inspection vlan 2 bridge 1	Enable DAI on VLAN
(config)#commit	Commit Candidate config to running-config

Validation

```
OcNOS#show hardware-profile filters

Note: Shared count is the calculated number from available resources.
      Dedicated count provides allocated resource to the group.
      If group shares the dedicated resource with other groups, then dedicated
      count of group will reduce with every resource usage by other groups.

```

Enable/Disable IP DHCP Snooping ARP-inspection Validate

Use this command to enable validation of the source-MAC, destination-MAC, or IP address field in the ARP packet payload.

Note: The IP address in a payload is validated for not being a broadcast address, a reserved zero IP address, and multicast address.

`#configure terminal`	Enter Configure mode.
`(config)#ip dhcp snooping arp-inspection validate src-mac bridge 1`	Enable SRC-MAC validate
`(config)#commit`	Commit Candidate config to running-config
`(config)#no ip dhcp snooping arp-inspection validate src-mac bridge 1`	Disable SRC-MAC validate
`(config)#commit`	Commit Candidate config to running-config
`(config)#ip dhcp snooping arp-inspection validate dst-mac bridge 1`	Enable DST-MAC validate
`(config)#commit`	Commit Candidate config to running-config
`(config)#no ip dhcp snooping arp-inspection validate dst-mac bridge 1`	Disable DST-MAC validate
`(config)#commit`	Commit Candidate config to running-config
`(config)#ip dhcp snooping arp-inspection validate ip bridge 1`	Enable IP validate
`(config)#commit`	Commit Candidate config to running-config
`(config)#no ip dhcp snooping arp-inspection validate ip bridge 1`	Disable IP validate
`(config)#commit`	Commit Candidate config to running-config

Configuring the Ports Connected to DHCP Server and DHCP Client

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface xe1 to be configured, and Enter interface mode
`(config-if)#switchport`	Configure the interface as a switch port.
`(config-if)#bridge-group 1`	Associate the interface xe1 with bridge-group 1.
`(config-if)#switchport mode access`	Configure the port as an access port
`(config-if)#switchport access vlan 2`	Bind the interface VLAN 2 to the port
`(config-if)#exit`	Exit interface mode.

`(config)#interface xe2`	Specify interface xe2 to be configured connected to server.
`(config-if)#switchport`	Configure the interface as a switch port
`(config-if)#bridge-group 1`	Associate interface xe2 with bridge-group 1.
`(config-if)#switchport mode access`	Configure the port as an access port.
`(config-if)#switchport access vlan 2`	Bind the interface VLAN 2 to the port
`(config-if)#exit`	Exit the config mode.
`(config)#commit`	Commit Candidate config to running-config
`(config)#exit`	Exit the config mode.

Configuring Trusted and Un-trusted Ports

Usually the port connected to server is configured as trusted port and the ports connected to client is configured as un-trusted port.

In this example, xe2 is connected to the **DHCP client**[1] and xe1 is connected to the DHCP server.

- Configure xe2 connected to DHCP client as un-trusted port.
- Configure xe1 connected to the DHCP server as trusted port.

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured
`(config-if)#ip dhcp snooping trust`	Enable the port as trusted.
`(config)#commit`	Commit Candidate config to running-config
`(config)#interface xe2`	Specify the interface to be configured
`(config-if)#no ip dhcp snooping trust`	Disable the port as trusted.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit Candidate config to running-config

Validation

```
OcNOS#show ip dhcp snooping arp-inspection statistics bridge 1
bridge     forwarded  dai dropped
------     ---------  -----------
1          0          10
```

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

Proxy ARP and Local Proxy ARP

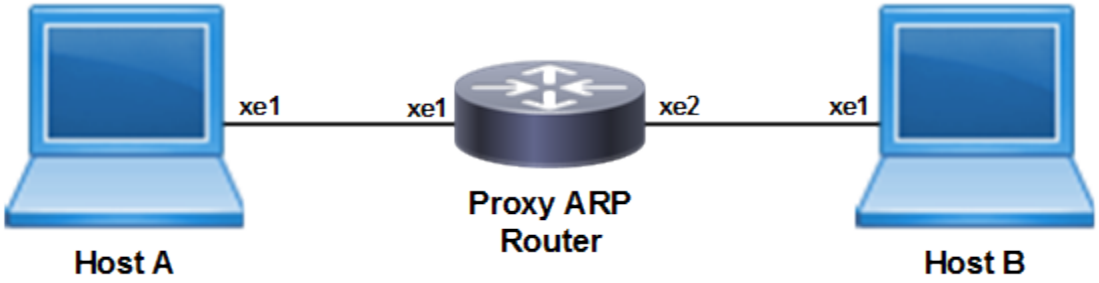
Overview

Proxy ARP (RFC 1027) is a technique by which a device on a given network answers the ARP queries for a network address that is not on that network. The Proxy ARP is aware of the location of the traffic's destination, and offers its own MAC address as destination. The captured traffic is then typically routed by the Proxy to the intended destination via another interface. Proxy ARP can help machines on a subnet reach remote subnets without the need to configure routing or a default gateway.

Use **`no ip proxy-arp`** to disable Proxy ARP, Proxy ARP is disabled by default.

Topology

Figure 74. Sample topology



Host A

Table 81.

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured on Host A
`(config-if)#ip address 20.20.0.3/24`	Configure the ip address on the interface
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface and configure mode

Host B

`#configure terminal`	Enter Configure mode
`(config)#interface xe1`	Specify the interface to be configured on Host B
`(config-if)#ip address 20.20.1.2/24`	Configure the ip address on the interface

`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface and configure mode

Enable Proxy ARP

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface connected to Host A
`(config-if)#ip address 20.20.0.1/24`	Configure the ip address on the interface
`(config-if)#interface xe2`	Specify the interface connected to Host B
`(config-if)#ip address 20.20.1.1/24`	Configure the ip address on the interface
`(config-if)#interface xe1`	Specify the interface to configure Proxy ARP
`(config-if)#ip proxy-arp`	Enable Proxy ARP
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface and configure mode

Validation

```
#show running-config arp
!
interface xe1
ip proxy-arp
!
```

The **`show arp`** command on the hosts shows the ARP table entries to reach different subnets. Ping Host A from Host B. The ARP table should have the router's xe1 interface MAC address to reach Host A. Execute the below command at Host B:

```
#show arp

Flags: D - Static Adjacencies attached to down interface

IP ARP Table for context default
Total number of entries: 2
Address          Age          MAC Address     Interface    State
20.20.0.3      00:02:39      ecf4.bbc0.3d71      xe1       STALE.
```

Local Proxy ARP Overview

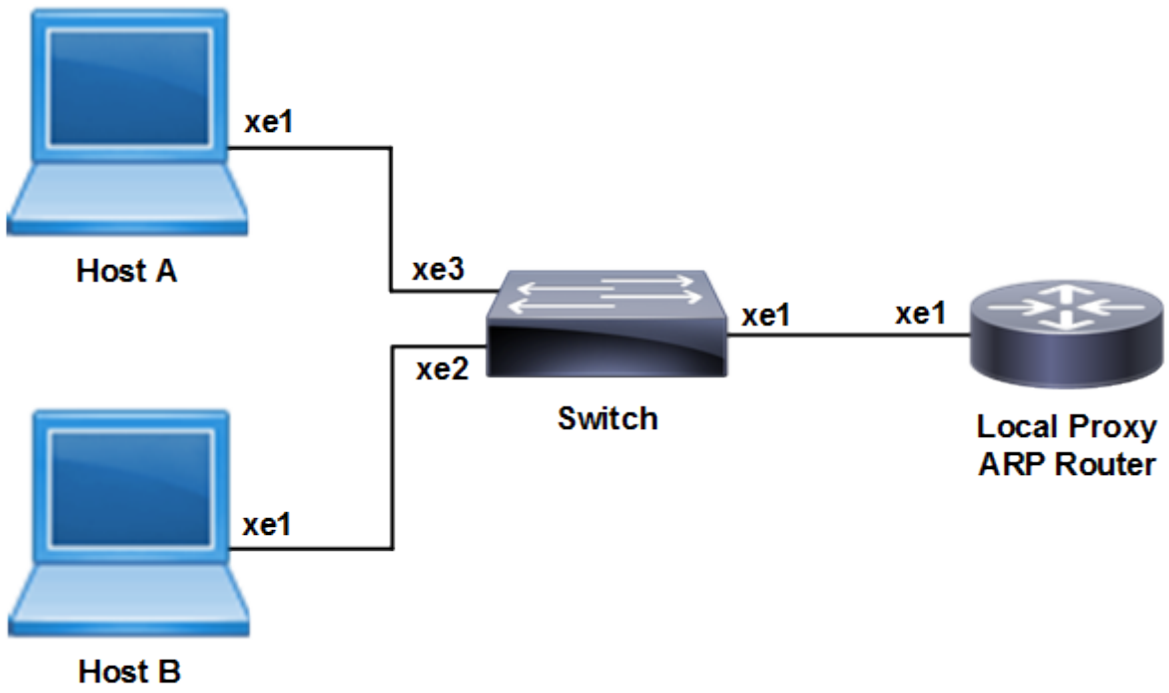
Local Proxy ARP feature is used to enable local proxy support for ARP requests per interface level. Activation will make the router answer all ARP requests on configured subnet, even for clients that should not normally need routing. Local proxy ARP means that the traffic comes in and goes out the same interface.

The local proxy ARP feature allows responding to ARP requests for IP addresses within a subnet where normally no routing is required. With the local proxy ARP feature enabled, ARP responds to all ARP requests for IP addresses

within the subnet and forwards all traffic between hosts in the subnet. Use this feature only on subnets where hosts are intentionally prevented from communicating directly.

Topology

Figure 75. Sample topology



Host A

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured on Host A
`(config-if)#ip address 20.20.0.2/24`	Configure the ip address on the interface
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface and configure mode

Host B

`#configure terminal`	Enter Configure mode
`(config)#interface xe1`	Specify the interface to be configured on Host B
`(config-if)#ip address 20.20.0.3/24`	Configure the ip address on the interface
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface and configure mode

Private Vlan Configuration on Switch

`#configure terminal`	Enter Configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Create ieee vlan-bridge on switch for pvlan configuration
`(config)#vlan database`	Enter into the vlan database
`(config-vlan)#vlan 100-101 bridge 1 state enable`	Create vlans 100 and 101 as part of bridge 1
`(config-vlan)#private-vlan 100 primary bridge 1`	Configure vlan 100 as a primary vlan
`(config-vlan)#private-vlan 101 isolated bridge 1`	Configure vlan 101 as a isolated vlan
`(config-vlan)#private-vlan 100 association add 101 bridge 1`	Associate secondary vlan 101 to primary vlan 100
`(config-vlan)#exit`	Exit from the vlan database
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe1`	Specify the interface to be configured
`(config-if)#switchport`	Configure xe1 as a layer2 interface.
`(config-if)#bridge-group 1`	Associate the interface to the bridge
`(config-if)#switchport access vlan 100`	Associate primary vlan to the interface
`(config-if)#switchport mode private-vlan promiscuous`	Configure xe1 interface as a promiscuous port
`(config-if)#switchport private-vlan mapping 100 add 101`	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe2`	Specify the interface to be configured
`(config-if)#switchport`	Configure xe2 as a layer2 interface.
`(config-if)#bridge-group 1`	Associate the interface to the bridge
`(config-if)#switchport access vlan 100`	Associate primary vlan to the interface
`(config-if)#switchport mode private-vlan promiscuous`	Configure xe2 interface as a promiscuous port
`(config-if)#switchport private-vlan mapping 100 add 101`	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe3`	Specify the interface to be configured
`(config-if)#switchport`	Configure xe3 as a layer2 interface.
`(config-if)#bridge-group 1`	Associate the interface to the bridge

`(config-if)#switchport access vlan 100`	Associate primary VLAN to the interface
`(config-if)#switchport mode private-vlan promiscuous`	Configure xe2 interface as a promiscuous port
`(config-if)#switchport private-vlan mapping 100 add 101`	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration

Enable Local Proxy ARP on Router

`#configure terminal`	Enter Configure mode
`(config)#interface xe1`	Specify the interface to be configured on Host B
`(config-if)#ip address 20.20.0.3/24`	Configure the ip address on the interface
`(config-if)#ip local-proxy-arp`	Enable Local Proxy ARP
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface and configure mode

Validation

ARP cache on Host A and Host B

The **`show arp`** command on hosts shows the arp table entries to reach different subnets. Ping Host B from Host A.Host A ARP table should have Router's xe1 interface MAC address to reach Host B. Execute the below command at Host A.

```
#show arp

Flags: D - Static Adjacencies attached to down interface

IP ARP Table for context default
Total number of entries: 2
Address          Age          MAC Address     Interface    State
20.20.0.3      00:02:39      ecf4.bbc0.3d71      xe1       STALE.
```

DHCP Snooping

Overview

DHCP[1] snooping is a series of techniques applied to ensure the security of an existing DHCP infrastructure. It is a security feature that acts like a fire wall between untrusted hosts and trusted DHCP servers. It is a layer-2 security technology built into the operating system of a capable network switch that drops DHCP traffic determined to be unacceptable.

The fundamental use case of DHCP snooping is to prevent unauthorized (rogue) DHCP servers offering IP addresses to DHCP clients. Rogue DHCP servers are often used in 'man-in the middle' or 'Denial of Service' attacks from malicious purpose. Similarly DHCP clients (rogue) can also cause 'Denial of Service' attacks by continuously requesting for IP addresses causing address depletion in the DHCP server.

The DHCP snooping feature performs the following activities:

- Validates DHCP messages received from un-trusted sources and filters out invalid messages.
- Rate-limits DHCP traffic from trusted and un-trusted sources.
- Builds and maintains the DHCP snooping binding database, which contains information about un-trusted hosts with leased IP addresses.
- Utilizes the DHCP snooping binding database to validate subsequent requests from un-trusted hosts.
- To retain the DHCP snooping bindings database across reloads, it is stored in a persistent file on switch itself. Upon reload, the switch restores binding database from the persistent file. On NTP sync, the lease time of the binding entries gets re-adjusted based on the timestamp that was written in the persistent file. The switch keeps the file updated by writing to the file periodically (default interval 300 seconds). **Note:** To ensure the accuracy of lease time adjustment, NTP should be configured on the snooper.
- When DHCP snooping is used over MLAG, the DHCP snooping binding database syncing will be happening among the peers via IDL.

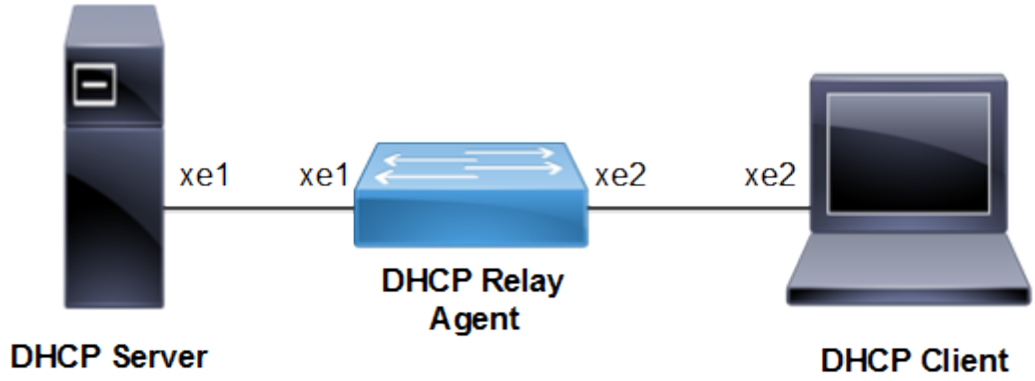
DHCP snooping with provider bridge is not supported.

DHCP snooping is enabled on a per-VLAN basis. By default, the feature is inactive on all VLANs. You can enable the feature on a single VLAN or a range of VLANs.

[1]Dynamic Host Configuration Protocol

Topology

Figure 76. DHCP Snooping topology



Configuration

When configuring DHCP snooping, follow these guidelines:

- DHCP snooping is not active until you enable the feature on at least one VLAN, and enable DHCP snooping globally on the switch.
- Before globally enabling DHCP snooping on the switch, make sure that the device acting as the DHCP server is configured and enabled.
- If a Layer 2 LAN port is connected to a DHCP server, configure the port as trusted by entering the **`ip dhcp snooping trust interface`** configuration command.
- If a Layer 2 LAN port is connected to a **DHCP client**[1], configure the port as un-trusted by entering the **`no ip dhcp snooping trust`** interface configuration command.

Procedures

The following subsections provide examples of how to enable and configure DHCP Snooping.

Enable the Ingress DHCP-snoop TCAM group

`#configure terminal`	Enter Configure mode.
`(config)#hardware-profile filter dhcp-snoop enable`	Enable the ingress DHCP-snoop TCAM group
`(config)#commit`	Commit Candidate config to running-config

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

Disable the Ingress DHCP-snoop TCAM group

`#configure terminal`	Enter Configure mode.
`(config)# hardware-profile filter dhcp-snoop disable`	Disable the ingress DHCP-snoop TCAM group
`(config)#commit`	Commit Candidate config to running-config

Enable the Ingress DHCP-snoop-IPv6 TCAM group

`#configure terminal`	Enter Configure mode.
`(config)#hardware-profile filter dhcp-snoop-ipv6 enable`	Enable the ingress DHCP-snoop-IPv6 TCAM group
`(config)#commit`	Commit Candidate config to running-config

Disable the Ingress DHCP-snoop-IPv6 TCAM group

`#configure terminal`	Enter Configure mode.
`(config)# hardware-profile filter dhcp-snoop-ipv6 disable`	Disable the ingress DHCP-snoop-IPv6 TCAM group
`(config)#commit`	Commit Candidate config to running-config

Enable DHCP Snooping Globally

`#configure terminal`	Enter Configure mode.
`(config)#bridge 1 protocol mstp`	Create MSTP or IEEE VLAN-bridge.
`(config)#ip dhcp snooping bridge 1`	Enable DHCP Snooping on the bridge
`(config)#commit`	Commit Candidate config to running-config

Enable DHCP Snooping on a VLAN

`#configure terminal`	Enter Configure mode.
`(config)#vlan 2 bridge 1`	Configure a VLAN for the bridge.
`(config)#ip dhcp snooping vlan 2 bridge 1`	Enable DHCP Snooping on the VLAN 2
`(config)#commit`	Commit Candidate config to running-config

Validation

```
OcNOS#show hardware-profile filters

Note: Shared count is the calculated number from available resources.
      Dedicated count provides allocated resource to the group.
      If group shares the dedicated resource with other groups, then dedicated
      count of group will reduce with every resource usage by other groups.

+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| Unit - TCAMS       | Entries |---------------|----------------------------|
```

```
|                     |         |  %  | Entries | Total | Dedicated | shared |
+---------------------+---------+-----+---------+-------+-----------+--------+
0 DHCP-SNOOP            9717      0     5         9722    1018        8704
0 DHCP-SNOOP-IPV6       9717      0     6         9723    1019        8704
```

Configuring the Ports Connected to DHCP Server and DHCP Client

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface xe1 to be configured, and Enter interface mode
`(config-if)#switchport`	Configure the interface as a switch port.
`(config-if)#bridge-group 1`	Associate the interface xe1 with bridge-group 1.
`(config-if)#switchport mode access`	Configure the port as an access port
`(config-if)#switchport access vlan 2`	Bind the interface VLAN 2 to the port
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Specify interface xe2 to be configured connected to server.
`(config-if)#switchport`	Configure the interface as a switch port
`(config-if)#bridge-group 1`	Associate interface xe2 with bridge-group 1.
`(config-if)#switchport mode access`	Configure the port as an access port.
`(config-if)#switchport access vlan 2`	Bind the interface VLAN 2 to the port
`(config-if)#exit`	Exit the config mode.
`(config)#commit`	Commit Candidate config to running-config
`(config)#exit`	Exit the config mode.

Configuring Trusted and Un-trusted Ports

Usually the port connected to server is configured as trusted port and the ports connected to client is configured as un-trusted port.

In this example, xe2 is connected to the **DHCP client**[1] and xe1 is connected to the **DHCP**[2] server.

- Configure xe2 connected to DHCP client as un-trusted port.
- Configure xe1 connected to the DHCP server as trusted port.

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured
`(config-if)#ip dhcp snooping trust`	Enable the port as trusted.
`(config)#commit`	Commit Candidate config to running-config
`(config)#interface xe2`	Specify the interface to be configured
`(config-if)#no ip dhcp snooping trust`	Disable the port as trusted.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit Candidate config to running-config

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[2]Dynamic Host Configuration Protocol

IDHCP Snooping Operation

1. Configure **DHCP**[1] server that is connected to DHCP Snooper through trusted port.
2. Request an IP address from the **DHCP client**[2] connected through the un-trusted port.
3. DHCP client broadcast the DHCP DISCOVER message to the switch.
4. DHCP server responds to the DHCP DISCOVER message with DHCP offer message to the client.
5. Once the DHCP OFFER is received by the client, it sends an DHCP REQUEST to the server.
6. DHCP server validates the request from the client and sends DHCP ACK with the offered IP address to the client with the lease time.
7. DHCP Snooper creates an entry for the above operation into the binding table which includes the MAC address of the host, the leased IP address, the lease time, the binding type, and the VLAN number and interface information associated with the host.
8. DHCP Snooper clears the entry in the binding table once the client sends the DHCP RELEASE query or lease time is expired.

Note: On snooper once lease time becomes 0 for an entry, it is removed from the bind table within 10 sec.

Validation

The **`show running-config ip dhcp snooping`** command displays the DHCP snooping commands configured on the device in question.

```
#show running-config ip dhcp snooping
!
!
ip dhcp snooping bridge 1
ip dhcp snooping vlan 2 bridge 1
interface xe1
 ip dhcp snooping trust
!
```

The **`show ip dhcp snooping bridge 1`** command displays the configured information about DHCP Snooping.

```
#show ip dhcp snooping bridge 1

Bridge Group : 1
DHCP snooping is : Enabled
DHCP snooping option82 is : Disabled
Verification of hwaddr field is : Disabled
Strict validation of DHCP packet is                    : Disabled
Rate limit(pps) : 100
DHCP snooping is configured on following VLANs : 2
DHCP snooping is operational on following VLANs : 2
```

Interface       Source Guard
-------         -----------
```

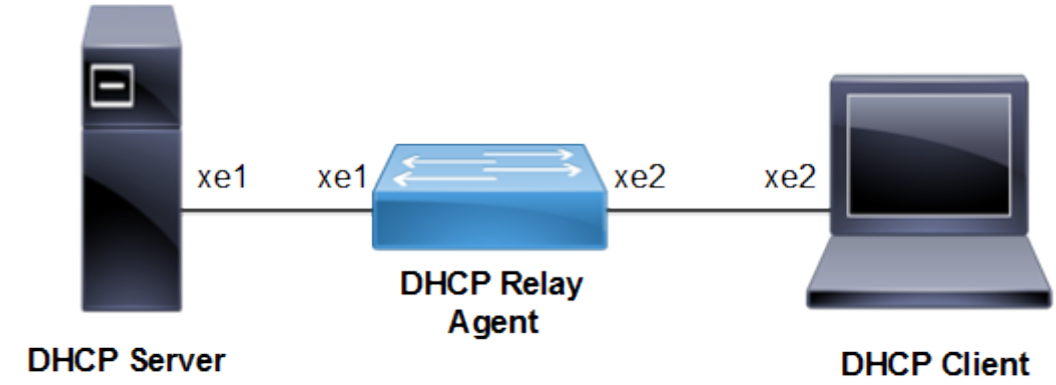
DHCP Snooping IP Source Guard

Overview

IPSG is a security feature that restricts IP traffic on non-routed, Layer 2 interfaces by filtering traffic based on the **DHCP**[1] snooping binding database. Use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor. Enable IP source guard when DHCP snooping is enabled on an untrusted interface. After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping. A port access control list (ACL) is applied to the interface. The port ACL allows only IP traffic with a source IP address in the IP DHCP snooping binding table and denies all other traffic.

Topology

Figure 77. IP Source Guard Topology



Enable/Disable the Ingress DHCP-snoop TCAM Group

`#configure terminal`	Enter Configure mode.
`(config)#hardware-profile filter dhcp-snoop enable`	Enable the ingress DHCP-snoop TCAM group
`(config)#commit`	Commit Candidate config to running-config
`(config)#hardware-profile filter dhcp-snoop disable`	Disable the ingress DHCP-snoop TCAM group
`(config)#commit`	Commit Candidate config to running-config

Enable/Disable the Ingress DHCP-snoop-IPv6 TCAM Group

`#configure terminal`	Enter Configure mode.
`(config)#hardware-profile filter dhcp-snoop-ipv6 disable`	Disable the ingress DHCP-snoop-IPv6 TCAM group

[1]Dynamic Host Configuration Protocol

(config)#commit	Commit Candidate config to running-config
(config)#hardware-profile filter dhcp-snoop-ipv6 disable	Disable the ingress DHCP-snoop-IPv6 TCAM group
(config)#commit	Commit Candidate config to running-config

Enable/Disable the Ingress IPSG TCAM group

#configure terminal	Enter Configure mode.
(config)#hardware-profile filter ipsg enable	Enable the ingress IPSG TCAM group
(config)#commit	Commit Candidate config to running-config
(config)#hardware-profile filter ipsg disable	Disable the ingress IPSG TCAM group
(config)#commit	Commit Candidate config to running-config

Enable/Disable the Ingress IPSG-IPV6 TCAM group

#configure terminal	Enter Configure mode.
(config)#hardware-profile filter ipsg-ipv6 enable	Enable the ingress IPSG-IPv6 TCAM group
(config)#commit	Commit Candidate config to running-config
(config)#hardware-profile filter ipsg-ipv6 disable	Disable the ingress IPSG-IPv6 TCAM group
(config)#commit	Commit Candidate config to running-config

Validation

```
OcNOS#show hardware-profile filters

Note: Shared count is the calculated number from available resources.
      Dedicated count provides allocated resource to the group.
      If group shares the dedicated resource with other groups, then dedicated
      count of group will reduce with every resource usage by other groups.

```

Configuring the Ports Connected to DHCP Server and DHCP Client

`#configure terminal`	Enter Configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Create IEEE VLAN bridge 1.
`(config)#vlan 2 bridge 1 state enable`	Create VLAN 2
`(config)#ip dhcp snooping bridge 1`	Configure **DHCP**[1] snooping for bridge 1
`(config)#ip dhcp snooping information option bridge 1`	Configure DHCP snooping information option 82
`(config)#ip dhcp snooping vlan 2 bridge 1`	Configure DHCP snooping for VLAN 2 for bridge 1
`(config)#ip dhcp snooping verify mac-address bridge 1`	Configure DHCP snooping verify MAC-address
`(config)#interface xe1`	Enter Interface Mode
`(config-if)#switchport`	Configure the interface as Layer 2
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)#switchport mode access`	Set the Layer2 interface as Access. (It can be Trunk mode also)
`(config-if)#switchport access vlan 2`	Set the default VLAN for the interface
`(config-if)#ip dhcp snooping trust`	Configuring the interface as Trust. Basically this is configured on the interface which is connected to Server Side.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter Interface Mode
`(config-if)#switchport`	Configure the interface as Layer 2
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)#switchport mode access`	Set the Layer2 interface as Access. (It can be Trunk mode also)
`(config-if)#switchport access vlan 2`	Set the default VLAN for the interface
`(config-if)#ip verify source dhcp-snooping-vlan`	Configuring IP source guard at Interface level and configured on the interface which is connected to client side
`(config-if)#ip verify source access-group mode merge`	Merge IPSG policy with other ACL
`(config-if)#exit`	Exit interface mode
`(config)#ip dhcp snooping binding bridge 1 0011.1111.2222 2 ipv4 1.1.1.1 xe2`	Configure IPv4 Static Entry For DHCP snooping with MAC address and Source Address for an interface and VLAN configured
`(config)#ip dhcp snooping binding bridge 1`	Configure IPv6 Static Entry For DHCP snooping with

[1]Dynamic Host Configuration Protocol

`0022.2222.3333 2 ipv6 3ffe::1 xe2`	MAC address and Source Address for an interface and VLAN configured
`(config)#commit`	Commit Candidate config to running-config
`(config)#exit`	Exit config mode
`#clear ip dhcp snooping binding bridge 1`	Clear DHCP binding tables which are learned dynamically

Validation

Verify that DHCP snooping is enabled on the bridge:

```
#sh ip dhcp snooping bridge 1
Bridge Group : 1
DHCP snooping is : Enabled
DHCP snooping option82 is : Enabled
Verification of hwaddr field is : Enabled
DHCP snooping is configured on following VLANs : 2
DHCP snooping is operational on following VLANs : 2
DHCP snooping trust is configured on the following Interfaces
Interface       Trusted
--------------- -------
xe1             Yes
```

DHCP snooping IP Source Guard is configured on the following Interfaces.

```
Interface       Source Guard
--------------- ------------
xe2             Yes
```

Configuring Trusted and Un-trusted Ports

Usually the port connected to server is configured as trusted port and the ports connected to client is configured as un-trusted port.

In this example, xe2 is connected to the **DHCP client**[1] and xe1 is connected to the **DHCP**[2] server.

- Configure xe2 connected to DHCP client as un-trusted port.
- Configure xe1 connected to the DHCP server as trusted port.

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured
`(config-if)#ip dhcp snooping trust`	Enable the port as trusted.
`(config)#commit`	Commit Candidate config to running-config
`(config)#interface xe2`	Specify the interface to be configured
`(config-if)#no ip dhcp snooping trust`	Disable the port as trusted.
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit Candidate config to running-config

Validation

Verify that static DHCP snooping entries are configured for the bridge:

```
#sh ip dhcp snooping binding bridge 1
Total number of static IPV4 entries : 1
Total number of dynamic IPV4 entries : 0
Total number of static IPV6 entries : 1
Total number of dynamic IPV6 entries : 0

MacAddress         IpAddress       Lease(sec) Type          VLAN Interface
------------------ --------------- ---------- ------------- ---- ---------------
0011.1111.2222     1.1.1.1         0          static        2    xe2
0022.2222.3333     3ffe::1         0          static        2    xe2
```

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[2]Dynamic Host Configuration Protocol

Configuring IP Source Guard on LAG Port

In this example, the **LAG**[1] port (sa2) is created, then physical interfaces are added.

`#configure terminal`	Enter Configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Create IEEE VLAN bridge 1.
`(config)#vlan 2 bridge 1 state enable`	Create VLAN 2
`(config)#ip dhcp snooping bridge 1`	Configure **DHCP**[2] snooping for bridge 1
`(config)#ip dhcp snooping information option bridge 1`	Configure DHCP snooping information option 82
`(config)#ip dhcp snooping vlan 2 bridge 1`	Configure DHCP snooping for VLAN 2 for bridge 1
`(config)#ip dhcp snooping verify mac-address bridge 1`	Configure DHCP snooping verify MAC-address
`(config)#interface sa2`	Enter Interface Mode
`(config-if)#switchport`	Configure the interface as Layer 2
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)#ip verify source dhcp-snooping-vlan`	Configuring IP source guard at Interface level and configured on the interface which is connected to client side
`(config-if)#ip verify source access-group mode merge`	Merge IPSG policy with other ACL
`(config-if)#exit`	Exit interface mode
`(config)#interface xe1`	Enter Interface Mode
`(config-if)#switchport`	Configure the interface as Layer 2
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)#switchport mode access`	Set the Layer2 interface as Access. (It can be Trunk mode also)
`(config-if)#switchport access vlan 2`	Set the default VLAN for the interface
`(config-if)#ip dhcp snooping trust`	Configuring the interface as Trust. Basically this is configured on the interface which is connected to Server Side.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter Interface Mode
`(config-if)#switchport`	Configure the interface as Layer 2
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)#switchport mode access`	Set the Layer2 interface as Access. (It can be Trunk mode also)

[1]Link Aggregation Group

[2]Dynamic Host Configuration Protocol

`(config-if)#switchport access vlan 2`	Set the default VLAN for the interface
`(config-if)#static-channel-group 2`	Configure Static Channel LAG on the interface
`(config-if)#exit`	Exit interface mode
`(config)#ip dhcp snooping binding bridge 1 0011.1111.2222 2 ipv4 1.1.1.1 xe1`	Configure IPv4 Static Entry For DHCP snooping with MAC address and Source Address for an interface and VLAN configured
`(config)#ip dhcp snooping binding bridge 1 0022.2222.3333 2 ipv6 3ffe::1 xe2`	Configure IPv6 Static Entry For DHCP snooping with MAC address and Source Address for an interface and VLAN configured
`(config)#commit`	Commit Candidate config to running-config
`(config)#exit`	Exit config mode
`#clear ip dhcp snooping binding bridge 1`	Clear DHCP binding tables which are learned dynamically

Validation

Verify that DHCP snooping is enabled on the bridge with the static LAG interface:

```
#sh ip dhcp snooping bridge 1
Bridge Group : 1
DHCP snooping is : Enabled
DHCP snooping option82 is : Enabled
Verification of hwaddr field is : Enabled
DHCP snooping is configured on following VLANs : 2
DHCP snooping is operational on following VLANs : 2
```

DHCP snooping IP Source Guard is configured on the following Interfaces

```
Interface       Source Guard
--------------- ------------
sa2             Yes
```

Verify that static DHCP snooping or source guard entries are configured for the bridge with the LAG interface:

```
#sh ip dhcp snooping binding bridge 1
Total number of static IPV4 entries : 1
Total number of dynamic IPV4 entries : 0
Total number of static IPV6 entries : 1
Total number of dynamic IPV6 entries : 0
MacAddress         IpAddress       Lease(sec) Type          VLAN Interface
------------------ --------------- ---------- ------------- ---- --------------
----
0011.1111.2222     1.1.1.1         0          static        2    sa2
0022.2222.3333     3ffe::1         0          static        2    sa2
```

No IP Unreachable

Overview

The "no ip unreachable" feature in networking devices is a configuration used to enhance network security and efficiency by disabling the generation of Internet Control Message Protocol (**ICMP**[1]) unreachable messages. Normally, these messages are sent by routers and other network devices in response to packets that cannot be delivered to their intended destination for various reasons.

When the "no ip unreachable" command is enabled, the network device stops sending these ICMP unreachable messages.

Supported ICMP Unreachable Codes

Here are the codes used in ICMPv6 Unreachable.

Table 82. ICMP Unreachable Codes

Code	Message	Description
0	Destination network unreachable	
1	Destination host unreachable	
2	Destination protocol unreachable	
3	Destination port unreachable	The destination network is not reachable from the current router.
4	Fragmentation needed and DF flag set	The specific destination host within a reachable network is not accessible.
5	Source Route Failed	The protocol specified in the packet is not supported by the destination.
6	Destination Network Unknown	The destination port is not open or not listening on the destination device.
7	Destination Host Unknown	NA
8	Source Host Isolated	NA
9	Network Administratively Prohibited	NA
10	Network Administratively Prohibited	NA
11	Network Unreachable for TOS	NA
12	Host Unreachable for TOS	NA
13	Communication Administratively Prohibited	NA
14	Host Precedence Violation	NA

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

Table 82. ICMP Unreachable Codes (continued)

Code	Message	Description
15	Precedence Cutoff in Effect	NA

Supported ICMPv6 Unreachable Codes

Here are the codes used in ICMPv6 Unreachable.

Table 83. ICMPv6 Unreachable Codes

Codes	Description
0	No route to destination
1	Communication with destination administratively prohibited
2	Beyond scope of source address
3	Address unreachable
4	Port unreachable
5	Source address failed ingress/egress policy
6	Reject route to destination

Feature Characteristics

The "no ip unreachable" feature is used to prevent a device from sending ICMP unreachable messages. These messages are typically generated when a router cannot forward a packet because the destination is unreachable. Disabling these messages can enhance network performance and security.

Benefits

The advantages of utilizing a No IP Unreachables:

- Enhanced Security
- Performance Optimization
- Simplified Troubleshooting.

Configuration

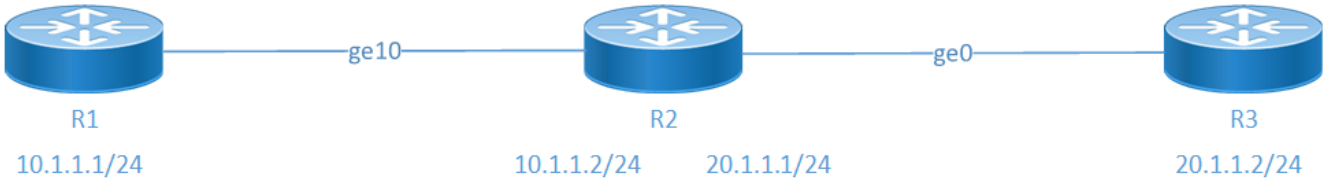
To configure "no ip unreachable," enter interface configuration mode on the device, select the outgoing interface, and apply the "no ip unreachable" command. This prevents the device from sending **ICMP**[1] unreachable messages for packets sent through that interface, thereby enhancing network security.

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

Example for Suppressing the ICMP Destination Host Unreachable Message

With the configuration shown in the diagram, R2 is set to drop ICMP unreachable messages for packets exiting from interface ge10. The following steps describe how it operates. The procedures in this section use the topology in Figure 78

Figure 78. No IP Unreachable



1. Packet Reception: R2 receives a packet that it needs to forward to a destination.
2. Routing Decision: R2 checks its routing table to determine the next hop for the packet.
3. Unreachable Destination: If there is no valid route to reach the destination 20.1.1.3, R2 would normally generate an ICMP unreachable message, indicating Destination Host Unreachable.
4. Suppression of ICMP Message: With the "no ip unreachable" command enabled on R2's interface ge10, R2 suppresses outgoing ICMP messages from interface ge10, effectively dropping the packet without notifying the sender. In this case, R2 drops the Destination Host Unreachable message.

Example for Suppressing the ICMP Destination Network Unreachable Message

With the configuration shown in the diagram, R2 is set to drop ICMP unreachable messages for packets going out from interface ge10. The following steps describe how it operates. The procedures in this section use the topology in

1. Packet Reception: R2 receives a packet that it needs to forward to a destination.
2. Routing Decision: R2 checks its routing table to determine the next hop for the packet.
3. Unreachable Destination: If there is no valid route to reach the destination network 30.1.1.1, R2 would normally generate an ICMP unreachable message, indicating Destination Network Unreachable.
4. Suppression of ICMP Message: With the "no ip unreachable" command enabled on R2's interface ge10, R2 suppresses outgoing ICMP messages from interface ge10, effectively dropping the packet without notifying the sender. In this case, R2 drops the "Destination Network Unreachable" message.

Example for Suppressing the ICMP Fragmentation Needed Message

With the configuration shown in the diagram, R2 is set to drop ICMP unreachable messages for packets going out from interface ge10. The following steps describe how it operates. The procedures in this section use the topology in Figure 79. No IPv6 Unreachable (page 1290)

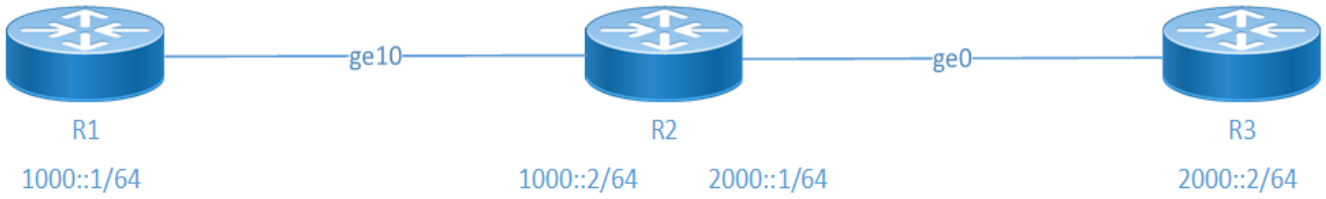
1. Packet Reception: R2 receives a packet that it needs to forward to a destination.
2. Routing Decision: R2 checks the data size of the packet to transmit to the next hop. In this case, the data size is 1328 bytes.
3. Unreachable Destination: Since the maximum transmission unit (MTU) on R2 is set to 1200 bytes, R2 would normally generate an ICMP unreachable message, indicating "Fragmentation needed but DF is set."

4. Suppression of ICMP Message: With the "no ip unreachable" command enabled on R2's interface ge10, R2 suppresses outgoing ICMP messages from interface ge10, effectively dropping the packet without notifying the sender. In this case, R2 drops the "Fragmentation needed" message.

Topology

The procedures in this section use the topology in Figure 79

Figure 79. No IPv6 Unreachable



Configurations

This configuration suppresses ICMP messages from being sent out of the interface. Perform the following steps to configure no ip unreachable functionality for R2.

No IP Unreachable Configuration

- Supports all type of nodes.

Configuring No IP/IPv6 Unreachable

1. To enter into interface mode, execute the following command in the config mode. Access interface configuration mode for the interface.

   ```
   R2(config)#interface ge10
   ```

   Assign an IPv6 address to the interface using the ipv6 address command followed by the desired IPv6 address and subnet mask.

   (ipv6 address 1000::1/64)

2. To enable No IP/IPv6 Unreachable, execute the following command.

   ```
   R2(config-if)#no ip unreachable
   R2(config-if)#no ipv6 unreachable
   ```

3. To configure, execute the following command.

   ```
   R2(config-if)#commit
   ```

4. Verify the configuration as instructed in the validation.

Snippet configuration on R1 router is as follows:

```
!
interface ge10
 ip address 10.1.1.1/24
!
```

Snippet configuration on R2 router is as follows:

```
!
interface ge10
 ip address 10.1.1.2/24
 no ip unreachable
!
```

Validation

To verify that the no ip unreachables command has been applied to the interface, you can use the following command:.

R1:

```
OcNOS#ping 20.1.1.3
Press CTRL+C to exit
PING 20.1.1.3 (20.1.1.3) 100(128) bytes of data.
From 10.1.1.2 icmp_seq=1 Destination Host Unreachable
From 10.1.1.2 icmp_seq=2 Destination Host Unreachable
From 10.1.1.2 icmp_seq=3 Destination Host Unreachable
From 10.1.1.2 icmp_seq=4 Destination Host Unreachable
From 10.1.1.2 icmp_seq=5 Destination Host Unreachable
From 10.1.1.2 icmp_seq=6 Destination Host Unreachable

--- 20.1.1.3 ping statistics ---
7 packets transmitted, 0 received, +6 errors, 100% packet loss, time 142ms
pipe 3
OcNOS#
```

No IP Unreachable Unconfiguration

To revert the suppression of **ICMP**[1] messages to the original configuration, follow the steps.

1. Enter the global configuration mode.
   ```
   R2#configure terminal
   ```
2. Configure the interface ge10.
   ```
   R2(config)#interface ge10
   ```
3. Re-enable ICMP unreachable messages.
   ```
   R2(config-if)#ip unreachable
   ```
4. To commit the changes exit.
   ```
   R2(config)#commit
   R2(config)#exit
   ```

Validation

R1:

```
OcNOS#ping 20.1.1.3
Press CTRL+C to exit
PING 20.1.1.3 (20.1.1.3) 100(128) bytes of data.
```

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

```
--- 20.1.1.3 ping statistics ---
8 packets transmitted, 0 received, 100% packet loss, time 167ms
OcNOS#
```

No IPv6 Unreachable Unconfiguration

To revert the suppression of ICMPv6 messages to the original configuration, follow the steps.

1. Enter the global configuration mode.
   ```
   R2#configure terminal
   ```
2. Configure the interface ge10.
   ```
   R2(config)#interface ge10
   ```
3. Re-enable **ICMP**[1] unreachable messages.
   ```
   R2(config-if)#ipv6 unreachable
   ```
4. To commit the changes exit.
   ```
   R2(config)#commit
   R2(config)#exit
   ```

CLI Commands

The no ip unreachable introduces the following configuration commands:

no ip unreachable

This command to suppress the **ICMP**[2] messages going out from the interface.

Remove the no form of this command to allow ICMP messages going out from the interface.

Command Syntax

```
no ip unreachable
ip unreachable
```

Parameters

None

Default

None

Command Mode

Interface mode

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

[2]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

Applicability

This command was introduced in OcNOS version 6.5.2.

Examples

```
#configure terminal
(config)# interface ge0
(config-if)#no ip unreachable
```

no ipv6 unreachable

This command to suppress the ICMPv6 messages going out from the interface.

Remove the no form of this command to allow ICMPv6 messages going out from the interface.

Command Syntax

```
no ipv6 unreachable
ipv6 unreachable
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.5.2.

Examples

```
#configure terminal
(config)# interface ge0
(config-if)#no ipv6 unreachable
```

Port Breakout Configuration

Port Breakout (100G and 400G) on Qumran Series Platforms

Overview

Port breakout divides high-speed Ethernet ports into multiple lower-speed ports, ensuring efficient network connectivity and seamless scalability. Modern networks require various Ethernet interface speeds, including 10GbE, 25GbE, 40GbE, 50GbE, 100GbE, and 400GbE. To meet evolving speed and density demands, networks rely on cost-effective cabling solutions that support flexible connectivity.

Note: The port breakout functionality is supported only for QSFP28 100G ports explicitly designated for breakout configurations. Ports such as 10GbE SFP+ and 25GbE SFP28 do not support this functionality.

400G Port Breakout

Each 400GbE port (**QSFP-DD**[1]) supports up to eight serdes, with each serdes delivering 50G of bandwidth. This capability enables multiple breakout configurations, including:

- 8x50G
- 4x100G
- 2x200G
- 8X50g
- 8X25g
- 8X10g

Port breakout allows networks to allocate bandwidth efficiently and optimize connectivity while maintaining full Layer 2 (L2) and Layer 3 (L3) support. The default SERDES mode operates at 50G.

100G Port Breakout

100GbE ports break out into multiple lower-speed interfaces through a secure and reliable breakout cabling solution. Supported configurations include:

- 4x1G
- 4x10G
- 4x25G
- 2x50G

Control ports manage breakout functionality, while the newly created lower-speed ports function as subsidiary ports. When breaking out a 100GbE port (for example: ce3) into four 10GbE ports, the system removes the original port (ce3) and creates four new ports (ce3/1, ce3/2, ce3/3, and ce3/4). These breakout ports support all standard L2 and L3 features, just like regular ports.

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

When removing the breakout configuration, the system deletes the subsidiary ports and restores the original 100GbE port.

Port breakout maximizes hardware efficiency, adapts to changing bandwidth demands, and enables a seamless transition between different Ethernet speeds.

Feature Characteristics

- **Port Speed Adaptability**: Breakout configurations enable connection to devices with different port speeds, enhancing network flexibility and bandwidth optimization.
- **Enhanced Port Utilization**: Improves available faceplate capacity and facilitates easier upgrades to higher-speed networks.

Benefits

Utilizing a 100G and 400G port breakout offers several advantages:

- **Increased Port Density:** Maximizes equipment utilization and conserves rack space.
- **Energy Efficiency:** Reduces power consumption per port.
- **Future-Ready Networks:** Simplifies transitions to higher-speed interfaces, ensuring scalability.

Platform-Specific Details 100G Port

Platform Name	100G Port Details	Hardware(HW) Profile		Global Level Breakout Configurations Irrelevant of the HW Profile
		Mode 1(Default)	Mode2/Mode3/Mode4	
S9500-22XST	2 x 100GE with QSFP28 interfaces	NA	NA	Yes

[1]QSFP-DD stands for Quad Small Form Factor Pluggable Double Density. QSFP-DD modules provide a scalable, high-bandwidth solution for data center networking, enabling efficient data transmission and network performance in modern computing environments.

Key Considerations

- Port breakout is supported on all 100G interfaces except those with an external PHY. Use the **`show hsl extphy status`**. command to identify these ports.
- Switching directly between breakout modes (4x10G and 4x25G) is not possible. To change the mode, first remove the existing breakout configuration.
- Port breakout is not supported on ports with sub-interfaces or active services. Before enabling breakout, all services on the interface must be unconfigured. After breakout, services can be reconfigured on the breakout ports.
- If the error message **`% Max egress credit limit reached`** appears during port breakout configuration, reducing the speed of some interfaces may be required due to hardware limitations.

Configuration

The Qumran platform supports two approaches to configure port breakout: `hardware-profile` (supports only for Qumran1 (Q1) series platforms and interface-level breakout for both Qumran (Q1 and Q2) series platforms. Each method has unique requirements and implications.

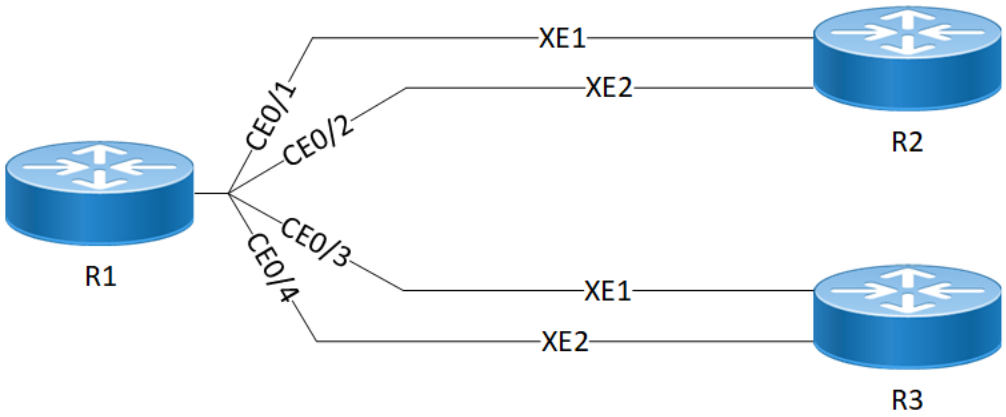
Topology through Hardware Profile

The topology illustrates a 100G port breakout involving three routers (R1, R2, and R3).

R1 represents the central router, which has a 100G QSFP28 port split into four sub-ports: CE0/1, CE0/2, CE0/3, and CE0/4.

Each sub-port is connected to the routers R2 and R3 using XE1 and XE2 interfaces, creating high-speed connections.

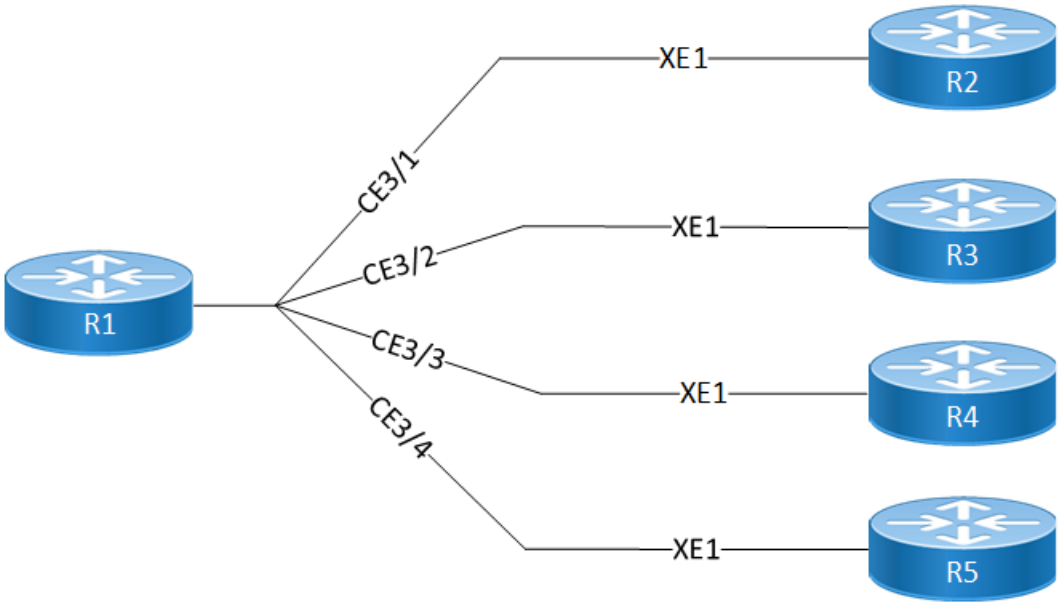
Figure 80. Qumran AX or MX 100G Port Breakout



Topology through Global Level

The topology depicts a 100G QSFP28 port on Router 1 (R1) split into four 25G sub-ports (CE3/1 to CE3/4), each connecting to downstream routers (R2 to R5) via XE1 interfaces. This configuration enhances port density and enables efficient utilization of high-speed ports.

Figure 81. Qumran 2 100G Port Breakout



Configuration of Hardware-profile Breakout for 100G/400G Ports

Perform the following to configure port breakout on a supported device:

1. Enter the configuration mode:
```
ocnos#configure terminal
```
2. Configure the ports to mode2 and to enable port breakout into 4x25G or 4x1G.
```
ocnos(config)#hardware-profile port-config mode2
```

Note: Similarly, as per network configuration requirements, you can configure mode3 breakout to 4x10G, or `mode4` breakout to 4x25G. Refer to the Platform-Specific Details 100G Port (page 1297), and Platform-Specific Details 400G Port (page 1299) for detailed port breakout options.

3. Save the configuration, and reload the device to view the changes:
```
ocnos(config)#commit
ocnos#reload
```

After the reload, the designated 100G/400G QSFP28/**QSFP-DD**[1] ports are subdivided into the configured breakout sub-ports.

Validation

To verify the port breakout configuration for 100G, execute the following command:

```
ocnos#show interface brief

Codes: ETH - Ethernet, LB - Loopback, AGG - Aggregate, MLAG - MLAG Aggregate

Configuration of Global-Level Breakout (No Reload Required)

This method configures the port breakout without requiring a system reload. Perform the following to configure port breakout on a supported device:

1. Enter the configuration mode:
   ```
   ocnos#configure terminal
   ```
2. For the interface (`ce3`), set the breakout type (for example: 1X40g, 4x25G, 2X50g, 4X10g, and 4X25g) depending on the network requirements:
   ```
   ocnos(config)#port ce3 breakout 4X10g
   ```
3. Save the configuration view the changes:
   ```
   ocnos(config)#commit
   ```

Validation

To verify the port breakout configuration, execute the following command:

```
OcNOS#sh run int ce3
% Can't find interface ce3.
OcNOS#sh run int ce3/1
!
interface ce3/1
!
OcNOS#sh run int ce3/2
!
interface ce3/2
!
OcNOS#sh run int ce3/3
!
interface ce3/3
!
OcNOS#sh run int ce3/4
!
interface ce3/4
!

OcNOS#sh int br

```

Unconfigure Port Breakout through Mode 1

To revert ports to the default configuration:

1. Enter the configuration mode:

```
ocnos#configure terminal
```

2. Configure the 100G ports to operate in mode1 to disable breakout mode:

```
ocnos(config)#hardware-profile port-config mode1
```

3. Save the configuration, and reload the device to view the changes:

```
ocnos(config)#commit
```

Validation

To verify the port breakout unconfiguration, execute the following command:

```
R1#show interface brief

Codes: ETH - Ethernet, LB - Loopback, AGG - Aggregate, MLAG - MLAG Aggregate
       FR - Frame Relay, TUN -Tunnel, PBB - PBB Logical Port, VP - Virtual Port

```

Unconfigure Port Breakout through Global Level

To revert ports to the default configuration:

1. Enter the configuration mode:

```
ocnos#configure terminal
```

2. Remove the breakout setting to combine the breakout port back to original port as (ce3):

```
ocnos(config)#no port ce3 breakout
```

3. Save the configuration to view the changes:

```
ocnos(config)#commit
```

Validation

To verify the port breakout unconfiguration, execute the following command:

```
OcNOS#sh run int ce3
!
interface ce3
!
OcNOS#sh run int ce3/1
% Can't find interface ce3/1.
OcNOS#sh run int ce3/2
% Can't find interface ce3/2.
OcNOS#sh run int ce3/3
% Can't find interface ce3/3.
OcNOS#sh run int ce3/4
% Can't find interface ce3/4.

OcNOS#sh int br

Dynamic Port Breakout (100G) on Qumran AX and MX

Overview

Dynamic port breakout allows switches and routers to adjust physical port configurations based on the speed and protocol requirements of connected devices. This feature enhances network flexibility, scalability, and cost efficiency by dynamically adapting switch ports to changing networking demands.

Port breakout splits a single high-speed port, such as a 100G interface, into multiple lower-speed ports. For example, a 100G port (ce1) can break out into four 10G ports (ce1/1, ce1/2, ce1/3, and ce1/4) using breakout cables. These newly created ports fully support all Layer 2 (L2) and Layer 3 (L3) functionalities. Dynamic port breakout ensures seamless connectivity, simplifies network migration, optimizes bandwidth allocation, and reduces infrastructure costs.

Feature Characteristics

Dynamic port breakout provides the following key capabilities:

- **Adaptive Port Configuration:** Adjusts port speeds dynamically based on network requirements, supporting mixed interface speeds (10G, 25G, 40G, 50G, 100G).Seamless
- **Seamless Bandwidth Allocation:** Allocates bandwidth efficiently by reconfiguring ports without replacing existing hardware.
- **Increased Port Density:** Maximizes port utilization by enabling multiple logical interfaces on a single high-speed port.
- **Incremental Upgrades:** Supports gradual migration to higher-speed connections without requiring a complete infrastructure overhaul.

Benefits

The advantages of utilizing a 100G port breakout:

- Maximizes port density while saving rack space.
- Reduces power consumption.
- Simplifies future upgrades.
- Does not require a system reload after changes.

Prerequisites

- Ensure the board is operational and running the appropriate software version.
- Ensure to remove the current breakout configuration to switch between modes (for example: 4x10G to 4x25G).

Key Considerations

- Dynamic port breakout is not supported on interfaces that use external Physical Layer Transceiver(PHYs). Use the **`show hsl extphy status`** command to check the ports.
- Interfaces hosting sub-interfaces or active services do not support port breakout. Disable all services on the interface before enabling breakout. After reconfiguration, services can be re-enabled on the breakout ports.

Configuration

Perform the following steps to configure port breakout:

1. Enter the configuration mode:
   ```
   ocnos#configure terminal
   ```
2. Apply the breakout configuration to the specified port. For instance, configure port **ce1** for breakout to divide it into multiple smaller ports, such as **ce1/1**, **ce1/2**, **ce1/3**, and **ce1/4**:
   ```
   ocnos(config)#port ce1 breakout 4x10g
   ```
3. Verify the configuration as instructed in the validation.

Validation

Execute the following command to verify the breakout configuration:

```
ocnos#show interface brief
```

Verify that the original 100G port has been divided into smaller ports. Example output:

```
Codes: ETH - Ethernet, LB - Loopback, AGG - Aggregate, MLAG - MLAG Aggregate
       LBG - Link Bonding Group, MODEM - Link Bonding Modem

```

Verify that the interfaces **ce0/1**, **ce0/2**, **ce0/3**, **ce0/4**, all the 4x10G sub-ports will be deleted, and the 100G ports **ce0**, **ce1**, **ce2**, **ce3**, **ce4**, and **ce5** will be added.

```
ce0 - ce0/1,ce0/2,ce0/3,ce0/4
ce1 - ce1/1,ce1/2,ce1/3,ce1/4
ce2 - ce2/1,ce2/2,ce2/3,ce2/4
ce3 - ce3/1,ce3/2,ce3/3,ce3/4
ce4 - ce4/1,ce4/2,ce4/3,ce4/4
ce5 - ce5/1,ce5/2,ce5/3,ce5/4
```

Unconfigure Port Breakout

To revert ports back to the default configuration:

1. Enter the configuration mode:

   ```
   ocnos#configure terminal
   ```

2. Select the port that is currently configured with breakout. For example, if **ce1** was previously split into breakout sub-ports, execute the following command:

   ```
   ocnos(config)#no port ce1 breakout
   ```

Validation

Execute the following command to dynamic port breakout unconfiguration:

```
ocnos#show interface brief
```

Verify that the original 100G port has been divided into smaller ports. Example output:

```
Codes: ETH - Ethernet, LB - Loopback, AGG - Aggregate, MLAG - MLAG Aggregate

```

Verify that the interfaces **ce0/1**, **ce0/2**, **ce0/3**, **ce0/4**, all the 4x10G sub-ports will be deleted, and the 100G ports **ce0**, **ce1**, **ce2**, **ce3**, **ce4**, and **ce5** will be added.

```
ce0 - ce0/1,ce0/2,ce0/3,ce0/4
ce1 - ce1/1,ce1/2,ce1/3,ce1/4
ce2 - ce2/1,ce2/2,ce2/3,ce2/4
ce3 - ce3/1,ce3/2,ce3/3,ce3/4
ce4 - ce4/1,ce4/2,ce4/3,ce4/4
ce5 - ce5/1,ce5/2,ce5/3,ce5/4
```

Configuration

By default, the device is supported with 100G ports interfaces such as ce0, ce1, ce2, and ce3. Following a breakout, all 100G ports will be divided into 4x10G, 4x25G, and 2x50G ports. The following configuration steps outlines for dividing a single port into multiple ports through channelization.

1. Execute the following command in the config mode to break a port into multiple ports.

   ```
   R1#configure terminal
   R1(config)#port ce1 breakout 4X10g
   ```

2. Breakout 100G ports into 4x10G ports called as ce1/1, ce1/2, ce1/3, ce1/4 as shown in the Configuration (page 1317) section.

Sample running configuration

Use this command for the sample running configuration.

```
OcNOS#show running-config

Unconfiguration

Combine a port that has been previously split into multiple smaller ports. This command allows you to revert the port to its original combined state. For example, if port ce0 was a 100G port that was broken into four 25G ports, this command will allow you to revert the port to its original state as a 100G port.

1. To revert the breakout of multiple ports to the original configuration, execute the following command in the config mode.

```
R1#configure terminal
R1(config)#no port ce1 breakout
```

Validation

Use this command to validate the dynamic port breakout unconfiguration.

```
R1#show interface brief

xe15          ETH           --    routed           down    PD      10g   --       No  No
xe16          ETH           --    routed           down    PD      10g   --       No  No
xe17          ETH           --    routed           down    PD      10g   --       No  No
xe18          ETH           --    routed           down    PD      10g   --       No  No
xe19          ETH           --    routed           down    PD      10g   --       No  No
xe20          ETH           --    routed           down    PD      10g   --       No  No
xe21          ETH           --    routed           down    PD      10g   --       No  No
xe22          ETH           --    routed           down    PD      10g   --       No  No
xe23          ETH           --    routed           down    PD      10g   --       No  No
xe24          ETH           --    routed           down    PD      10g   --       No  No
xe25          ETH           --    routed           down    PD      10g   --       No  No
xe26          ETH           --    routed           down    PD      10g   --       No  No
xe27          ETH           --    routed           down    PD      10g   --       No  No
xe28          ETH           --    routed           down    PD      10g   --       No  No
xe29          ETH           --    routed           down    PD      10g   --       No  No
xe30          ETH           --    routed           down    PD      10g   --       No  No
xe31          ETH           --    routed           down    PD      10g   --       No  No
xe32          ETH           --    routed           down    PD      10g   --       No  No
xe33          ETH           --    routed           down    PD      10g   --       No  No
xe34          ETH           --    routed           down    PD      10g   --       No  No
xe35          ETH           --    routed           down    PD      10g   --       No  No
xe36          ETH           --    routed           down    PD      10g   --       No  No
xe37          ETH           --    routed           down    PD      10g   --       No  No
xe38          ETH           --    routed           down    PD      10g   --       No  No
xe39          ETH           --    routed           down    PD      10g   --       No  No
xe40          ETH           --    routed           down    PD      10g   --       No  No
xe41          ETH           --    routed           down    PD      10g   --       No  No
xe42          ETH           --    routed           down    PD      10g   --       No  No
xe43          ETH           --    routed           down    PD      10g   --       No  No
xe44          ETH           --    routed           down    PD      10g   --       No  No
xe45          ETH           --    routed           down    PD      10g   --       No  No
xe46          ETH           --    routed           down    PD      10g   --       No  No
xe47          ETH           --    routed           down    PD      10g   --       No  No
```

The interfaces ce0/1, ce0/2, ce0/3, ce0/4, all the 4x10G sub-ports will be deleted, and the 100G ports ce0, ce1, ce2, ce3, ce4, and ce5 will be added.

```
ce0 - ce0/1,ce0/2,ce0/3,ce0/4
ce1 - ce1/1,ce1/2,ce1/3,ce1/4
ce2 - ce2/1,ce2/2,ce2/3,ce2/4
ce3 - ce3/1,ce3/2,ce3/3,ce3/4
ce4 - ce4/1,ce4/2,ce4/3,ce4/4
ce5 - ce5/1,ce5/2,ce5/3,ce5/4
```

SECURITY MANAGEMENT COMMAND REFERENCE

Access Control List Commands

This chapter is a reference for the Access Control List (ACL) commands:

arp access-group

Use this command to attach an ARP access list to an interface to filter incoming ARP packets.

When you attach an ARP access list to a VLAN or **LAG**[1] interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

Use the **no** form of this command to detach an ARP access group.

- An ARP access-list is supported only on switch ports.
- To attach an ARP access-group to an interface, the **ingress-arp** TCAM group should be enabled. See the hardware-profile filter (Qumran 1) (page 1785) command for more details.

Command Syntax

```
arp access-group NAME in
no arp access-group NAME in
```

Parameters

NAME
ARP Access list name

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#permit ip any mac any
(config-arp-acl)#exit

(config)#interface xe1
(config-if)#arp access-group arp1 in
(config-if)#exit

(config)#interface xe1
(config-if)#no arp access-group arp1 in
(config-if)#exit
```

[1]Link Aggregation Group

arp access-list

Use this command to define a named ARP access control list (ACL) that determines whether to accept or drop an incoming ARP packet based on the sender or target IP address, sender or target MAC address, ARP type.

An ACL is made up of one or more ACL specifications. You can repeat this command and add multiple specifications. Each time you give this command, the specification is added to the end of the list.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are sequenced. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied by default. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied deny specification for traffic that is not permitted. The implied specification can be updated to permit if the use-case is to deny a certain set of ARP traffic. A single-entry ACL with only one deny specification is the same as denying all traffic. You must have at least one permit specification in an ACL or all traffic is blocked.

Use the no form of this command to remove an ACL specification.

Note: An ARP access list is supported only on switch ports.

Command Syntax

```
arp access-list NAME
no arp access-list NAME
```

Parameters

NAME
ARP Access list name

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#arp access-list ARP_ACL1
(config-arp-acl)#exit
(config)#no arp access-list ARP_ACL1
```

arp access-list default

Use this command to modify the default rule action of an access list.

The default rule is applicable only when an access list is attached to an interface. The default rule will have the lowest priority and only ARP packets not matching any of the user defined rules match the default rule.

Command Syntax

```
default (deny-all|permit-all)
```

Parameters

deny-all
Drop all packets.

permit-all
Accept all packets.

Default

The default rule is **`deny-all`** when an access list is attached to an interface.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#default permit-all
```

arp access-list remark

Use this command to add a description to a named ARP access control list (ACL).

Use the **no** form of this command to remove an ACL description.

Command Syntax

```
remark LINE
no remark
```

Parameters

LINE
ACL description up to 100 characters.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#remark Permit arp request packets
(config-arp-acl)#no remark
(config-arp-acl)#exit
```

arp access-list request

Use this command to configure ARP access control entry in an ARP access control list (ACL).

This command determines whether to accept or drop a packet based on the configured match criteria.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring the same filter again with a change of sequence number or change of action will result in updating the sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit)(request |) ip (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
mac (any | ((XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) |
(host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))) (vlan <1-4094>|) (inner-vlan <1-4094>|)
```

```
no (<1-268435453>|)(deny|permit)(request |) ip (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
mac (any | ((XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) |
(host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))) (vlan <1-4094>|) (inner-vlan <1-4094>|)
```

Parameters

<1-268435453>
ARP ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

request
ARP request.

ip
Internet Protocol (IP).

A.B.C.D/M
Source IP prefix and length.

A.B.C.D A.B.C.D
Source IP address and mask.

host A.B.C.D
A single source host IP address.

any
Match any source IP address.

mac
MAC address configuration.

any
Match any source mac address.

XX-XX-XX-XX-XX-XX
Source MAC address (Option 1).

XX:XX:XX:XX:XX:XX
Source MAC address (Option 2).

XXXX.XXXX.XXXX
Source MAC address (Option 3).

XX-XX-XX-XX-XX-XX
Source wildcard (Option 1).

XX:XX:XX:XX:XX:XX
Source wildcard (Option 2).

XXXX.XXXX.XXXX
Source wildcard (Option 3).

host (XX-XX-XX-XX-XX-XX)
A single source host MAC address.

vlan <1-4094>
VLAN identifier.

inner-vlan <1-4094>
Inner VLAN identifier.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#10 permit request ip 1.1.1.0/24 mac 0000.0000.0001 FFFF.FFFF.FFF0
(config-arp-acl)#no 10
```

arp access-list resequence

Use this command to modify the sequence numbers of an ARP access list.

Note: IP Infusion Inc. recommends to use a non-overlapping sequence space for a new sequence number set to avoid unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax

```
resequence <1-268435453> INCREMENT
```

Parameters

<1-268435453>
Starting sequence number.

INCREMENT
Sequence number increment steps.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#resequence 15 15
```

arp access-list response

Use this command to configure an ARP access control entry in an ARP access control list (ACL).

This command determines whether to accept or drop an ARP response packet based on the configured match criteria.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring the same filter again with a change of sequence number or change of action will result in updating the sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) response ip (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
mac (any | ((XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) -XX-XX-XX-
XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))
| (host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)))
(any | ((XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))
| (host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)))(vlan <1-4094>|) (inner-vlan <1-4094>|)

no (<1-268435453>|)(deny|permit) response ip (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
(A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
mac (any | ((XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) -XX-XX-XX-
XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))
| (host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)))
(any | ((XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))
| (host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)))(vlan <1-4094>|) (inner-vlan <1-4094>|)
```

Parameters

<1-268435453>
ARP ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

response
ARP response

A.B.C.D/M
Source/destination IP prefix and length.

A.B.C.D A.B.C.D
Source/destination IP address and mask.

host A.B.C.D
A single source/destination host IP address.

any
Match any source/destination IP address.

mac
MAC address configuration.

any
Match any source/destination MAC address.

XX-XX-XX-XX-XX-XX
Source/destination MAC address (Option 1).

XX:XX:XX:XX:XX:XX
Source/destination MAC address (Option 2).

XXXX.XXXX.XXXX
Source/destination MAC address (Option 3).

XX-XX-XX-XX-XX-XX
Source/destination wildcard (Option 1).

XX:XX:XX:XX:XX:XX
Source/destination wildcard (Option 2).

XXXX.XXXX.XXXX
Source/destination wildcard (Option 3).

vlan <1-4094>
VLAN identifier.

inner-vlan <1-4094>
Inner VLAN identifier.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#10 permit response ip 1.1.1.0/24 mac 0000.0000.0001 FFFF.FFFF.FFF0
(config-arp-acl)#no 10
```

clear access-list

Use this command to clear the access-list counters.

Command Syntax

```
clear access-list (NAME|) counters
```

Parameters

NAME
Access-list name.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear access-list counters
```

clear arp access-list

Use this command to clear the ARP access-list counters.

Command Syntax

```
clear arp access-list (NAME|) counters
```

Parameters

NAME
ARP access list name

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#clear arp access-list counters
```

clear ip access-list

Use this command to clear the IP access-list counters.

Command Syntax

```
clear ip access-list (NAME|) counters
```

Parameters

NAME
Access-list name.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip access-list counters
```

clear ipv6 access-list

Use this command to clear the IPv6 access-list counters.

Command Syntax

```
clear ipv6 access-list (NAME|) counters
```

Parameters

NAME
Access-list name.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ipv6 access-list counters
```

clear mac access-list

Use this command to clear the MAC access-list counters.

Command Syntax

```
clear mac access-list (NAME|) counters
```

Parameters

NAME
Access-list name.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear mac access-list counters
```

ip access-group

Use this command to attach an IP access list to an interface or terminal line to filter incoming or outgoing IP packets.

The **time-range** parameter is optional. If used, the access-group is tied to the timer specified.

After the access-group has been configured with the time-range, to detach the access-group from the time-range, use the **no** form of this command with a time-range parameter as shown in the syntax and examples below.

To delete the access-group, use the **no** form of this command without a time-range.

Note: An egress IP ACL is supported on physical and lag interfaces only. An egress IP ACL will match only routed traffic and not switched traffic. VLAN and inner-VLAN options in ACL rules will match incoming packet VLANs even when ACL attached at egress.

Note: Egress TCAMs do not auto-expand beyond 256 entries if any entry includes a policer action. Therefore, the total number of configurable entries in the egress direction is limited to 256.

Command Syntax

```
ip access-group NAME (in|out) (time-range TR_NAME|)
no ip access-group NAME (in|out) (time-range TR_NAME|)
```

Parameter

NAME
Access list name.

in
Filter incoming packets

out
Filter outgoing packets.

TR_NAME
Time range name set with the time-range (page 1777) command.

Command Mode

Line mode and Interface mode

Applicability

This command was introduced before OcNOS version 3.0. The **time-range** parameter was added in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#ip access-list mylist
(config-ip-acl)#permit ip any any
(config-ip-acl)#exit
```

```
(config)#hardware-profile filter ingress-ipv4-ext enable

(config)#interface xe3
(config-if)#ip access-group mylist in
(config-if)#exit

(config)#interface xe3
(config-if)#no ip access-group mylist in time-range TIMER1
(config-if)#exit

(config)#line vty
(config-all-line)#no ip access-group mylist in
```

Usage: VLANs and LAGs

When you attach an access list to a VLAN interface or **LAG**[1] interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

Usage: TCAM Groups

An access-group in the egress direction uses the TCAM group used by the QoS output service policy. Therefore, actions are unpredictable when conflicting matches are configured on same interface. IP Infusion Inc. recommends to avoid such a configuration. Otherwise, you need to configure the priority (in QoS) or the sequence number (in ACL) carefully to handle such cases.

To attach an IP ACL in the ingress direction the **`ingress-ipv4`** or **`ingress-ipv4-ext`** TCAM group needs to be enabled and to attach an IP ACL in the egress direction the **`egress-ipv4`** TCAM group needs to be enabled. See the hardware-profile filter (Qumran 1) (page 1785) commands for details.

Usage: Loopback and VTY Interfaces

You can create ACLs for VTY interfaces to filter packets from management applications such as SSH, Telnet, NTP, SNMP, and SNMP traps. TCP, **UDP**[2], and **ICMP**[3] are supported.

Note: Loopback and VTY ACLs are mutually exclusive. If you set up one, you cannot set up the other.

For an ACL for a loopback interface, you create the ACL, configure it with rules, and associate the ACL with a loopback interface:

```
...
(config)#interface lo
(config-if)#ip access-group loopback in
```

[1]Link Aggregation Group

[2]User Datagram Protocol

[3]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

For an ACL for VTY, you create the ACL, configure it with rules, and associate the ACL to the terminal line in line mode.

```
...
```

```
...
(config)#line vty
(config-all-line)#ip access-group vty in
```

Loopback and VTY ACLs do not support the following:

- The default rule **`deny all`**. You must explicitly set up a **`deny all`** rule based on your requirements.
- VLAN-specific rules.
- Rules with TCP flags.
- Rules with **`dscp`**, **`fragments`**, **`log`**, **`precedence`**, and **`sample`** parameters.
- Rules with ICMP code and message types.

Usage: Timed ACL on interfaces

You create a timer range that is identified by a name and configured with a start time, end time, and frequency. Once you create the time range, you can tie the ACL configuration to the time-range object. This allows you to create an access group that is enabled when the timer has started and disabled when the timer ends. You can also disassociate an access group from the timer if needed.

ip access-list

Use this command to define a named access control list (ACL) that determines whether to accept or drop an incoming IP packet based on specifications configured under the ACL. An ACL is made up of one or more ACL specifications.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied by default. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied deny specification for traffic that is not permitted. Implied specification can be updated to permit if the use-case is to deny a certain set of traffic.

Use the **no** form of this command to remove an ACL.

Command Syntax

```
ip access-list NAME
no ip access-list NAME
```

Parameters

NAME
Access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
```

ip access-list default

Use this command to modify the default rule action of access-list. Default rule is applicable only when access-list is attached to interface. Default rule will have the lowest priority and only the IP packets not matching any of the user defined rules match default rule.

Command Syntax

```
default (deny-all|permit-all)
```

Parameters

deny-all
Drop all packets.

permit-all
Accept all packets.

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
(config-ip-acl)#default permit-all
```

ip access-list filter

Use this command to configure access control entry in an access control list (ACL).

This determines whether to accept or drop an IP packet based on the configured match criteria.

Use the **no** form of this command to remove an ACL specification. ACL specification can be removed using the sequence number as well.

Note: Configuring the same filter again with change of sequence number or change of action results in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|) (deny|permit) (<0-255>|ahp|any|eigrp|esp|gre|ipip|ipcomp|ipv6ip |ospf|pim|rsvp|vrrp)
(A.B.C.D/ M|A.B.C.D A.B.C.D|host A.B.C.D|any) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) (dscp (<0-
63>|af11| af12| af13| af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4|
cs5|cs6| cs7| default| ef )|) (precedence (<0-7>| critical| flash | flashoverride| immediate|
internet| network| priority| routine))|) (vlan <1-4094>|) (inner-vlan <1-4094>|)
no (<1-268435453>|)(deny|permit)(<0-255> |ahp | any | eigrp | esp | gre | ipip | ipcomp | ipv6ip |
ospf | pim | rsvp| vrrp) (A.B.C.D/ M|A.B.C.D A.B.C.D | host A.B.C.D|any) (A.B.C.D/M|A.B.C.D
A.B.C.D|host A.B.C.D|any) (dscp (<0-63> |af11| af12| af13| af21| af22| af23| af31|af32| af33| af41|
af42| af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7| default| ef )|) (precedence (<0-7>| critical| flash |
flashoverride| immediate| internet| network| priority| routine))|) (vlan <1-4094>|) (inner-vlan <1-
4094>|)
no (<1-268435453>)
```

Parameters

<1-268435453>
IPv4 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

<0-255>
IANA assigned protocol number.

any
Any protocol packet.

ahp
Authentication Header packet.

eigrp
Enhanced Interior Gateway Routing Protocol packet.

esp
Encapsulating Security Payload packet.

gre
Generic Routing Encapsulation packet.

ipip
IPv4 over IPv4 encapsulation packet.

ipcomp
IP Payload Compression Protocol packet.

ipv6ip
IPv6 over IPv4 encapsulation packet.

ospf
Open Shortest Path First packet.

pim
Protocol Independent Multicast packet

rsvp
Resource Reservation Protocol packet.

vrrp
Virtual Router Redundancy Protocol packet.

A.B.C.D/M
Source IP prefix and length.

A.B.C.D A.B.C.D
Source IP address and mask.

host A.B.C.D
A single source host IP address.

any
Match any source IP address.

A.B.C.D/M
Destination IP prefix and length.

A.B.C.D A.B.C.D
Destination IP address and mask.

host A.B.C.D
A single destination host IP address.

any
Match any destination IP address.

dscp
Match packets with given DSCP value.

<0-63>
Enter DSCP value between 0-63.

af11
AF11 DSCP (001010) decimal value 10.

af12
AF12 DSCP (001100) decimal value 12.

af13
AF13 DSCP (001110) decimal value 14.

af21
AF21 DSCP (010010) decimal value 18.

af22
AF22 DSCP (010100) decimal value 20.

af23
AF23 DSCP (010110) decimal value 22.

af31
AF31 DSCP (011010) decimal value 26.

af32
AF32 DSCP (011100) decimal value 28.

af33
AF33 DSCP (011110) decimal value 30.

af41
AF41 DSCP (100010) decimal value 34

af42
AF42 DSCP (100100) decimal value 36.

af43
AF43 DSCP (100110) decimal value 38.

cs1
CS1 (precedence 1) DSCP (001000) decimal value 8.

cs2
CS2 (precedence 2) DSCP (010000) decimal value 16.

cs3
CS3 (precedence 3) DSCP (011000) decimal value 24.

cs4
CS4 (precedence 4) DSCP (100000) decimal value 32.

cs5
CS5 (precedence 5) DSCP (101000) decimal value 40.

cs6
CS6 (precedence 6) DSCP (110000) decimal value 48.

cs7
CS7 (precedence 7) DSCP (111000) decimal value 56.

default
Default DSCP (000000) decimal value 0.

ef
EF DSCP (101110) decimal value 46.

precedence
Match packets with given precedence value.

<0-7>
Enter precedence value 0-7.

critical
Match packets with critical precedence (5).

flash
Match packets with flash precedence (3).

flashoverride
Match packets with flash override precedence (4).

immediate
Match packets with immediate precedence (2).

internet
Match packets with internetwork control precedence (6).

network
Match packets with network control precedence (7).

priority
Match packets with priority precedence (1).

routine
Match packets with routine precedence (0).

vlan
Match packets with given vlan value.

<1 - 4094>
VLAN identifier.

inner-vlan
Match packets with given inner vlan value.

<1 - 4094>
VLAN identifier.

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal(config)#ip access-list ip-acl-01
(config-ip-acl)#11 permit any 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
(config-ip-acl)#no 11
```

ip access-list icmp

Use this command to permit or deny **ICMP**[1] packets based on the given source and destination IP address. Even DSCP, precedence, VLAN identifier, inner VLAN identifier, and fragment number can be configured to permit or deny with the given values.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) (icmp) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) (A.B.C.D/M|A.B.C.D
A.B.C.D|host A.B.C.D|any) ((dscp (<0-63>|af11| af12| af13| af21| af22| af23| af31|af32| af33| af41|
af42| af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7| default| ef ))| (precedence (<0-7>| critical| flash |

(sample|) ((redirect-to-port IFNAME)|)
```

Parameters

<1-268435453>
IPv4 ACL sequence number.

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

deny
Drop the packet.

permit
Accept the packet.

icmp
Internet Control Message Protocol packet.

A.B.C.D/M
Source IP prefix and length.

A.B.C.D A.B.C.D
Source IP address and mask.

host A.B.C.D
A single source host IP address.

any
Match any source IP address.

A.B.C.D/M
Destination IP prefix and length.

A.B.C.D A.B.C.D
Destination IP address and mask.

host A.B.C.D
A single destination host IP address.

any
Match any destination IP address.

dscp
Match packets with given DSCP value.

<0-63>
Enter DSCP value between 0-63.

af11
AF11 DSCP (001010) decimal value 10.

af12
AF12 DSCP (001100) decimal value 12.

af13
AF13 DSCP (001110) decimal value 14.

af21
AF21 DSCP (010010) decimal value 18.

af22
AF22 DSCP (010100) decimal value 20.

af23
AF23 DSCP (010110) decimal value 22.

af31
AF31 DSCP (011010) decimal value 26.

af32
AF32 DSCP (011100) decimal value 28.

af33
AF33 DSCP (011110) decimal value 30.

af41
AF41 DSCP (100010) decimal value 34

af42
AF42 DSCP (100100) decimal value 36.

af43
AF43 DSCP (100110) decimal value 38.

cs1
CS1 (precedence 1) DSCP (001000) decimal value 8.

cs2
CS2 (precedence 2) DSCP (010000) decimal value 16.

cs3
CS3 (precedence 3) DSCP (011000) decimal value 24.

cs4
CS4 (precedence 4) DSCP (100000) decimal value 32.

cs5
CS5 (precedence 5) DSCP (101000) decimal value 40.

cs6
CS6 (precedence 6) DSCP (110000) decimal value 48.

cs7
CS7 (precedence 7) DSCP (111000) decimal value 56.

default
Default DSCP (000000) decimal value 0.

ef
EF DSCP (101110) decimal value 46.

precedence
Match packets with given precedence value.

<0-7>
Enter precedence value 0-7.

critical
Match packets with critical precedence (5).

flash
Match packets with flash precedence (3).

flashoverride
Match packets with flash override precedence (4).

immediate
Match packets with immediate precedence (2).

internet
Match packets with internetwork control precedence (6).

network
Match packets with network control precedence (7).

priority
Match packets with priority precedence (1).

routine
Match packets with routine precedence (0).

vlan
Match packets with given vlan value.

<1-4094>
VLAN identifier.

inner-vlan
Match packets with given inner-vlan value.

<1-4094>
VLAN identifier.

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-icmp
(config-ip-acl)#200 permit icmp any any
```

ip access-list remark

Use this command to add a description to a named IPv4 access control list (ACL).

Use the **no** form of this command to remove an ACL description.

Command Syntax

```
remark LINE
no remark
```

Parameters

LINE
ACL description up to 100 characters.

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list mylist
(config-ip-acl)#remark permit the inside admin address
(config-ip-acl)#exit

(config)#ip access-list mylist
(config-ip-acl)#no remark
(config-ip-acl)#exit
```

ip access-list resequence

Use this command to modify sequence numbers of the IP access list specifications.

Note: Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax

```
resequence <1-268435453> INCREMENT
```

Parameters

<1-268435453>
Starting sequence number.

INCREMENT
Sequence number increment steps.

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list mylist
(config-ip-acl)#resequence 5 5
(config-ip-acl)#end
```

ip access-list tcp|udp

Use this command to define a named access control list (ACL) that determines whether to accept or drop an incoming TCP or **UDP**[1] IP packet based on the specified match criteria. This form of command filters packets based on source and destination IP address along with protocol (TCP or UDP) and port.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: TCP flags options and range options like neq, gt, lt and range are not supported by hardware in egress direction.

Note: Both Ack and established flag in tcp have same functionality in hardware.

Note: *neq* option from IPv4 access list configuration should removed for Qumran2 Series Platform.

Command Syntax

```
(<1-268435453>|) (deny|permit) tcp (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) ((eq|gt|lt|neq) (<0-

```

Parameters

<1-268435453>
IPv4 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

tcp
Transmission Control Protocol.

udp
User Datagram Protocol.

A.B.C.D/M
Source or destination IP prefix and length.

A.B.C.D A.B.C.D
Source or destination IP address and mask.

host A.B.C.D
Source or destination host IP address.

any
Any source or destination IP address.

eq
Source or destination port equal to.

gt
Source or destination port greater than.

lt
Source or destination port less than.

neq
Source or destination port not equal to.

<0-65535>
Source or destination port number.

range
Range of source or destination port numbers:

<0-65535>
Lowest value in the range.

<0-65535>
Highest value in the range.

bgp
Border Gateway Protocol.

chargen
Character generator.

cmd
Remote commands.

daytime
Daytime.

discard
Discard.

domain
Domain Name Service.

drip
Dynamic Routing Information Protocol.

echo
Echo.

exec
EXEC.

finger
Finger.

ftp
File Transfer Protocol.

ftp-data
FTP data connections.

gopher
Gopher.

hostname
NIC hostname server.

ident
Ident Protocol.

irc
Internet Relay Chat.

klogin
Kerberos login.

kshell
Kerberos shell.

login
Login.

lpd
Printer service.

nntp
Network News Transport Protocol.

pim-auto-rp
PIM Auto-RP.

pop2
Post Office Protocol v2.

pop3
Post Office Protocol v3.

smtp
Simple Mail Transport Protocol.

ssh
Secure Shell.

sunrpc
Sun Remote Procedure Call.

tacacs
TAC Access Control System.

talk
Talk.

telnet
Telnet.

time
Time.

uucp
UNIX-to-UNIX Copy Program.

whois
WHOIS/NICNAME

www
World Wide Web.

netconf-ssh
Secure Shell Network Configuration

netconf-tls
Transport Layer Security Network Configuration

nntp
Range of source or destination port numbers:

dscp
Match packets with given DSCP value.

<0-63>
Enter DSCP value between 0-63.

af11
AF11 DSCP (001010) decimal value 10.

af12
AF12 DSCP (001100) decimal value 12.

af13
AF13 DSCP (001110) decimal value 14.

af21
AF21 DSCP (010010) decimal value 18.

af22
AF22 DSCP (010100) decimal value 20.

af23
AF23 DSCP (010110) decimal value 22.

af31
AF31 DSCP (011010) decimal value 26.

af32
AF32 DSCP (011100) decimal value 28.

af33
AF33 DSCP (011110) decimal value 30.

af41
AF41 DSCP (100010) decimal value 34.

af42
AF42 DSCP (100100) decimal value 36.

af43
AF43 DSCP (100110) decimal value 38.

cs1
CS1 (precedence 1) DSCP (001000) decimal value 8.

cs2
CS2 (precedence 2) DSCP (010000) decimal value 16.

cs3
CS3 (precedence 3) DSCP (011000) decimal value 24.

cs4
CS4 (precedence 4) DSCP (100000) decimal value 32.

cs5
CS5 (precedence 5) DSCP (101000) decimal value 40.

cs6
CS6 (precedence 6) DSCP (110000) decimal value 48.

cs7
CS7 (precedence 7) DSCP (111000) decimal value 56.

default
Default DSCP (000000) decimal value 0.

ef
EF DSCP (101110) decimal value 46.

precedence
Match packets with given precedence value.

<0-7>
Enter precedence value 0-7.

critical
Match packets with critical precedence (5).

flash
Match packets with flash precedence (3).

flashoverride
Match packets with flash override precedence (4).

immediate
Match packets with immediate precedence (2).

internet
Match packets with internetwork control precedence (6).

network
Match packets with network control precedence (7).

priority
Match packets with priority precedence (1).

routine
Match packets with routine precedence (0).

ack
Match on the Acknowledgment (ack) bit.

established
Matches only packets that belong to an established TCP connection.

fin
Match on the Finish (fin) bit.

psh
Match on the Push (psh) bit.

rst
Match on the Reset (rst) bit.

syn
Match on the Synchronize (syn) bit.

urg
Match on the Urgent (urg) bit.

biff
Biff.

bootpc
Bootstrap Protocol (BOOTP) client.

bootps
Bootstrap Protocol (BOOTP) server.

discard
Discard.

dnsix
DNSIX security protocol auditing.

domain
Domain Name Service.

echo
Echo.

isakmp
Internet Security Association and Key Management Protocol.

mobile-ip
Mobile IP registration.

nameserver
IEN116 name service.

netbios-dgm
Net BIOS datagram service.

netbios-ns
Net BIOS name service.

netbios-ss
Net BIOS session service.

non500-isakmp
Non500-Internet Security Association and Key Management Protocol.

ntp
Network Time Protocol.

pim-auto-rp
PIM Auto-RP.

rip
Routing Information Protocol.

snmp
Simple Network Management Protocol.

snmptrap
SNMP Traps.

sunrpc
Sun Remote Procedure Call.

syslog
System Logger.

tacacs
TAC Access Control System.

talk
Talk.

tftp
Trivial File Transfer Protocol.

time
Time.

who
Who service.

xdmcp
X Display Manager Control Protocol.

fragments
Check non-initial fragments.

vlan
Match packets with given vlan value.

<1-4094>
VLAN identifier.

inner-vlan
Match packets with given inner VLAN Identifier.

<1-4094>
VLAN identifier.

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-02
(config-ip-acl)#deny udp any any eq tftp
(config-ip-acl)#deny tcp any any eq ssh
(config-ip-acl)#end
```

ipv6 access-group

Use this command to attach an IPv6 access list to an interface to filter incoming IPv6 packets.

When you attach an access list to a VLAN interface or **LAG**[1] interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

The **time-range** parameter is optional. If used, the access-group is tied to the timer specified.

After the access-group has been configured with the time-range, to detach the access-group from the time-range, use the **no** form of this command with a time-range parameter as shown in the syntax and examples below.

To delete the access-group, use the **no** form of this command without a time-range.

Note: To attach IPv6 ACL in the ingress direction ingress-ipv6 TCAM group needs to be enabled. See the hardware-profile filter (Qumran 1) (page 1785) command for details.

Command Syntax

```
ipv6 access-group NAME in (time-range TR_NAME|)
no ipv6 access-group NAME in (time-range TR_NAME|)
```

Parameters

NAME
Access list name.

TR_NAME
Time range name set with the time-range (page 1777) command.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3. The **time-range** parameter was added in OcNOS version 5.0.

[1]Link Aggregation Group

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#permit ipv6 any any
(config-ipv6-acl)#exit
(config)#hardware-profile filter ingress-ipv6 enable

(config)#interface xe3
(config-if)#ipv6 access-group mylist in

(config)#interface xe3
(config-if)#no ipv6 access-group mylist in

(config)#interface xe3
(config-if)#ipv6 access-group mylist in time-range TIMER1

(config)#interface xe3
(config-if)#no ipv6 access-group mylist in time-range TIMER1
```

ipv6 access-list

Use this command to define a IPv6 access control list (ACL) that determines whether to accept or drop an incoming IPv6 packet based on specifications configured under the ACL. An ACL is made up of one or more ACL specifications.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied by default. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied deny specification for traffic that is not permitted. Implied specification can be updated to permit if the use-case is to deny a certain set of traffic.

IPv6 routing protocols need neighbor discovery to establish sessions. Applying IPv6 ACLs implicitly drops all the ICMPv6 packets, thereby affecting the protocol sessions. To overcome this problem, an implicit ICMPv6 permit rule is added to the IPv6 ACLs.

If required behavior is to deny the icmpv6, the implicit rule can be deleted. For example, create an IPv6 ACL:

For example,

To create an ipv6 ACL, execute the following:

```
(config)#ipv6 access-list ipv6-acl

#show ipv6 access-lists
IPv6 access list ip1
268435453 permit icmpv6 any any
```

To delete this rule execute the following:

```
(config)#ipv6 access-list ipv6-acl

(config-ipv6-acl)#no 268435453 permit icmpv6 any any

#show ipv6 access-lists
IPv6 access list ip1
```

Use the **no** form of this command to remove the ACL.

Command Syntax

```
ipv6 access-list NAME
no ipv6 access-list NAME
```

Parameters

NAME
Access-list name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Implicit rule was introduced in OcNOS version 2.0

Examples

```
#configure terminal
(config)#ipv6 access-list ipv6-acl-01
(config-ipv6-acl)#exit
```

ipv6 access-list default

Use this command to modify the default rule action of IPv6 access-list. Default rule is applicable only when IPv6 access-list is attached to interface. Default rule will have the lowest priority and only the IPv6 packets not matching any of the user defined rules match default rule.

Command Syntax

```
default (deny-all|permit-all)
```

Parameter

deny-all
Drop all packets.

permit-all
Accept all packets.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ipv6-acl-01
(config-ipv6-acl)#default permit-all
```

ipv6 access-list filter

Use this command to define an access-control entry in an access control list (ACL) that determines whether to accept or drop an IPv6 packet based on the criteria specified. This form of this command filters packets based on:

- Protocol
- Source IP address
- Destination IP address
- DSCP value
- VLAN identifier

Use the **no** form of this command to remove an ACL specification. ACL specification can be removed using the sequence number as well.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: For IPv6 source and destination address filters, only the network part from the address (upper 64 bits) is supported due to hardware restriction. If the address length is more than 64 bits, it cannot be applied on the interfaces but it can be used with distributed lists in control plane protocols.

Command Syntax

```
(<1-268435453>|) (deny|permit)(<0-255>|ahp|any|eigrp|esp|gre|ipipv6|ipcomp
|ipv6ipv6|ospf|pim|rsvp|vrrp) (X:X::X:X/ M|X:X::X:X X:X::X:X|any) (X:X::X:X/M|X:X::X:X X:X::X:X|any)
(dscp (<0-63>|af11| af12| af13| af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3|
cs4| cs5|cs6| cs7| default| ef )|) (vlan <1-4094>|)

no (<1-268435453>|)(deny|permit)(<0-255>|ahp|any|eigrp|esp|gre|ipipv6|ipcomp
|ipv6ipv6|ospf|pim|rsvp|vrrp) (X:X::X:X/ M|X:X::X:X X:X::X:X|any) (X:X::X:X/M|X:X::X:X X:X::X:X|any)
(dscp (<0-63>|af11| af12| af13| af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3|
cs4| cs5|cs6| cs7| default| ef )|) (vlan <1-4094>|)

no (<1-268435453>)
```

Parameters

<1-268435453>
IPv6 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

<0-255>
IANA assigned protocol number.

any
Any protocol packet.

ahp
Authentication Header packet.

eigrp
Enhanced Interior Gateway Routing Protocol packet.

esp
Encapsulating Security Payload packet.

gre
Generic Routing Encapsulation packet.

ipipv6
IPv4 over IPv6 Encapsulation packet.

ipcomp
IP Payload Compression Protocol packet.

ipv6ipv6
IPv6 over IPv6 Encapsulation packet.

ospf
Open Shortest Path First packet.

pim
Protocol Independent Multicast packet

rsvp
Resource Reservation Protocol packet.

vrrp
Virtual Router Redundancy Protocol packet.

X:X::X:X/M
Source Address with network mask length.

X:X::X:X X:X::X:X
Source Address with wild card mask.

any
Any source address.

X:X::X:X/M
Destination address with network mask length.

X:X::X:X X:X::X:X
Destination address with wild card mask.

any
Any destination address

any
Match any destination IP address.

dscp
Match packets with given DSCP value.

<0-63>
Enter DSCP value between 0-63.

af11
AF11 DSCP (001010) decimal value 10.

af12
AF12 DSCP (001100) decimal value 12.

af13
AF13 DSCP (001110) decimal value 14.

af21
AF21 DSCP (010010) decimal value 18.

af22
AF22 DSCP (010100) decimal value 20.

af23
AF23 DSCP (010110) decimal value 22.

af31
AF31 DSCP (011010) decimal value 26.

af32
AF32 DSCP (011100) decimal value 28.

af33
AF33 DSCP (011110) decimal value 30.

af41
AF41 DSCP (100010) decimal value 34

af42
AF42 DSCP (100100) decimal value 36.

af43
AF43 DSCP (100110) decimal value 38.

cs1
CS1 (precedence 1) DSCP (001000) decimal value 8.

cs2
CS2 (precedence 2) DSCP (010000) decimal value 16.

cs3
CS3 (precedence 3) DSCP (011000) decimal value 24.

cs4
CS4 (precedence 4) DSCP (100000) decimal value 32.

cs5
CS5 (precedence 5) DSCP (101000) decimal value 40.

cs6
CS6 (precedence 6) DSCP (110000) decimal value 48.

cs7
CS7 (precedence 7) DSCP (111000) decimal value 56.

default
Default DSCP (000000) decimal value 0.

ef
EF DSCP (101110) decimal value 46.

vlan <1-4094>
Match packets with given VLAN identifier.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list ipv6-acl-01
(config-ipv6-acl)#permit ipipv6 any any
(config-ipv6-acl)#end
```

ipv6 access-list icmpv6

Use this command to permit or deny IPv6 **ICMP**[1] packets with the given source and destination IPv6 address, DSCP value and VLAN ID.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) (icmpv6) (X:X::X:X/M|X:X::X:X X:X::X:X|any) (X:X::X:X/ M|X:X::X:X
X:X::X:X|any) ((dscp (<0-63>|af11| af12| af13| af21| af22| af23| af31|af32| af33| af41| af42| af43|
cs1| cs2| cs3| cs4| cs5|cs6| cs7| default| ef)|) (vlan <1-4094>|)

no (<1-268435453>|)(deny|permit) (icmpv6) (X:X::X:X/M|X:X::X:X X:X::X:X|any) (X:X::X:X/M|X:X::X:X
X:X::X:X|any) ((dscp (<0-63>|af11| af12| af13| af21| af22| af23| af31|af32| af33| af41| af42| af43|
cs1| cs2| cs3| cs4| cs5|cs6| cs7| default| ef )|) (vlan <1-4094>|)
```

Parameters

<1-268435453>
IPv6 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

icmpv6
Internet Control Message Protocol packet.

X:X::X:X/M
Source Address with network mask length.

X:X::X:X X:X::X:X
Source Address with wild card mask.

any
Any source address.

X:X::X:X/M
Destination address with network mask length.

X:X::X:X X:X::X:X
Destination address with wild card mask.

any
Any destination address

dscp
Match packets with given DSCP value.

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

<0-63>
Enter DSCP value between 0-63.

af11
AF11 DSCP (001010) decimal value 10.

af12
AF12 DSCP (001100) decimal value 12.

af13
AF13 DSCP (001110) decimal value 14.

af21
AF21 DSCP (010010) decimal value 18.

af22
AF22 DSCP (010100) decimal value 20.

af23
AF23 DSCP (010110) decimal value 22.

af31
AF31 DSCP (011010) decimal value 26.

af32
AF32 DSCP (011100) decimal value 28.

af33
AF33 DSCP (011110) decimal value 30.

af41
AF41 DSCP (100010) decimal value 34

af42
AF42 DSCP (100100) decimal value 36.

af43
AF43 DSCP (100110) decimal value 38.

cs1
CS1 (precedence 1) DSCP (001000) decimal value 8.

cs2
CS2 (precedence 2) DSCP (010000) decimal value 16.

cs3
CS3 (precedence 3) DSCP (011000) decimal value 24.

cs4
CS4 (precedence 4) DSCP (100000) decimal value 32.

cs5
CS5 (precedence 5) DSCP (101000) decimal value 40.

cs6
CS6 (precedence 6) DSCP (110000) decimal value 48.

cs7
CS7 (precedence 7) DSCP (111000) decimal value 56.

default
Default DSCP (000000) decimal value 0.

ef
EF DSCP (101110) decimal value 46.

flow-label
IPv6 Flow-label.

<0-1048575>
IPv6 Flow-label value.

fragments
Check non-initial fragments.

vlan <1-4094>
Match packets with given VLAN identifier.

inner-vlan <1-4094>
Match packets with given inner VLAN identifier.

redirect-to-port
Redirect the packet (in-direction only)

IFNAME
Interface name to which packet to be redirected (switchport only)

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#200 permit icmpv6 any any
```

ipv6 access-list remark

Use this command to add a description to an IPv6 access control list (ACL).

Use the **no** form of this command to remove an access control list description.

Command Syntax

```
remark LINE
no remark
```

Command Syntax

LINE
ACL description up to 100 characters.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)# remark Permit the inside admin address
```

ipv6 access-list resequence

Use this command to modify the sequence numbers of an IPv6 access list specification.

Note: Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax

```
resequence <1-268435453> INCREMENT
```

Parameter

<1-268435453>
Starting Sequence number.

INCREMENT
Sequence number increment steps.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#resequence 15 15
```

ipv6 access-list sctp

Use this command to allow ACL to permit or deny SCTP packets based on the given source and destination IPV6 address. Even DSCP, and vlan ID can be configured to permit or deny with the given values.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: Range options like neq, gt, lt and range are not supported by hardware in egress direction.

Command Syntax

```
(<1-268435453>|) (deny|permit) (sctp) (X:X::X:X/M|X:X::X:X X:X::X:X|any) (X:X::X:X/ M|X:X::X:X
X:X::X:X|any) {(eq|gt|lt|neq) (<0-65535>) | (range <0-65535> <0-65535>)|  }
(dscp (<0-63>| af11| af12| af13| af21| af22| af23| af31| af32| af33| af41| af42| af43| cs1| cs2| cs3|
cs4| cs5| cs6| cs7| default| ef)|) (vlan <1-4094>|)
no (<1-268435453>|) (deny|permit) (sctp) (X:X::X:X/M|X:X::X:X X:X::X:X|any) (X:X::X:X/M|X:X::X:X
X:X::X:X|any) {(eq|gt|lt|neq) (<0-65535>) | (range <0-65535> <0-65535>)| }
(dscp (<0-63>| af11| af12| af13| af21| af22| af23| af31| af32| af33| af41| af42| af43| cs1| cs2| cs3|
cs4| cs5| cs6| cs7| default| ef)|) (vlan <1-4094>|)
```

Parameters

<1-268435453>
IPv6 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

sctp
Stream Control Transmission Protocol packet.

X:X::X:X/M
Source address with network mask length.

X:X::X:X
Source address with wild card mask.

X:X::X:X
Source address's wild card mask (ignored bits).

any
Any source address.

X:X::X:X/M
Destination address with network mask length.

X:X::X:X
Destination address with wild card mask.

X:X::X:X
Destination address's wild card mask (ignored bits).

any
Any destination address.

eq
Source or destination port equal to.

gt
Source or destination port greater than.

lt
Source or destination port less than.

neq
Source or destination port not equal to.

<0-65535>
Source or destination port number.

range
Range of source or destination port numbers:

<0-65535>
Lowest value in the range.

<0-65535>
Highest value in the range.

dscp
Match packets with given DSCP value.

<0-63>
Enter DSCP value between 0-63.

af11
AF11 DSCP (001010) decimal value 10.

af12
AF12 DSCP (001100) decimal value 12.

af13
AF13 DSCP (001110) decimal value 14.

af21
AF21 DSCP (010010) decimal value 18.

af22
AF22 DSCP (010100) decimal value 20.

af23
AF23 DSCP (010110) decimal value 22.

af31
AF31 DSCP (011010) decimal value 26.

af32
AF32 DSCP (011100) decimal value 28.

af33
AF33 DSCP (011110) decimal value 30.

af41
AF41 DSCP (100010) decimal value 34

af42
AF42 DSCP (100100) decimal value 36.

af43
AF43 DSCP (100110) decimal value 38.

cs1
CS1 (precedence 1) DSCP (001000) decimal value 8.

cs2
CS2 (precedence 2) DSCP (010000) decimal value 16.

cs3
CS3 (precedence 3) DSCP (011000) decimal value 24.

cs4
CS4 (precedence 4) DSCP (100000) decimal value 32.

cs5
CS5 (precedence 5) DSCP (101000) decimal value 40.

cs6
CS6 (precedence 6) DSCP (110000) decimal value 48.

cs7
CS7 (precedence 7) DSCP (111000) decimal value 56.

default
Default DSCP (000000) decimal value 0.

ef
EF DSCP (101110) decimal value 46.

vlan <1-4094>
Match packets with given VLAN identifier.

Default

None

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#200 permit sctp any any
```

ipv6 access-list tcp|udp

Use this command to define a IPv6 access control list (ACL) specification that determines whether to accept or drop an incoming IPv6 packet based on the criteria that you specify. This form of this command filters packets based on source and destination IPv6 address along with protocol (TCP or **UDP**[1]) and port.

Use the **no** form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: Range options such as neq, gt, lt and range are not supported by the hardware in the egress direction.

Note: *neq* option from IPv6 access list configuration should removed for Qumran2 Series Platform.

Command Syntax

```
(<1-268435453>|) (deny|permit) tcp (X:X::X:X/M|X:X::X:X X:X::X:X|any) ((eq|gt|lt|neq) <0-65535>
|bgp|chargen|cmd|daytime|discard|domain|drip |echo|exec|finger|ftp |ftp-

```

Parameters

<1-268435453>
IPv6 ACL sequence number.

deny
Drop the packet.

permit
Accept the packet.

tcp
Transmission Control Protocol.

udp
User Datagram Protocol.

X:X::X:X/M
Source or destination IPv6 prefix and length.

X:X::X:X X:X::X:X
Source or destination IPv6 address and mask.

any
Any source or destination IPv6 address.

eq
Source or destination port equal to.

gt
Source or destination port greater than.

lt
Source or destination port less than.

neq
Source or destination port not equal to.

<0-65535>
Source or destination port number.

range
Range of source or destination port numbers:

<0-65535>
Lowest value in the range.

<0-65535>
Highest value in the range.

ftp
File Transfer Protocol (21).

ssh
Secure Shell (22).

telnet
Telnet (23).

www
World Wide Web (HTTP 80).

tftp
Trivial File Transfer Protocol (69).

bootp
Bootstrap Protocol (BOOTP) client (67).

bgp
Border Gateway Protocol.

chargen
Character generator.

cmd
Remote commands.

daytime
Daytime.

discard
Discard.

domain
Domain Name Service.

drip
Dynamic Routing Information Protocol.

echo
Echo.

exec
EXEC.

finger
Finger.

ftp
File Transfer Protocol.

ftp-data
FTP data connections.

gopher
Gopher.

hostname
NIC hostname server.

ident
Ident Protocol.

irc
Internet Relay Chat.

klogin
Kerberos login.

kshell
Kerberos shell.

login
Login.

lpd
Printer service.

nnt
Network News Transport Protocol.

pim-auto-rp
PIM Auto-RP.

pop2
Post Office Protocol v2.

pop3
Post Office Protocol v3.

smtp
Simple Mail Transport Protocol.

ssh
Secure Shell.

sunrpc
Sun Remote Procedure Call.

tacacs
TAC Access Control System.

talk
Talk.

telnet
Telnet.

time
Time.

uucp
UNIX-to-UNIX Copy Program.

whois
WHOIS/NICNAME

www
World Wide Web.

nntp
Range of source or destination port numbers:

dscp
Match packets with given DSCP value.

<0-63>

Enter DSCP value between 0-63

af11
AF11 DSCP (001010) decimal value 10.

af12
AF12 DSCP (001100) decimal value 12.

af13
AF13 DSCP (001110) decimal value 14.

af21
AF21 DSCP (010010) decimal value 18.

af22
AF22 DSCP (010100) decimal value 20.

af23
AF23 DSCP (010110) decimal value 22.

af31
AF31 DSCP (011010) decimal value 26.

af32
AF32 DSCP (011100) decimal value 28.

af33
AF33 DSCP (011110) decimal value 30.

af41
AF41 DSCP (100010) decimal value 34

af42
AF42 DSCP (100100) decimal value 36.

af43
AF43 DSCP (100110) decimal value 38.

cs1
CS1 (precedence 1) DSCP (001000) decimal value 8.

cs2
CS2 (precedence 2) DSCP (010000) decimal value 16.

cs3
CS3 (precedence 3) DSCP (011000) decimal value 24.

cs4
CS4 (precedence 4) DSCP (100000) decimal value 32.

cs5
CS5 (precedence 5) DSCP (101000) decimal value 40.

cs6
CS6 (precedence 6) DSCP (110000) decimal value 48.

cs7
CS7 (precedence 7) DSCP (111000) decimal value 56.

default
Default DSCP (000000) decimal value 0.

ef
EF DSCP (101110) decimal value 46.

biff
Biff.

bootpc
Bootstrap Protocol (BOOTP) client.

bootps
Bootstrap Protocol (BOOTP) server.

discard
Discard.

dnsix
DNSIX security protocol auditing.

domain
Domain Name Service.

echo
Echo.

isakmp
Internet Security Association and Key Management Protocol.

mobile-ip
Mobile IP registration.

nameserver
IEN116 name service.

netbios-dgm
Net BIOS datagram service.

netbios-ns
Net BIOS name service.

netbios-ss
Net BIOS session service.

non500-isakmp
Non500-Internet Security Association and Key Management Protocol.

ntp
Network Time Protocol.

pim-auto-rp
PIM Auto-RP.

rip
Routing Information Protocol.

snmp
Simple Network Management Protocol.

snmptrap
SNMP Traps.

sunrpc
Sun Remote Procedure Call.

syslog
System Logger.

tacacs
TAC Access Control System.

talk
Talk.

tftp
Trivial File Transfer Protocol.

time
Time.

who
Who service.

xdmcp
X Display Manager Control Protocol.

Check non-initial fragments.

vlan
Match packets with given vlan value.

<1-4094>
VLAN identifier

Default

None

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#deny udp any eq tftp any
(config-ipv6-acl)#deny tcp fd22:bf66:78a4:10a2::/64 fdf2:860a:746a:e49c::/64 eq ssh
```

mac access-group

Use this command to attach a MAC access list to an interface to filter incoming packets.

When you attach an access list to a VLAN interface or **LAG**[1] interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

The **time-range** parameter is optional. If used, the access-group is tied to the timer specified.

After the access-group has been configured with the time-range, to detach the access-group from the time-range, use the **no** form of this command with a time-range parameter as shown in the syntax and examples below.

To delete the access-group, use the **no** form of this command without a time-range.

- To attach a MAC ACL in the ingress direction ingress-l2 or ingress-l2-ext TCAM group needs to be enabled and to attach a MAC ACL in the egress direction egress-l2 TCAM group needs to be enabled. See the hardware-profile filter (Qumran 1) (page 1785) command for details.
- An egress ACL is supported on physical and lag interfaces only. VLAN and inner-VLAN options in ACL rules will match incoming packet VLANs even when ACL attached at egress.

Command Syntax

```
mac access-group NAME (in|out) (in|out) (time-range TR_NAME|)
no mac access-group NAME (in|out) (time-range TR_NAME|)
```

Parameters

NAME
Access list name.

in
Filter incoming packets.

out
Filter outgoing packets.

TR_NAME
Time range name set with the time-range (page 1777) command.

Default

None

[1]Link Aggregation Group

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3. The **`time-range`** parameter was added in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#mac access-list mylist
(config-mac-acl)#permit any any
(config-mac-acl)#exit

(config)#hardware-profile filter ingress-l2-ext enable

(config)#interface xe3
(config-if)#mac access-group mylist in
(config-if)#exit

(config)#interface xe3
(config-if)#mac access-group mylist in time-range TIMER1
(config-if)#exit

(config)#interface xe3
(config-if)#no mac access-group mylist in time-range TIMER1
(config-if)#exit

(config)#interface xe3
(config-if)#no mac access-group mylist in
(config-if)#exit
```

mac access-list

Use this command to define a MAC access control list (ACL) that determines whether to accept or drop an incoming packet based on specifications configured under the ACL. An ACL is made up of one or more ACL specifications.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied by default. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied deny specification for traffic that is not permitted. Implied specification can be updated to permit if the use-case is to deny a certain set of traffic.

Use the **no** form of this command to remove an ACL.

Command Syntax

```
mac access-list NAME
no mac access-list NAME
```

Parameters

NAME
Access-list name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01
(config-mac-acl)#exit
```

mac access-list default

Use this command to modify the default rule action of mac access-list. Default rule is applicable only when access-list is attached to interface. Default rule will have the lowest priority and only the packets not matching any of the user defined rules match default rule.

Command Syntax

```
default (deny-all|permit-all)
```

Parameters

deny-all
Drop all packets.

permit-all
Accept all packets.

Default

None

Command Mode

MAC access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01
(config-mac-acl)#default permit-all
```

mac access-list filter

Use this command to define an access control entry (ACE) in a mac access control list (ACL) that determines whether to permit or deny packets with the given source and destination MAC, ethertype cos and VLAN identifiers.

Use the **no** form of this command to remove an ACL specification. ACL specification can be removed using the sequence number as well.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: Ether type option is not supported by hardware in egress direction

Command Syntax

```
(<1-268435453>|)(deny|permit) (any | (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (any | (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))(aarp|appletalk|decnet-iv|diagnostic|etype-6000|etype-8042|ipv4|ipv6|mpls|lat|lavc-sca|mop-console|mop-dump|vines-echo|<0x600-0xFFF>))(cos <0-7>|)(vlan <1-4094>|) (inner-vlan <1-4094>|<0x600-0xFFF>)

no (<1-268435453>|)(deny|permit) (any | (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (any | (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))(aarp|appletalk|decnet-iv|diagnostic|etype-6000|etype-8042|ipv4|ipv6|mpls|lat|lavc-sca|mop-console|mop-dump|vines-echo|<0x600-0xFFF>|))(cos <0-7>|)(vlan <1-4094>|) (inner-vlan <1-4094>|<0x600-0xFFF>)

no (<1-268435453>)
```

Parameter

ETHTYPE	Any Ethertype value (0x600 - 0xffff)
deny	Drop the packet.
permit	Accept the packet.
<1-268435453>	IPv4 ACL sequence number.
any	Source/Destination any.
XX-XX-XX-XX-XX-XX	Source/Destination MAC address (Option 1)
XX-XX-XX-XX-XX-XX	Source/Destination MAC address (Option 2).
XXXX.XXXX.XXXX	Source/Destination MAC address (Option 3).
XX-XX-XX-XX-XX-XX	Source/Destination wildcard (Option1).
XX:XX:XX:XX:XX:XX	Source/Destination wildcard (Option2).
XXXX.XXXX.XXXX	Source/Destination wildcard (Option3).
host	A single source/destination host.

`aarp`	Ethertype - 0x80f3.
`appletalk`	Ethertype - 0x809b.
`decnet-iv`	Ethertype - 0x6003
`diagnostic`	Ethertype - 0x6005
`etype-6000`	Ethertype - 0x6000
`etype-8042`	Ethertype - 0x8042
`ip4`	Ethertype - 0x0800
`ip6`	Ethertype - 0x86dd
`mpls`	Ethertype - 0x8847
`lat`	Ethertype - 0x6004
`lavc-sca`	Ethertype - 0x6007
`mop-console`	Ethertype - 0x6002
`mop-dump`	Ethertype - 0x6001
`vines-echo`	Ethertype - 0x0baf
`WORD`	Any Ethertype value
`cos <0-7>`	Cos value
`vlan <1-4094>`	VLAN identifier
`inner-vlan <1 - 4094>`	Inner-VLAN identifier

Default

None

Command Mode

MAC ACL mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01
(config-mac-acl)#permit 0000.1234.1234 0000.0000.0000 any
```

mac access-list remark

Use this command to add a description to an MAC access control list (ACL).

Use the **no** form of this command to remove an ACL description.

Command Syntax

```
remark LINE
no remark
```

Parameters

LINE
ACL description up to 100 characters.

Default

None

Command Mode

MAC access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mylist
(config-mac-acl)# remark Permit the inside admin address
```

mac access-list resequence

Use this command to modify the sequence numbers of MAC access list specifications.

- Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.
- Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax

```
resequence <1-268435453> INCREMENT
```

Parameters

<1-268435453>
Starting sequence number.

INCREMENT
Sequence number increment steps.

Default

None

Command Mode

MAC access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mylist
(config-mac-acl)#resequence 15 15
```

show access-lists

Use this command to display access lists.

Command Syntax

```
show access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME
Access-list name.

expanded
Expanded access-list.

summary
Summary of access-list.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show access-lists expanded
IP access list Iprule1
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
default deny-all
MAC access list Macrule1
10 permit host 0000.1234.1234 any
default deny-all
IPv6 access list ipv6-acl-01
10 deny ahp 3ffe::/64 4ffe::/64
default deny-all

#show access-lists summary
IPV4 ACL Iprule1
statistics enabled
Total ACEs Configured: 1
Configured on interfaces:
xe3/1 - egress (Router ACL)
Active on interfaces:
xe1/3 - ingress (Router ACL)
MAC ACL Macrule1
statistics enabled
Total ACEs Configured: 0
Configured on interfaces:
Active on interfaces:

```

```
statistics enabled
Total ACEs Configured: 2
Configured on interfaces:
xe7/1 - ingress (Router ACL)
Active on interfaces:
```

show arp access-lists

Use this command to display ARP access lists.

Note: Broadcast ARP request packets are counted twice.

Command Syntax

```
show arp access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME
ARP access-list name.

expanded
Expanded access-list.

summary
Access-list summary.

Command Mode

Privileged execution mode mode and Execution mode mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#show arp access-lists
ARP access list arp1
        10 permit ip 1.1.1.0/24 mac 0000.0000.0001 FFFF.FFFF.FFF0
        20 deny ip 2.2.2.0/24 mac any
        default deny-all

#show arp access-lists summary
ARP ACL arp1
       statistics enabled
       Total ACEs Configured: 2
       Configured on interfaces:
          xe1 - ingress (Port ACL)
       Active on interfaces:
          xe1 - ingress (Port ACL)
```

show ip access-lists

Use this command to display IP access lists.

Note: In Qumran devices, when both ip access-list and mac access-list configured on the same interface with rules from both access-lists matching the packet, the match packet statistics is incremented only for the access-list whose hardware-profile filter is configured at the last. Also, when qos is configured on the same interface, along with ingress-acl statistics profile, ingress-qos statistics profile need to be enabled in order to get statistics for both qos entries and acl entries.

Note: See hardware-profile filter (Qumran 1) (page 1785) for filter groups and hardware-profile statistics (page 1811).

Command Syntax

```
show ip access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME
Access-list name.

expanded
Expanded access-list.

summary
Access-list summary.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip access-lists
IP access list Iprule2
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
12 deny ip 30.0.0.2 0.0.0.255 182.124.0.3/24
default deny-all

#show ip access-lists summary
IPV4 ACL Iprule3
statistics enabled
```

```
Total ACEs Configured: 4
Configured on interfaces:
sa1 - ingress (Port ACL)
sa3 - ingress (Router ACL)
sa8 - ingress (Port ACL)
vlan1.3 - ingress (Router ACL)
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
xe3/1 - egress (Router ACL)
Active on interfaces:
sa1 - ingress (Port ACL)
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
```

show ipv6 access-lists

Use this command to display IPv6 access lists.

Command Syntax

```
show ipv6 access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME
Access-list name.

expanded
Expanded access-list.

summary
Summary of access-list.

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 access-lists
IPv6 access list ipv6-acl-01
10 deny ahp 3ffe::/64 4ffe::/64
20 permit ahp 78fe::1/48 68fe::1/48
30 permit ahp 3333::1/64 4444::1/48 fragments
40 permit ahp 5555::1/64 4444::1/48 dscp af23
default deny-all
#show ipv6 access-lists summary
IPV6 ACL ipv6-acl-01
statistics enabled
Total ACEs Configured: 4
Configured on interfaces:
sa3 - ingress (Router ACL)
vlan1.3 - ingress (Router ACL)
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
Active on interfaces:
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
```

show mac access-lists

Use this command to display MAC access lists.

Note: In Qumran devices, when both ip access-list and mac access-list configured on the same interface with rules from both access-lists matching the packet, match packet statistics is incremented only for the access-list whose hardware-profile filter is configured at the last. Also, when qos is configured on the same interface, along with ingress-acl statistics profile, ingress-qos statistics profile need to be enabled in order to get statistics for both qos entries and acl entries.

Note: See hardware-profile filter (Qumran 1) (page 1785) for filter groups and hardware-profile statistics (page 1811).

Command Syntax

```
show mac access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME
Access-list name.

expanded
Expanded access-list.

summary
Summary of access-list.

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mac access-lists
MAC access list Macrule2
default deny-all
MAC access list Macrule3
10 permit host 0000.1234.1234 any
20 deny host 1111.1111.AAAA any 65535
30 permit host 2222.2222.AAAA any 65535
40 permit 0000.3333.3333 0000.0000.FFFF 4444.4444.4444 0000.0000.FFFF
default deny-all [match=1126931077]
```

```
# show mac access-lists summary
MAC ACL Macrule3
statistics enabled
Total ACEs Configured: 4
Configured on interfaces:
sa3 - ingress (Router ACL)
sa8 - ingress (Port ACL)
vlan1.3 - ingress (Router ACL)
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
Active on interfaces:
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
```

show running-config access-list

Use this command to show the running system status and configuration details for MAC and IP access lists.

Command Syntax

```
show running-config access-list
```

Parameters

None

Default

None

Command Mode

Privileged execution mode, Configure mode, and Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config access-list
ip access-list abd
10 deny any any any
!
mac access-list abc
remark test
10 deny any any
!
```

show running-config aclmgr

Use this command to display the entire access list configurations along with the attachment to interfaces.

Command Syntax

```
show running-config aclmgr (all|)
```

Parameters

all
Show running config with defaults

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config aclmgr
ip access-list ip-acl-01
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
12 deny ip 30.0.0.2 0.0.0.255 182.124.0.3/24
mac access-list mac-acl-01
10 permit host 0000.1234.1234 any
20 permit host 0000.1111.AAAA any ipv4 cos 3 vlan 3
!
ipv6 access-list ipv6-acl-01
10 deny ipv6 3ffe::/64 4ffe::/64 dscp af43
20 permit ipv6 78fe::/64 68fe::/64 dscp cs3
!
interface xe1/1
ip access-group ip-acl-01 in
!
```

show running-config ipv6 access-list

Use this command to show the running system status and configuration details for IPv6 access lists.

Command Syntax

```
show running-config ipv6 access-list
```

Parameters

None

Default

None

Command Mode

Privileged execution mode, Configure mode, and Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config ipv6 access-list
ipv6 access-list test
10 permit any any any
```

Access Control List Commands (Standard)

This chapter is a reference for the standard Access Control List (ACL) commands. Standard access-lists are not allowed to be attached to interfaces and are used for protocol-level filtering.

ip access-list standard

Use this command to define a standard IP access control list (ACL) in which multiple specifications can be configured. A specification determines whether to accept or drop an incoming IP packet based on the source IP address, either an exact match or a range of prefixes.

A standard ACL can be used by Layer 3 and SNMP protocols to permit or deny IP packets from a host or a range of prefixes.

Use the **no** form of this command to remove an ACL.

Note: Standard access-lists are not allowed to be attached to interfaces and are used for protocol-level filtering purposes.

Command Syntax

```
ip access-list standard NAME
no ip access-list standard NAME
```

Parameter

NAME
Standard IP access-list name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#ip access-list standard ip-acl-01
(config-ip-acl-std)#exit
(config)#no ip access-list standard ip-acl-01
```

ip access-list standard filter

Use this command to configure an access control entry in an access control list (ACL).

This command determines whether to accept or drop a packet based on the configured source IP address.

Use the **no** form of this command to remove an ACL specification.

Command Syntax

```
(deny|permit) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
no (deny|permit) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
```

Parameter

deny
Drop the packet.

permit
Accept the packet.

A.B.C.D/M
Source IP prefix and length.

A.B.C.D A.B.C.D
Source IP address and mask.

host A.B.C.D

A single source host IP address.
any

Match any source IP address.

Default

None

Command Mode

Standard IP access-list mode

Applicability

This command was introduced in OcNOS version 3.0

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
(config-ip-acl-std)#permit 30.30.30.0/24
(config-ip-acl-std)#no permit 30.30.30.0/24
```

Ipv6 access-list standard

Use this command to define a standard IPv6 access control list (ACL) in which multiple specifications can be configured. A specification determines whether to accept or drop an incoming IPv6 packet based on the source IPv6 address, either an exact match or a range of prefixes.

A standard IPv6 ACL can be used by Layer 3 protocols to permit or deny IPv6 packets from a host or a range of prefixes.

Use the **no** form of this command to remove an ACL.

Note: Standard access-lists are not allowed to be attached to interfaces and are used for protocol-level filtering purposes.

Command Syntax

```
ipv6 access-list standard NAME
no ipv6 access-list standard NAME
```

Parameter

NAME
Standard IPv6 access-list name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#ipv6 access-list standard ipv6-acl-01
(config-ipv6-acl-std)#exit
(config)#no ipv6 access-list standard ipv6-acl-01
```

ipv6 access-list standard filter

Use this command to configure access control entry in an access control list (ACL).This command determines whether to accept or drop a packet based on the configured IPv6 prefix.

Use the **no** form of this command to remove an ACL specification.

Command Syntax

```
(deny|permit)(X:X::X:X/M|X:X::X:X X:X::X:X|any)
no(deny|permit)(X:X::X:X/M|X:X::X:X X:X::X:X|any)
```

Parameters

deny
Drop the packet.

permit
Accept the packet.

X:X::X:X/M
Source address with network mask length.

X:X::X:X X:X::X:X
Source address with wild card mask.

any
Any source address.

Default

None

Command Mode

Standard IPv6 access-list mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#ipv6 access-list standard ipv6-acl-01
(config-ipv6-acl-std)#permit 2000::0/64
(config-ipv6-acl-std)#no permit 2000::0/64
```

DHCP Snooping Commands

This chapter describes the commands for **DHCP**[1] snooping.

[1]Dynamic Host Configuration Protocol

debug ip dhcp snooping

Use this command to enable the debugging **DHCP**[1] snooping.

Use the **no** parameter to disable the debug options.

Command Syntax

```
debug ip dhcp snooping (event|rx|tx|packet|all)
no debug ip dhcp snooping (event|rx|tx|packet|all)
```

Parameters

event
Enable event debugging

rx
Enable receive debugging

tx
Enable transmit debugging

packet
Enable packet debugging

all
Enable all debugging

Default

By default all debugging options are disabled.

Command Mode

Exec mode and configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#debug ip dhcp snooping all
#no debug ip dhcp snooping packet
```

[1]Dynamic Host Configuration Protocol

hardware-profile filter dhcp-snoop

Use this command to enable or disable the ingress dhcp-snoop TCAM group.

Command Syntax

```
hardware-profile filter dhcp-snoop (disable | enable)
```

Parameters

enable
Enable the ingress dhcp-snoop group

disable
Disable the ingress dhcp-snoop group

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
configure terminal
(config)#hardware-profile filter dhcp-snoop enable
```

hardware-profile filter dhcp-snoop-ipv6

Use this command to enable or disable the ingress dhcp-snoop-ipv6 TCAM group.

Command Syntax

```
hardware-profile filter dhcp-snoop-ipv6 (disable | enable)
```

Parameters

enable
Enable the ingress dhcp-snoop-ipv6 group

disable
Disable the ingress dhcp-snoop-ipv6 group

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
configure terminal
(config)#hardware-profile filter dhcp-snoop-ipv6 enable
```

ip dhcp packet strict-validation bridge

Use this command to enable strict validation of **DHCP**[1] packets. Strict validation checks that the DHCP option field in the packet is valid including the magic cookie in the first four bytes of the options field. The device drops the packet if validation fails.

Use the **no** form of this command to disable strict validation.

Command Syntax

```
ip dhcp packet strict-validation bridge <1-32>
no ip dhcp packet strict-validation bridge <1-32>
```

Parameters

<1-32>
Bridge number

Default

By default, strict validation of DHCP packets is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
configure terminal
(config)#bridge 1 protocol mstp
(config)#ip dhcp snooping bridge 1
(config)#ip dhcp packet strict-validation bridge 1
```

[1]Dynamic Host Configuration Protocol

ip dhcp snooping arp-inspection bridge

Use this command to enable/disable arp-inspection on the bridge.

Note: You must enable dhcp snooping before enabling ARP inspection.

Command Syntax

```
ip dhcp snooping arp-inspection bridge <1-32>
no ip dhcp snooping arp-inspection bridge <1-32>
```

Parameter

<1-32>
Bridge number

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#bridge 1 protocol mstp
(config)#ip dhcp snooping bridge 1
(config)#ip dhcp snooping arp-inspection bridge 1
```

ip dhcp snooping arp-inspection vlan

Use this command to enable ARP inspection on the VLAN in a bridge.

Use the no form of this command to disable ARP inspection on the VLAN in a bridge.

Command Syntax

```
ip dhcp snooping arp-inspection vlan VLAN_RANGE2 bridge <1-32>
no ip dhcp snooping arp-inspection vlan VLAN_RANGE2 bridge <1-32>
```

Parameters

VLAN_RANGE2
VLAN identifier <1-4094> or range such as 2-5,10 or 2-5,7-19

<1-32>
Bridge number

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
configure terminal
(config)#bridge 1 protocol mstp
(config)#ip dhcp snooping bridge 1
(config)#ip dhcp snooping arp-inspection bridge 1
(config)#vlan 2 bridge 1 state enable
(config)#ip dhcp snooping vlan 2 bridge 1
(config)#ip dhcp snooping arp-inspection vlan 2 bridge 1
```

ip dhcp snooping arp-inspection validate

Use this command to enable validation of the source-mac, destination-mac, or IP address field in the ARP packet payload.

Note: The IP address in a payload is validated for not being a broadcast address, a reserved zero IP address, and multicast address.

Use the **no** form of this command to disable validation of the source-mac, destination-mac, or IP address field in the ARP packet payload

Command Syntax

```
ip dhcp snooping arp-inspection validate (dst-mac | ip | src-mac) bridge <1-32>
no ip dhcp snooping arp-inspection validate (dst-mac | ip | src-mac) bridge <1-32>
```

Parameters

dst-mac
Destination MAC validation

ip
ARP IP address validation

src-mac
Source MAC validation

<1-32>
Bridge number

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
configure terminal
(config)# bridge 1 protocol mstp
(config)#ip dhcp snooping bridge 1
(config)#ip dhcp snooping arp-inspection bridge 1
(config)#ip dhcp snooping arp-inspection validate dst-mac bridge 1
(config)#no ip dhcp snooping arp-inspection validate dst-mac bridge 1
(config)#ip dhcp snooping arp-inspection validate src-mac bridge 1
```

```
(config)#no ip dhcp snooping arp-inspection validate src-mac bridge 1
(config)#ip dhcp snooping arp-inspection validate ip bridge 1
(config)#no ip dhcp snooping arp-inspection validate ip bridge 1
```

ip dhcp snooping bridge

Use this command to enable **DHCP**[1] snooping on a bridge.

Use the **no** form of this command to disable DHCP snooping on a bridge.

Command Syntax

```
ip dhcp snooping bridge <1-32>
no ip dhcp snooping bridge <1-32>
```

Parameters

<1-32>
Bridge number

Default

By default DHCP snooping is disabled on a bridge.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#bridge 1 protocol mstp
(config)#ip dhcp snooping bridge 1
```

[1]Dynamic Host Configuration Protocol

ip dhcp snooping database

Use this command to write the entries in the binding table to persistent storage.

Command Syntax

```
ip dhcp snooping database bridge <1-32>
```

Parameters

<1-32>
Bridge number

Default

No default value is specified.

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#ip dhcp snooping database bridge 1
```

ip dhcp snooping information option bridge

Use this command to insert interface and VLAN name in the option 82 field in **DHCP**[1] packets.

Use the **no** form of this command to disable inserting option 82 information in DHCP packets.

Command Syntax

```
ip dhcp snooping information option bridge <1-32>
no ip dhcp snooping information option bridge <1-32>
```

Parameters

<1-32>
Bridge number

Default

By default option 82 information insertion is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
configure terminal
(config)# bridge 1 protocol mstp
(config)#ip dhcp snooping bridge 1
(config)#vlan 2 bridge 1 state enable
(config)#ip dhcp snooping vlan 2 bridge 1
(config)#ip dhcp information option bridge 1
```

[1]Dynamic Host Configuration Protocol

ip dhcp snooping trust

Use this command to mark an interface as trusted. All **DHCP**[1] servers must be connected to the trusted interface.

Use the **no** form of this command to remove an interface from the list of trusted interfaces.

Command Syntax

```
ip dhcp snooping trust
no ip dhcp snooping trust
```

Parameters

None

Default

By default all interfaces are untrusted.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
configure terminal
(config)# bridge 1 protocol mstp
(config)#ip dhcp snooping bridge 1
(config)#vlan 2 bridge 1 state enable
(config)#ip dhcp snooping vlan 2 bridge 1
(config)#ip dhcp information option bridge 1
```

[1]Dynamic Host Configuration Protocol

ip dhcp snooping verify mac-address

Use this command to enable MAC address verification. If the device receives a **DHCP**[1] request packet on an untrusted interface and the source MAC address and the **DHCP client**[2] hardware address do not match, the device drops the packet.

Use the **no** form of this command to disable address verification.

Command Syntax

```
ip dhcp snooping verify mac-address bridge <1-32>
no ip dhcp snooping verify mac-address bridge <1-32>
```

Parameters

<1-32>
Bridge number

Default

By default MAC address verification is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
configure terminal
(config)# bridge 1 protocol mstp
(config)#ip dhcp snooping bridge 1
(config)#ip dhcp snooping verify mac-address bridge 1
```

[1]Dynamic Host Configuration Protocol

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

ip dhcp snooping vlan

Use this command to enable **DHCP**[1] snooping for the given VLAN.

Use the **no** form of this command to disable the DHCP snooping for aVLAN.

Command Syntax

```
ip dhcp snooping vlan VLAN_RANGE2 bridge <1-32>
no ip dhcp snooping vlan VLAN_RANGE2 bridge <1-32>
```

Parameters

VLAN_RANGE2
VLAN identifier <1-4094> or range such as 2-5,10 or 2-5,7-19

<1-32>
Bridge number

Default

By default DHCP snooping is disabled for all VLANs.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
configure terminal
(config)#vlan 2 bridge 1 state enable
(config)#ip dhcp snooping vlan 2 bridge 1
```

[1]Dynamic Host Configuration Protocol

renew ip dhcp snooping binding database

Use this command to populate the binding table by fetching the binding entries from persistent storage.

Command Syntax

```
renew ip dhcp snooping (source|) binding database bridge <1-32>
```

Parameters

<1-32>
Bridge number

source
IP source guard

Default

No default value is specified.

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#renew ip dhcp snooping binding database bridge 1
```

show debugging ip dhcp snooping

Use this command to display the enabled debugging options.

Command Syntax

```
show debugging ip dhcp snooping
```

Parameters

None

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show debugging ip dhcp snooping
DHCP snoop debugging status:
DHCP snoop event debugging is on
DHCP snoop tx debugging is on
```

show ip dhcp snooping bridge

Use this command to display the **DHCP**[1] configuration, including trusted ports, configured VLAN, active VLAN, and strict validation status.

Command Syntax

```
show ip dhcp snooping bridge <1-32>
```

Parameters

<1-32>
Bridge number

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show ip dhcp snooping bridge 1
Bridge Group                                        : 1
DHCP snooping is                                    : Enabled
DHCP snooping option82 is                           : Disabled
Verification of hwaddr field is                     : Disabled
Strict validation of DHCP packet is                 : Disabled
DB Write Interval(secs)                             : 300
DHCP snooping is configured on following VLANs      : 20,30
DHCP snooping is operational on following VLANs     : 20,30
DHCP snooping trust is configured on the following Interfaces
Interface               Trusted
---------------         -------
xe1                     Yes
DHCP snooping IP Source Guard is configured on the following Interfaces
Interface               Source Guard
---------------         ------------
```

Table 84 explains the fields in the output.

Table 84. show ip dhcp snooping bridge fields

Field	Description
Bridge Group	Bridge number
DHCP snooping is	Whether DHCP snooping is enabled
DHCP snooping	Whether DHCP snooping option 82 is enabled

[1]Dynamic Host Configuration Protocol

Table 84. show ip dhcp snooping bridge fields (continued)

Field	Description
option82 is	
Verification of hwaddr field is	Whether verification of hwaddr field is enabled
Strict validation of DHCP packet is	Whether strict validation of DHCP packets is enabled
DB Write Interval (secs)	Database write interval in seconds
DHCP snooping is configured on following VLANs	VLANs on which DHCP snooping is enabled
DHCP snooping is operational on following VLANs	VLANs on which DHCP snooping is operating
Interface	Interface name
Trusted	Whether DHCP snooping trust is enabled on the interface
Source Guard	Whether DHCP snooping IP source guard is enabled on the interface

show ip dhcp snooping binding bridge

Use this command to display the **DHCP**[1] snooping binding table.

Command Syntax

```
show ip dhcp snooping binding bridge <1-32>
```

Parameters

<1-32>
Bridge number

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show ip dhcp snooping binding bridge 1
Total number of static IPV4 entries                    : 0
Total number of dynamic IPV4 entries                   : 2
Total number of static IPV6 entries                    : 0
Total number of dynamic IPV6 entries                   : 0
MacAddress           IpAddress         Lease(sec) Type             VLAN   Interface
------------------   ---------------   ---------- -------------    ----   --------------
3cfd.fe0b.06e0       12.12.12.10       30         dhcp-snooping    20     xe12
3cfd.fe0b.06e0       30.30.30.30       480        dhcp-snooping    30     xe12
```

Table 85 explains the output .

Table 85. show ip dhcp snooping binding bridge fields

Field	Description
Total number of static IPV4 entries	Number of static IPV4 entries.
Total number of dynamic IPV4 entries	Number of dynamic IPV4 entries.
Total number of static IPV6 entries	Number of static IPV6 entries.
Total number of dynamic IPV6 entries	Number of dynamic IPV6 entries .
MacAddress	MAC address of the interface.

[1]Dynamic Host Configuration Protocol

Table 85. show ip dhcp snooping binding bridge fields (continued)

Field	Description
IP Address	IP address of the peer device.
Lease (sec)	DHCP lease time in seconds provided to untrusted IP addresses.
Type	Configured either statically or dynamically by the DHCP server.
VLAN	Identifier of the number.
Interface	Interface is being snooped.

IP Source Guard Commands

This chapter describes the commands for IP Source Guard (IPSG):

hardware-profile filter ipsg

Use this command to enable or disable the ingress IPSG TCAM group for IPv4.

Command Syntax

```
hardware-profile filter ipsg (disable | enable)
```

Parameters

enable
Enable the ingress IPSG TCAM group.

disable
Disable the ingress IPSG TCAM group.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
OcNOS#configure terminal
OcNOS(config)#hardware-profile filter ipsg enable
```

hardware-profile filter ipsg-ipv6

Use this command to enable or disable the ingress IPSG TCAM group for IPv6.

Command Syntax

```
hardware-profile filter ipsg-ipv6 (disable | enable)
```

Parameters

enable
Enable the ingress IPSG TCAM group.

disable
Disable the ingress IPSG TCAM group.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
OcNOS#configure terminal
OcNOS(config)#hardware-profile filter ipsg-ipv6 disable
```

ip verify source dhcp-snooping-vlan

Use this command to enable the IPSG feature at the interface level.

Use the no form of this command to disable the IPSG on an interface.

Command Syntax

```
ip verify source dhcp-snooping-vlan
no ip verify source dhcp-snooping-vlan
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
OcNOS#configure terminal
OcNOS(config)#interface xe1
OcNOS(config-if)#ip verify source dhcp-snooping-vlan

OcNOS(config-if)#no ip verify source dhcp-snooping-vlan
```

Internet Protocol Security Commands

This chapter is a reference for the Internet Protocol Security (IPsec) commands.

crypto ipsec transform-set

Use this command to configure a transform set that defines protocols and algorithm settings to apply to IPSec protected traffic.

During the IPSec security association negotiation, the peers agree to use a particular transform-set to be used for protecting a particular data flow.

Several transform-sets can be specified and associated with a crypto map entry.

A transform set defines the IPSec security protocols: Encapsulation Security Protocol (ESP) or Authentication Header (AH), and also specifies which algorithms to use with the selected security protocol.

Command Syntax

```
crypto ipsec transform-set NAME
crypto ipsec transform-set NAME ah (none|ah-md5|ah-sha1|ah-sha256|ah-sha384|ah-sha512)
crypto ipsec transform-set NAME esp-auth (none|esp-md5|esp-sha1|esp-sha256|esp-sha384|esp-sha512)
esp-enc (esp-null|esp-3des|esp-aes|esp-aes192|esp-aes256|esp-blf|esp-blf192|esp-blf256|esp-cast)
crypto ipsec transform-set NAME mode (transport)
no crypto ipsec transform-set NAME mode
no crypto ipsec transform-set NAME
```

Parameters

NAME
Name of the transform set.

mode
Change the transform-set mode to tunnel or transport.

transport
The payload (data) of the original IP packet is protected.

ah
Authentication Header protocol provides data authentication.

none
No authentication.

ah-md5
Authentication Header with Message Digest 5 (MD5) Hashed Message Authentication Code (HMAC) variant.

ah-sha1
Authentication Header with Secure Hash Algorithm 1 (SHA-1) Hashed Message Authentication Code (HMAC) variant.

ah-sha256
Authentication Header with Secure Hash Algorithm 256 (SHA-256) Hashed Message Authentication Code (HMAC) variant.

ah-sha384
Authentication Header with Secure Hash Algorithm 384 (SHA-384) Hashed Message Authentication Code (HMAC) variant.

ah-sha512
Authentication Header with Secure Hash Algorithm 512 (SHA-512) Hashed Message Authentication Code (HMAC) variant.

esp-auth
Encapsulating Security Payload authentication protocol provides data authentication.

none
No authentication.

esp-md5
Encapsulating Security Payload with Message Digest 5 (MD5) Hashed Message Authentication Code (HMAC) variant.

esp-sha1
Encapsulating Security Payload with Secure Hash Algorithm 1 (SHA-1) Hashed Message Authentication Code (HMAC) variant.

esp-sha256
Encapsulating Security Payload with Secure Hash Algorithm 256 (SHA-256) Hashed Message Authentication Code (HMAC) variant.

esp-sha384
Encapsulating Security Payload with Secure Hash Algorithm 384 (SHA-384) Hashed Message Authentication Code (HMAC) variant.

esp-sha512
Encapsulating Security Payload with Secure Hash Algorithm 512 (SHA-512) Hashed Message Authentication Code (HMAC) variant.

esp-enc
Encapsulating Security Payload encryption protocol

esp-null
Encapsulating Security Payload null encryption.

esp-3des
Encapsulating Security Payload with 168-bit DES encryption (3DES or Triple DES).

esp-aes
Alternative AES.

esp-aes192
Alternative AES192.

esp-aes256
Alternative AES256.

esp-blf
Alternative Blowfish.

esp-blf192
Alternative Blowfish192.

esp-blf256
Alternative Blowfish256.

esp-cast
Alternative Cast (IKEv1 not supported).

Command Mode

Command mode

Applicability

This command is introduced in OcNOS version 6.0.0

Example

```
#configure terminal
(config)#crypto ipsec transform-set TEST_ESP esp-auth esp-md5 esp-enc esp-3des
(config)#crypto ipsec transform-set TEST_AH ah ah-sha512
```

crypto map

Use this command to create or change a crypto map entry and enter crypto map configuration mode.

Use the **no** form of this command to delete a crypto map entry or set.

Command Syntax

```
crypto map MAP-NAME ipsec-manual
no crypto map MAP-NAME
```

Parameters

MAP-NAME
Name of the crypto map set (maximum length 127).

ipsec-manual
Do not use IKE to establish IPSec security associations.

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 6.0.0

Example

```
(config)#crypto map MAP1 ipsec-manual
(config-crypto)#
```

mode

Use this command to set the mode of negotiation for a transform set.

Use the `no` form of this command to reset the mode to its default (tunnel).

Command Syntax

```
mode (tunnel|transport)
no mode
```

Parameters

tunnel
The entire original IP packet is protected (default).

transport
The payload (data) of the original IP packet is protected.

Default

Tunnel mode

Command Mode

Transform Set mode

Applicability

This command is introduced in OcNOS version 6.0.0

Example

```
(config)#crypto ipsec transform-set TEST_ESP mode transport
(config-transform)#mode transport
```

set peer

Use this command to specify an IPSec peer IPv4 or IPv6 for a crypto map.

Use the **no** form of this command to remove an IPSec peer from a crypto map entry.

Command syntax

```
set peer (A.B.C.D | X:X::X:X) (spi (<0-4096>)|)
no set peer (A.B.C.D | X:X::X:X)
```

Parameters

A.B.C.D
IPv4 peer address

X:X:X:X
IPv6 peer address

spi
Specifies the security parameter index (SPI), a number that is used to uniquely identify a security association.

<0-4096>
Security parameter index (SPI) range

Default

None

Command Mode

Crypto Map sequence mode

Applicability

This command is introduced in OcNOS version 6.0.0

Examples

```
#configure terminal
(config)#crypto map MAP1 ipsec-manual
(config-crypto)#sequence 1
(config-crypto-seq)#set transform-set TEST_ESP
(config-crypto-seq)#set peer fe80::3617:ebff:fe0e:1222 spi 200
```

set session-key

Use this command to define IPSec keys for security associations via ipsec-manual crypto map entries.

When you define multiple IPSec session keys within a single crypto map, you can assign the same security parameter index (SPI) number to all the keys. The SPI is used to identify the security association used with the crypto map.

Session keys at one peer must match the session keys at the remote peer.

Command syntax

```
set session-key (inbound|outbound) (esp) <0-4096> cipher HEX-KEY-DATA authenticator HEX-KEY-DATA
no set session-key (inbound|outbound) esp <0-4096>
```

Parameters

inbound
Sets the inbound IPSec session key. Both inbound and outbound keys must be set.

outbound
Sets the outbound IPSec session key. Both inbound and outbound keys must be set.

esp
Sets the IPSec session key for the Encapsulation Security Protocol.

<0-4096>
Specifies the security parameter index (SPI), a number that is used to uniquely identify a security association.

cipher
Indicates that the key string is to be used with the ESP encryption.

HEX-KEY-DATA
Specifies the session key in hexadecimal format.

authenticator
Indicates that the key string is to be used with the ESP authentication.

Default

None

Command Mode

Crypto Map sequence mode

Applicability

This command is introduced in OcNOS version 6.0.0

Examples

```
#configure terminal
(config)#crypto map MAP1 ipsec-manual
(config-crypto)#sequence 1
(config-crypto-seq)#set session-key outbound esp 200 cipher
```

```
12345678123456781234567812345678123456781234567812345678 authenticator 12345678123456781234567812345678
(config-crypto-seq)#set session-key inbound esp 200 cipher
12345678123456781234567812345678123456781234567812345678  authenticator 12345678123456781234567812345678
```

set transform-set

Use this command to specify which transform sets to include in a crypto map entry.

Use no form of this command to unset the transform set.

Command syntax

```
set transform-set NAME
no set transform-set NAME
```

Parameters

NAME
Transform-set name

Default

None

Command Mode

Crypto Map sequence mode

Applicability

This command is introduced in OcNOS version 6.0.0

Examples

```
#configure terminal
(config)#crypto map MAP1 ipsec-manual
(config-crypto)#sequence 1
(config-crypto-seq)#set transform-set TEST_ESP
```

sequence

The number you assign to the seq-num will be used to rank multiple crypto map entries within a crypto map set. This number defines the priority of crypto-map evaluation within a crypto map set.

Command syntax

```
sequence <1-65535>
no sequence <1-65535>
```

Parameters

<1-65535>
Value for crypto map sequence number.

Default

None

Command Mode

Crypto Map mode

Applicability

Introduced in OcNOS version 6.0.0

Examples

```
#configure terminal
(config)#crypto map MAP1 ipsec-manual
(config-crypto)#sequence 1
(config-crypto-seq)#
```

show crypto ipsec transform-set

Use this command to show the IPsec transform-set entries.

Command syntax

```
show crypto ipsec transform-set NAME
```

Parameters

NAME
Transform-set name

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced in OcNOS version 6.0.0

Examples

```
#show crypto ipsec transform-set TEST_ESP
Transform set t3
  Mode is Transport
  Algorithm none esp-3des esp-md5
```

SYSTEM MANAGEMENT COMMAND REFERENCE

Basic Commands

This chapter describes basic commands.

banner motd

Use this command to set the message of the day (motd) at login.

After giving this command, you must write to memory using the terminal monitor (page 1530) command. If you do not write to memory, the new message of the day is not available after the device reboots.

Use the **no** parameter to not display a banner message at login. To configure multi-line banner message, see Multi-Banner Message Command (page 1538)command.

Command Syntax

```
banner motd LINE
banner motd default
banner motd file URL
no banner motd
```

Parameters

LINE
Custom message of the day.

default
Default message of the day.

file
A file input to set a custom message of the day.

URL
The file path and name containing the banner message.

Default

By default, the following banner is displayed after logging in:

```
OcNOS version 1.3.4.268-DC-MPLS-ZEBM 09/27/2018 13:44:22
```

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#banner motd default

#configure terminal
(config)#no banner motd
```

cli timestamp

Use this command to enable timestamp print after every show command line interfaces.

Use the **no** form of this command disable the timestamp print.

Command Syntax

```
cli timestamp
```

Parameters

None

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.5.2.

Example

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#cli timestamp
OcNOS(config)#commit
OcNOS(config)#exit
OcNOS#
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#no cli timestamp
OcNOS(config)#commit
OcNOS(config)#exit
```

Validation Example

```
Virgo-6#show ip ospf neighbor
! [execution timestamp : 2024 May 14 08:57:44]
Virgo-6#
Virgo-6#show mpls forwarding-table
! [execution timestamp : 2024 May 14 08:57:49]
Codes: > - installed FTN, * - selected FTN, p - stale FTN, ! - using backup
       B - BGP FTN, K - CLI FTN, (t) - tunnel, P - SR Policy FTN, (b) - bypass,
       L - LDP FTN, R - RSVP-TE FTN, S - SNMP FTN, I - IGP-Shortcut,
       U - unknown FTN, O - SR-OSPF FTN, i - SR-ISIS FTN, k - SR-CLI FTN
       (m) - FTN mapped over multipath transport, (e) - FTN is ECMP

FTN-ECMP LDP: Disabled
Code   FEC  FTN-ID  Nhlfe-ID  Tunnel-ID Pri Out-Label Out-Intf ELC   Nexthop         UpTime
```

clock set

Use this command to set the system time manually.

Command Syntax

```
clock set HH:MM:SS <1-31> MONTH <2000-2099>
```

Parameters

HH:MM:SS
Time of day: hour, minutes, seconds

<1-31>
Day of month

MONTH
Month of the year (january-december)

<2000-2099>
Year

Default

N/A

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clock set 18:30:00 13 january 2021
18:30:00 UTC Wed Jan 13 2021
```

clock timezone

Use this command to set the system time zone.

Use **no** form of this command to set the default system time zone (UTC).

Command Syntax

```
clock timezone (WORD)
no clock timezone
```

Parameters

WORD
Timezone name. Use 'show timezone' to get the list of city names.

Default

By default, system time zone is UTC

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#clock timezone Los_Angeles
```

configure terminal

Use this command to enter configure mode.

When multiple CLI sessions are enabled with the command, configure terminal will not acquire a running datastore lock.

Command Syntax

```
configure terminal
```

Parameters

None

Default

No default value is specified

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows entering configure mode (note the change in the command prompt).

```
#configure terminal
(config)#
```

configure terminal force

Use the configure terminal force command to kick out the configure command mode to privileged EXEC mode, if there is any session already in configure command mode.

Note: Configure terminal force with option 0 or without any option indicates immediate kick out the session which is locked to configure command mode. similarly, configure terminal force with option of any value indicates session locked to configure command mode will be exited to privileged Exec mode after the specified number of seconds completed.

When multiple CLI sessions are enabled with the command, configure terminal force has no effect because configuration mode is allowed for multiple users simultaneously.

Command Syntax

```
configure terminal force <0-600|>
```

Parameters

<0-600>
Timeout value in seconds for the session in config mode to exit to Privileged

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal force 0
#
```

copy empty-config startup-config

Use this command to clear the contents of the startup configuration.

Command Syntax

```
copy empty-config startup-config
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#copy empty-config startup-config
#
```

copy running-config startup-config

Use this command to a write the configuration to the file used at startup. This is the same as the write command.

Command Syntax

```
copy running-config startup-config
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#copy running-config startup-config
Building configuration...
[OK]
#
```

crypto pki generate rsa common-name ipv4

Use this command to generate a private key and Certificate Signing Request (CSR) which are required for OcNOS to establish a Transport Layer Security (TLS) connection with a NetConf client.

Command Syntax

```
crypto pki generate rsa common-name ipv4 IPv4ADDR
```

Parameters

IPv4ADDR
IPv4 address for the Common Name field of the CSR

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#crypto pki generate rsa common-name ipv4 7.7.7.7
#show crypto csr

-----END CERTIFICATE REQUEST-----
#
```

debug nsm

Use this command to enable NSM debugging.

Use the **no** form of this command to disable NSM debugging.

Command Syntax

```
debug nsm (all|)
no debug nsm (all|)

debug nsm bfd
no debug nsm bfd

debug nsm events
no debug nsm events

debug nsm hal (all|) debug
debug nsm hal events
no debug nsm hal (all|)
no debug nsm hal events

debug nsm packet (recv|send|) (detail|)
no debug nsm packet (recv|send|) (detail|)
```

Parameters

all
Enable all debugging.

bfd
Debug BFD events.

events
Debug NSM events.

hal
Debug HAL.

events
Debug HAL events.

packet
Debug packet events.

recv
Debug received packets.

send
Debug sent packets.

detail
Show detailed packet information.

Default

By default, debugging is disabled.

Command Mode

Execution mode, Privileged execution mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug nsm all
#
#debug nsm bfd
#
#debug nsm events
#
#debug nsm hal all
#
#debug nsm packet
#
#debug nsm packet recv detail
```

debug vm-events

Use this command to enable debug logs for Guest VM events

Use the no form of this command to disable debug logs for Guest VM events

Command Syntax

```
debug vm-events
no debug vm-events
```

Parameters

None

Default

None

Command Mode

Configure mode and Execution mode

Applicability

This command was introduced before OcNOS version 6.1.0

Examples

```
#configure terminal
(config)#debug vm-events
```

disable

Use this command from to exit privileged exec mode and return to exec mode. This is the only command that allows you to go back to exec mode. The exit (page 1477) or quit (page 1494) commands in privileged exec mode end the session without returning to exec mode.

Command Syntax

```
disable
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#disable
>
```

do

Use this command to run several exec mode or privileged exec mode commands from configure mode. The commands that can be run from configure mode using **do** are: **show**, **clear**, **debug**, **ping**, **traceroute**, **write**, and **no debug**.

Command Syntax

```
do LINE
```

Parameters

LINE
Command and its parameters.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
#(config)#do show interface
Interface lo
  Hardware is Loopback index 1 metric 1 mtu 16436 duplex-half arp ageing timeout 25
  <UP,LOOPBACK,RUNNING>
  VRF Binding: Not bound
  Label switching is disabled
  No Virtual Circuit configured
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
  inet 4.4.4.40/32 secondary
  inet 127.0.0.1/8
  inet6 ::1/128
  Interface Gifindex: 3
  Number of Data Links: 0
  GMPLS Switching Capability Type:
    Packet-Switch Capable-1 (PSC-1)
  GMPLS Encoding Type: Packet
  Minimum LSP Bandwidth 0
    input packets 10026, bytes 730660, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
    output packets 10026, bytes 730660, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0
#
```

enable

Use this command to enter privileged exec command mode.

Command Syntax

```
enable
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows entering the Privileged Exec mode (note the change in the command prompt).

```
>enable
#
```

enable password

Use this command to change or create a password to use when entering enable mode.

Note: Only network administrators can execute this command. For more, see the username (page 371) command.

There are two methods to enable a password:

- Plain Password: a clear text string that appears in the configuration file.
- Encrypted Password: An encrypted password does not display in the configuration file; instead, it displays as an encrypted string. First, use this command to create a password. Then, use the service password-encryption (page 1497) command to encrypt the password.

Use the **no** parameter to disable the password.

Command Syntax

```
enable password LINE
no enable password
no enable password LINE
```

Parameters

LINE
Password string, up to 8 alpha-numeric characters, including spaces. The string cannot begin with a number.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#enable password mypasswd
```

end

Use this command to return to privileged exec command mode from any other advanced command mode.

Command Syntax

```
end
```

Parameters

None

Default

None

Command Mode

All command modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows returning to privileged exec mode directly from interface mode.

```
#configure terminal
(config)#interface eth0
(config-if)#end
#
```

exec-timeout

Use this command to set the interval the command interpreter waits for user input detected. That is, this sets the time a telnet session waits for an idle VTY session before it times out. A value of zero minutes and zero seconds (0 and 0) causes the session to wait indefinitely.

Use the **no** parameter to disable the wait interval.

Command Syntax

```
exec-timeout <0-35791> (<0-2147483>|)
no exec-timeout
```

Parameters

<0-35791>
Timeout value in minutes.

<0-2147483>
Timeout value in seconds.

Default

None

Command Mode

Line mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example, the telnet session will timeout after 2 minutes, 30 seconds if there is no response from the user.

```
Router#configure terminal
Router(config)#line vty 23 66
Router(config-line)#exec-timeout 2 30
```

exit

Use the exit command to leave the current mode and return to the previous mode. This command is available in exec mode and all higher CLI modes. When executed in exec mode or other modes, it ends the session.

Command Syntax

```
exit
```

Parameters

None

Default

None

Command Mode

All command modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows exiting interface mode and returning to configure mode.

```
#configure terminal
(config)#interface eth0
(config-if)#exit
(config)#
```

help

Use this command to display help for the OcNOS command line interface.

Command Syntax

```
help
```

Parameters

None

Default

None

Command Mode

All command modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#help
CLI provides advanced help feature. When you need help,
anytime at the command line please press '?'.

If nothing matches, the help list will be empty and you must backup
until entering a '?' shows the available options.
Two styles of help are provided:
1. Full help is available when you are ready to enter a
   command argument (e.g. 'show ?') and describes each possible
   argument.
2. Partial help is provided when an abbreviated argument is entered
   and you want to know what arguments match the input
   (e.g. 'show ve?'.)
```

history

Use this command to set the maximum number of commands stored in the command history.

Use the **no** parameter to remove the configuration.

Command Syntax

```
history max <0-2147483647>
no history max
```

Parameters

<0-2147483647>
Number of commands.

Default

None

Command Mode

Line mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#line vty 12 77
(config-line)#history max 123

(config-line)#no history max
```

hostname

Use this command to set the network name for the device. OcNOS uses this name in system prompts and default configuration filenames.

Setting a host name using this command also sets the host name in the kernel.

Note: After giving the **hostname** command, you must write to memory using the terminal monitor (page 1530) command. If you do not write to memory, the change made by this command (the new host name) is not set after the device reboots.

Use the **no** parameter to disable this function.

Command Syntax

```
hostname WORD
no hostname (WORD|)
```

Parameter

WORD
Network name for a system. Per RFC 952 and RFC 1123, a host name string can contain only the special characters period (“.”) and hyphen (“-”). These special characters cannot be at the start or end of a host name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#hostname ABC
(config)#

(config)#no hostname
(config)#exit
```

line console

Use the this command to move or change to the line console mode.

Command Syntax

```
line console <0-0>
```

Parameters

<0-0>
First line number.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example enters line mode (note the change in the prompt).

```
#configure terminal
(config)#line console 0
(config-line)#
```

line vty (all line mode)

Use this command to move or change to all line VTY mode.

Note: line vty is just a mode changing command, and it can't exist without sub attributes being configured. i.e exec-timeout.

Command Syntax

```
line vty
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

The following example shows entering all line mode (note the change in the prompt).

```
#configure terminal
(config)#line vty
(config-all-line)#exit
(config)#
```

line vty (line mode)

Use this command to move or change to VTY mode. This command is used to connect to a protocol daemon. This configuration is necessary for any session. This configuration should be in the daemon's config file before starting the daemon.

Use the **no** parameter to disable this command.

Note: line vty is just a mode changing command, and it can't exist without sub attributes being configured. i.e exec-timeout.

Command Syntax

```
line vty <0-871> <0-871>
no line vty <0-871> (<0-871>|)
```

Parameters

<0-871>
Specify the first line number.

<0-871>
Specify the last line number.

Note: Configurations (exec-timeout) performed under this mode, affects only the current VTY session.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows entering line mode (note the change in the prompt).

```
#configure terminal
(config)#line vty 9
(config-line)#exit
(config)no line vty 9
```

logging cli

Use this command to enable logging commands entered by all users.

Use the **no** parameter to disable logging commands entered by all users.

Command Syntax

```
logging cli
no logging cli
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#logging cli
(config)#no logging cli
```

logout

Use this command to exit the OcNOS shell. It presents only in exec mode, on execution it will exit from the exec mode.

Command Syntax

```
logout
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>logout
 login:
>enable
en#logout
>
```

max-session

Use this command to set maximum VTY session limit.

Use **no** form of this command to unset session-limit.

User can configure session-limit for Telnet and SSH sessions separately but this max-session parameter value takes the precedence to restrict the maximum number of sessions. If user configured this max-session to be 4, then the device would allow only maximum of 4 SSH and Telnet sessions collectively irrespective of the individual SSH and Telnet max-session configuration. Active sessions won't be disturbed even if the configured max-session limit is lesser than the current active sessions.

Command syntax

```
max-session <1-40>
```

Parameters

<1-40>
Number of sessions

Default

By default, 40 sessions are allowed.

Command Mode

Line mode

Applicability

This command is introduced in OcNOS version 5.0

Example

In the following example max-session is configured as 4, thus the device would allow only 4 management sessions of SSH and Telnet collectively.

```
#configure terminal
(config)#line vty
(config-all-line)#max-session 5
(config-all-line)#commit
(config-all-line)#exit
(config)#exit
```

ping

Use this command to send echo messages to another host.

Note: When data packets copied to cpu due to destination lookup fail, both data packets and icmp echo request packets processed in cpu through same cpu queue and it may happen that ping fails due to congestion. In such cases, to check connectivity, please use interactive ping command and update tos value 192. Refer ping (interactive) (page 1490) for the interactive ping command.

Command Syntax

```
ping WORD (broadcast | count <1-2147483647> | datasize <36-18024> |interface IFNAME| source-ip
A.B.C.D | interval <0-3600>  | timeout <0-3600>|) (vrf (NAME|management)|)
ping ip WORD (broadcast | count <1-2147483647> | datasize <36-18024> | interface IFNAME| source-ip
A.B.C.D | interval <0-3600>  | timeout <0-3600>|) (vrf (NAME|management)|)
ping ipv6 WORD (broadcast | count <1-2147483647> | datasize <36-18024> |interface IFNAME| source-ip
X:X::X:X | interval <0-3600>  | timeout <0-3600>|) (vrf (NAME|management)|)
```

Parameters

WORD
Destination address (in A.B.C.D format for IPv4 or X:X::X:X for IPv6) or host name.

ip
IPv4 echo.

WORD
Destination address in A.B.C.D format or host name.

ipv6
IPv6 echo.

WORD
Destination address in X:X::X:X format or host name.

interface
Interface name through which the **ICMP**[1] packets to be sent.

IFNAME
Interface's name

source-ip
Source IP to be used in ICMP packet.

A.B.C.D
Source IPv4 address in the ping.

X:X::X:X
Source IPv6 address in the ping.

vrf
Virtual Routing and Forwarding instance.

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

NAME
VRF[1] instance name.

management
Management VRF.

broadcast
Allow broadcast

count
Ping repeat count

<1-2147483647>
Repeat count value

datasize
Datagram size

<36-18024>
Data size in bytes (Default value is 100)

interval
Interval between sending each packet

<0-3600>
Interval value (Default value is 1)

timeout
Response timeout

<0-3600>
Timeout in seconds (Default value is 2)

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>enable
#ping 20.20.20.1 vrf management
Press CTRL+C to exit
PING 20.20.20.1 (20.20.20.1) 56(84) bytes of data.

```

The input prompts are described in Table 86:

Table 86. ping output fields

Protocol [ip]	IPv4 or IPv6. The default is IPv4 if not specified.
Target IP address	IPv4 or IPv6 address or host name.
Name of the **VRF**[1]	Name of the Virtual Routing and Forwarding instance.
Repeat count [5]	Number of ping packets to send. The default is 5 if not specified.
Time Interval in Sec [1]	Time interval between two ping packets. The default is 1 second if not specified.
Datagram size [100]	Ping packet size. The default is 100 bytes if not specified.
Timeout in seconds [2]	Time to wait for ping reply. The default is 2 seconds if not specified.
Extended commands [n]	Options for extended ping. The default is “no”.
Source address or interface	Source address or interface.
Type of service [0]	Types of service. The default is 0 if not specified.
Set DF bit in IP header? [no]	Do not fragment bit. The default value is “no” if not specified.
Data pattern [0xABCD]	Specify a pattern.
Ping Broadcast? Then -b [n]	Broadcast ping. The default is “no”. For a broadcast address, the value should be “y”.

[1]Virtual Routing and Forwarding

port breakout

Use this command for the port breakout configuration.

Notes:

- Application and related breakout types will differ for transceivers based on the make or vendor. Check the related applications and breakout type using the command "#show qsfp-dd <port no> advertisement applications" and configure application, corresponding breakout type as network needed.
- serdes command is applicable only for 1X100g and 1X200g breakout modes. If we configure serdes 25g then each lane will be configured with 25g.
- The 100g (ce) ports support 4X10g, 4X25g, and 2X50g breakout modes only.

Command Syntax

```
port IFNAME breakout (4X10g|4X25g|2X50g)
port IFNAME breakout
(1X100g|1X200g|2X100g|2X200g|2X50g|3X100g|4X100g|4X10g|4X25g|4X50g|8X10g|8X25g|8X50g)
port IFNAME breakout (2X100g|1X100g) (serdes (25g)|)
no port IFNAME breakout
```

Parameters

IFNAME
Interface Name.

1X100g
split to 1X100g(default serdes is 50G).

1X200g
split to 1X200g.

2X100g
split to 2X100g(default serdes is 50G).

2X200g
split to 2X200g.

2X50g
split to 2X50g.

3X100g
split to 3X100g.

4X100g
split to 4X100g.

4X10g
split to 4X10g.

4X25g
split to 4X25g.

4X50g
split to 4X50g.

8X10g
split to 8X10g.

8X25g
split to 8X25g.

8X50g
split to 8X50g.

Serdes 25g
configure serdes 25g.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.4.

Examples

```
#Configuring port breakout:
OcNOS(config)#port cd2 breakout 1X100g
OcNOS(config)#port cd3 breakout 1X200g
OcNOS(config)#port cd4 breakout 2X100g
OcNOS(config)#port cd5 breakout 2X200g
OcNOS(config)#port cd6 breakout 2X50g
OcNOS(config)#port cd7 breakout 3X100g
OcNOS(config)#port cd8 breakout 4X100g
OcNOS(config)#port cd9 breakout 4X10g
OcNOS(config)#port cd10 breakout 4X25g
OcNOS(config)#port cd11 breakout 4X50g
OcNOS(config)#port cd12 breakout 8X10g
OcNOS(config)#port cd13 breakout 8X25g
OcNOS(config)#port cd14 breakout 8X50g
Configuring port-breakout with serdes option:
OcNOS(config)#port cd15 breakout 1X100g serdes 25g
OcNOS(config)#port cd16 breakout 2X100g serdes 25g
Unconfiguring the port-breakout:
OcNOS(config)#no port cd5 breakout
```

quit

Use this command to leave the current mode and return to the previous mode. When executed in an exec mode, it terminates the session and logs you out.

Command Syntax

```
quit
```

Parameters

None

Default

None

Command Mode

All modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#quit
(config)#quit
#quit
>enable
#quit
[root@TSUP-123 sbin]#
```

reload

Use this command to shut down the device and perform a cold restart. You call this command when:

- You detect a configuration issue such as **`show running-config`** displaying a configuration but when you try to remove that configuration, you get a message that it is not configured.
- You have replaced the start-up configuration file (in this case you specify the flush-db parameter).

Command Syntax

```
reload (flush-db|)
```

Parameters

flush-db
Delete the database file and recreate it from the start-up configuration file.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows replacing a start-up configuration file and then synchronizing it to the configuration database:

```
#copy file /home/TEST.conf startup-config
Copy Success
#
#reload flush-db
The system has unsaved changes.
Would you like to save them now? (y/n): n

Configuration Not Saved!
Are you sure you would like to reset the system? (y/n): y
For both of these prompts, you must specify whether to save or discard the changes. Abnormal
termination of the session without these inputs can impact the system behavior.
For the unsaved changes prompt:
Would you like to save them now?
You should always say “no” to this prompt because otherwise the command takes the current running
configuration and applies it to the current start-up configuration.
```

service advanced-vty

Use this command to set multiple options to list when the tab key is pressed while entering a command. This feature applies to commands with more than one option.

Use the **no** parameter to not list options when the tab key is pressed while entering a command.

Command Syntax

```
service advanced-vty
no service advanced-vty
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#service advanced-vty
(config)#no service advanced-vty
```

service password-encryption

Use this command to encrypt passwords created with the enable password (page 1474) command. Encryption helps prevent observers from reading passwords.

Use the **no** parameter to disable this feature.

Command Syntax

```
service password-encryption
no service password-encryption
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#enable password mypasswd
(config)#service password-encryption
```

service terminal-length

Use this command to set the number of lines that display at one time on the screen for the current terminal session.

Use the **no** parameter to disable this feature.

Command Syntax

```
service terminal-length <0-512>
no service terminal-length (<0-512>|)
```

Parameters

<0-512>
Number of lines to display. A value of 0 prevents pauses between screens of output.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#service terminal-length 60
```

show clock

Use this command to display the current system time.

Command Syntax

```
show clock
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show clock
12:54:02 IST Fri Apr 29 2016
```

show cli

Use this command to display the command tree of the current mode.

Command Syntax

```
show cli
```

Parameters

None

Default

None

Command Mode

All command modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show cli
Exec mode:
+-clear
  +-arp-cache [clear arp-cache]
  +-ethernet
    +-cfm
      +-errors
        +-domain
          +-DOMAIN_NAME [clear ethernet cfm errors (domain DOMAIN_NAME|level LEVEL_ID) (bridge <1-
32>|)]
            +-bridge
              +-<1-32> [clear ethernet cfm errors (domain DOMAIN_NAME|level LEVEL_ID) (bridge <1-
32>|)]
        +-level
          +-LEVEL_ID [clear ethernet cfm errors (domain DOMAIN_NAME|level LEVEL_ID) (bridge <1-32>|)]
            +-bridge
              +-<1-32> [clear ethernet cfm errors (domain DOMAIN_NAME|level LEVEL_ID) (bridge <1-
32>|)]
      +-maintenance-points
        +-remote
          +-domain
            +-DOMAIN_NAME [clear ethernet cfm maintenance-points remote(domain D
--More--
```

show cli history

Use this command to list the commands entered in the current session. The history buffer is cleared automatically upon reboot.

Command Syntax

```
show cli history
show cli history timestamped
```

Parameters

timestamped
Display a timestamped along with the history entry.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3 and the timestamped parameter was introduced in OcNOS version 6.6.0.

Examples

```
#show cli history
   1 en
   2 show ru
   3 con t
   4 show spanning-tree
   5 exit
   6 show cli history

#show cli history timestamped
[2024 Sep 13 17:43:21.122]   1 en
[2024 Sep 13 17:43:23.984]   2 show ru
[2024 Sep 13 17:43:26.715]   3 con t
[2024 Sep 13 17:43:33.068]   4 show spanning-tree
[2024 Sep 13 17:43:37.495]   5 exit
[2024 Sep 13 17:43:50.515]   6 show cli history
[2024 Sep 13 17:43:55.029]   7 show cli history timestamped
```

show cli list

Use this command to display the commands relevant to the current mode.

Command Syntax

```
show cli list
```

Parameters

None

Default

None

Command Mode

All command modes except IPv4 access-list and IPv6 access-list mode.

Applicability

This command was introduced before OcNOS version 6.4.

Examples

```
> show cli list
  cat LINE
  cd (WORD|)
  clear aaa local user lockout username USERNAME
  clear access-list NAME counters
  clear access-list counters
  clear arp access-list NAME counters
  clear arp access-list counters
  clear arp-cache
  clear bgp *
  clear bgp * in
  clear bgp * in prefix-filter
  clear bgp * l2vpn vpls
  clear bgp * out
  clear bgp * soft
  clear bgp * soft in
  clear bgp * soft out
  clear bgp <1-4294967295>
  clear bgp <1-4294967295>
```

show cli list all

Use this command to display all the cli's present in OcNOS device.

Command Syntax

```
show cli list all
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 6.4.

Example

```
> show cli list all
  cat LINE
  cd (WORD|)
  clear aaa local user lockout username USERNAME
  clear access-list NAME counters
  clear access-list counters
  clear arp access-list NAME counters
  clear arp access-list counters
  clear arp-cache
  clear bgp *
  clear bgp * in
  clear bgp * in prefix-filter
  clear bgp * l2vpn vpls
  clear bgp * out
  clear bgp * soft
  clear bgp * soft in
  clear bgp * soft out

```

show cli modes

Use this command to display cli modes present in OcNOS.

Command Syntax

```
show cli modes
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 6.4.

Examples

```
> Mode(4) Exec  []
Mode(5) Configure  [(config)]
Mode(6) Line configuration  [(config-line)]
Mode(12) Key-chain configuration  [(config-keychain)]
Mode(13) Key-chain key configuration  [(config-keychain-key)]
Mode(14) Virtual-router instance configuration  [(config-vr)]
Mode(15) IP VPN Routing/Forwarding instance configuration  [(config-vrf)]
Mode(16) Interface configuration  [(config-if)]
Mode(24) VPLS configuration  [(config-vpls)]
Mode(26) Router configuration  [(config-router)]
Mode(27) Router Address Family configuration  [(config-router-af)]
Mode(28) Router Address Family configuration  [(config-router-af)]
Mode(29) Router Address Family configuration  [(config-router-af)]
Mode(30) Router Address Family configuration  [(config-router-af)]
Mode(31) Router Address Family configuration  [(config-router-af)]
Mode(32) Router configuration  [(config-router)]
Mode(33) Router Address Family configuration  [(config-router-af)]
Mode(34) Router configuration  [(config-router)]
Mode(35) Router configuration  [(config-router)]
Mode(36) Router configuration  [(config-router)]
Mode(37) Router configuration  [(config-router)]

Mode(96) Crypto Map configuration  [(config-crypto)]
```

```
Mode(99) RSVP Bypass Tunnel configuration  [(config-bypass)]
--More--
```

show crypto csr

Use this command to display the Certificate Signing Request (CSR) created with the crypto pki generate rsa common-name ipv4 (page 1467) command.

Command Syntax

```
show crypto csr
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#crypto pki generate rsa common-name ipv4 7.7.7.7
#show crypto csr

```

show debugging nsm

Use this command to display debugging information.

Command Syntax

```
show debugging nsm
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debugging nsm
NSM debugging status:
  NSM event debugging is on
  NSM packet debugging is on
  NSM kernel debugging is on
```

show debugging vm-events

Use this command to display the vm-events debugging information

Command Syntax

```
show debugging events
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 6.1.0

Examples

```
#show debugging vm-events#
```

show logging cli

Use this command to display command history for all users.

Command Syntax

```
show logging cli ((logfile LOGFILENAME)|) (match-pattern WORD |)
show logging cli last <1-9999>
show logging logfile list
```

Parameters

LOGFILENAME
Name of a saved command history log file. The default path is **/var/log/messages**, but you can specify a full path to override the default.

WORD
Display only lines with this search pattern.

<1-9999>
Number of lines to display from the end of the command history.

logfile list
Display a list of command history files.

Default

LOGFILENAME Name of a saved command history log file. The default path is /var/log/messages, but you can specify a full path to override the default.

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh logging cli
2017 Mar 01 16:30:59 :  : User root@/dev/pts/1 : CLI : 'exit'
2017 Mar 01 16:31:06 :  : User root@/dev/pts/1 : CLI : 'sh logging logfile list'
#sh logging cli logfile ipi
2017 Mar 01 16:30:59 :  : User root@/dev/pts/1 : CLI : 'exit'
2017 Mar 01 16:31:06 :  : User root@/dev/pts/1 : CLI : 'sh logging logfile list'
#sh logging cli match-pattern root
2017 Mar 01 16:30:59 :  : User root@/dev/pts/1 : CLI : 'exit'
2017 Mar 01 16:31:06 :  : User root@/dev/pts/1 : CLI : 'sh logging logfile list'
#sh logging cli logfile ipi match-pattern root
2017 Mar 01 16:30:59 :  : User root@/dev/pts/1 : CLI : 'exit'
2017 Mar 01 16:31:06 :  : User root@/dev/pts/1 : CLI : 'sh logging logfile list'
#show logging cli last 2
2017 Mar 1 16:34:26.302 :  : User root@/dev/pts/1 : CLI : 'sh logging info'
2017 Mar 1 16:34:37.317 :  : User root@/dev/pts/1 : CLI : 'sh logging cli last 2'
#show logging logfile list
file1
file2
```

show nsm client

Use this command to display NSM client information including the services requested by the protocols, statistics and the connection time

Command Syntax

```
show nsm client
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show nsm client
NSM client ID: 1
NSM client ID: 19
 IMI, socket 23
  Service: Interface Service, Router ID Service, VRF Service
  Messsage received 1, sent 58
  Connection time: Thu Jul 22 11:03:12 2010
  Last message read: Service Request
  Last message write: Link Up
NSM client ID: 25
 ONMD, socket 24
  Service: Interface Service, Bridge service, VLAN service
  Messsage received 2, sent 74
  Connection time: Thu Jul 22 11:03:15 2010
  Last message read: OAM  LLDP msg
  Last message write: Link Up
#
```

show process

Use this command to display the OcNOS daemon processes that are running.

Command Syntax

```
show process
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show process
 PID NAME             TIME    FD
   1 nsm          00:56:29    7
   2 ripd         00:56:29    11
   3 ripngd       00:56:29    12
   4 ospfd        00:56:29    9
   5 ospf6d       00:56:29    10
   6 bgpd         00:56:29    14
   9 isisd        00:56:29    8
#
```

Table 87 explains the output fields.

Table 87. show process fields

Entry	Description
PID Name	Process identifier name.
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.
FD	The Flexible Data-Rates (FD) of the interface.

show running-config

Use this command to show the running system status and configuration.

Command Syntax

```
show running-config
show running-config full
```

Parameters

full
Display the full configuration information.

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config
no service password-encryption
!
no service dhcp
ip domain-lookup
!
mpls propagate-ttl
!
vrrp vmac enable
spanning-tree mode provider-rstp
no data-center-bridging enable
!
interface lo
 ip address 127.0.0.1/8
 ipv6 address ::1/128
 no shutdown
!
interface eth0
 ip address 10.1.2.173/24
 no shutdown
!
interface eth1
 shutdown
!
line con 0
 login
!
end
(config)#
```

show running-config switch

Use this command to display the running system switch configuration.

Command Syntax

```
show running-config switch bridge
show running-config switch dot1x
show running-config switch lacp
show running-config switch ptp
show running-config switch radius-server
show running-config switch spanning-tree
show running-config switch synce
show running-config switch vlan
```

Parameters

bridge
Display Bridge group information.

dot1x
Display 802.1x port-based authentication information.

lacp
Display Link Aggregation Control Protocol (LACP) information.

ptp
Display Precision time Protocol (PTP)

radius-server
Display **RADIUS**[1] server information.

stp
Display Spanning Tree Protocol (STP) information.

synce
Display synce information.

vlan
Display values associated with a single VLAN.

Default

None

Command Mode

Privileged execution mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

[1]Remote Authentication Dial-In User Service

Example

```
(config)#show running-config switch stp
!
bridge 6 ageing-time 45
bridge 6 priority 4096
bridge 6 max-age 7
```

show startup-config

Use this command to display the startup configuration.

Command Syntax

```
show startup-config
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show startup-config
!   2001/04/21 11:38:52
!
hostname ripd
password zebra
log stdout
!
debug rip events
debug rip packet
!
interface lo
!
interface eth0
 ip rip send version 1 2
 ip rip receive version 1 2
!
interface eth1
 ip rip send version 1 2
 ip rip receive version 1 2
!
router rip
 redistribute connected
 network 10.10.10.0/24
 network 10.10.11.0/24
!
line vty
 exec-timeout 0 0
```

show tcp

Use this command to display the Transmission Control Protocol (TCP) connection details.

Command Syntax

```
show tcp
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show tcp
Proto Recv-Q Send-Q Local Address          Foreign Address        State
tcp        0      0 0.0.0.0:22            0.0.0.0:*              LISTEN
tcp        0      0 127.0.0.1:25          0.0.0.0:*              LISTEN
tcp        0      1 10.12.44.1:57740      127.0.0.1:705          CLOSE_WAIT
tcp       52      0 10.12.44.21:22        10.12.7.89:705         ESTABLISHED
tcp       85      0 10.12.44.21:57742     10.12.44.21:57738      ESTABLISHED
```

Table 88. Show tcp output

Entry	Description
Proto	Protocol – TCP
Recv-Q	Number of TCP packets in the Receive Queue.
Send-Q	Number of TCP packets in the Send-Q.
Local Address and port number	Local IP address and the port number.
Foreign Address and port number	Foreign (received) IP address and the port number.
State	Current state of TCP connections: ESTABLISHED SYN_SENT SYN_RECV FIN_WAIT1 FIN_WAIT2 TIME_WAIT CLOSE

Table 88. Show tcp output (continued)

Entry	Description
	CLOSE_WAIT LAST_ACK LISTEN CLOSING UNKNOWN

show timezone

Use this command to display the list of timezone names.

Command Syntax

```
show timezone
(all|africa|america|antarctica|arctic|asia|atlantic|australia|brazil|canada|chile|europe|indian|mexic
o|pacific|us)
```

Parameters

africa
Africa timezone list

all
All timezone list

l2-profile-three
L2 profile Three (default); the size of the l2 table (Mac address table) and l3 table (Host table) is almost equal

l3-profile
L3 profile

america
America timezone list

antarctica
Antarctica timezone list

asia
Asia timezone list

atlantic
Atlantic timezone list

```

show users

Use this command to display information about current users.

Command Syntax

```
show users
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.
      Line      User     Idle     Location/Session      PID     TYPE        Role
(*) 130 vty 0 [C]root   00:00:36      pts/0            20872    Local    network-admin
(#)   NA      [N]root     NA           1                NA       NA      network-admin
      NA      [N]root     NA           2                NA       NA      network-admin
    131 vty 1 [C]joyce  00:00:26     pts/1             17593    Remote   network-admin
```

Table 89 explains the output fields.

Table 89. show users fields

Entry	Description
Current users	
CLI user	
Location	
Session	
Lock acquired by user	
Netconf users	
Line	
User	User name.
Idle	How long the user has been idle.
Location/Session	

Table 89. show users fields (continued)

Entry	Description
PID	Process identifier name.
Type	
Role	

show version

Use this command to display OcNOS version information.

Command Syntax

```
show version
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show version
Software version: EC_AS5812-54X--1.3.4.268-DC_MPLS_ZEBM-S0-P0 09/27/2018 13:44:22
 Copyright (C) 2018 Coriant. All rights reserved
 Software Product: , Version: 1.3.4.268
 Hardware Model: Edgecore 5812-54X-O-AC-F
 Software Feature Code: DC-MPLS-ZEBM
 System Configuration Code: S0
 Package Configuration Code: P0
 Software Baseline Version: 1.3.4.208
Installation Information:
 Image Filename: EC_AS5812_54X--1.3.4.268-DC_MPLS_ZEBM-S0-P0-installer
 Install method: http
 ONIE SysInfo: x86_64-accton_as5812_54x-r0
#
```

Table 90. Show version output

Entry	Description
Software version	The software version including hardware device name and date.
Software Product	Product name and version.
Hardware Model	Hardware platform.
Software Feature Code	SKU that specifies the capabilities of this version of the software.
System Configuration Code	System configuration number.
Package Configuration Code	ONIE package installer versions.

Table 90. Show version output (continued)

Entry	Description
Software Baseline Version	Version from which this release branch is created.
Installation Information	Information about the installation.
Image Filename	The file name of the installed image.
Install method	The type of server (or USB stick) from which the software was installed.
ONIE SysInfo	ONIE version.

sys-reload

Use this command to cold restart the device.

Note: This command is an alias for the reload (page 1495) command.

Command Syntax

```
sys-reload
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 1.3.7.

Examples

```
>sys-reload
The system has unsaved changes.
Would you like to save them now? (y/n): y
Building Configuration...
[OK]
Are you sure you would like to reset the system? (y/n): n
```

sys-shutdown

Use this command to shut down the device gracefully. After giving this command, you can remove the device power cable.

> **Note:** Some of the switch hardwares doesn't support system shutdown. On such devices this command will make the switch to go for a reboot.

Command Syntax

```
sys-shutdown
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 1.3.7.

Examples

```
>sys-shutdown
The system has unsaved changes.
Would you like to save them now? (y/n): y
Building Configuration...
[OK]
Are you sure you would like to shutdown the system? (y/n): y
For both of these prompts, you must specify whether to save or discard the changes.
For the unsaved changes prompt:
Would you like to save them now?
```

terminal width

Use this command to set the number of characters to be displayed in one line on the screen. Use the no option to unset the number of characters on the screen.

> **Note:** If user wants to have a fixed terminal length and width, then terminal length should not be set to 0. i.e. CLI “terminal length 0“ should not be used, and only non-zero length to be used.

> **Note:** If the terminal length is set to 0, the width defaults to 80 and cannot be changed. To adjust the width, the length must first be set to a non-zero value, after which the width can be adjusted as needed.

Command Syntax

```
terminal width <24-511>
terminal no width <24-511>
```

Parameters

<24-511>
Number of lines on screen

Default

Default width value 80 is optionally overridden by kernel.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
host#terminal width 120
```

terminal length

Use this command to set the number of lines displayed on the screen.

Use the **no** option to unset the number of lines on a screen.

> **Note:** If user wants to have a fixed terminal length and width, then terminal length should not be set to 0. i.e. CLI “terminal length 0“ should not be used, and only non-zero length to be used.

> **Note:** If the terminal length is set to 0, the width defaults to 80 and cannot be changed. To adjust the width, the length must first be set to a non-zero value, after which the width can be adjusted as needed.

Command Syntax

```
terminal length <0-511>
terminal no length <0-511>
```

Parameters

<0-511>
Number of lines on screen. Specify 0 for no pausing.

Default

Default length value 24 is optionally overridden by kernel.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>enable
#terminal length 0
The following example sets the terminal length to 30 lines.
#terminal length 30
```

terminal monitor

Use this command to display debugging output on the terminal for the current or active session and does not reflect in the running configuration.

Use optional parameters to display debug output for OcNOS users. Without a parameter, the command shows local user debug output. When used with a parameter, it restricts access only to the OcNOS user.

Use `no` form of the command to terminate the debug output on the terminal. The OcNOS user can use this command. In addition, the OcNOS users can cancel debug output for a specific Virtual Router (VR) or for all VRs.

Command Syntax

```
terminal monitor
terminal monitor (all|WORD|)
terminal no monitor
terminal no monitor (WORD|)
```

Parameters

WORD
In the PVR context, it specifies the VR name to include in the debugging session.

all
Includes all VRs in the debugging session when used in a PVR context.

Default

Enabled

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

Enable debugging output on the current terminal session.

```
OcNOS>enable
OcNOS#terminal monitor
```

Disable debugging output on the current terminal session

```
OcNOS#terminal no monitor
```

terminal monitor default

Use this command to enable logging messages globally for all new user sessions, retaining the default behavior of the terminal monitor (page 1530) command.

Use `no` form of this command to disable logging messages globally for all new user sessions, allowing users to avoid prompt interruptions from excessive logs.

Note: Once a session is active, logging can still be controlled per session using the terminal monitor (page 1530) commands. The command `no terminal monitor default` will be shown in the `show running-config` output, while `terminal monitor default` will not appear.

Command Syntax

```
terminal monitor default
no terminal monitor default
```

Parameters

None

Default

Enabled

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.6.0.

Examples

Disable Logging Output Globally

New user sessions will not display logging messages. Users can manually enable logging in the session using the terminal monitor (page 1530) command.

```
OcNOS#configure terminal
OcNOS(config)#no terminal monitor default
OcNOS(config)#commit
```

Enable Logging Output Globally

New user sessions will display logging messages by default.

```
OcNOS#configure terminal
OcNOS(config)#terminal monitor default
OcNOS(config)#commit
```

terminal timestamping

Use this command to display the command timestamp along with the terminal CLI prompt. Use the no option to disable it.

Command Syntax

```
terminal timestamping
terminal no timestamping
```

Parameters

None

Default

Disabled

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Examples

```
#terminal timestamping
[2024 Sep 13 17:24:01.442]
#<enter>
[2024 Sep 13 17:24:02.948]
#terminal no timestamping
#<enter>
#
```

terminal default timestamping

Use this command to timestamp the terminal CLI prompt by default when a new terminal session is started. Use the no option to disable it.

Command Syntax

```
terminal default timestamping
no terminal default timestamping
```

Parameters

None

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Examples

```
#configure terminal
#terminal default timestamping
#commit

# Further terminal sessions start with the CLI prompt timestamp enabled:
[2024 Sep 13 17:31:18.330]
>enable
[2024 Sep 13 17:31:19.778]
#
```

traceroute

Use this command to trace an IPv4/v6 route to its destination.

Command Syntax

```
traceroute WORD
traceroute WORD (vrf (NAME|management)|)
traceroute ip WORD
traceroute ip WORD (vrf (NAME|management)|)
traceroute ipv6 WORD
traceroute ipv6 WORD (vrf (NAME|management)|)
```

Parameters

WORD
Destination address (in A.B.C.D format for IPv4 or X:X::X:X for IPv6) or host name.

vrf
Virtual Routing and Forwarding instance.

NAME
Virtual Routing and Forwarding name.

management
Virtual Routing and Forwarding name.

ip
IPv4 echo.

WORD
Destination address in A.B.C.D format or host name.

ipv6
IPv6 echo.

WORD
Destination address in X:X::X:X format or host name.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#traceroute ip 10.10.100.126 vrf management
traceroute to 10.10.100.126 (10.10.100.126), 30 hops max, 38 byte packets
 1  10.1.2.1 (10.1.2.1)  0.386 ms  0.315 ms  0.293 ms
 2  10.10.100.126 (10.10.100.126)  1.944 ms  1.497 ms  1.296 ms
#
```

watch static-mac-movement

Use this command to watch if any MAC movement is detected over static MAC entries for a time period. A notification will display if static MAC movement happens before the timer expires.

The counters can be validated with for the L2 movement queue (**`Tx pkts`** and **`Dropped pkts`** columns).

Without enabling **`watch static-mac-movement`**, the statistics are reflected in the **`Rx EGR Port Unavail`** of .

For VXLAN, **`watch static-mac-movement`** applies to all the MAC entries learned from the remote peer (remote dynamic or static remote), as these learned MACs are installed as static MAC entries in the hardware.

Command Syntax

```
watch static-mac-movement (<1-300>|)
```

Command Syntax

<1-300>
Timer value in seconds.

Default

By default, the timer is 10 seconds

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#watch static-mac-movement
```

write

Use this command to a write the running configuration to the file used at startup or to a specified file. This is the same as the copy running-config startup-config (page 1466) command.

Command Syntax

```
write
write file FILE
write memory
write WORD
```

Parameters

FILE
Write to a given path and file. If you do not give a file path, the file is added to **/root**.

memory
Write to non-volatile memory.

WORD
Write to running configuration file path.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
This example shows writing the running configuration to the startup configuration file:
#write
Building configuration...
[OK]
This example shows writing the running configuration to a specified file:
#write file /home/test.txt
Building configuration...
[OK]
```

write terminal

Use this command to display the current configuration.

Command Syntax

```
write terminal
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#write terminal
Current configuration:
!
hostname ripd
password zebra
log stdout
!
debug rip events
debug rip packet
!
interface lo
!
interface eth0
 ip rip send version 1 2
 ip rip receive version 1 2
!
interface eth1
 ip rip send version 1 2
 ip rip receive version 1 2
!
!
router rip
 network 10.10.10.0/24
 network 10.10.11.0/24
 redistribute connected
!
line vty
 exec-timeout 0 0
```

Multi-Line Banner Support

Overview

Multi-Line Banner support enables you to configure banner messages spanning multiple lines.

Options to Configure Multi-Banner Message

Two options to facilitate the configuration of multi-line banner messages:

- Use escape character sequences within the CLI to format the banner message with appropriate line breaks and indentation. Supported escape character sequences enable flexible alignment and multi-line message display.

The supported escape characters are:

Characters	Description
\"	double quote
\'	single quote
\‘	forward quote
\\	backslash
\f	form feed
\n	newline
\r	carriage return
\t	horizontal tab
\v	vertical tab

- Specify a local file containing the banner message. The content of the file is retrieved and displayed as the banner message.

Multi-Banner Message Command

The Multi-Banner Message uses the following configuration command.

banner motd file URL

Use this optional command to set the multi-line banner messages of the day (motd) at login. To set a customized or default message of the day, use banner motd (page 1459) command.

Use the **no** parameter to not display a banner message at login.

Notes:

- Users are responsible for aligning the text of the banner. For instance, when using the "banner motd LINE" or "banner motd FILE" options, the alignment of the banner message output matches the alignment of the banner message input provided by the user.
- There is a restriction on the character count for banner messages, with a maximum limit of 1024 characters.
  - When using the FILE option to input a banner message, only the first 1024 characters from the file will be read and displayed as the banner output.
  - If the LINE option is used to input a banner message, only 1024 characters are allowed from the command line interface (CLI). If the user tries to include more than that, an error message such as "% Invalid input (Allowed length 1 - 1024):" will be displayed.
- When using the banner motd file option, consider the following:
  - The file must be available locally, and users must specify the file name along with the path during configuration.
  - Users are responsible for ensuring the correct file type, as there are no restrictions regarding the type of file allowed.
  - If the file content is empty, a notification log will be displayed to alert the user, and the default banner message will be shown.
  - If the file is removed or cannot be opened, an error log will be displayed to notify the user, and the default banner message will be shown.
- During a downgrade to a lower version that does not support the banner motd file option, if the banner motd file option is configured, the default banner message will be used.

Command Syntax

```
banner motd file URL
```

```
no banner motd
```

Parameters

file
A file input to set a custom message of the day.

URL
The file path and name containing the banner message.

Default

Disabled

Command Mode

Configure mode

Applicability

Introduced before OcNOS version 1.3.

Examples

LINE option with escape character sequence

```
#configure terminal
(config)#banner motd Welcome\n To \n OcNOS
(config)#commit
(config)#exit
```

By using a specific file

```
#configure terminal
(config)#banner motd file /home/ocnos/banner.txt
(config)#commit
(config)#exit
```

Common Management Layer Commands

This chapter is a reference for the Common Management Layer (CML) commands.

Transaction are enabled by default. You can disable the feature by using the cmlsh transaction (page 1565) command outside of configuration mode, but IP Infusion Inc. does `not` recommend this.

These are the steps to follow to use transactions:

- When transactions are enabled, any changes done in configure mode are stored in a separate `candidate` configuration that you can view with the show transaction current (page 1602) command.
- When a configuration is complete, apply the candidate configuration to the running configuration with the commit (page 1567) command.
- If a commit (page 1567) fails, no configuration is applied as the entire transaction is considered failed. You can continue to change the candidate configuration and then retry the commit (page 1567).
- Discard the candidate configuration with the abort transaction (page 1543) command.
- Check the last aborted transaction with the show transaction last-aborted (page 1603) command.

This chapter describes these commands:

abort transaction

Use this command to end a configuration session and discard all uncommitted changes.

Command Syntax

```
abort transaction
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
(config)#
(config)#interface eth2
(config-if)#ip address 10.12.3.4/24
(config-if)#exit
(config)#abort transaction
(config)#exit
#show running-config interface eth2
!
interface eth2
!
#
```

cancel-commit (WORD|)

When a <cancel-commit> operation is performed before timer expiry of a time based commit, the committed configuration will be reverted immediately.

When <cancel-commit> is performed in the same session as <commit confirmed>, a commit-id is not required, and configurations can be canceled without providing the commit-id. However, if <cancel-commit> is performed from a different session, a valid commit-id must be provided to cancel the ongoing <commit confirmed> operation.

Note: The <cancel-commit commit-id> is supported starting from OcNOS version 6.6.0. The <cancel-commit commit-id> command can be executed from different sessions as well.

Command Syntax

```
cancel-commit  (WORD|)
```

Parameters

WORD
(Optional) The commit-id of the commit confirmed operation.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.3.0 and updated in OcNOS version 6.6.0.

Example

The following example shows commit configuration changes before the timeout in a “confirmed commit” operation:

```
(config)#router ospf 1
(config-router)#router ospf 2
(config-router)#commit confirmed timeout 100 description This is a test for confirmed commit
(config-router)#confirm-commit
```

The following example shows the cancel commit configuration changes before the timer expires in a time-based commit within the same session:

```
(config)#
(config)#router ospf 1
(config-router)#router ospf 2
(config-router)#commit confirmed timeout 100 description This is Test for confirmed commit
(config-router)#cancel-commit
```

The following example shows the cancel commit configuration changes before the timer expires in a time-based commit in a different session:

Session 1

```
------------------------
#show commit list
S.No.         ID           User    Client         TimeStamp               Commit

~~~~~~~~~~~~~~~~~~~~~~~~
```

```
~~~~~~

#show run router ospf
!
#
```

clear cml commit-history (WORD|)

Use this command to delete any specific entry mentioned by commit ID or to delete entire list entries.

Notes:

- To use the commit-rollback operation, the **`cml commit-history`** operation must be enabled, and note that commit-rollback cannot be used for deleted entries.
- While the commit confirmation is in progress, the commit entries cannot be deleted using this command.

Command Syntax

```
clear cml commit-history (WORD|)
```

Parameters

Word
commit ID of the recorded commit operations into commit-history list

Default

When no parameter is provided, the commit history is deleted by default. If you specify the 'Word' parameter, it will delete the specific commit record.

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Example for clear commit using Commit History ID:

```
#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                     Description
~~~~~  ~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~
 ~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684486018411866   ocnos    cmlsh    19-05-2023
08:46:58              Confirmed                          NA
  2    1684486037040268   ocnos    cmlsh    19-05-2023 08:47:17              Confirmed

#clear cml commit-history 1684486018411866
#show commit list

S.No.         ID           User    Client         TimeStamp                Commit
Status                    Description
~~~~~  ~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~
 ~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684486037040268   ocnos    cmlsh    19-05-2023
08:47:17            Confirmed                           NA
```

cml auto-config-sync

Use this command to enable or disable the CML auto configure synchronization after each 'commit'.

Command Syntax

```
cml auto-config-sync (disable|enable)
```

Parameters

enable
Enable auto configure synchronization.

disable
Disable auto configure synchronization.

Default

Enable

Config Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.1

Example

```
OcNOS#cml auto-config-sync disable
```

cml bulk-config

Use this command to avoid CPU spikes when bulk-config commit throttling occurs.

If disabled, a warning: message appears:

```
Applying bulk configuration, performance may be impacted by high CPU usage.
Consider using 'cml bulk-config limit cpu enable' to limit CPU usage
```

Command Syntax

```
cml bulk-config limit cpu (disable|enable)
```

Parameters

limit
limit CPU usage

disable
Disable CPU limiter

enable
Enable CPU limiter.

Default

Disable

Config Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.

Example

```
OCNOS#cml bulk-config limit cpu enable
```

cml commit-history

Use this command to enable or disable confirmed commit operation (commit-history operation). To verify the state of the operation, use the command **`show cml commit-history state`**.

Notes:

- By default, cml commit-history operation is enabled.
- After disabling the cml commit-history operation, confirmed commit CLIs cannot be used, rendering the confirm-commit (WORD|) (page 1569), and cancel-commit (WORD|) (page 1544) operations unavailable.

Command Syntax

```
cml commit-history (enable | disable)
```

Parameters

enable
Enables commit confirmed and commit rollback operations

disable
Disables commit confirmed and commit rollback operations

Default

By default, commit confirmed and commit rollback operations are enabled.

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 6.4.1 and updated the Command Mode to Configuration mode inOcNOS version 6.6.0 .

Examples

Example for disabling Commit History:

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#cml commit-history disable
OcNOS(config)#commit
```

Example for verifying Commit History when commit-history is disabled:

```
OcNOS#show run commit-history
!
cml commit-history disable
!
OcNOS#
OcNOS#show xml run netconf-server
```

```
<netconf-server xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-management-serve
r">
        .
        .
  <commit-history>
    <config>
      <disable-commit-history></disable-commit-history>
    </config>
  </commit-history>
OcNOS#
OcNOS#show cml commit-history state
cml commit-history feature is disabled
```

Example for enabling Commit History:

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#cml commit-history enable
OcNOS(config)#commit
```

Example for verifying Commit History when the commit-history is enabled, either by default or explicitly, it will not be displayed in the show run or show xml commands.

```
OcNOS#show run commit-history
!
OcNOS#
OcNOS#
OcNOS#show xml run netconf-server
=== NO config for commit-history =====
OcNOS#
OcNOS#show cml commit-history state
cml commit-history feature is enabled
OcNOS#
```

cml commit-id rollover

Use this command to enable or disable commit entry rollover when the maximum count of 50 commit entries is reached. When enabled, older commit entries will be automatically deleted from the commit history list to record new entries. When disabled and list contains 50 entries, commit confirmed operation is not allowed.

To verify the state of the operation, use command **`show cml commit-id rollover state`**.

Notes:

- By default, cml commit-id rollover operation is enabled.
- The cml commit-history operation must be enabled to use this operation.
- The commit-rollback operation can not be used for deleted entry.
- When this operation is disabled and the number of commit entries reaches the maximum count, the addition of commit records to the commit history list will be stopped.
- If this operation is disabled and the list contains 50 entries, the commit-confirmed operation cannot be performed. However, a normal commit operation is allowed even with 50 entries in the list.

Command Syntax

```
cml commit-id rollover (enable | disable)
```

Parameters

enable
Enables commit ID rollover

disable
Disables commit ID rollover

Default

By default, commit ID rollover is enabled.

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Example for verifying commit ID rollover state:

```
#show cml commit-id rollover state
cml commit-id rollover feature is enabled
```

cml config-sync check

Use this command to manually check the configuration and create the temporary database which will help to find dbsync issues.

Command Syntax

```
cml config-sync check
```

Parameters

None

Default

None

Config Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
OcNOS#cml config-sync check
```

cml force-unlock config-datastore

Use this command to release a configuration lock previously obtained with the cml lock config-datastore (page 1555) command by a `different` user.

This command is available only to users with the **`network-admin`** role.

A notification message is sent to the lock holder when forced out.

Command Syntax

```
cml force-unlock config-datastore (running|startup|candidate) (<0-600>|)
```

Parameters

<0-600>
Timeout interval to force out lock acquired by another user session. Zero (0) is immediate and is the default.

running
Release the lock on the running datastore.

startup
Release the lock on the startup datastore.

candidate
Release the lock on the candidate datastore.

Default

The default timeout is zero (0) which is immediate.

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
#cml force-unlock config-datastore running
```

cml lock config-datastore

Use this command to lock the entire configuration datastore of a device. Such locks are intended to be short-lived and allow you to make a change without fear of interaction with other users.

When the lock is acquired, the server prevents any changes to the locked resource other than those requested by this session.

The duration of the lock is defined as beginning when the lock is acquired and lasting until either the lock is released or the user session closes. The session closure can be explicitly performed by the user, or implicitly performed by the server based on criteria such as failure of the underlying transport, simple inactivity timeout, or detection of abusive behavior on the part of the client.

A lock will not be granted if any of the following conditions is true:

- A lock is already held by any user session or another entity.
- The target configuration is candidate, it has already been modified, and these changes have not been committed or rolled back.
- The target configuration is running, and another user session has an ongoing confirmed commit.

Command Syntax

```
cml lock config-datastore (running|startup|candidate)
```

Parameters

running
Lock on this datastore will not allow other sessions to perform operations with the target as running like commit, copy candidate to running and so on.

startup
Lock on this datastore will not allow other sessions to perform operations like copy-config and delete-config with the target startup

candidate
Lock on this datastore will not allow other sessions to perform operations with the target as candidate like edit-config, copy file candidate and so on. (Not supported in OcNOS version 5.1.)

Default

All three datastores are in the unlocked state.

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
#cml lock config-datastore running
```

```
#
#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

           Line        User               Idle         Location/Session  PID     TYPE   Role

(#)(*) 130 vty 0    [C]ocnos              0d00h00m     pts/0             10732   Local  network-
admin
```

cml logging

Use this command to enable or disable CML logging. The logging level and should also be configured.

Command Syntax

```
cml logging (enable | disable)
```

Parameters

enable
Enable CML logging

disable
Disable CML logging

Default

By default CML Logging is enabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#cml logging disable
```

cml netconf translation

Use this command to enable or disable NetConf support for OpenConfig-based YANG translation.This allows OcNOS to handle OpenConfig YANG files in its NetConf server.

Command Syntax

```
cml netconf translation (disable|openconfig)
```

Parameters

openconfig
Translate NetConf to YANG

disable
Do not translate NetConf to YANG

Default

By default NetConf-to-YANG translation is disabled.

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 2.0

```
#cml netconf translation openconfig
```

cml notification

Use this command to enable or disable notification for a given CML client.

Command Syntax

```
cml notification (enable|disable) (netconf|snmp|cmlsh|all)
```

Parameters

disable
Disable notification subscription

enable
Enable notification subscription

all
All CML clients

cmlsh
CML client CMLSH

netconf
CML client NETCONF

snmp
CML client SNMP

Default

By default, notification is enabled for all CML clients.

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

To enable notification for NETCONF client:

```
#cml notification enable netconf
```

To disable notification for NETCONF client:

```
#cml notification disable netconf
```

cml unlock config-datastore

Use this command to release a configuration lock previously obtained with the cml lock config-datastore (page 1555) command.

An unlock operation will not succeed if either of the following conditions is true:

- The specified lock is not currently active.
- The session calling tis command is not the same session that obtained the lock.

Command Syntax

```
cml unlock config-datastore (running|startup|candidate)
```

Parameters

running
Release the lock on the running datastore.

startup
Release the lock on the startup datastore.

candidate
Release the lock on the candidate datastore.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
#cml unlock config-datastore running
#
#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.

#
```

cmlsh cli-format

Use this command to display command strings in CLI error messages. By default, OcNOS displays error messages with Xpaths (path notation for navigating through the hierarchical structure of an XML document) which is not very clear for users.

Command Syntax

```
cmlsh cli-format (enable | disable)
```

Parameters

enable
Display command strings in CLI error messages.

disble
Display Xpaths in CLI error messages.

Default

Display Xpaths in CLI error messages

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Example

This is the default behavior where an Xpath is displayed:

```
>en
#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#router ospf 10
(config-router)#area 3.3.3.3 interface xe1
(config-router)#commit
% Configuration " /ospfv2/processes/process[ospf-id='10']/areas/area[area-
id='3.3.3.3']/interfaces/interface[name='xe1']/vrf-name" depends on "/ospfv2/global/config/area-
interface-config-mode"
% Failed to commit .. As error(s) encountered during commit operation…
```

If you enable this feature, the Xpath is replaced with the respective command string:

```
>en
#cmlsh cli-format enable
#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#router ospf 10
(config-router)#area 3.3.3.3 interface xe1
(config-router)#commit
% Configuration "   area <value-option>  interface <value-option>" depends on "  ospf area-interface-
config-mode"
% Failed to commit .. As error(s) encountered during commit operation…
```

cmlsh multiple-config-session

Use this command to enable or disable multiple CLI sessions to enter into configuration mode simultaneously.

With this support, multiple CLI users can enter into configuration mode simultaneously and do configurations in parallel and commit into the running datastore. This is similar to NetConf multiple session support described in RFC 6241.

When multiple configuration mode sessions are disabled, only one user can enter configuration mode and it will lock the running datastore.

If any CLI session is already there in configuration mode, error will be given when user tries to enable this mode.

A datastore lock can be acquired using the cml lock config-datastore (page 1555) command if you want to do configuration without fear of interaction with other user sessions.

This command is available only to users with the **`network-admin`** role.

This configuration is retained across reboots.

Command Syntax

```
cmlsh multiple-config-session (enable|disable)
```

Parameters

enable
Enable multiple configuration mode sessions.

disable
Disable multiple configuration mode sessions.

Default

By default, multiple CLI sessions are disabled.

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
#cmlsh multiple-config-session enable
#
#show cmlsh multiple-config-session status
CMLSh multiple configuration session mode : Enabled
#
```

Usage

Multiple users can enter into configuration mode simultaneously and do configurations in parallel and commit into the running datastore. Examples of when you need this feature are:

- Migrating to replace an existing device. If an existing device has a large configuration and it is only done by one person, it will take more time to configure. If multiple users can configure at same time, it will take less time.
- Troubleshooting and operating. Sometimes a single device has 2 or more links to troubleshoot. If only one user only can do configuration, it will take more time to resolve the problem.

When multiple sessions are doing parallel configurations, there is a chance that one user's configuration might conflict with another user's configuration.

If you do not lock the datastore before doing a configuration, a parallel candidate datastore can be created and will be allowed to commit to the datastore. So the datastore can change while the previous user is still having the configuration in its candidate. Now when the previous user tries to commit, if the configurations conflict, it will fail.

For example, if the previous user was adding a BGP neighbor and the BGP router itself is removed from the datastore via the parallel transaction, when this user tries to commit, it will fail. The reason is when commands are added to candidate, it only checks the running datastore at that point and allows them to be added to candidate configuration datastore. But later if the running datastore itself is changed, these configurations can be irrelevant and will cause an error on commit. So the user will have to abort the transaction.

cmlsh notification

Use this command to enable or disable notification for the current CMLSH session.

Command Syntax

```
cmlsh notification (enable|disable)
```

Parameters

disable
Disable notification subscription for current CMLSH session

enable
Enable notification subscription for current CMLSH session

Default

By default, notification is enabled for the CMLSH session.

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

To enable notification for current CMLSH session:

```
#cmlsh notification enable
```

To disable notification for current CMLSH session:

```
#cmlsh notification disable
```

cmlsh transaction

Use this command to enable or disable the transaction-based command-line interface.

Note: IP Infusion Inc. recommends that you do *not* disable transactions.

Command Syntax

```
cmlsh transaction (enable | disable)
```

Parameters

enable
Enable transaction-based command-line interface

disable
Disable transaction-based command-line interface

Default

The transaction-based command-line interface is enabled by default.

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
>en
#cmlsh transaction disable
% Deprecated CLI. Disabling transaction mode is not recommended
#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#router ipv6 ospf test
(config-router)#exit
(config)#show running-config router ipv6 ospf
!
router ipv6 ospf test
!
(config)#
```

cmlsh transaction limit

Use this command to set the maximum number of transactions.

To verify, give the command in exec mode.

Command Syntax

```
cml transaction limit <0-300000>
```

Parameters

<0-300000>
Maximum number of transactions with zero (0) indicating unlimited transactions.

Default

300,000 transactions

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#cml transaction limit 1500
(config)#exit
#show max-transaction limit
Max-Transaction Limit is 1500
```

commit

Use this command to commit the candidate configuration to the running configuration.

Notes:

- After a successful **commit** command, you must give the Basic Commands (page 1457) command to save the running configuration to the startup configuration.
- Multiple configurations cannot be removed with a single **commit**. You must remove each configuration followed by a **commit**.

Optionally with “confirmed commit”, you can commit the configuration on a trial basis for a time specified in seconds. If you do not confirm within the specified time, the configuration will be reverted after the timeout.

- To revert the configuration before timeout, then give the cancel-commit (WORD|) (page 1544) command.
- To retain the configuration before timeout, then give the confirm-commit (WORD|) (page 1569) command.

See RFC 6241 “Confirmed Commit Capability”.

Notes:

- If a **<commit>** operation is executed without any parameters, the commit will be treated as permanent, and an explicit confirm-commit (WORD|) (page 1569) operation is not necessary to confirm the commit.
- Multiple confirmed commits in the same session or different sessions are not supported. The **commit** command does not support the <persist-id> parameter as specified in RFC 6241.
- The <confirm-commit> and <cancel-commit> commands can be used from different sessions with the appropriate commit ID.

Command Syntax

```
commit (confirmed (timeout <1-86400>|)|) (description LINE|)
```

Parameters

confirmed
(Optional) Commits the configuration on a trial basis, default time will be of 300 seconds.

<1-86400>
(Optional) Specifies the timeout value in seconds after which the configuration will be reverted if no confirmation is provided.

description LINE
(Optional) Commit description up to 64 valid characters.

Default

None

Command Mode

All configuration modes

Applicability

This command was introduced in OcNOS version 5.0, added the **`confirmed`** clause in OcNOS version 6.3.0, and enhanced the parameters in OcNOS version 6.6.0.

Example

```
(config)#router ospf 1
(config-router)#exit
(config)#router isis 3
(config-router)#commit
(config-router)#exit
(config)#show running-config ospf
!
router ospf 1
!
(config)#show running-config isis
!
router isis 3
!
(config)#

If you try to exit or end, you are prompted to commit or abort first:
(config)#router bgp 10
(config-router)#bgp as-local-count 34
(config-router)#exit
(config)#exit
% Un-committed transactions present. Please do commit or abort before exiting.
(config)#end
% Un-committed transactions present. Please do commit or abort before exiting.
(config)#commit
(config)#show running-config bgp
!
router bgp 10
 bgp as-local-count 34
!
(config)#
This is an example of a “confirmed commit”:
(config)#router ospf 1
(config-router)#router ospf 2
(config-router)#commit confirmed timeout 100 description This is Test for confirmed commit
```

Usage

OcNOS validates dependencies when you commit. In this example, bridge 1 must exist before you can create a VLAN on it:

```
(config)#vlan database
(config-vlan)#vlan 10 bridge 1
(config-vlan)#exit
(config)commit
```

Because of the unmet dependency, you get an error when you try to commit.

If you also create the bridge, the commit succeeds:

```
(config)#bridge 1 protocol mstp
(config)#vlan database
```

```
(config-vlan)#vlan 10 bridge 1
(config-vlan)#exit
(config)commit
```

In a single transaction, dependent configurations can be given in any order. Using the same example as before, you can create the bridge *after* the VLAN:

```
(config)#vlan database
(config-vlan)#vlan 10 bridge 1
(config-vlan)#exit
(config)#bridge 1 protocol mstp
(config)commit
```

OcNOS supports “hitless merges” and does not write to the candidate configuration if you make the same configuration in separate transactions. In this example, subinterface xe1.1 is not created the second time because it already exists:

```
(config)#interface xe1.1
(config-if)#commit
(config)#interface xe1.1
(config-if)#commit
```

OcNOS does not write to the candidate configuration if you create and delete the same entity in the same transaction. You must create the entity and delete it with separate commits.

Mode changes, action items (such as **`clear interface counters`**), and **`show`** commands are not part of a transaction and are not displayed by the show transaction current (page 1602) command.

confirm-commit (WORD|)

When a <confirm-commit> operation is performed before the timer expiry of a time based commit, it will stop the revert timer of the commit and the commit will be confirmed.

When the <confirm-commit> operation is performed in the same session as the <commit confirmed>, the commit-id is not required, and configurations can be confirmed without providing the commit-id as input. However, if the operation is performed from a different session, the appropriate commit-id must be provided to confirm the ongoing commit-confirmed operation.

Note: The <confirm-commit commit-id> is supported starting from OcNOS version 6.6.0. The <confirm-commit commit-id> command can be executed from different sessions as well.

Command Syntax

```
confirm-commit  (WORD|)
```

Parameters

WORD
(Optional) The commit-id of the commit confirmed operation.

Default

None

Command Mode

All configuration modes

Applicability

This command was introduced in OcNOS version 6.3.0 and updated in OcNOS version 6.6.0.

Example

The following example shows commit configuration changes before the timeout in a “confirmed commit” operation:

```
(config)#router ospf 1
(config-router)#router ospf 2
(config-router)#commit confirmed timeout 100 description This is a test for confirmed commit
(config-router)#
(config-router)#confirm-commit
```

The following example shows the cancel commit configuration changes before the timer expires in a time-based commit within the same session:

```
(config)#
(config)#router ospf 1
(config-router)#router ospf 2
(config-router)#commit confirmed timeout 100 description This is Test for confirmed commit
(config-router)#
(config-router)#cancel-commit
```

The following example shows the cancel commit configuration changes before the timer expires in a time-based commit in a different session:

Session 1

```
OcNOS#show commit list

commit dry-run

Use this command to validate the current candidate configuration without committing.

Command Syntax

```
commit dry-run
```

Parameters

None

Default

None

Command Mode

All configuration modes

Applicability

This command was introduced in OcNOS version 6.3.0.

Example

```
OcNOS(config)#commit dry-run
```

commit-rollback

Use this command to revert configurations to a previously committed stable state. This action will remove configurations made after the provided commit ID (Word).

The <commit confirmed> command applies the configuration on a trial basis for the time period specified in seconds. If the configuration is not confirmed by the user within this time, an auto roll-back will be triggered once the timer expires.

After the configurations are confirmed, if the user wishes to revert to either the normal commit operation or the confirmed commit operation, the commit rollback feature can be used.

Note: To use commit-rollback, cml commit-history must be enabled.

Command Syntax

```
commit-rollback to WORD (description LINE|)
```

Parameters

WORD

Commit ID associated with recorded commit operations stored within the commit- history list.

description LINE
[Optional] Short description about commit-rollback, maximum 64 valid characters.

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Example output for commit-rollback WORD:

```
#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                     Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~~
 ~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684542445002144   ocnos    cmlsh    20-05-2023
00:27:25             Confirmed                          NA
```

Example of a Commit Rollback to the Commit List ID 1684542445002144:

```
#commit-rollback to 1684542445002144 description commit-rollback Test
#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                      Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
      ~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684542445002144   ocnos    cmlsh    20-05-2023
00:27:25            Confirmed                          NA
  2    1684542402123428   ocnos    cmlsh    20-05-2023 00:28:45     Rollback to 20-05-2023
00:27:25         commit-rollback Test
```

Example of an automatic Commit Rollback

```
#show commit list

#
```

debug cml

Use this command to enable or disable CML sub-module logging.

Command Syntax

```
debug cml (enable | disable) (events | engine | transaction | database | replace | smi | notification
| all)
```

Parameters

enable
Enable debugging.

disable
Disable debugging.

events
Enable/disable events debugging

engine
Enable/disable engine debugging

transaction
Enable/disable transaction debugging

database
Enable/disable database debugging

replace
Enable/disable replace debugging

smi
Enable/disable SMI debugging

notification
Enable/disable notification debugging

all
Enable/disable all debugging

Default

By default, CML sub-module logging is disabled for all sub-modules.

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 4.2 and the **`notification`** parameter added in OcNOS version 6.1.0.

Example

```
#debug cml enable transaction
```

module notification

Use this command to enable or disable notification for a given protocol at a given notification severity level.

Command Syntax

```
module PROTOCOL_NAME notification (enable|disable) (severity
(all|info|warning|minor|major|critical)|)
```

Parameters

PROTOCOL_NAME
Protocol name. Specify **all** for all protocols.

enable
Enable notification subscription

disable
Disable notification subscription

severity
If notification is enabled, then all notifications having severity higher than or equal to this severity allowed. If notification disabled then all the notifications having severity lower than or equal to this severity not allowed.

all
Notification severity all

critical
Notification severity critical

info
Notification severity info

major
Notification severity major

minor
Notification severity minor

warning
Notification severity warning

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

To enable notification for NSM for all severity levels:

```
#module nsm notification enable
```

To disable notifications for NSM for all severity levels:

```
#module nsm notification disable
```

To enable notifications for NSM for severity levels higher than or equal to major (major and critical):

```
#module nsm notification enable severity major
```

To disable notifications for NSM for severity levels lower than or equal to minor (info, warning, and minor):

```
#module nsm notification disable severity minor
```

netconf translation openconfig

Use this command to enable or disable Netconf OpenConfig translation.

Use the **no** form of this command to Netconf translation.

Command Syntax

```
netconf translation openconfig
no netconf translation openconfig
```

Parameters

openconfig
Translate NetConf to YANG

no
Disable OpenConfig translation

Default

Netconf OpenConfig translation is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.4.

Example

```
OcNOS# configure terminal
OcNOS(config)# netconf translation openconfig
OcNOS(config)# commit
```

save cml commit-history WORD

Use this command to save a specific commit entry mentioned by its commit ID.

Prerequisites

The **<cml commit-history>** functionality must be enabled for commit records to be stored in the commit history list to display the commit configuration.

Command Syntax

```
save cml commit-history WORD
```

Parameters

WORD
Specifies the commit ID of the commit entry to be saved. You can find the commit ID in the commit history list using the command **show commit list**.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.0.

Example

The following example shows the sequence of the commands to be performed to save the commit list and view it:

```
OcNOS#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                    Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~   ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~   ~
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1703839538291276    root    cmlsh    29-12-2023
08:45:38               Confirmed                          NA
  2    1703849659767186    root    cmlsh    29-12-2023
11:34:19               Confirmed                          NA
  3    1703849669076279    root    cmlsh    29-12-2023
11:34:29               Confirmed                          NA

OcNOS#save cml commit-history
OcNOS#save cml commit-history ?
  WORD  Commit-id of commit entry to be saved

OcNOS#save cml commit-history 1703839538291276
OcNOS#show commit saved list

S.No.         ID           User    Client         TimeStamp               Commit
Status                    Description
```

```
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~   ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~   ~
~~~~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1703839538291276    root    cmlsh    29-12-2023
08:45:38               Confirmed                         NA

OcNOS#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                    Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~   ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~   ~
~~~~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1703839538291276    root    cmlsh    29-12-2023
08:45:38               Confirmed                         NA
  2    1703849659767186    root    cmlsh    29-12-2023
11:34:19               Confirmed                         NA
  3    1703849669076279    root    cmlsh    29-12-2023
11:34:29               Confirmed                         NA

OcNOS#
```

show cml auto-config-sync state

Use this command to inspect the status and functionality of automatic configuration synchronization in a CML environment.

Command Syntax

```
show cml auto-config-sync state
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.

Example

```
#Disable auto db sync:
OcNOS#cml auto-config-sync disable

#Configure the CLI that is causing the issue

#Do the config check manually:
OcNOS#cml config-sync check

#Compare the tables in both running and temporary databases:
sqlite3 /cfg/usr/local/etc/CML_RD.db
sqlite> select * from ipiCMLSEPifCMLSEPip_ipv4;
cmlAutoDummy4097|name|cmlAutoDummy3073
4097|lo.management|3073
4097|lo|3073

sqlite3 /tmp/.CML_TMP_DB.db
sqlite> select * from ipiCMLSEPifCMLSEPip_ipv4;
cmlAutoDummy4097|name|cmlAutoDummy3073
4097|lo.management|3073
4097|eth0|3073
4097|lo|3073
```

show cml bulk limit cpu state

Use this command to enable or disable CPU limitation when applying bulk configurations and should be used to prevent CPU spikes and system degradation during the apply process.

Command Syntax

```
show cml bulk limit cpu state
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.5.1.

Example

```
OcNOS#show cml bulk ?
  limit  limitation

OcNOS#show cml bulk limit ?
  cpu  cpu

OcNOS#show cml bulk limit cpu ?
  state  status (enabled | disabled)

OcNOS#show cml bulk limit cpu state ?
  |  Output modifiers
  >  Output redirection
  <cr>

OcNOS#show cml bulk limit cpu state
bulk timeout prompt config status is disabled

# show cml bulk limit cpu state
bulk timeout prompt config status is enabled
```

show cml cli-error status

Use this command to know the status of the cli-error feature.

Command Syntax

```
show cml cli-error status
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.

Example

```
OcNOS#show cml cli-error status
cmlsh cli-error feature disabled
OcNOS#
OcNOS#cmlsh cli-format enable
OcNOS#show cml cli-error status
cmlsh cli-error feature enabled
```

show cml commit-history state

Use this command to verify whether the CMLSH commit confirmed and commit rollback feature is enabled or disabled.

Command Syntax

```
show cml commit-history state
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

```
OcNOS#
OcNOS#show cml commit-history state
cml commit-history feature is enabled
```

show cml commit-id rollover state

Use this command to check commit-id rollover is enabled or not. If it is enabled after max commit-history count, old commit entry gets deleted and it adds new commit entry to the commit-history list.

Note: By default, cml commit-id rollover feature is enabled.

Command Syntax

```
show cml commit-id rollover state
```

Parameters

None

Default

Enabled

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

```
OcNOS#show cml commit-id rollover state
cml commit-id rollover feature is enabled
```

show cml config-sync detail

Use this command to check information on database sync issue, if there is mismatch in database and show running config, it will display information of invalid config with table name and values.

Command Syntax

```
show cml config-sync detail
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.

Example

```
OcNOS#show cml config-sync detail
CREATE: it indicates that mentioned config is removed from DB but present in 'show running-config'
output
DELETE: it indicates that mentioned config is present in DB but does not exist in 'show running-
config' output
UPDATE1: it indicates incorrectly modified attribute value in DB. Attribute value needs to modify as
present in UPDATE2
UPDATE2: it indicates correct attribute value present in 'show running-config' output

Config datastore check done at 08-Jan-2024 at 15:31:13;

[Invalid Config from DB]:  UPDATE1:INSERT INTO "ipiCMLSEPtimeCMLSEPrange_timeCMLSEPranges_
timeCMLSEPrange_endCMLSEPtimeCMLSEPoptions_config" VALUES(135688,135687
,'1',135681,'2:53 15 sep 2023','?');

[    Running Config    ]:  UPDATE2:INSERT INTO "ipiCMLSEPtimeCMLSEPrange_timeCMLSEPranges_
timeCMLSEPrange_endCMLSEPtimeCMLSEPoptions_config" VALUES(135688,135687
,'1',135681,'02:53 15 sep 2023','?');
```

show cml database-dump

Use this command to display information such as the status, size, creation date, and other relevant details about the specified database dump.

Command Syntax

```
show cml database-dump (WORD|) (candidate|)
```

Parameters

WORD
Refers to the specific name or identifier of the database dump you want to inspect.

candidate
Indicates that querying information about a candidate database dump.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.

Example

```
Ocnos# show cml database-dump my_database_dump candidate
Database dump "my_database_dump" details:
- Name: my_database_dump
- Type: Candidate
- Status: Complete
- Size: 512 MB
- Creation Time: 2024-05-03 10:15:00
- Location: /var/cml/database_dumps/my_database_dump
```

show cml config-datastore lock status

Use this command to display the configuration datastore lock state and its holder. The identifier of the process holding the lock is shown in parenthesis.

Command Syntax

```
show cml config-datastore lock status
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

```
OcNOS#cml lock config-datastore candidate
OcNOS#show cml config-datastore lock status

 Running datastore is unlocked
 Candidate datastore is locked by client cmlsh(2831)
 Startup datastore is unlocked
```

show cml notification status

Use this command to display notification status (enabled or disabled) for all CML clients.

Command Syntax

```
show cml notification status
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

To show notification status for all clients:

```
#show cml notification status
NETCONF notification enabled
CMLSH notification enabled
SNMP notification enabled
```

show cmlsh multiple-config-session status

Use this command to display the multiple configuration mode session setting.

Command Syntax

```
show cmlsh multiple-config-session status
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
#cmlsh multiple-config-session enable
#
#show cmlsh multiple-config-session status
CMLSh multiple configuration session mode : Enabled
#
```

show cmlsh notification status

Use this command to display the notification status (enabled or disabled) for the current CMLSH session.

Command Syntax

```
show cmlsh notification status
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

To show notification status for the CMLSH session.

```
# OcNOS#show cmlsh notification status
CMLSH notification enabled.
```

show commit list

Use this command to display a record of commit operations stored in the commit history list.

Note: For commit records to be stored in the commit history list, enable cml commit-history (page 1834). Otherwise, commit operations will not be stored.

Command Syntax

```
show commit list
```

Parameters

None

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Example for show commit list:

```
#show commit list
S.No.         ID           User    Client         TimeStamp               Commit
Status                      Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~
 ~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684542224876712    ocnos    cmlsh    20-05-2023
00:23:44              Confirmed                          NA
```

show json/xml commit config WORD

Use this command to display the full running system configurations of the specified commit ID in JSON or XML format.

Prerequisites

The **<cml commit-history>** functionality must be enabled for commit records to be stored in the commit history list to display the commit configuration.

Command Syntax

```
show json/xml commit config WORD
```

Parameters

WORD
Specifies the commit ID of the recorded commit operations that is found in the commit-history list. You can find the commit ID in the commit history list using the command **show commit list**.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.0.

Example

The following example shows the sequence of the commands to be performed to view the running configuration in JSON format:

```
OcNOS#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                    Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~   ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~   ~
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1703839538291276    root    cmlsh    29-12-2023
08:45:38              Confirmed                        NA

OcNOS#show json commit ?
  config  Full snapshot of a system configurations
  diff    Difference of two different commit id

OcNOS#show json commit config ?
  WORD  Commit-id of a commit record from commit histroy list

OcNOS#show json commit config
```

show json/xml commit diff WORD WORD

Use this command to display configuration changes from the 1st commit operation to the 2nd commit operation.

Prerequisites

The **<cml commit-history>** functionality must be enabled for commit records to be stored in the commit history list to display the commit configuration.

Command Syntax

```
show json/xml commit diff WORD WORD
```

Parameters

WORD
Specifies the starting commit ID from which you want to see the difference in recorded commit operations. You can find the commit ID in the commit history list using the command **show commit list**.

WORD
Specifies the starting commit ID to which you want to see the difference in recorded commit operations. You can find the commit ID in the commit history list using the command **show commit list**.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.5.0.

Example

The following example shows the sequence of the commands to be performed to view difference between the commits in JSON format:

```
OcNOS#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                    Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~   ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~   ~
~~~~~~~~~~~~~~~~~~~~~~~~~~

OcNOS#
```

show max-transaction limit

Use this command to display the maximum number of transactions.

Command Syntax

```
show max-transaction limit
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show max-transaction limit
Max-Transaction Limit is 30000
```

show module-info

Use this command to display module's config and state configuration for any top-level object in the data model. This command can be used to display module configuration in XML or JSON format. This command is equivalent to a NETCONF GET operation.show module-info OBJECT_NAME format (xml|json)

Command Syntax

```
show module-info OBJECT_NAME format (xml|json)
```

Parameters

OBJECT_NAME
Name of the object, such as ISIS or OSPF

xml
XML output format

json
JSON output format

Command Mode

All modes

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

To display the user-session module's config and state configuration in XML format:

```
#show module-info user-session format xml
<user-session xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-user-session-management">
  <sessions>
    <session>
      <id>pts/0</id>
      <state>
        <id>pts/0</id>
        <user-role>network-admin</user-role>
        <type>Local</type>
        <process-identifier>1099</process-identifier>
        <idle-time>0d00h00m</idle-time>
        <client-type>CLI</client-type>
        <user-name>root</user-name>
        <line>130 vty 0</line>
      </state>
    </session>
  </sessions>
</user-session>
```

To display the user-session module's config and state configuration in JSON format:

```
#show module-info user-session format json
{
  "user-session":{
    "sessions":{
```

```
      "session":[
        {
          "id":"pts/0",
          "state":{
            "id":"pts/0",
            "user-role":"network-admin",
            "type":"Local",
            "process-identifier":"1099",
            "idle-time":"0d00h00m",
            "client-type":"CLI",
            "user-name":"root",
            "line":"130 vty 0"
          }
        }
      ]
    }
  }
}
```

show running-config notification

Use this command to display the notification status (enabled or disabled) and notification severity levels.

Command Syntax

```
show running-config notification
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

To display the notification status and notification severity levels.

```
#show running-config notification
!
module nsm notification enable severity major
!
```

show system restore failures

Use this command to display configuration restoration status after save reload device.

Command Syntax

```
show system restore failures
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

Configuration restoration successful status information after save reload device:

```
#show system restore failures
Configuration restore from DB is completed.
Total no. of failed configuration objects = 0
```

Configuration restoration failure status information after save reload device:

```
#show system restore failures
Configuration restore from DB is completed.
Total no. of failed configuration objects = 1.

Failed Protocols information :
Protocol Name=ipi-interface, Protocol Id=3 :
Failed configuration object information :
Total no. of failed configuration objects = 1.
  Object Name = config, DN = cmlAutoDummy3074=3074,name=eth0,cmlAutoDummy3073=3073 :
  Error Information :
  Total no. of configuration errors = 1.
    ErrorCode = -16946, ErrorMessage = % No such VRF, ErrorXpath =  /interfaces/interface
[name='eth0']/config.
```

show transaction current

Use this command to display the current transaction.

Mode changes, action items (such as **`clear interface counters`**), and **`show`** commands are not part of a transaction and are not displayed by this command.

Command Syntax

```
show transaction current
```

Parameters

None

Default

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#interface eth3
(config-if)#description testing
(config-if)#mtu 664
(config-if)#exit
(config)#show transaction current
interface eth3
description testing
mtu 664
```

show transaction last-aborted

Use this command to display the last aborted transaction.

Command Syntax

```
show transaction last-aborted
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#router isis 4
(config-router)#isis wait-timer 45
(config-router)#net 11.22.33
(config-router)#exit
(config)#commit
%% Invalid NET length -  /isis/isis-instance[instance='4']/config
(config)#show running-config isis
!
!
(config)#abort transaction
(config)#exit
#show transaction last-aborted
router isis 4
isis wait-timer 45
net 11.22.33
#
```

show xml/json OBJECT_NAME

Use this command to display the running or candidate or startup system configuration for any top-level object in the data model. This CLI can also be used for display full running or candidate or startup system configuration for all protocol modules. This command can be used to display running or candidate or startup system configuration in xml or json format. This command is equivalent to a NETCONF GET-CONFIG operation.

Command Syntax

```
show (xml|json) (running-config | candidate-config | startup-config) OBJECT_NAME
```

Parameters

xml
XML output format

json
JSON output format

candidate-config
Candidate system configuration

running-config
Running system configuration

startup-config
Startup system configuration

OBJECT_NAME
Name of the object, such as ISIS or OSPF

Command Mode

All modes

Applicability

This command was introduced before OcNOS version 4.2 and updated in OcNOS version 6.0.0.

Example

To display the top level objects:

```
#show xml running-config
arp                 bfd                 bgp                 dhcp                evpn                e
vpn-mpls
interfaces          ip-global           isis                key-
chains          lacp                layer2-global
ldp                 lldp                logging             mpls                neighbor-
discovery  network-instances
ospfv2              pcep                ping                prefixes            routemaps           r
outing
rsvp-te             segment-routing     system-info         tacacs              time-
ranges         vlan-classifier
vpls                vpws                vxlan
```

To display the ISIS running configuration in XML format:

```
#show xml running-config isis
<isis xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-isis">
  <isis-instance xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-isis">
  <instance>1</instance>
  <config xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-isis">
    <instance>1</instance>
    <vrf-name>default</vrf-name>
  </config>
  </isis-instance>
</isis>
```

To display the logging running configuration in XML format:

```
#show xml running-config logging
<logging xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-logging">
  <rsyslog>
    <vrf>default</vrf>
    <config>
      <vrf>default</vrf>
      <enable-rsyslog>rsyslog</enable-rsyslog>
    </config>
  </rsyslog>
</logging>
```

To display the logging running configuration in JSON format:

```
#show json running-config logging
{
   "logging":{
      "rsyslog":[
         {
            "vrf":"default",
            "config":{
            "vrf":"default",
            "enable-rsyslog":"rsyslog"
            }
         }
      ]
   }
}
```

To display the OSPFv2 candidate configuration in XML format:

```
#show xml candidate-config ospfv2
<ospfv2 xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-ospf">
  <processes>
    <process>
      <ospf-id>1</ospf-id>
      <config>
        <ospf-id>1</ospf-id>
        <vrf-name>default</vrf-name>
      </config>
    </process>
  </processes>
</ospfv2>
```

To display the OSPFv2 candidate configuration in JSON format:

```
#show json candidate-config ospfv2
{
  "ospfv2":{
    "processes":{
      "process":[
        {
          "ospf-id":"1",
          "config":{
            "ospf-id":"1",
```

```
            "vrf-name":"default"
          }
        }
      ]
    }
  }
}
```

Remote Management Commands

This chapter is a reference for commands that copy these types of files:

- Start-up configuration and running configuration
- System files such as boot files, core dumps, and debug logs

Users can use these commands to copy files locally or to copy between the local device and a remote system.

Here are the techniques used in the commands of this chapter to transfer files remotely:

Table 91. File transfer techniques

Trivial File Transfer Protocol (TFTP)	No authentication or encryption; dangerous to use over the Internet, but might be acceptable in a trusted environment Address format: **`tftp:[//server[:port]][/path]`**
File Transfer Protocol (FTP)	Authenticates, but does not encrypt Address format: **`ftp:[//server][/path]`**
Secure copy (SCP)	Authenticates and encrypts using Secure Shell (SSH1) Address format: **`scp:[//server][/path]`**
SSH File Transfer Protocol (SFTP)	Authenticates and encrypts using Secure Shell (SSH2); this is the most secure technique Address format: **`sftp:[//server][/path]`**
Hyper text Transfer Protocol (HTTP)	Address format: **`http:[//server][/path]`** For download of running and startup configurations

This chapter contains these commands.

copy running-config

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, or a TFTP server .

Command Syntax

```
copy running-config (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL) (vrf (NAME|management)|)
```

Parameters

TFTP-URL
Destination: **`tftp://server[:port]][/path]`**

FTP-URL
Destination: **`ftp://server][/path]`**

SCP-URL
Destination: **`scp://server][/path]`**

SFTP-URL
Destination: **`sftp://server][/path]`**

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3. Removed `http` parameter in OcNOS version 6.6.0.

Example

```
#copy running-config sftp sftp://sftp.mysite.com/running_conf vrf management
```

[1]Virtual Routing and Forwarding

copy running-config (interactive)

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Command Syntax

```
copy running-config (ftp|tftp|scp|sftp) (vrf (NAME|management)|)
```

Parameters

ftp
Destination: FTP server

tftp
Destination: TFTP server

scp
Destination: SCP server

sftp
Destination: SFTP server

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3. Removed `http` parameter in OcNOS version 6.6.0.

Example

```
#copy running-config sftp vrf management
```

[1]Virtual Routing and Forwarding

copy startup-config

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, or a TFTP server .

Command Syntax

```
copy startup-config (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL) (vrf (NAME|management)|)
```

Parameters

TFTP-URL
Destination: **`tftp://server[:port]][/path]`**

FTP-URL
Destination: **`ftp://server][/path]`**

SCP-URL
Destination: **`scp://server][/path]`**

SFTP-URL
Destination: **`sftp://server][/path]`**

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3. Removed `http` parameter in OcNOS version 6.6.0.

Examples

```
#copy startup-config sftp sftp://sftp.mysite.com/start-up_conf vrf management
```

[1]Virtual Routing and Forwarding

copy startup-config (interactive)

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, or a TFTP server .

Command Syntax

```
copy startup-config (ftp|tftp|scp|sftp) (vrf (NAME|management)|)
```

Parameters

ftp
Destination: FTP server

tftp
Destination: TFTP server

scp
Destination: SCP server

sftp
Destination: SFTP server

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3. Removed `http` parameter in OcNOS version 6.6.0.

Examples

```
#copy startup-config sftp vrf management
```

[1]Virtual Routing and Forwarding

copy system file

Use this command to copy a system file to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Note: The names of the options for the source in the first parameter refer to symbolic locations. The specific locations for Linux are noted below. The locations on a specific device can vary depending on the platform.

Command Syntax

```
copy (core|debug|log|techsupport) FILE (ftp|tftp|scp|sftp) (vrf (NAME|management)|)
```

Parameters

core
Core file storage; on Linux this refers to **`/var/log/crash/cores/`**

debug
Debug file storage; on Linux this refers to **`/log/`**

log
Log file storage; on Linux this refers to **`/var/log/`**

techsupport
Copy techsupport log files to remote machine

filepath
Copy device file to remote machine

FILE
Source file name

TFTP-URL
Destination: **`tftp://server[:port][/path]`**

FTP-URL
Destination: **`ftp://server[/path]`**

SCP-URL
Destination: **`scp://server[/path]`**

SFTP-URL
Destination: **`sftp://server[/path]`**

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

[1]Virtual Routing and Forwarding

Applicability

This command was introduced before OcNOS version 1.3. Removed `http` parameter in OcNOS version 6.6.0.

Examples

```
#copy core myFile sftp sftp://sftp.mysite.com/dst_filename vrf management

#copy techsupport tech_support_23_Feb_2001_18_27_00.tar.gz scp scp://10.12.16.17/home/satya/tech_
support_23_Feb_2001_18_27_00.tar.gz vrf management
Enter Username:root
Enter Password:
% Total % Received % Xferd Average Speed Time Time Time Current
Dload Upload Total Spent Left Speed
100 72368 0 0 0 72368 0 147k -::- -::- -::- 147k
100 72368 0 0 0 72368 0 147k -::- -::- -::- 147k
Copy Success
```

copy system file (interactive)

Use this command to copy a system file to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Note: The names of the options for the source in the first parameter refer to symbolic locations. The specific locations for Linux are noted below. The locations on a specific device can vary depending on the platform.

Command Syntax

```
copy (core|debug|log|techsupport|filepath) FILE (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL)
(vrf (NAME|management)|)
```

Parameters

core
Core file storage; on Linux this refers to **`/var/log/crash/cores/`**

debug
Debug file storage; on Linux this refers to **`/log/`**

log
Log file storage; on Linux this refers to **`/var/log/`**

techsupport
Copy techsupport log files to remote machine

filepath
Copy device file to remote machine

FILE
Source file name

TFTP-URL
Destination: **`tftp:[//server[:port]][/path]`**

FTP-URL
Destination: **`ftp:[//server][/path]`**

SCP-URL
Destination: **`scp:[//server][/path]`**

SFTP-URL
Destination: **`sftp:[//server][/path]`**

ftp
Destination: FTP server

tftp
Destination: TFTP server

scp
Destination: SCP server

sftp
Destination: SFTP server

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy log myFile sftp sftp://sftp.mysite.com/dst_filename vrf management
```

[1]Virtual Routing and Forwarding

copy ftp startup-config

Use this command to copy the start up configuration from an FTP server to the local device.

Command Syntax

```
copy ftp FTP-URL startup-config (vrf (NAME|management)|)
```

Parameters

FTP-URL
Configuration source: **`ftp:[//server][/path]`**

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy ftp ftp://ftp.mysite.com/scr filename startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy scp filepath

Use this command to copy the remote system file using SCP to the local device.

Note: OcNOS has a dedicated partition called **/cfg** for storing system level configurations, OcNOS configurations and license data. This is persistent across reboots and upgrades and consists of directories **/cfg/** and **/usr/local/etc**. Copying **user/general** files under **/cfg** partition is discouraged because the size of this partition is very small and impacts normal system operations like **bootup/upgrades** and important system files copy when it doesn't have enough space. Users are recommended to use **/home** to copy the general files. Please note that the contents placed in **/home** directory are deleted upon software upgrade.

Command Syntax

```
copy scp SCP-URL (filepath FILEPATH) (vrf (NAME|management)|)
```

Parameters

SCP-URL
Configuration source: **scp:[//server][/path]**

FILEPATH
Enter the local filesystem path with filename

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#copy scp scp://10.12.65.89/root/cmlsh filepath /root/cmlsh vrf management
```

[1]Virtual Routing and Forwarding

copy scp startup-config

Use this command to copy the start up configuration from a SCP server to the local device.

Command Syntax

```
copy scp SCP-URL startup-config (vrf (NAME|management)|)
```

Parameters

SCP-URL
Configuration source: **`scp:[//server][/path]`**

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy scp scp://scp.mysite.com/scr filename startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy sftp startup-config

Use this command to copy the start up configuration from a SFTP server to the local device.

Command Syntax

```
copy sftp SFTP-URL startup-config (vrf (NAME|management)|)
```

Parameters

SFTP-URL
Configuration source: **`sftp:[//server][/path]`**

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy sftp sftp://sftp.mysite.com/scr filename startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy tftp startup-config

Use this command to copy the start up configuration from a TFTP server to the local device.

Command Syntax

```
copy tftp TFTP-URL startup-config (vrf (NAME|management)|)
```

Parameters

TFTP-URL
Configuration source: **`tftp:[//server][/path]`**

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy tftp tftp://tftp.mysite.com/scr filename startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy http startup-config

Use this command to copy the start up configuration from an HTTP server to the local device.

Command Syntax

```
copy http HTTP-URL startup-config (vrf (NAME|management)|)
```

Parameters

HTTP-URL
Configuration source: **`http:[//server][/path]`**

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy http http://http.mysite.com/scr filename startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy ftp startup-config (interactive)

Use this command to copy the start up confguration from an FTP server to the local device.

Command Syntax

```
copy ftp startup-config (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#copy ftp startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy scp startup-config (interactive)

Use this command to copy the start up confguration from a SCP server to the local device.

Command Syntax

```
copy scp startup-config (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy scp startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy sftp startup-config (interactive)

Use this command to copy the start up confguration from an SFTP server to the local device.

Command Syntax

```
copy sftp startup-config (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
OcNOS#copy sftp startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy tftp startup-config (interactive)

Use this command to copy the start-up confguration from a TFTP server to the local device.

Command Syntax

```
copy tftp startup-config (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
OcNOS#copy tftp startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy http startup-config (interactive)

Use this command to copy the start-up confguration from an HTTP server to the local device.

Command Syntax

```
copy http startup-config (vrf (NAME|management)|)
```

Parameters

vrf management
Defines the management **VRF**[1] instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
OcNOS#copy http startup-config vrf management
```

[1]Virtual Routing and Forwarding

copy file startup-config

Use this command to copy and store a local file into the startup configuration.

Command Syntax

```
copy file FILE startup-config
```

Parameters

FILE
File name

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
OcNOS#copy file myFile startup-config
```

load-config

Use this command to copy a configuration file from either the remote or local file system and apply it to the running-config.

Command Syntax

```
load-config ((scp SCP-URL) | (filepath FILEPATH))
```

Parameters

SCP-URL
Configuration source in the format **scp:[//server][/path]**

FILEPATH
Enter the local file system path with the filename.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Example

For instance, when retrieving a configuration from a remote source, the command might be used as follows:

Remote:

```
Remote#cat /home/config.txt
interface eth2
 ip address 3.3.3.5/24
```

Device:

```
OcNOS#load-config scp scp://10.12.43.155/home/config.txt
Enter Username:root
Enter Password:
Enter configuration commands, one per line.  End with CNTL/Z.
Please wait. System is restoring previous saved configs..
This may take sometime. Please don't abort....
 50% [||||||||||||||||||||||||                      ]
Please wait. Starting commit operation..
This may take sometime. Please don't abort....
100% [||||||||||||||||||||||||||||||||||||||||||||||||||]
```

Interface Commands

This chapter is a reference for each of the interface commands.

admin-group

Use this command to create an administrative group to be used for links. Each link can be a member of one or more, or no administrative groups.

When used in the interface mode, this command adds a link between an interface and a group. The name is the name of the group previously configured. There can be multiple groups per interface. The group is created in configure mode, then interfaces are added to the group in interface mode.

Use the **no** parameter with this command to disable this command.

Command Syntax

```
admin-group NAME
no admin-group NAME
```

Parameters

Name
Name of the admin group to add.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example, the **eth3** interface is added to the group **myGroup**:

```
#configure terminal
(config)#interface eth3
(config-if)#admin-group myGroup
```

bandwidth

Use this command to specify a discrete, maximum bandwidth value for the interface.

Use the **no** parameter resets the interface's bandwidth to the default value.

Command Syntax

```
bandwidth BANDWIDTH
no bandwidth
```

Parameters

BANDWIDTH

<1-999>k for 1 to 999 kilobits/s
<1-999>m for 1 to 999 megabits/s
<1-100>g for 1 to 100 gigabits/s

Default

Default bandwidth is the link speed of the interface. For **LAG**[1], default bandwidth will be collective bandwidth of its member ports. For VLAN interface, default bandwidth is 1 gigabits/sec.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe4
(config-if)#bandwidth 100m
```

[1]Link Aggregation Group

bandwidth-measurement static uni-available-bandwidth

Use this command to advertise the available bandwidth between two directly connected OSPF/ISIS neighbors.

Use the **no** parameter with this command to unset available bandwidth on the current interface.

Command Syntax

```
bandwidth-measurement static uni-available-bandwidth BANDWIDTH
no bandwidth-measurement static uni-available-bandwidth
```

Parameters

BANDWIDTH

<0-999>k for 0 to 999 kilobits/s
<0-999>m for 0 to 999 megabits/s
<0-100>g for 0 to 100 gigabits/s

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
(config)#int eth2
(config-if)#bandwidth-measurement static uni-available-bandwidth 10k
(config-if)#commit

(config)#int eth2
(config-if)#no bandwidth-measurement static uni-available-bandwidth
(config-if)#commit
```

bandwidth-measurement static uni-residual-bandwidth

Use this command to advertise the residual bandwidth between two directly connected OSPF/ISIS neighbors.

Use the **no** parameter with this command to unset residual bandwidth on the current interface.

Command Syntax

```
bandwidth-measurement static uni-residual-bandwidth BANDWIDTH
no bandwidth-measurement static uni-residual-bandwidth
```

Parameters

BANDWIDTH

<0-999>k for 0 to 999 kilobits/s
<0-999>m for 0 to 999 megabits/s
<0-100>g for 0 to 100 gigabits/s

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
(config)#interface ethernet 2
(config-if)#bandwidth-measurement static uni-residual-bandwidth 10g
(config-if)#commit

(config)#interface ethernet 2
(config-if)#no bandwidth-measurement static uni-residual-bandwidth
(config-if)#commit
```

bandwidth-measurement static uni-utilized-bandwidth

Use this command to advertise the utilized bandwidth between two directly connected OSPF/ISIS neighbors.

Use the **no** parameter with this command to unset utilized bandwidth on the current interface.

Command Syntax

```
bandwidth-measurement static uni-utilized-bandwidth BANDWIDTH
no bandwidth-measurement static uni-utilized-bandwidth
```

Parameters

BANDWIDTH

<0-999>k for 0 to 999 kilobits/s
<0-999>m for 0 to 999 megabits/s
<0-100>g for 0 to 100 gigabits/s

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
(config)#int eth2
(config-if)#bandwidth-measurement static uni-utilized-bandwidth 10m
(config-if)#commit

(config)#int eth2
(config-if)#no bandwidth-measurement static uni-utilized-bandwidth
(config-if)#commit
```

clear hardware-discard-counters

Use this command to clear device level discard counters.

Command Syntax

```
clear hardware-discard-counters
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

The command is introduced before OcNOS version 1.3.

Examples

```
#clear hardware-discard-counters
```

clear interface counters

Use this command to clear the statistics on a specified interface or on all interfaces.

Note: This command is not supported on loopback interfaces or the out-of-band management (OOB) management interface.

Command Syntax

```
clear interface (IFNAME|) counters
```

Parameters

IFNAME
Interface name.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear interface xe0 counters
```

clear interface cpu counters

Use this command to clear the CPU queue counters.

Command Syntax

```
clear interface cpu counters
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
OcNOS#clear interface cpu counters
```

clear interface fec

Use this command to clear **FEC**[1] (forward error correction) statistics on a specified interface or on all interfaces.

Note: This command is not supported on loop-back interfaces or the out-of-band (OOB) management interface.

Command Syntax

```
clear interface (IFNAME|) fec
```

Parameter

IFNAME
Physical Interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear interface ce1/1 fec
```

[1]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

clear ip prefix-list

Use this command to reset the hit count to zero in the prefix-list entries for an IPv4 interface.

Command Syntax

```
clear ip prefix-list
clear ip prefix-list WORD
clear ip prefix-list WORD A.B.C.D/M
```

Parameters

WORD
Name of the prefix-list.

A.B.C.D/M
IP prefix and length.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip prefix-list List1
```

clear ipv6 neighbors

Use this command to clear all dynamic IPv6 neighbor entries.

Command Syntax

```
clear ipv6 neighbors
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
OcNOS#clear ipv6 neighbors
```

clear ipv6 prefix-list

Use this command to reset the hit count to zero in the prefix-list entries for an IPv6 interface.

Command Syntax

```
clear ipv6 prefix-list
clear ipv6 prefix-list WORD
clear ipv6 prefix-list WORD X:X::X:X/M
```

Parameters

WORD
Name of the prefix-list.

X:X::X:X/M
IP prefix and length.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
OcNOS#clear ipv6 prefix-list List1
```

debounce-time

Use this command to set the debounce time for a interface.

The debounce timer avoids frequent updates (churn) to higher layer protocol during interface flapping. If the status of a link changes quickly from up to down and then back to up, the port debounce timer suppresses the link status notification. If the link transitions from up to down, but does not come back up, the port debounce timer delays the link status notification.

Notes:

- Keep the following in mind when using the debounce timer:
- Debounce is not applicable for admin down operations.
- Debounce timer is supported only for physical L2 and L3 interfaces.
- The debounce flap-count refers to the number of flaps OcNOS receives while the debounce timer is running:
  - The flap-count is only updated if the timer is still running and OcNOS receives a link status event for the interface.
  - The flap-count is reset at the subsequent start of the debounce timer.
- Protocol-specific timers such as BFD which depend on the link status should be configured to a minimum of 1.5 times the value of the debounce timer. Otherwise it could affect the protocol states if the debounce timer is still running.

Use the **no** form of this command to turn-off the debounce timer on a interface.

Command Syntax

```
debounce-time <250-5000>
no debounce-time
```

Parameters

<250-5000>
Timer value in milliseconds.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#debounce-time 4000
```

delay-measurement dynamic twamp

This command will start the measurement on the interface by using the "interfaces" profile.

The user should be aware that the IP used as a reflector IP must be a directly connected IP.

In case hostname needs to be used, the user must be sure about the hostnames configured in the network.

In case the user configures the delay-measurement with a certain hostname and then the hostname entry in the DNS changes, the delay-measurement must be unconfigured and configured again for the new configuration to take effect (a clear command would not be sufficient in this situation)

Use the **no** form of this command to stop the delay measurement.

Command Syntax

```
delay-measurement dynamic twamp reflector-ip (HOSTNAME | X:X::X:X | A.B.C.D) (reflector-port <1025-
65535>|) (sender-ip (HOSTNAME | X:X::X:X | A.B.C.D)|) (dscp WORD|)
no delay-measurement dynamic twamp reflector-ip (HOSTNAME | X:X::X:X | A.B.C.D)
```

Parameters

twamp
This parameter specifies the protocol to be used to do the measurement. It is the only protocol available in this implementation. The subsequent parameters in this command are specific to the protocol chosen (TWAMP).

reflector-ip
Specify the reflector ip/hostname used to send the TWAMP packets to

HOSTNAME
The hostname of the reflector

X:X::X:X
The ip address of the reflector

A.B.C.D
The ip address of the reflector

reflector-port
Specify the **UDP**[1] port of the TWAMP reflector

<1025-65535>
The reflector port value

sender-ip
Specify the IP used to send the TWAMP packets from (must be an IP configured on the current interface)

HOSTNAME
The hostname of the reflector

X:X::X:X
The ip address of the reflector

A.B.C.D
The ip address of the reflector

dscp
Specify the dscp value used during this measurement

[1]User Datagram Protocol

WORD
The dscp value

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
(config)#interface xe7
(config-if)#delay-measurement dynamic twamp reflector-ip 23.1.1.2 sender-ip 23.1.1.1 dscp 24
(config-if)#commit

(config-if)#no delay-measurement dynamic twamp reflector-ip 23.1.1.2
(config-if)#commit
```

delay-measurement a-bit-min-max-delay-threshold

Use this command to advertise the minimum and maximum delay values between two directly connected IS-IS/OSPF neighbors.

The A bit is set when one or more measured values exceed a configured maximum threshold. The A bit is cleared when the measured value falls below its configured reuse threshold.

Use the **no** parameter with this command to unset a-bit-min-max-delay-threshold on the current interface.

Command Syntax

```
delay-measurement a-bit-min-max-delay-threshold min <1-16777215> <1-16777215> max <1-16777215> <1-
16777215>)
no delay-measurement a-bit-min-max-delay-threshold
```

Parameters

min
Reuse threshold

<1-16777215>
Reuse threshold value of Min-Delay in microseconds

<1-16777215>
Reuse threshold value of Max-Delay in microseconds

a-bit-threshold
Threshold values to set/clear A-bit

max
Maximum threshold

<1-16777215>
Maximum threshold value of Min-Delay in microseconds

<1-16777215>
Maximum threshold value of Max-Delay in microseconds

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#delay-measurement a-bit-min-max-delay-threshold min 11 22 max 33 44
(config-if)#no delay-measurement a-bit-min-max-delay-threshold
```

delay-measurement static

Use this command to advertise static the minimum and maximum delay values or average link delay variation or average link delay values between two directly connected IS-IS/OSPF neighbors.

Use the **no** parameter with this command to unset min-max-uni-link-delay, uni-delay-variation and uni-link-delay static values on the current interface.

Command Syntax

```
delay-measurement static (min-max-uni-link-delay <1-16777215> <1-16777215> |  uni-delay-
variation  <0-16777215> |  uni-link-delay <1-16777215>)
no delay-measurement static (min-max-uni-link-delay | uni-delay-variation | uni-link-delay)
```

Parameters

min-max-uni-link-delay
Min/Max Unidirectional Link Delay

<1-16777215>
Minimum Unidirectional Link Delay in microseconds

<1-16777215>
Maximum Unidirectional Link Delay in microseconds

uni-delay-variation
Unidirectional Delay Variation

<0-16777215>
Value in microseconds

uni-link-delay
Unidirectional Link Delay

<1-16777215>
Value in microseconds

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#delay-measurement uni-delay-variation static 12
(config-if)#no delay-measurement uni-delay-variation static

#configure terminal
```

```
(config)#interface eth1
(config-if)#delay-measurement static uni-link-delay 12
(config-if)#no delay-measurement static uni-link-delay
(config-if)#delay-measurement static min-max-uni-link-delay 1 3
config-if)#no delay-measurement static min-max-uni-link-delay
```

delay-measurement a-bit-delay-threshold

Use this command to advertise average link delay between two directly connected IS-IS/OSPF neighbors.

a-bit-threshold represents the Anomalous (A) bit. The A bit is set when the static value exceeds its configured maximum threshold. The A bit is cleared when the static value falls below its configured reuse threshold.

Use the **no** parameter with this command to unset uni-link-delay on the current interface.

Command Syntax

```
delay-measurement a-bit-delay-threshold min <1-16777215> max <1-16777215>))
no delay-measurement a-bit-delay-threshold
```

Parameters

min
Reuse threshold

<1-16777215>
Reuse threshold value in microseconds

max
Maximum threshold

<1-16777215>
Maximum threshold value in microseconds

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#delay-measurement a-bit-delay-threshold min 11 max 22
(config-if)#no delay-measurement a-bit-delay-threshold
```

default-interface l2protocol

Use this command to configure the L2CP globally specific to protocol type.

Use the **no** parameter with this command to remove this configuration.

Command Syntax

```
default-interface l2protocol (stp | lacp | dot1x | lldp | efm | elmi) (peer | tunnel | discard)
no default-interface l2protocol (stp | lacp | dot1x | lldp | efm | elmi)
```

Parameter

dot1x
Port Authentication (802.1 X).

efm
Ethernet first mile (Link OAM).

elmi
Ethernet local management interface.

lacp
Link Aggregation (LACP).

lldp
Link layer discovery protocol.

stp
Spanning Tree Protocols.

synce
Synchronous Ethernet.

discard
Discard the protocol data unit.

peer
Peer the protocol data unit.

tunnel
tunnel the protocol data.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Example

```
#configure terminal
(config)# default-interface l2protocol lacp tunnel
(config)#no default-interface l2protocol lacp
```

default-interface load-interval

Use this command to configure the load interval globally for all interface types. This shall be overridden by the interface-specific configuration, see load-interval configuration on interface level.

Use the *no* parameter to un-configure the load interval globally.

Use show default-interface to verify this configuration.

Command Syntax

```
default-interface load-interval <30-300>
no default-interface load-interval
```

Parameter

<3-300>

Configure on all interfaces load period in multiples of 30 seconds

(default is 300 seconds).

Default

Disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Example

#configure terminal

```
#configure terminal
(config)# default-interface load-interval 90
#configure terminal
(config)#no  default-interface load-interval
```

default-interface type mtu

Use this command to configure the MTU globally specific to interface types.

Use the ***no*** to un-configure the MTU globally specific to interface.

Command Syntax

```
default-interface type (eth-routed | eth-switchport | l2-subif | l3-subif | svi | lag | mlag | bvi |
irb) mtu <64-65535>
no default-interface type (eth-routed | eth-switchport | l2-subif | l3-subif | svi | lag | mlag | bvi
| irb) mtu
```

Parameter

eth-routed
Physical L3 interface.

eth-switchport
Physical L2 interface.

irb
IRB logical Interface.

l2-subif
L2 subinterface.

l3-subif
L3 subinterface.

lag
Port-channel and static-aggregate.

mlag
Mlag Aggregate interface.

svi
VLAN interface.

<64-65535>
MTU in bytes.

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Example

#configure terminal

```
#configure terminal
(config)# default-interface type  lag mtu 9200
(config)#no default-interface type lag
```

description

Use this command to assign an description to an interface.

Use the **no** parameter to remove an interface description.

Command Syntax

```
description LINE
no description
```

Parameter

LINE
Interface description. Avoid the special characters “?”, “,”, “>”, “|”, and “=” in the description.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example provides information about the connecting router for interface **eth1**.

```
Router#configure terminal
Router(config)#interface eth1
Router(config-if)#description Connected to Zenith's fas2/0
```

duplex

Use this command to set the duplex mode for each interface.

Use the **no** parameter to remove the duplex mode.

Note: Interface duplex setting is not supported on Management interface **eth0**.

Command Syntax

```
duplex (half|full)
no duplex
```

Parameters

half
Half-duplex mode.

full
Full-duplex mode.

Default

By default, duplex mode is full duplex.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#duplex full

(config-if)#no duplex
```

fec

Use this command to force/auto configure forward error correction (**FEC**[1]) on a physical port.

Use the **no** parameter to enable automatic FEC configuration provisioning based on medium.

Command Syntax

```
fec (on (cl74|cl91|cl108)|off|auto)
no fec
```

Parameters

on
Enables FEC.

on cl74
Enables Base-R FEC if hardware supports it.

on cl91
Enables RS-528 FEC if hardware supports it.

on cl108
Enables RS-108 with 64/66b 5T low latency RS FEC for fabric.

off
Disable FEC.

auto
Automatically apply FEC for the below transceiver Ethernet compliance codes.
Transceiver compliance codes can be fetched via the "show interface controller" command. Also, "fec auto" behavior is the same as no fec.
100G Active Optical Cable (AOC) or 25GAUI C2M AOC
100G Active Copper Cable (ACC) or 25GAUI C2M ACC
100G ACC or 25GAUI C2M ACC
100G AOC or 25GAUI C2M AOC
100GBASE-SR4 or 25GBASE-SR
100G AOC or 25GAUI C2M AOC

Default

By default, FEC mode is set to auto.

Command Mode

Interface mode

Applicability

Introduced before OcNOS version 4.1. Added new parameters `cl74` and `cl91` in OcNOS version 6.3.1 and `cl108` in OcNOS version 6.6.0.

[1]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

Examples

```
(config)#interface eth3
(config-if)#fec on
(config-if)#fec off
(config-if)#fec auto
(config-if)#fec on cl74
(config-if)#fec on cl91
(config-if)#fec on cl108
```

flowcontrol

Use this command to enable or disable flow control.

Flow control enables connected Ethernet ports to control traffic rates during periods of congestion by allowing congested nodes to pause link operations at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When a local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the period of congestion.

Use the **no** parameter with this command to disable flow control.

Command Syntax

```
flowcontrol both
flowcontrol send on
flowcontrol send off
flowcontrol receive on
flowcontrol receive off
no flowcontrol
```

Parameters

both
Specify flow control mode for sending or receiving.

send
Specify flow control mode for sending.

receive
Specify the flow control mode for receiving.

off
Turn off flow control.

on
Turn on flow control.

Default

The flow control is enabled globally and auto-negotiation is on, flow control is enabled and advertised on 10/100/1000M ports. If auto-negotiation is off or if the port speed was configured manually, flow control is neither negotiated with nor advertised to the peer.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
```

```
(config-if)#flowcontrol receive off

#configure terminal
(config)#interface eth1
(config-if)#flowcontrol receive on

(config)#interface eth1
(config-if)#no flowcontrol
```

hardware-profile port-config

To use the four SFP28 ports UFIS9600-32X model, the new command is being introduced to breakout the first 100G port 0 and initialize the first four SFP28 ports as either 4X1G or 4X10G or 4X25G. By default, port 0 is being used as 100G and the four SFP28 ports are not available to OcNOS, as these ports are inactive in HW.

Command Syntax

```
hardware-profile port-config (mode1 | mode2 |mode3|mode4 )
```

Parameters

mode1
32X100G (Default) ALL 100G ports will be present

mode2
4X1G + 31X100G 100G port 0 and initialize the first four SFP ports 4X1G

mode3
4X10G + 31X100G 100G port 0 and initialize the first four SFP+ ports 4X10G

mode4
4X25G + 31X100G 100G port 0 and initialize the first four SFP28 ports 4X25G

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.0.0

Examples

```
OcNOS(config)#hardware-profile port-config ?
  mode1  32X100G (Default)
  mode2  4X1G  + 31X100G (ce0 breakout to 4X1G)
  mode3  4X10G + 31X100G (ce0 breakout to 4X10G)
  mode4  4X25G + 31X100G (ce0 breakout to 4X25G)

OcNOS(config)#hardware-profile port-config mode2
OcNOS(config)#comm
OcNOS(config)#
```

hardware-profile portmode

Use this command to set the global port mode.

Command Syntax

```
hardware-profile portmode (4X10g|40g)
```

Parameters

4X10g
Split all the 40G flex ports on the system

40g
Disable splitting on all flex ports and make all ports 40G

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#hardware-profile portmode 40g
```

if-arbiter

Use this command to discover new interfaces recently added to the kernel and add them to the OcNOS database.

This command starts the arbiter to check interface information periodically. OcNOS dynamically finds any new interfaces added to the kernel. If an interface is loaded dynamically into the kernel when OcNOS is already running, this command polls and updates the kernel information periodically.

Use the **no** parameter with this command to revert to default.

Command Syntax

```
if-arbiter (interval <1-65535>|)
no if-arbiter
```

Parameters

interval <1-65535>
Interval (in seconds) after which NSM sends a query to the kernel.

Default

By default, **if-arbiter** is disabled. When interface-related operations are performed outside of OcNOS (such as when using the **ifconfig** command), enable **if-arbiter** for a transient time to complete synchronization. When synchronization is complete, disable it by giving the **noif-arbiter** command.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#if-arbiter interval 5
```

interface

Use this command to select an interface to configure, and to enter the **`Interface`** command mode.

Use the **`no`** parameter with this command to remove this configuration.

Command Syntax

```
interface IFNAME
no interface IFNAME
```

Parameter

IFNAME
Name of the interface.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows the use of this command to enter the **`Interface`** mode (note the change in the prompt).

```
#configure terminal
(config)#interface eth3
(config-if)#
```

ip address A.B.C.D/M

Use this command to specify that an IP address and prefix length will be used by this interface. If the **secondary** parameter is not specified, this command overwrites the primary IP address. If the **secondary** parameter is specified, this command adds a new IP address to the interface. The secondary address cannot be configured in the absence of a primary IP address. The primary address cannot be removed when a secondary address is present.

Use the **no** parameter with this command to remove the IP address from an interface.

Command Syntax

```
ip address A.B.C.D/M label LINE
ip address A.B.C.D/M (secondary|)
ip address A.B.C.D/M secondary label LINE
no ip address A.B.C.D/M label LINE
no ip address A.B.C.D/M secondary label LINE
no ip address (A.B.C.D/M (secondary|)|)
```

Parameters

LINE
Label of this address.

secondary
Make the IP address secondary.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#interface eth3
(config-if)#ip address 10.10.10.50/24
(config-if)#ip address 10.10.11.50/24 secondary
```

ip address dhcp

Use this command to specify that a **DHCP client**[1] will be used to obtain an IP address for an interface.

Use the **no** parameter with this command to remove the IP address from an interface.

Command Syntax

```
ip address dhcp
no ip address dhcp
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#interface eth3
(config-if)#ip address 10.10.10.50/24
(config-if)#ip address 10.10.11.50/24 secondary
(config-if)#ip address dhcp
```

[1]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

ip forwarding

Use this command to turn on IP forwarding.

Use the **no** parameter with this command to turn off IP forwarding.

Command Syntax

```
ip forwarding
ip forwarding vrf NAME
no ip forwarding
no ip forwarding vrf NAME
```

Parameters

NAME
Virtual Routing and Forwarding name

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip forwarding
```

ip prefix-list

Use this command to create an entry for a prefix list.

A router starts to match prefixes from the top of the prefix list and stops whenever a match or deny occurs. To promote efficiency, use the **seq** parameter and place common matches or denials towards the top of the list. The sequence values are generated in the sequence of 5.

Use the parameters **ge** and **le** specify the range of the prefix length to be matched. When setting these parameters, set **le** to be less than 32 and **ge** to be less than **le** value.

Use the **no** parameter with this command to delete the prefix-list entry.

Command Syntax

```
ip prefix-list WORD
 (deny|permit) (A.B.C.D/M|any)
 (deny|permit) A.B.C.D/M eq <0-32>
 (deny|permit) A.B.C.D/M ge <0-32>
 (deny|permit) A.B.C.D/M ge <0-32> le <0-32>
 (deny|permit) A.B.C.D/M le <0-32>
 (deny|permit) A.B.C.D/M le <0-32> ge <0-32>
 seq <1-4294967295> (deny|permit) (A.B.C.D/M|any)
 seq <1-4294967295> (deny|permit) A.B.C.D/M eq <0-32>
 seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32>
 seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32> le <0-32>
 seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32>
 seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32> ge <0-32>
 description LINE
 no seq <1-4294967295> (deny|permit) (A.B.C.D/M|any)
 no description LINE
 no description
no ip prefix-list WORD
ip prefix-list sequence-number
no ip prefix-list sequence-number
```

Parameters

WORD
Name of the prefix list.

deny
Reject packets.

permit
Accept packets.

A.B.C.D/M
IP address mask and length of the prefix list mask.

eq
Exact prefix length to be matched

le
Maximum prefix length to be matched

ge
Minimum prefix length to be matched

<0-32>
Prefix length to match

<1-4294967295>
Sequence number of the prefix list.

any
Take all packets of any length. This parameter is the same as using 0.0.0.0/0 le 32 for **A.B.C.D/M**.

sequence-number
To suppress sequence number generation, give the **no ip prefix-list sequence-number** command. If you disable the generating sequence numbers, you must specify the sequence number for each entry using the sequence number parameter in the **ip prefix-list** command.

To enable sequence number generation, give the **ip prefix-list sequence-number** command.

LINE
Up to 80 characters describing this prefix-list.

Default

None

Command Mode

Configure mode and IP prefix-list mode

Applicability

This command was introduced before OcNOS Version SP 4.0.

Examples

In this configuration, the **ip prefix-list** command matches all, but denies the IP address range, 76.2.2.0.

```
#conf t
(config)#router bgp 100
(config-router)#network 172.1.1.0
(config-router)#network 172.1.2.0
(config-router)#
(config-router)#neighbor 10.6.5.3 remote-as 300
(config-router)#neighbor 10.6.5.3 prefix-list mylist out
(config-router)#exit
(config)#ip prefix-list mylist
(config-ip-prefix-list)#seq 5 deny 76.2.2.0/24
(config-ip-prefix-list)#seq 10 permit 0.0.0.0/0
```

ip proxy-arp

Use this command to enable the proxy ARP feature on an interface.

Use the **no** parameter to disable the proxy ARP feature on an interface.

Command Syntax

```
ip proxy-arp
no ip proxy-arp
```

Parameters

None

Default

By default, the ip proxy-arp is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ip proxy-arp
```

ip remote-address

Use this command to set the remote address (far end) on a point-to-point non multi-access link. This command can be used only on unnumbered interfaces. When a new remote-address is configured, the old address gets overwritten.

Use the **no** parameter to disable this function.

Command Syntax

```
ip remote-address A.B.C.D/M
no ip remote-address
```

Command Syntax

A.B.C.D/M
IP address and prefix length of the link remote address.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#interface ppp0
(config-if)#ip unnumbered eth1
(config-if)#ip remote-address 1.1.1.1/32
```

ip unnumbered

Use this command to enable IP processing without an explicit address on a point-to-point non multi-access link. Moreover, this command lets an interface borrow the IP address of a specified interface to enable IP processing on a point-to-point interface without assigning it an explicit IP address. In this way, the IP unnumbered interface can borrow the IP address of another interface already configured on the router to conserve network and address space.

Use the **no** parameter with this command to remove this feature on an interface.

Command Syntax

```
ip unnumbered IFNAME
no ip unnumbered
```

Parameters

IFNAME
Interface name.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example creates a tunnel on **eth1**.

```
(config)#interface lo
(config-if)#ip address 127.0.0.1/8
(config-if)#ip address 33.33.33.33/32 secondary
(config-if)#exit
(config)#interface eth1
(config-if)#ip address 10.10.10.145/24
(config-if)#exit
(config)#interface Tunnel0
(config-if)#tunnel source 10.70.0.145
(config-if)#tunnel destination 10.70.0.77
(config-if)#tunnel ttl 255
(config-if)#tunnel path-mtu-discovery
(config-if)#tunnel mode vxlan
(config-if)#ip unnumbered eth1
(config-if)#exit
(config)#router ospf
(config-router)#network 10.10.10.0/24 area 0
```

ip vrf forwarding

This command associates an interface with a **VRF**[1].

Use the **no** parameter with this command to unbind an interface.

Notes:

- When you give this command in interface configuration or subinterface configuration mode of the parent VR, the IP address and other attributes of the interface are deleted from the interface. After giving this command, the IP attributes must then be configured in the context of the VRF.
- The Out Of Band (OOB) management port is part of the “management” VRF. Also, this port cannot be moved out of “management” VRF.

Command Syntax

```
ip vrf forwarding WORD
no ip vrf forwarding WORD
```

Parameters

WORD
Name of the VRF.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip vrf myVRF
(config-vrf)#exit
(config)#interface eth1
(config-if)#ip vrf forwarding myVRF
```

[1]Virtual Routing and Forwarding

ipv6 address

Use this command to configure the global IPv6 address using the learned prefix and user provided suffix.

Use the **no** form of this command to remove the configuration.

Command Syntax

```
ipv6 address PREFIX-NAME X:X::X:X/M
no ipv6 address PREFIX-NAME X:X::X:X/M
```

Parameters

PREFIX-NAME
Name of the prefix which stores the address-prefix learnt using prefix delegation enabled in the client interface

X:X::X:X/M
Suffix address consists subnet id and host address. This value must start with '::', and end with a /64 bit prefix.

Default

DHCPv6 IA_PD option is not requested by default.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ipv6 address dhcp
(config-if)#ipv6 dhcp prefix-delegation prefix_xe1
(config-if)#

(config)#interface xe3
(config-if)#ipv6 address prefix_xe1 ::1:0:0:0:1/64
(config-if)#
```

ipv6 forwarding

Use this command to turn on IPv6 forwarding.

Use the **no** parameter with this command to turn off IPv6 forwarding.

Command Syntax

```
ipv6 forwarding
ipv6 forwarding vrf NAME
no ipv6 forwarding
no ipv6 forwarding vrf NAME
```

Parameters

NAME
Virtual Routing or Forwarding name

Default

None

Command Mode

Command mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 forwarding
```

ipv6 prefix-list

Use this command to create an entry for an ipv6 prefix-list.

Router starts to match prefixes from the top of the prefix list, and stops whenever a match or deny occurs. To promote efficiency, use the **seq** parameter and place common matches or denials towards the top of the list. The sequence values are generated in the sequence of 5.

The parameters **ge** and **le** specify the range of the prefix length to be matched.

Use the **no** parameter with this command to delete the prefix-list entry.

Command Syntax

```
ipv6 prefix-list WORD
 (deny|permit) (X:X::X:X/M|any)
 (deny|permit) X:X::X:X/M ge <0-128>
 (deny|permit) X:X::X:X/M ge <0-128> le <0-128>
 (deny|permit) X:X::X:X/M le <0-128>
 (deny|permit) X:X::X:X/M le <0-128> ge <0-128>
 seq <1-4294967295> (deny|permit) (X:X::X:X/M|any)
 seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128>
 seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128> le <0-128>
 seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128>
 seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128> ge <0-128>
 description LINE
 no seq <1-4294967295> (deny|permit) (X:X::X:X/M|any)
 no description
no ipv6 prefix-list WORD
ipv6 prefix-list sequence-number
no ipv6 prefix-list sequence-number
```

Parameters

WORD
Name of the prefix list.

deny
Reject packets.

permit
Accept packets.

X:X::X:X/M
IP address mask and length of the prefix list mask.

any
Take all packets of any length. This is the same as specifying ::/0 for X:X::X:X/M.

le
Maximum prefix length match

ge
Minimum prefix length match

<0-128>
Prefix length to match

<1-4294967295>
Sequence number of the prefix list.

sequence-number

To suppress sequence number generation, give the **`no ipv6 prefix-list sequence-number`** command. If you disable the generating sequence numbers, you must specify the sequence number for each entry using the sequence number parameter in the **`ipv6 prefix-list`** command.
To enable sequence number generation, give the **`ipv6 prefix-list sequence-number`** command.

LINE

Up to 80 characters describing this prefix-list.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 prefix-list mylist
(config-ipv6-prefix-list)#seq 12345 deny 3ffe:345::/16 le 22 ge 14
```

ipv6 unnumbered

Use this command to enable IPv6 processing without an explicit address, on a point-to-point non multi-access link.

This command lets an interface borrow the IPv6 address of a specified interface to enable IPv6 processing on a point-to-point interface without assigning it an explicit IPv6 address. In this way, the IPv6 unnumbered interface can borrow the IPv6 address of another interface already configured on the router to conserve network and address space.

Use the **no** parameter with this command to remove this feature on an interface.

Command Syntax

```
ipv6 unnumbered IFNAME
no ipv6 unnumbered
```

Parameters

IFNAME
Interface name.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example creates a tunnel on eth1.

```
#configure terminal
(config)#interface lo
(config-if)#ipv6 address::1/128
(config-if)#exit
(config)#interface eth1
(config-if)#ipv6 address fe80::20e:cff:fe6e:56dd/64
(config-if)#exit
(config)#interface Tunnel0
(config-if)#tunnel source 10.70.0.145
(config-if)#tunnel destination 10.70.0.77
(config-if)#tunnel ttl 255
(config-if)#tunnel path-mtu-discovery
(config-if)#tunnel mode vxlan
(config-if)#ipv6 unnumbered eth1
(config-if)#ipv6 router ospf area 0 tag 1
(config-if)#exit
(config)#router ipv6 ospf 1
(config-router)#router-id 10.70.0.145
```

link-debounce-time

Use this command to set the debounce time for linkup and linkdown transitions for the interface.

User can set only one of the timers (either linkup or linkdown) by setting the other one to 0.

Use the **no** form of this command to turn off the link debounce timer on the interface.

Command Syntax

```
link-debounce-time <0-5000> <0-5000>
no link-debounce-time
```

Parameters

<0-5000>
timer value in milliseconds for the linkup transition

<0-5000>
timer value in milliseconds for the linkdown transition

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#link-debounce-time 4000 5000
(config-if)#link-debounce-time 0 5000
(config-if)#link-debounce-time 3000 0
```

load interval

Use this command to configure the interval for which average traffic rate need to be shown. Intervals can be configured in steps of 30 seconds.

Use the no parameter with this command to set the load interval to its default.

Command Syntax

```
load-interval <30-300>
no load-interval
```

Parameters

<30-300>
Load period in multiples of 30 seconds.

Default

By default, load interval is 300 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)#load-interval 30
(config-if)#no load-interval
```

loopback

Use this command to loopback TX or RX packets at MAC or PHY level.

Use the **no** form of the command to remove loopback configuration.

Command Syntax

```
loopback (tx | rx) (mac | phy)
no loopback
```

Parameters

tx
Loopback TX packets

rx
Loopback RX packets

mac
Loopback TX or RX packets at MAC level

phy
Loopback TX or RX packets ar PHY level

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#configure terminal
(config)#int ce1/2
(config-if)#loopback rx phy

#configure terminal
(config)#int ce1/2
(config-if)#no loopback
```

loss-measurement dynamic

This command enables the loss measurement. This command is tied to the delay measurement session already created to measure the delay. In case this command is issued without the delay-measurement command previously issued, an error is returned.

Use the **no** form of this command to disable the loss measurement.

Command Syntax

```
loss-measurement dynamic
no loss-measurement dynamic
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 5.1.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#loss-measurement dynamic
(config-if)#no loss-measurement dynamic
```

loss-measurement uni-link-loss

Use this command to advertise the loss (as a packet percentage) between two directly connected IS-IS/OSPF neighbors.

The A bit is set when the measured value of this parameter exceeds its configured maximum threshold. The A bit is cleared when the measured value falls below its configured reuse threshold.

Use the **no** parameter with this command to unset uni-link-loss on the current interface.

Command Syntax

```
loss-measurement uni-link-loss ((static VALUE) | (a-bit-threshold min VALUE max VALUE))
no loss-measurement uni-link-loss (static | a-bit-threshold)
```

Parameters

static
Static value

VALUE
Loss percentage in six precision float format. eg: 3.123456

a-bit-threshold
Threshold values to set/clear A-bit

min
Reuse threshold

VALUE
Reuse threshold percentage in six precision float format. eg:3.123456

max
Maximum threshold

VALUE
Maximum threshold percentage in six precision float format. eg:3.123456

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#loss-measurement uni-link-loss static 12.3
(config-if)#no loss-measurement uni-link-loss static
(config-if)#loss-measurement uni-link-loss a-bit-threshold min 1.12 max 2.2
(config-if)#no loss-measurement uni-link-loss a-bit-threshold
```

mac-address

Use this command to configure a MAC address for Layer 3 interfaces. Interface can be Layer 3 physical interface or routed VLAN interface or port-channel.

Use the **no** form of this command to remove the MAC address from an interface.

Command Syntax

```
mac-address  HHHH.HHHH.HHHH
no mac-address
```

Parameters

mac-address
Mac-address in HHHH.HHHH.HHHH format (only supported on L3 Interfaces)

Default

None

Command mode

Interface mode

Applicability

This command was introduced before OcNOS version 6.4.2.

Examples

```
OcNOS(config)#int xe46
OcNOS(config-if)#mac-address 00e0.aaaa.bbbb
```

monitor speed

Use this command to enable speed monitoring on interface.

Use the **no** parameter with this command to disable monitoring.

Command Syntax

```
monitor speed
no monitor speed
```

Parameters

None

Default

By default, speed monitoring will be disabled

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)#monitor speed
(config-if)#no monitor speed
```

monitor queue-drops

Use this command to enable queue-drops monitoring on interface.

Use the **no** parameter with this command to disable monitoring.

Command Syntax

```
monitor queue-drops
no monitor queue-drops
```

Parameters

None

Default

By default, queue-drops monitoring will be disabled

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)#monitor queue-drops
(config-if)#no monitor queue-drops
```

monitor speed threshold

Use this command to modify default speed monitor threshold on interface.

Use the **no** parameter with this command to set the monitor speed threshold to its default.

Note: Warning threshold must be greater than recovery threshold and it is recommended to keep a difference of 10 percent to avoid frequent notifications caused by variations in average speed.

Command Syntax

```
monitor speed threshold warning <1-100> recovery <1-100>
no monitor speed threshold
```

Parameters

warning <1-100>
Warning level threshold value in percentage

recovery <1-100>
Recovery level threshold value in percentage

Default

By default, warning threshold is 90 percentage and recovery is 80 percentage.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)# monitor speed threshold warning 80 recovery 70
(config-if)#no monitor speed threshold
```

mtu

Use this command to set the Maximum Transmission Unit (MTU) and Maximum Receive Unit (MRU) for an interface

Use the **no** parameter with this command to set the MTU to its default.

Notes:

- To allow jumbo frames over **SVI**[1] interfaces, it is mandatory to configure the applicable MTU for the specific SVI interfaces.

Limitation for MTU configuration on Label-Switching

1. Creating a sub-interface automatically increases the physical interface MTU size by 8 bytes to accommodate double VLAN tag encapsulation.
2. Configuring label switching for physical layer-3 interfaces adds 20 bytes internally to the MTU to accommodate up-to five labels. However, configuring label-switching on sub-interface does not change the MTU of physical interface. Hence, the physical interface requires a manual increase in MTU size.
3. During the BGP update, in case the control packet contains 1500 bytes when it reaches the hardware, the hardware adds the Encapsulation for the sub-interface and MPLS header (Additional bytes). Now, the hardware drops it as physical port MTU is limited to 1500 bytes.
4. While configuring MTU on label-switching enabled with Subinterface/SVI/**LAG**[2] and the Parent Physical port follow guide lines mentioned below:
    - It is recommended to configure higher MTU on network ports in comparison with access ports. Hence, increase the MTU on both physical and sub-interfaces to accommodate the **PDU**[3].
    - When using sub-interface for MPLS network interfaces, considering the default MTU of 1500, minimum MTU configuration recommendation is as follows
    - **Sub-interface:** MTU 1520 (to accommodate 5 MPLS labels)
    - **Physical interface:** MTU 1528: (Default MTU 1500 + double encap 8 + MPLS up-to 5 labels 20) = 1528).

      Note: MTU configuration is considered from IP header onwards. Hence, OcNOS adds 14 bytes to MTU internally to accommodate L2 header. The effective MTU in hardware will be 1528+14 = 1542.

    - **LAG interface:** MTU is applied on all members internally
    - **SVI:** When label-switching enabled on VLAN interface, MTU value must be manually increased by at least 20 bytes on Parent interfaces of VLAN.
      Example, default MTU must be set as 1520 instead of 1500 on label-switching parent interface label switched VLAN interface. (Parent Interface MTU >= label switched VLAN interface MTU + 20).

[1]Switched Virtual Interface

[2]Link Aggregation Group

[3]A unit of data transmitted as a composite by a protocol.

Command Syntax

```
mtu <64-65536>
no mtu
```

Parameters

<64-65536>
Specify the size of MTU in bytes:
<64-16338> for L2 packet
<576-9216> for L3 IPv4 packet
<1280-9216> for L3 IPv6 packet
<576-65536> for IPv4 packet
<1280-65536> for IPv6 packet on loopback interface

Default

By default, MTU is 1500 bytes

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#mtu 120
```

multicast

Use this command to set the multicast flag for the interface.

Use the **no** form of this command to disable this function.

Command Syntax

```
multicast
no multicast
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#multicast
```

show flowcontrol

Use this command to display flow control information.

Command Syntax

```
show flowcontrol
show flowcontrol interface IFNAME
```

Parameters

interface IFNAME
Specify the name of the interface to be displayed.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the **`show flowcontrol interface`** command displaying flow control information.

```
#show flowcontrol interface ge1
Port    Send FlowControl    Receive FlowControl RxPause TxPause

        admin    oper        admin    oper

-----   ------- --------    ------- --------     ------- -------
ge1      on       on           on       on            0       0
```

Here is the explanation of the show command output fields.

Table 92. show flow control output

Entry	Description
Port	Interface being checked for flowcontrol.
Send admin	Displays whether the flowcontrol send process is administratively on or off.
FlowControl oper	Displays whether send flowcontrol is on or off on this interface.
Received admin	Displays whether the flowcontrol receive process is administratively on or off.

Table 92. show flow control output (continued)

Entry	Description
FlowControl oper	Displays whether receive flowcontrol is on or off on this interface.
RxPause	Number of received pause frames.
TxPause	Number of transmitted pause frames.

show hardware-discard-counters

Use this command to check device level discard counters.

Command Syntax

```
show hardware-discard-counters
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

The command is introduced before OcNOS version 1.3.

Qumran devices do not support discard counters per interface. Only global level counters are available for advanced debugging using the show hardware-discard-counters (page 1694) command.

Examples

```
#show hardware-discard-counters
+-------------------------------------------------+--------------------+
| Registers                                       | Core 0             |
+-------------------------------------------------+--------------------+
 CGM_VOQ_SRAM_ENQ_RJCT_PKT_CTR                     437
   Reason : QNUM_NOT_VALID                         Y
 EGQ_PQP_DISCARD_UNICAST_PACKET_COUNTER            8894
   Reason : SRC_EQUAL_DEST_INT                     Y
```

Here is the explanation of the show command output fields.

Table 93. Table detailing about counters supported

Register	Description
`CGM_VOQ_SRAM_ENQ_RJCT_PKT_CTR for QAX` `IQM_QUEUE_ENQ_DISCARDED_PACKET_COUNTER for QMX`	Drop is due to PPdecision to drop, or invalid destination received from PPblocks. The packet DP (Drop Precedence) is higher than the configured Drop DP.
`EGQ_PQP_DISCARD_UNICAST_PACKET_COUNTER`	Seen with unknown unicast frames, source and destination learnt from same interface.

Table 94. Table detailing about reasons supported

Register	Description
QNUM_NOT_VALID for QAX QUEUE_NOT_VALID_STATUS for QMX DP_LEVEL_RJCT for QAX DP_LEVEL_STATUS for QMX	Seen with Vlan Discards, ACL Drops, Storm Control, STP Blocked Port. Seen with Policer Discards.
SRC_EQUAL_DEST_INTF	Seen when traffic is not learned, but is still forwarded/flooded.

show interface

Use this command to display interface configuration and status information.

Command Syntax

```
show interface (IFNAME|)
show interface brief (IFNAME|)
```

Parameters

IFNAME
Interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1
Interface xe1/1
  Scope: both
  Flexport: Breakout Control Port (Active): Break Out Enabled
  Hardware is ETH  Current HW addr: ecf4.bb6e.934b
  Physical:ecf4.bb6e.934b  Logical:(not set)
  Port Mode is access
  Interface index: 5001
  Metric 1 mtu 1500 duplex-full(auto) link-speed 1g(auto)
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Label switching is disabled
  No Virtual Circuit configured
DHCP client is disabled.
  Last Flapped: 2016 Nov 05 22:40:23 (00:19:25 ago)
  Statistics last cleared: 2016 Nov 05 04:49:55 (18:09:53 ago)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 256 bits/sec, 0 packets/sec
  RX
    unicast packets 39215813 multicast packets 0 broadcast packets 0
    input packets 39215813 bytes 2666662432
    jumbo packets 0
    runts 0 giants 0 CRC 0 fragments 0 jabbers 0
    input error 0
    input with dribble 0 input discard 0
    Rx pause 0
  TX
    unicast packets 38902 multicast packets 437 broadcast packets 0
    output packets 437 bytes 28018
    jumbo packets 0
    output errors 0 collision 0 deferred 0 late collision 0
```

```
    output discard 0
    Tx pause 0
```

Here is the explanation of the show command output fields.

Table 95. show interface output details

Field	Description
Scope	Interface can be used for communication within the device and outside the device (Both).
Flexport	Specifies whether the ports has Breakout capabilities or is a Non-Control Port.
Breakout Control Port (Active)	Specifies whether Breakout is active or disabled.
Hardware is ETH Current HW addr	The MAC address of the interface.
Physical	Displays the physical MAC address of the interface.
Logical	Displays the logical MAC address (if any) of the interface.
Port Mode	Displays the port mode: Router, VLAN access, switch, or trunk.
Interface index	Index number, Metric, MTU size, duplex-full (auto) or half-duplex, minimum link speed in gigabits, and if the interface is up, broadcasting, and multicasting.
VRF[1] Binding	Show whether the interface is VRF bound and (if bound) with what VRF, if Label Switching is enabled or disabled, and if a virtual circuit is configured.
DHCP client[2]	The state of the **DHCP**[3] client – whether this interface is connected to a DHCP server.
Last Flapped	Date and time when the interface last flapped.
Statistics last cleared	Date and time when the interface's statistics were cleared.
5 minute input rate	Input rate in bits/second and packets/second
5 minute output rate	Output rate in bits/second and packets/second
RX	Counters for unicast packets, multicast packets, broadcast packets, input packets, bytes, jumbo packets, runts, giants, CRC errors, fragments, jabbers, input errors, input with dribble input discards, and receive pause.
TX	Counters for unicast packets, multicast packets, broadcast packets, output packets, bytes, jumbo packets, output errors, collisions, differed packets, input late collisions, output discards, and transmit pause.

#show interface brief xe51

Codes: ETH - Ethernet, LB - Loopback, AGG - Aggregate, MLAG - MLAG Aggregate
       FR - Frame Relay, TUN -Tunnel, PBB - PBB Logical Port, VP - Virtual Port
```

[1]Virtual Routing and Forwarding

[2]A DHCP client is a hardware device or software that uses DHCP to get the network configuration information from a DHCP Server. VRF: VRF creates a logically isolated routing table within a single physical network device. Each VRF instance works as an independent routing instance that enables separate network traffic, maintains different routing tables, and provides network isolation.

[3]Dynamic Host Configuration Protocol

```
       CVP - Channelised Virtual Port, METH - Management Ethernet, UNK- Unknown
       ED - ErrDisabled, PD - Protocol Down, AD - Admin Down, IA - InActive
       PD(Min L/B) - Protocol Down Min-Links/Bandwidth
       OTD  - Object Tracking Down
       DV - DDM Violation, NA - Not Applicable
       NOM - No operational members, PVID - Port Vlan-id
       Ctl - Control Port (Br-Breakout/Bu-Bundle)

```

show interface capabilities

Use this command to display interface capabilities

Command Syntax

```
show interface (IFNAME|) capabilities
```

Parameters

IFNAME
Displays the name of a specific interface for which status and configuration data is desired.

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1 capabilities
xe1/1
Speed(FD) : 10MB,100MB,1000MB,10GB,20GB,40GB
Interface : xgmii
Medium : copper
Loopback : none,MAC,PHY
Pause : pause_tx,pause_rx,pause_asymm
Flags : autoneg
Encap : IEEE,HIGIG,HIGIG2
OcNOS#show interface cd49 capabilities
cd49
Speed(FD)            : 400GB
Speed(HD)            : 400GB
Medium               : copper,fiber
Pause                : pause_tx/pause_rx/pause_asymm
Encap                : IEEE
FEC                  : RS-272-2xN,RS-544-2xN,BASE-R(CL74),RS(CL91)
OcNOS#show interface cd49/1 capabilities
cd49/1
Speed(FD)            : 100GB

```

Here is the explanation of the show command output fields.

Table 96. show interface capabilities output details

Field	Description
Interface number	The identifying ID number of the interface – eht0, xe1, etc.
Speed (FD)	The Flexible Data-Rates (FD) of the interface
interface	XAUI is a standard for extending the XGMII (10 Gigabit Media Independent Interface) between the MAC and PHY layer of Gigabit Ethernet.
Medium	Members have to have the same medium type configured. This only applies to Ethernet port-channel. Copper, fiber optics, etc.
Loop back	The loop back between the MAC and PHY layers.
Pause	Pause transmit, pause receive, pause asymmetrically.
Flags	Interface flags set for Auto-negotiation.
Encap	Encapsulation – IEEE, HIGIG, and HIGIG2 specifications – HIGIG is a proprietary protocol that is implemented by Broadcom. The HIGIG protocol supports various switching functions. The physical signaling across the interface is XAUI, four differential pairs for receive and transmit (SerDes), each operating at 3.125 Gbit/s.

show interface counters

Use this command to display the ingress and egress traffic counters on the interface.

Note: Counters are meant for debugging purpose and the accuracy of the transmit discard counter is not guaranteed in all scenarios.

Command Syntax

```
show interface (IFNAME|) counters (active|)
show interface cpu counters
```

Parameters

IFNAME
Interface name.

active
Statistics for link-up interfaces.

cpu
CPU interface.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1 counters
Interface xe1/1
  Scope: both
  Rx Packets: 1000
  Rx Bytes: 1000000
  Rx Unicast Packets: 1000
  Rx Packets from 512 to 1023 bytes: 1000
  Tx Packets: 3897
  Tx Bytes: 249408
  Tx Multicast Packets: 3897
  Tx Packets with 64 bytes: 3897
  Tx Packet rate: 1 pps
  Tx Bit rate: 255 bps
#show interface cpu counters
CPU Interface
  Tx Packets: 104508
  Tx Bytes: 7106272
  Tx Discard Packets: 89613672
  Tx Discard Bytes: 5735237844
  Rx Discard Packets: 11938
```

Here is the explanation of the show command output fields.

show interface counters drop-stats

Use this command to display the ingress and egress traffic discard reason counters on the interface.

Notes:

- You can only display statistics for physical ports and cpu ports, but not for the out-of-band management (OOB) management port or logical interfaces.
- Drops in the CPU queue are listed under **`Tx Multicast Queue Drops`**, whether the packet is unicast or multicast

Command Syntax

```
show interface (IFNAME|) counters drop-stats
show interface cpu counters drop-stats
```

Parameters

IFNAME
Physical interface name

cpu
CPU interface

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.1.

For Qumran devices, only error statistics are applicable and discard counters are not applicable. Only global level counters are available for advanced debugging using the command show hardware-discard-counters (page 1694).

Example

```
#show interface xe32/2 counters drop-stats
+---------------------+----------------+----------------+--------------------+
| Counter Description | Count          | Last Increment | Last Increment Time |
+---------------------+----------------+----------------+--------------------+
 Rx Bad CRC errors     0                0
 Rx Undersize errors   0                0
 Rx Oversize errors    0                0
 Rx Fragments errors   0                0
 Rx Jabbers errors     0                0
 Rx Port Block Drops   6                1               2016 Nov 09 08:59:33
 Rx Vlan Discards      0                0
 Rx ACL/QOS Drops      0                0
 Rx Policy Discards    0                0
```

```
  Rx EGR Port Unavail   38784            5                2016 Nov 09 18:19:31
  Rx IBP Discards       0                0
  Tx Port Block Drops   359              1                2016 Nov 09 08:59:33
  Tx Vlan Discards      0                0
  Tx TTL Discards       0                0
  Tx Unknown Discards   359              1                2016 Nov 09 08:59:33
  Tx Ucast Queue Drops  0                0
  Tx Mcast Queue Drops  0                0
+---------------------+----------------+----------------+--------------------+
```

Here is the explanation of the show command output fields.

Table 98. show interface counters drop-stats output details

Field	Description
Counter Description	Shows the type of packet and/or the reason why the packet was dropped.
Count	The number of packets dropped for each reason.
Last Increment	Number of packets dropped since this command was last entered.
Last Increment Time	Date and time when the last packet was dropped.
Rx Bad CRC errors	Received packets dropped because they didn't pass the cyclic Redundancy Check (CRC).
Rx Undersize errors	Number of received runt packets dropped.
Rx Oversize errors	Number of received giant packets dropped
Rx Fragments errors	Number of received packet fragments dropped
Rx Jabbers errors	Received packets dropped because of jabber – long packet error.
Rx Port Block Drops	Received packets dropped because port blocking is enabled (not applicable for Qumran platform).
Rx Vlan Discards	VLAN received packets dropped because there is no VLAN configured on the port (not applicable for Qumran platform).
Rx ACL/QOS Drops	Received packets match a field processing entry with a drop or color drop action, such as: User-configured ACL that denies traffic Service policy with a police action that drops the traffic received at a rate higher than the configured limit. (not applicable for Qumran platform)
Rx **Policy**[1] Discards	Received packets dropped because of device policies violated, such as a storm control rate violation (not applicable for Qumran platform).
Rx EGR Port Unavail	No output port can be determined for these received packets. This counter increments along with other counter types in this table because it is a "catchall" for multiple types of discards as shown below (not applicable for Qumran platform): VLAN check failed MTU check failed ACL/QoS drops

[1]A set of rules determining which actions are permitted or denied for a specific user role.

Table 98. show interface counters drop-stats output details (continued)

Field	Description
	Policy discards Source MAC is null Destination IP/source IP address is null Source MAC address and destination MAC address are the same Forwarding lookup failure
Rx IBP Discards	Ingress Back Pressure (ingress congestion) when the ingress packets buffer is full for an interface. (not applicable for Qumran platform)
Tx Port Block Drops	Transmitted packets dropped because port blocking is enabled (not applicable for Qumran platform).
Tx Vlan Discards	Transmitted VLAN packets dropped because there is no VLAN configured on the port (not applicable for Qumran platform).
Tx TTL Discards	Transmitted packets discarded because their Time To Live (TTL) has ended. (not applicable for Qumran platform)
Tx Unknown Discards	Transmitted packets dropped for unknown reason. May have something to do with the condition/configuration of the port at the other end of the connection (not applicable for Qumran platform).
Tx Ucast Queue Drops	Transmitted packets dropped as a result of Unicast buffer overflow.
Tx Mcast Queue Drops	Transmitted packets dropped as a result of Multicast buffer overflow.

show interface counters error-stats

Use this command to display the ingress error traffic counters on the interface.

Command Syntax

```
show interface (IFNAME|) counters error-stats
```

Parameters

IFNAME
Interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1 counters error-stats
+----------+-------------+--------+----------+---------+-----------+---------+
|Interface |Total errors |Bad CRC |Undersize |Oversize | Fragments | Jabbers |
+----------+-------------+--------+----------+---------+-----------+---------+
 xe1/1      120           8        100        10        2           0
```

The table below explains the columns in the output.

Table 99. error traffic counters

Column	Description	Causes
Interface	Name of the interface	Point of interconnection in network.
Total errors	Total number of all types of errors	Number of errors in network.
Bad CRC	Number of packets received by the port from the network, where the packets have no CRC or a bad CRC.	Packet data modified making the CRC invalid.
Undersize	Total number of packets received that are less than 64 octets long (which exclude framing bits, but include the FCS) and have a good FCS value.	Bad frame generated by the connected device.
Oversize	Number of packets received by the port from the network, where the packets were more than	Faulty hardware, dot1q, or ISL trunking configuration issues.

Table 99. error traffic counters (continued)

Column	Description	Causes
	maximum transmission unit size.	
Fragments	Total number of frames whose length is less than 64 octets (which exclude framing bits, but which include the FCS) and have a bad FCS value.	Ports are configured at half-duplex. Change the setting to full-duplex.
Jabbers	Total number of frames whose length is more than the maximum MTU size. (which exclude framing bits, but which include FCS) and have a bad FCS value.	Ports are configured at half-duplex. Change the setting to full-duplex.

show interface counters (indiscard-stats|outdiscard-stats)

Use this command to display the ingress and egress traffic discard reason counters on the interface.

Note: You can only display statistics for data ports and CPU ports, not for the out-of-band management (OOB) management port or logical interfaces.

Command Syntax

```
show interface (IFNAME|) counters (indiscard-stats|outdiscard-stats)
show interface cpu counters (indiscard-stats|outdiscard-stats)
```

Parameters

IFNAME
Physical Interface name.

indiscard-stats
Discard reasons for ingress dropped packets.

outdiscard-stats
Discard reasons for egress dropped packets.

cpu
CPU Interface.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Note: This command is not available on Qumran platforms.

Examples

```
#show interface xe1/3 counters indiscard-stats
+---------------------+----------------+----------------+---------------------+
| Counter Description | Count          | Last Increment | Last Increment Time |
+---------------------+----------------+----------------+---------------------+
 STP Discards          0                0
 Vlan Discards         0                0
 ACL Drops             0                0
```

```
 Policy Discards       0               0
 EGR Port Unavail      1092867         1092867          2016 Oct 25 19:54:58
 IBP Discards          0               0
+--------------------+----------------+----------------+--------------------+

#show interface counters indiscard-stats
+-------------+------------------+---------------+---------------+-----------------+-----------------
-+--------------+--------------------+
|  Interface  | Port Block Drops | Vlan Discards | ACL/QOS Drops | Policy Discards | EGR Port Unavail

xe1           0                  0               35703           0                 11
 0              35714
xe2           0                  0               295744          0                 13604
 0              309348
xe3           0                  0               9501            0                 20405
 0              29906
xe5           0                  0               0               0                 13602
 0              13602
xe49/1        0                  0               0               0                 0
 20658          20658
xe52/1        0                  3               856029          10                13613
 0              869642
xe54/1        0                  5371            0               0                 5371
 0              5371
cpu           0                  0               0               0                 6
 0              N/A
```

Here is the explanation of the show command output fields.

Table 100. indiscard statistic output details

Statistic	Description
STP Discards	Packets received when the ingress interface is not in STP forwarding state.
Port Block Drops	Packets discarded on an ingress interface where port blocking is configured.
VLAN Discards	VLAN tagged packets received on a port which is not a member of the VLAN or untagged packets received on a trunk port.
ACL/QoS Drops	Incoming packets match a field processing entry with a drop or color drop action, such as: 1. User-configured ACL that denies traffic 2. Service policy with a police action that drops the traffic received at a rate higher than the configured limit
Policy[1] Discards	Device policies violated, such as a storm control rate violation, source or destination discards when L2 tagged traffic received on router interface.
EGR (Egress) Port Unavail	No output port can be determined for this packet. This counter increments along with other counter types in this table because it is a “catchall” for multiple types of discards as shown below: 1. VLAN check failed 2. MTU check failed 3. ACL/QoS drops 4. Policy discards

[1]A set of rules determining which actions are permitted or denied for a specific user role.

Table 100. indiscard statistic output details (continued)

	5. Source MAC is null 6. Destination IP/source IP address is null 7. Source MAC address and destination MAC address are the same 8. Source MAC is configured as static on other interface 9. Forwarding lookup failure
IBP Drops	Ingress Back Pressure (ingress congestion) when the ingress packet buffer is full for an interface.
Total Discards	Total number of ingress dropped packets.

```
#show interface counters outdiscard-stats
+-------------+------------------+---------------+--------------+------------------+----------------
+----------------+--------------------+
|  Interface  | Port Block Drops | Vlan Discards | TTL Discards | Unknown Discards |  UcastQ

                1275156
xe54/1        0                  0               0              13575              0                0
                13575
cpu           0                  0               0              0                  N/A              1
014224          N/A
```

Here is the explanation of the show command output fields.

Table 101. outdiscard statistics

Statistics	Description
Port Block Drops	Packets discarded on an egress interface where port blocking is configured.
VLAN Discards	Packets discarded because an invalid VLAN tag is encountered at an egress interface.
TTL Discards	Packets discarded because the Time-To Live (TTL) of the outgoing packet has passed.
Unknown Discards	Packets discarded for other possible reasons like ACL drop in egress or a policer drop in egress. Discards caused by congestion at queues and drops at queues are not counted under unknown discards.
Unicast Queue Drops	Packets dropped in the unicast queues because of congestion.
Multicast Queue Drops	Packets dropped in the multicast queues because of congestion.
Total Discards	Total number of egress dropped packets.

show interface counters protocol

Use this command to display protocol packets received at the CPU by the control plane.

Command Syntax

```
show interface (IFNAME|) counters protocol
```

Parameters

IFNAME
Interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Note: This command is not available on Qumran platforms.

Example

```
#show interface counters protocol
Interface ce1/1
  lacp                : 4
  icmp6               : 5
```

Here is the explanation of the show command output fields.

Table 102. show interface counters protocol output details

Field	Description
Interface	Name of the configured interface.
lacp	Total number of lacp protocol in the interface.
icmp6	Total number of icmp6 protocol in the interface.

show interface counters queue-drop-stats

Use this command to display dropped packets in the CPU queue and the last increment time.

Command Syntax

```
show interface cpu counters queue-drop-stats
```

Parameters

cpu
CPU interface.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface cpu counters queue-drop-stats
+-------------------+----------------+----------------+---------------------+
|    Queue Name     |     Count      | Last Increment | Last Increment Time |
+-------------------+----------------+----------------+---------------------+
arp                  169735545        9145653          2017 Oct 23 14:33:54
```

Here is the explanation of the show command output fields.

Table 103. show interface counters queue-drop-stats output details

Field	Description
Queue Name	Name of the protocol.
Count	Number of arp protocols in the interface.
Last Increment	Final increment number in the protocol.
Last Increment time	Time of the last increment in the protocol.

show interface counters queue-stats

Use this command to display transmitted and dropped packet and byte counts of individual queues.

Note: In Qumran devices, all packets dropped in a queue are counted (even policer drops).

Command Syntax

```
show interface (IFNAME|) counters queue-stats
show interface cpu counters queue-stats
```

Parameters

IFNAME
Interface name.

cpu
CPU interface.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Note: Default traffic counters are not supported on Qumran AX.

Example

```
#show interface counters queue-stats
D - Default Queue, U - User-defined Queue
+--------+----------------+------+-----------+------------+------------+---------------+
|Interface|Queue/Class-map|Q-Size|Output pkts|Output bytes|Dropped pkts|Dropped bytes  |
+--------+----------------+------+-----------+------------+------------+---------------+
xe1/1     q1           (D) 0      12          1368         0            0
xe1/1     mc-q7        (D) 0      1           82           0            0
xe25      q1           (D) 0      6           684          0            0

#show interface xe1/1 counters queue-stats
D - Default Queue, U - User-defined Queue
+---------------+------+-------+-  -------+------------+--------------+
|Queue/Class-map|Q-Size|Tx pkts| Tx bytes |Dropped pkts|Dropped bytes |
+---------------+------+-------+----------+------------+--------------+
q0            (D) 0     0       0          0            0
q1            (D) 0     12      1368       0            0
q2            (D) 0     0       0          0            0
q3            (D) 0     0       0          0            0
```

```
q4              (D) 0     0       0          0            0
q5              (D) 0     0       0          0            0

arp               (E) 1250496  1008785           68597380            0                 0
```

Here is the explanation of the show command output fields.

Table 104. queue flags detail

Flag	Meaning
D	Default queue of the port.
U	User defined queue of the port.
E	Outgoing hello packet's queue in the port.
I	Incoming hello packet's queue in the port.
Q	Hello packet's queue size in bytes.

Here is the explanation of the show command output fields.

Table 105. show interface counters queue-stats output details

Field	Description
Interface	A defined physical interface to which the queue is associated.
Queue/Class-map	Queues associated with a QoS class-map.
Q-Size	The size of a specified queue in bytes.
Output pkts	The number of out bound packets residing in the queues.
Output Bytes	The number of bytes in the outbound queue.
Dropped pkts	The number of packets dropped because of queue overflow.
Dropped bytes	The number of bytes dropped because of queue overflow.
Tx pkts	The number of transmit packets contained in the out bound queue.
Tx bytes	The number of transmit bytes contained in the out bound queue.

show interface counters rate

Use this command to display the average traffic rate over the load interval of the interface.

Command Syntax

```
show interface (IFNAME|) counters rate (kbps|mbps|gbps|)
show interface cpu counters rate (kbps|mbps|gbps|)
```

Parameters

IFNAME
Interface name.

kbps
Kilobits per second.

mbps
Megabits per second.

gbps
Gigabits per second.

cpu
CPU interface.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface counters rate
+-------------+---------------------------+-------------------------------+
|             |              Rx           |               Tx              |
|  Interface  |---------------------------+-------------------------------|
|             |      bps     |      pps   |      bps      |      pps      |
+-------------+---------------------------+-------------------------------+
 xe1/1         548439552       1008160     544400           1000

#show interface cpu counters rate
Load interval: 30 second
+-------------------+--------------+-------------+--------------+-------------+
|    CPU Queue(%)   |    Rx bps    |    Rx pps   |    Tx bps    |    Tx pps   |
+-------------------+--------------+-------------+--------------+-------------+
 isis          (  0%) -              -             742            0
 arp           (  0%) -              -             6              0
```

Here is the explanation of the show command output fields.

Table 106. show interface counters rate output details

Field	Description
Interface	The particular interface.
RX	Number of hello packets received from the neighbor.
TX	Number hello packets transmitted to the neighbor.
bps	Bytes per second.
pps	Packets per second.
CPU Queue	CPU Queues used for various functions. In the example the CPU is maintaining queues for ARP and the IS-IS routing facilities.
Load interval	The length of time for which data is used to compute load statistics.
RX bps	Number of hello packets received from the neighbor in bytes per second.
RX pps	Number of hello packets received from the neighbor in packets per second.
TX bps	Number hello packets transmitted to the neighbor in bytes per second.
Tx pps	Number hello packets transmitted to the neighbor in packets per second.

show interface counters speed

Use this command to display the current average speed on the interface.

Command Syntax

```
show interface (IFNAME|) counters speed (kbps|mbps|gbps|)
```

Parameters

IFNAME
Interface name.

kbps
Kilobits per second.

mbps
Megabits per second.

gbps
Gigabits per second.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#show interface counters speed
* indicates monitor is active
+------------+--------------+--------------------+-------------------------------------------+
|            |              |     Threshold(%)   |          Current average speed            |
|  interface | configured   +--------------------+-------------+-------+-------------+-------+
|            | speed ( bps) | Warning | Recovery |  Rx ( bps)  |   %   |  Tx ( bps)  |   %   |
+------------+--------------+---------+----------+-------------+-------+-------------+-------+
  ce45        100000000000   90        80         0             0.00    0             0.00
  xe7         10000000000    90        80         0             0.00    0             0.00
  xe31        10000000000    90        80         0             0.00    0             0.00
  xe33        10000000000    90        80         0             0.00    0             0.00
  xe39        10000000000    90        80         0             0.00    0             0.00
  xe40        10000000000    90        80         0             0.00    0             0.00
```

show interface counters summary

Use this command to display the summary of traffic counters on a specific interface or all interfaces.

Note: This command is supported for the out-of-band management (OOB) management interface.

Command Syntax

```
show interface (IFNAME|) counters summary
```

Parameters

IFNAME
Interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1 counters summary
+-----------+------------------------------+------------------------------+
|           |              Rx              |              Tx              |
| Interface |------------------------------+------------------------------|
|           |    packets    |     bytes    |    packets    |     bytes    |

```

```
xe32/3          603759              51208946            620502              68865557
xe32/4          7                   766                 7                   766
```

Here is the explanation of the show command output fields.

Table 107. show interface counters summary output details

Field	Description
Interface	The particular interface.
RX	Number of hello packets received from the neighbor.
TX	Number hello packets transmitted to the neighbor.
bps	Bytes per second.
pps	Packets per second.
RX bps	Number of hello packets received from the neighbor in bytes per second.
RX pps	Number of hello packets received from the neighbor in packets per second.
TX bps	Number hello packets transmitted to the neighbor in bytes per second.
Tx pps	Number hello packets transmitted to the neighbor in packets per second.

show interface fec

Use this command to display the forward error correction (**FEC**[1]) statistics for an interface.

Note: Displays only FEC statistics for physical interfaces, not management or logical interfaces.

Command Syntax

```
show interface (IFNAME|) fec
```

Parameters

IFNAME
Specifies the physical interface name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced before OcNOS version 1.3. Introduced new fields, `bit error`, and `symbol error`; renamed the fields from `Corrected Block Count` and `Uncorrected Block Count` to `Corrected Codeword Count` and `Uncorrected Codeword Count` in the show output display in OcNOS version 6.6.0.

Example

```
OcNOS#show interface fec
+------------------+--------+--------------------+------------------------+-------------------------
-+------------+------------+
|Interface         |Config  |HW Status|Oper Status|Corrected Codeword Count|Uncorrected Codeword
Count|Bit Error   |Symbol Error|
+------------------+--------+--------------------+------------------------+-------------------------
-+------------+------------+
cd1                 auto     RS544_2xN  RS544_
2xN   3916680617              48                          3751187751   3923420622
ce2                 auto     off        off         0                         0
   0            0
ce3                 auto     off        off         0                         0
   0            0

OcNOS#show interface cd1 fec
+------------------+--------+--------------------+------------------------+-------------------------
-+------------+------------+
|Interface         |Config  |HW Status|Oper Status|Corrected Codeword Count|Uncorrected Codeword
Count|Bit Error   |Symbol Error|
+------------------+--------+--------------------+------------------------+-------------------------
-+------------+------------+
```

[1]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

```
 cd1                auto     RS544_2xN  RS544_
2xN   3930398699               48                          3764260805   3937147040
```

Here is the explanation of the show command output fields.

Table 108. show interface fec

Field	Description
Interface	Name of the configured interface.
Config	Configured value
HW Status	FEC currently programmed in hardware (HW).
Oper Status	FEC currently operating over the link.
Corrected Codeword Count	Number of the corrected codeword count.
Uncorrected Codeword Count	Number of the uncorrected codeword count.
Bit Error	Number of individual RX RS-FEC bit errors.
Symbol Error	Number of individual RX RS-FEC symbol errors.

show ip forwarding

Use this command to display the IP forwarding status.

Command Syntax

```
show ip forwarding
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the **`show ip forwarding`** command displaying the IP forwarding status.

```
#show ip forwarding
vrf (management) :IP forwarding is on
vrf (default) :IP forwarding is on
```

The table below explains the fields in the command output.

Table 109. show ip forwarding

Field	Description
vrf (management)	Management **VRF**[1] is for management purposes. IP forwarding packet is on.
vrf (default)	The default VRF uses the default routing context for ip forwarding. IP forwarding packet is on.

[1]Virtual Routing and Forwarding

show ip interface

Use this command to display brief information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

Command Syntax

```
show ip interface brief
show ip interface IFNAME brief
```

Parameters

IFNAME
Interface name.

brief
Brief summary of IP status and configuration.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the **`show ip interface brief`** command:

```
#show ip interface brief

'*' - address is assigned by dhcp client

Interface            IP-Address      Admin-Status          Link-Status
eth0                *10.10.26.101    up                    up
lo                   127.0.0.1       up                    up
lo.management        127.0.0.1       up                    up
xe1/1                10.1.1.1        up                    up
xe1/2                unassigned      down                  down
xe1/3                unassigned      down                  down
xe1/4                unassigned      down                  down
xe2                  unassigned      up                    down
xe3/1                unassigned      up                    up
xe3/2                unassigned      down                  down
xe3/3                unassigned      down                  down
```

Here is the explanation of the show command output fields.

Table 110. show ip interface output details

Field	Description
Interface	Interface name, also specifies interface type (eth0, lo, xe1/1, and xe1/2).
IP-Address	The IP address assigned to the interface. An asterisks indicates that the IP address was provided by **DHCP**[1].
Admin-Status	Interface is up and functioning or down.
Link-Status	Interface is connected and passing traffic.

[1]Dynamic Host Configuration Protocol

show ip prefix-list

Use this command to display the prefix list entries for IPv4 interfaces.

Command Syntax

```
show ip prefix-list
show ip prefix-list WORD
show ip prefix-list WORD seq <1-4294967295>
show ip prefix-list WORD A.B.C.D/M
show ip prefix-list WORD A.B.C.D/M longer
show ip prefix-list WORD A.B.C.D/M first-match
show ip prefix-list summary
show ip prefix-list summary WORD
show ip prefix-list detail
show ip prefix-list detail WORD
```

Parameters

WORD
Name of a prefix list.

A.B.C.D/M
IP prefix <network>/<length> (for example, 35.0.0.0/8).

first-match
First matched prefix.

longer
Lookup longer prefix.

<1-4294967295>
Sequence number.

detail
Detail of prefix lists.

summary
Summary of prefix lists.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the **`show ip prefix-list`** command showing prefix-list entries.

```
#show ip prefix-list
ip prefix-list myPrefixList: 3 entries
```

```
    seq      5 permit 172.1.1.0/16
    seq     10 permit 173.1.1.0/16
    seq     15 permit 174.1.1.0/16
```

show ip route

Use this command to display the IP routing table for a protocol or from a particular table.

When multiple entries are available for the same prefix, NSM uses an internal route selection mechanism based on protocol administrative distance and metric values to choose the best route. All best routes are entered into the FIB and can be viewed using this command. To display all routes (selected and not selected), use the **`show ip route database`** command.

Use this command to see all subnets of a specified network if they are present in the routing table. Use this command with mask information.

Command Syntax

```
show ip route A.B.C.D
show ip route (database|)
show ip route (database|) (bgp|connected|database|isis|fast-
reroute|interface|isis|kernel|mbgp|mstatic|next-hop|ospf|rip|static)
show ip route summary
show ip route vrf WORD (database|)
show ip route vrf WORD (database|) (bgp|connected|isis|kernel|ospf|rip|static)
```

Parameters

A.B.C.D
Network in the IP routing table.

A.B.C.D/M
IP prefix <network>/<length>, for example, 35.0.0.0/8.

bgp
Border Gateway Protocol.

connected
Connected.

database
Routing table database.

fast-reroute
Fast reroute repair paths.

interface
Interface.

isis
IS-IS.

kernel
Kernel.

mbgp
Multiprotocol BGP routes.

mstatic
Multicast static routes.

next-hop
Next hop address.

ospf
Open Shortest Path First.

rip
Routing Information Protocol.

static
Static routes.

summary
Summarize all routes.

WORD
Routes for a Virtual Routing or Forwarding instance.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Display FIB Routes

The following shows output for the best routes.

```
#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area       E - EVPN,
v - vrf leaked
       * - candidate default
```

show ip route A.B.C.D/M longer-prefixes

Use this command to see all subnets of a specified network if they are present in the routing table with mask information.

Command Syntax

```
show ip route A.B.C.D/M longer-prefixes
```

Parameters

A.B.C.D/M
IP prefix

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Example

```
#sh ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
ia - IS-IS inter area, E - EVPN,
v - vrf leaked

    - candidate default

IP Route Table for VRF "default"

```

Header

Each entry in this table has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route and K indicates that the route has been learned from the kernel. The Table 111. route codes and modifiers (page 1732) table shows these codes and modifiers and explain the fields in the command output.

Table 111. route codes and modifiers

Code	Meaning	Description
K	kernel	Routes added through means other than by using the CLI; for example by using the operating system route command. Static routes added using kernel commands and static routes added using OcNOS commands are different. The kernel static routes are not redistributed when you give the **`redistribute static`** command in a protocol. However, the kernel static routes can

Table 111. route codes and modifiers (continued)

Code	Meaning	Description
		be redistributed using the **`redistribute kernel`** command.
C	connected	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from other routing protocols. Routes for connected networks always exist in the kernel routing table but as an exception are not marked as kernel routes because OcNOS always calculates entries for these routes upon learning interface information from the kernel.
S	static	Routes manually configured via CLI which are not updated dynamically by IGPs.
The codes below are for routes received and dynamically learned via IGP neighbors. These networks are not directly connected to this device and were announced by some other device on the network. IGPs update these routes as the network topology changes.		
R	RIP	RIP routing process and enter Router mode.
B	BGP	Route is from an Border Gateway Protocol.
O	OSPF	Modifiers for OSPF: IA - OSPF inter area N1 - OSPF NSSA external type 1 N2 - OSPF NSSA external type 2 E1 - OSPF external type 1 E2 - OSPF external type 2
i	IS-IS	Modifiers for IS-IS: L1 - IS-IS level-1 L2 - IS-IS level-2 ia - IS-IS inter area
Other modifiers:		
v	vrf leaked	The device has two or more VRFs configured and each has at least one interface bound to it. While each **VRF**[1] will have its own routing table, the VRFs can learn each other's routes.
*	candidate default	Route has been added to the FIB. With equal cost paths to a destination, the router does per-packet or per-destination load sharing. An asterisk ("*") means that the route is being used at that instant for forwarding packets. If you run the same **`show ip route x.x.x.x`** command over and over, you might see the * moving between the route entries.
>	selected route	When multiple routes are available for the same prefix, the best route. When multiple entries are available for the same prefix, OcNOS uses an internal route selection mechanism based on protocol administrative distance and metric values to

[1]Virtual Routing and Forwarding

Table 111. route codes and modifiers (continued)

Code	Meaning	Description
		choose the best route. OcNOS populates the FIB with the *best* route to each destination
p	stale info	A route information that is marked stale due to graceful restart.

After the codes, the header has default gateway information:

```
Gateway of last resort is 10.12.4.1 to network 0.0.0.0
```

The “gateway of last resort”, also called the default gateway, is a static route that routes IP address 0.0.0.0 (all destinations) through a single host (the gateway). The effect of setting a gateway is that if no routing table entry exists for a destination address, packets to that address will be forwarded to the gateway router.

Route Entry Fields

The Table 112. route entry output details (page 1734) table explains the each route entry fields.

Table 112. route entry output details

Field	Description
Codes and modifiers	As explained in Table 111. route codes and modifiers (page 1732) table.
IP address	IP address of the remote network.
Administrative distance and metric	The administrative distance determines how trustworthy this route is. If there is a similar route but with a smaller administrative distance, it is used instead, because it is more “trustworthy”. The smaller the administrative distance, the more trustworthy the route. Directly connected routes have an administrative distance of 0, which makes them the most trustworthy type of route.The metric varies from protocol to protocol, and for OSPF the metric is cost, which indicates the best quality path to use to forward packets. Other protocols, like RIP, use hop count as a metric. For neighboring routers, the metric value is 1.
Next hop router IP address	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Outgoing interface name	Interface used to get to the next-hop address for this route.
Duration	Length of time that this route has been present in the routing table. This is also the length of time this route has existed without an update. If the route were removed and then re-added (if the cable was disconnected, for instance), this timer would begin again at 00:00:00.

Route Entry Examples

```
O 10.10.37.0/24 [110/11] via 10.10.31.16, eth2, 00:20:54
```

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via nexthop 10.10.31.16.
- The outgoing local interface for this route is eth2.
- This route was added 20 minutes and 54 seconds ago.

```
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, eth2, 00:18:56
```

- This route is the same as the other OSPF route above; the only difference is that it is a Type 2 External OSPF route.

```
C 10.10.31.0/24 is directly connected, eth2
```

- This route is directly connected.
- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface eth2.

```
K 10.10.0.0/24 via 10.30.0.11, eth0
```

- This route in the network 10.10.0.0/24 was learned from the kernel routing table (route was statically added using kernel commands).
- This route is reachable via nexthop 10.30.0.11.
- The outgoing local interface for this route is eth0.

```
K* 0.0.0.0/0 via 10.30.0.11, eth0
```

- This is a default route that was learned from the kernel (route was statically added using kernel commands).
- This route is reachable via nexthop 10.30.0.11.
- The local interface for this route is eth0.

Display OSPF Routes

The following is the output with the **`ospf`** parameter:

```
#show ip route ospf
O       1.1.1.0/24 [110/20] via 2.2.2.1, eth2, 00:00:44
O IA    4.4.4.0/24 [110/21] via 2.2.2.1, eth2, 00:00:44
```

Display Route Summary

The following is the output with the **`summary`** parameter.

```
#show ip route summary
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
kernel          1
connected       5
ospf            2
Total           8
FIB             2
```

Display RIB Routes

The following shows displaying database routes.

```
#show ip route database
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       > - selected route, * - FIB route, p - stale info

K    *> 0.0.0.0/0 via 10.30.0.11, eth0
O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, eth2, 00:19:21
K    *> 10.10.0.0/24 via 10.30.0.11, eth0
O       10.10.31.0/24 [110/1] is directly connected, eth2, 00:28:20
C    *> 10.10.31.0/24 is directly connected, eth2
```

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, eth2
O       10.10.34.0/24 [110/31] via 10.10.31.16, eth2, 00:21:19
O    *> 10.10.37.0/24 [110/11] via 10.10.31.16, eth2, 00:21:19
K    *  10.30.0.0/24 is directly connected, eth0
C    *> 10.30.0.0/24 is directly connected, eth0
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, eth2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16, eth2, 00:19:21
O       16.16.16.16/32 [110/11] via 10.10.31.16, eth2, 00:21:19
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, eth2
O    *> 17.17.17.17/32 [110/31] via 10.10.31.16, eth2, 00:21:19
C    *> 45.45.45.45/32 is directly connected, lo
O    *> 55.55.55.55/32 [110/21] via 10.10.31.16, eth2, 00:21:19
K    *  127.0.0.0/8 is directly connected, lo
C    *> 127.0.0.0/8 is directly connected, lo
```

The codes and modifier at the start of each route entry are explained in Table 111. route codes and modifiers (page 1732) table.

Routes in the FIB are marked with a *****. When multiple routes are available for the same prefix, the best route is indicated with the **>** symbol. Unselected routes have neither the ***** nor the **>** symbol.

Route Database Entry Examples

This example shows 2 entries in the route database; one learned from the kernel and the other derived from interface information.

```
K * 10.30.0.0/24 is directly connected, eth0
```

```
C *> 10.30.0.0/24 is directly connected, eth0
```

- Both these routes are in the same network 10.30.0.0/24.
- The first route has originated from the kernel. The ***** indicates that it has been added to the FIB.
- The second route is derived from the IP address of local interface eth0. It is marked as a connected route. Since a connected route has the lowest administrative distance, it is the selected route.

```
S *> 10.10.34.0/24 [1/0] via 10.10.31.16, eth2
```

```
O 10.10.34.0/24 [110/31] via 10.10.31.16, eth2, 00:21:19
```

- The same prefix was learned from OSPF and from static route configuration.
- Static routes are preferred over OSPF routes, so the static route is selected and installed in the FIB.

Note: If the static route becomes unavailable, OcNOS automatically selects the OSPF route and installs it in the FIB.

Display VRF Routes

The following is the output with the **`vrf`** parameter:

```
#show ip route vrf vrf31
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
ia - IS-IS inter area, E - EVPN,
v - vrf leaked
* - candidate default

IP Route Table for VRF "vrf31"
O           2.2.2.2/32 [110/2] via 21.1.1.2, vlan1.4, 00:01:29
O           10.1.1.0/24 [110/2] via 21.1.1.2, vlan1.4, 00:01:29
```

```
O            20.1.1.0/24 [110/2] via 21.1.1.2, vlan1.4, 00:01:29
C            21.1.1.0/24 is directly connected, vlan1.4, 00:02:54
C            31.31.1.1/32 is directly connected, lo.vrf31, 00:03:02
O            40.40.1.1/32 [110/3] via 21.1.1.2, vlan1.4, 00:00:43
C            127.0.0.0/8 is directly connected, lo.vrf31, 00:03:05

Gateway of last resort is not set
```

The following is the output with the **`vrf database`** parameter:

```
#show ip route vrf vrf31 database
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
ia - IS-IS inter area, E - EVPN,
v - vrf leaked
> - selected route, * - FIB route, p - stale info

C    *>  127.0.0.0/8 is directly connected, lo.vrf31, 00:03:08

Gateway of last resort is not set
```

show ip vrf

This command displays routing information about VRFs.

Command Syntax

```
show ip vrf
show ip vrf WORD
```

Parameters

WORD
Virtual Routing and Forwarding name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip forwarding
 vrf (management) :IP forwarding is on
 vrf (default) :IP forwarding is on
```

show ipv6 forwarding

Use this command to display the IPv6 forwarding status.

Command Syntax

```
show ipv6 forwarding
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the **`show ipv6 forwarding`** command displaying the IPv6 forwarding status.

```
#show ipv6 forwarding
 vrf (management) :IPv6 forwarding is on
 vrf (default) :IPv6 forwarding is on
```

show ipv6 interface brief

Use this command to display information about interfaces. To display information about a specific interface, include the interface name.

Command Syntax

```
show ipv6 interface brief
show ipv6 interface IFNAME brief
```

Parameters

IFNAME
Name of the interface.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 interface brief
Interface           IPv6-Address                Admin-Status
lo                  ::1                         [up/up]

gre0                unassigned                  [admin down/down]

eth3                3ffe:abcd:104::1            [up/up]
                    3ffe:abcd:103::1
                    fe80::2e0:29ff:fe6f:cf0

eth1                fe80::260:97ff:fe20:f257    [up/up]

eth2                unassigned                  [admin down/down]

eth3                unassigned                  [admin down/down]

sit0                unassigned                  [admin down/down]

tun24               unassigned                  [admin down/down]

tunl0               unassigned                  [admin down/down]
```

The table below explains the each interface brief entry.

Table 113. show interface brief output details

Field	Description
Interface	Name of the interface.
IPv6-Address	IPv6 address. An asterisk (“*”) means the address was assigned by the DHCPv6 client.
Admin-Status	Status of the interface: The first part of the field indicates if the interface is up. The second part indicates if the interface is running.

show ipv6 route

Use this command to display the IP routing table for a protocol or from a particular table, including database entries known by NSM. When multiple entries are available for the same prefix, NSM uses an internal route selection mechanism based on protocol administrative distance and metric values to choose the best route. The best routes in the FIB can be viewed using **`show ipv6 route`**.

Command Syntax

```
show ipv6 route vrf WORD (database|)
show ipv6 route vrf WORD (database|) (bgp|connected|isis|kernel|ospf|rip|static)
show ipv6 route (database)
show ipv6 route (database) (bgp|connected|isis|kernel|ospf|rip|static)
show ipv6 route X:X::X:X
show ipv6 route X:X::X:X/M
show ipv6 route summary
```

Parameters

X:X::X:X
Network in the IP routing table.

X:X::X:X/M
Prefix <network>/<length>, e.g., 35.0.0.0/8

all
All IPv6 routes

bgp
Border Gateway Protocol.

connected
Connected.

database
IPv6 routing table database.

isis
IS-IS.

IFNAME
Interface name

kernel
Kernel.

ospf
Open Shortest Path First.

rip
Routing Information Protocol.

static
Static routes.

summary
Summarize all routes

WORD
Routes from a Virtual Routing and Forwarding instance

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

See Table 111. route codes and modifiers (page 1732) and Table 112. route entry output details (page 1734) tables for an explanation of the codes and fields in the output.

```
#show ipv6 route
Codes: K - kernel route, C - connected, S - static, R - RIPng, O - OSPFv3,
       I - IS-IS, B - BGP, > - selected route, * - FIB route, p - stale info.
C> * ::1/128 is directly connected, lo
C> * 3ffe:1::/48 is directly connected, eth1
C> * 3ffe:2:2::/48 is directly connected, eth2
```

show ipv6 prefix-list

Use this command to display the prefix list entries for IPv6 interfaces.

Command Syntax

```
show ipv6 prefix-list
show ipv6 prefix-list WORD
show ipv6 prefix-list WORD seq <1-4294967295>
show ipv6 prefix-list WORD X:X::X:X/M
show ipv6 prefix-list WORD X:X::X:X/M longer
show ipv6 prefix-list WORD X:X::X:X/M first-match
show ipv6 prefix-list summary
show ipv6 prefix-list summary WORD
show ipv6 prefix-list detail
show ipv6 prefix-list detail WORD
```

Parameters

WORD
Name of prefix list.

X:X::X:X/M
IP prefix <network>/<length> (for example, 35.0.0.0/8).

first-match
First matched prefix.

longer
Look up longer prefix.

<1-4294967295>
Sequence number of an entry.

detail
Detail of prefix lists.

summary
Summary of prefix lists.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the **`show ip prefix-list`** command showing prefix-list entries.

```
#show ip prefix-list
ip prefix-list myPrefixList: 3 entries
```

```
    seq      5 permit 172.1.1.0/16
    seq     10 permit 173.1.1.0/16
    seq     15 permit 174.1.1.0/16
```

show hosts

Use this command to display the IP domain-name, lookup style and any name server.

Command Syntax

```
show hosts
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show hosts
       VRF: management
DNS lookup is enabled
 Default domain      : .com
 Additional Domain   : .in .ac
 Name Servers        : 10.12.3.23
Host                                                                Address
----                                                                -------
test                                                                10.12.12.67
test                                                                10::23
 * - Values assigned by DHCP Client.
```

Here is the explanation of the show command output fields.

Table 114. show hosts fields

Entry	Description
VRF[1]: management	DNS configuration of specified VRF
DNS lookup is enabled	DNS feature enabled or disabled
Default domain	Default domain name used to complete unqualified host names (names without a dotted decimal domain name).
Additional Domain	A list of default domain names used to complete unqualified host names. Each domain in the list is to be tried in turn.

[1]Virtual Routing and Forwarding

Table 114. show hosts fields (continued)

Entry	Description
Name Servers	DNS server addresses that are used to translate hostnames to IP addresses.
Host Address test 10.12.12.67 test 10::23	Static hostname-to-address mappings in DNS.
* - Values assigned by **DHCP**[1] Client.	* in name-server indicates it has been learned dynamically.

[1]Dynamic Host Configuration Protocol

show running-config interface

Use this command to show the running system status and configuration for a specified interface, or a specified interface for a specified protocol.

Command Syntax

```
show running-config interface IFNAME
show running-config interface IFNAME bridge
show running-config interface IFNAME ip igmp
show running-config interface IFNAME ip multicast
show running-config interface IFNAME ip pim
show running-config interface IFNAME ipv6 ospf
show running-config interface IFNAME ipv6 rip
show running-config interface IFNAME ipv6 pim
show running-config interface IFNAME isis
show running-config interface IFNAME lacp
show running-config interface IFNAME mstp
show running-config interface IFNAME ospf
show running-config interface IFNAME ptp
show running-config interface IFNAME rip
show running-config interface IFNAME rstp
show running-config interface IFNAME stp
show running-config interface IFNAME synce
```

```
show running-config interface IFNAME ldp
show running-config interface IFNAME mpls
show running-config interface IFNAME rsvp
```

Parameter

bridge
Bridge.

ip
IPv4 (see also show running-config interface ip (page 1750)).

ipv6
IPv6 (see also show running-config interface ipv6 (page 1751)).

isis
Intermediate System to Intermediate System.

lacp
Link Aggregation Control Protocol.

ldp
Label Distribution Protocol.

mpls
Multi-Protocol Label Switching.

mstp
Multiple Spanning Tree Protocol.

ospf
Open Shortest Path First.

ptp
Precision Time Protocol.

rip
Routing Information Protocol.

rstp
Rapid Spanning Tree Protocol.

rsvp
Resource Reservation Protocol.

stp
Spanning Tree Protocol.

synce
Synchronous Ethernet.

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 bridge
!
interface eth1
 switchport
 bridge-group 1
 switchport mode access
 user-priority 3
 traffic-class-table user-priority 2 num-traffic-classes 3 value 3 traffic-class-table user-priority
7 num-traffic-classes 1 value 2 traffic-class-table user-priority 7 num-traffic-classes 2 value 0
traffic-class-table user-priority 7 num-traffic-classes 3 value 0 traffic-class-table user-priority 7
num-traffic-classes 4 value 0 traffic-class-table user-priority 7 num-traffic-classes 5 value 0
traffic-class-table user-priority 7 num-traffic-classes 6
```

show running-config interface ip

Use this command to show the running system status and configuration for a specified IP.

Command Syntax

```
show running-config interface IFNAME ip (igmp|multicast|pim|)
```

Parameters

IFNAME
Interface name.

igmp
Internet Group Management Protocol.

multicast
Multicast.

pim
Protocol Independent Multicast.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 ip igmp
!
interface eth1
 switchport
```

show running-config interface ipv6

Use this command to show the running system status and configuration for a specified IPv6 protocol.

Command Syntax

```
show running-config interface IFNAME ipv6 (mld|multicast|ospf|pim|rip|)
```

Parameters

IFNAME
Interface name.

mld
Multicast Listener Discovery

multicast
Multicast

ospf
Open Shortest Path First

pim
Protocol Independent Multicast

rip
Routing Information Protocol

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 ipv6 rip
!
interface eth1
 switchport
```

show running-config ip

Use this command to show the running system of IP configurations.

Command Syntax

```
show running-config ip (dhcp|mroute|route)
```

Parameters

dhcp
Dynamic Host Configuration Protocol.

mroute
Static IP multicast route.

route
Static IP route.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config ip route
!
ip route 3.3.3.3/32 eth3
ip route 3.3.3.3/32 eth2
ip route 200.0.0.0/16 lo
!
```

show running-config ipv6

Use this command to show the running system status and configuration for IPv6.

Command Syntax

```
show running-config ipv6 (access-list|mroute|neighbor|prefix-list|route|)
```

Parameters

access-list
Access list.

mroute
Static IPv6 Multicast route.

neighbor
Static IPv6 neighbor entry.

prefix-list
IPv6 prefix-list.

route
Static IPv6 route.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config ipv6 access-list
!
ipv6 access-list abc permit any
!
#show running-config ipv6 prefix-list
!
ipv6 prefix-list sde
 seq 5 permit any
!
#show running-config ipv6 route
!
ipv6 route 3e11::/64 lo
ipv6 route 3e11::/64 eth2
ipv6 route fe80::/64 eth2
!
```

show running-config prefix-list

Use this command to display the running system status and configuration details for prefix lists.

Command Syntax

```
show running-config prefix-list
```

Parameters

None

Default

None

Command Mode

Privileged execution mode, Configure mode, Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
(config)#show running-config prefix-list
!
ip prefix-list abc
 seq 5 permit any
!
ip prefix-list as
 description annai
!
ip prefix-list wer
 seq 45 permit any
!
(config)#
```

shutdown

Use this command to shut down an interface.

Use the **no** form of this command to bring up an interface.

Command Syntax

```
shutdown
no shutdown
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the use of the **shutdown** command to shut down the interface called **eth3**.

```
#configure terminal
(config)#interface eth3
(config-if)#shutdown
```

speed

Use this command to set the link speed of the interface.

Use the **no** parameter to reset the speed to its default value.

- On copper ports, auto-negotiation is enabled by default. Limited auto-negotiation is also supported, allowing users to advertise a specific speed for an interface. For example, user can configure an interface to auto-negotiate only with a 100m peer.
- On fiber optic ports, auto-negotiation is disabled by default. Auto-negotiation is not supported on fiber optic medium or AOC for speeds 10g and beyond. IP Infusion Inc.does not recommend using auto speed on such transceivers. For DAC cables, both force and auto-negotiation are supported.
- IP Infusion Inc. recommends configuring the same speed mode on both peers.
- When user configure an interface with the speed auto option, the negotiated parameters are speed, duplex (page 1657), flowcontrol (page 1660), and fec (page 1658), each configured separately. Refer to the respective command for details.

Notes:

- For 10g DAC or AOC, setting speed auto negotiates with a maximum of 1G.
- Interface speed setting is only supported on physical front-panel ports and not supported on Management interface **eth0.**
- Configuring or unconfiguring speed will reset **FEC**[1] to auto mode.

The Table 115. Recommendations (page 1756) shows the IP Infusion Inc. recommendations for front-panel port speed and transceivers.

Table 115. Recommendations

Supported/Recommended	Explanation
Not Supported	When the front panel port capability is less than the transceiver's capability, the behavior is undefined.
Not Recommended	When the transceiver's capability matches the front panel port capability, reducing the speed is not recommended.
Recommended	When the transceiver's capability is less than the front panel port capability, the behavior is undefined, and the link might still come up. Set the speed to match the transceiver's capability.

The table below shows examples of front-panel configurations:

[1]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

Table 116. Front-panel configurations

Front Panel Port	Explanation
Front Panel Port 100g	Use the **speed 40g** command with 40g transceivers. IP Infusion Inc. does not recommend to use 40g on 100g speed transceivers.
Front Panel Port 40g	Do not use 100g transceivers.
Front Panel Port 25g	Use the **port-group** command to reduce the speed to 10g when using 10g transceivers. IP Infusion Inc. does not recommend to use 10g on 25g speed transceivers. Set the speed to 1g when using 1g transceivers. Below 25g, port speed can vary (10g or 1g) for ports within the same port group, e.g., one port can have 1g while the remaining have 10g. However, one port at 25g and the rest at 10g is not allowed. Using the **no speed** command at the interface level tries to set the speed to 25g for one port in the **port-group** while others may be at 10g or 1g, which is not allowed. Use the **no port-group** command in such cases.
Front Panel Port 10g	Do not use 25g transceivers. Set the speed to 1g when using 1g transceivers.
Front Panel Port 1g	Do not use 10g or 25g transceivers..

Command Syntax

```
speed (10m | 100m | 1g | 2.5g | 10g | 20g | 25g | 40g | 50g | 100g | auto (10m | 100m | 1g) )
no speed
```

Parameters

10m
Set the speed to 10 megabits per second.

100m
Set the speed to 100 megabits per second.

1g
Set the speed to 1 gigabit per second.

2.5g
Set the speed to 2.5 gigabits per second.

10g
Set the speed to 10 gigabits per second.

20g
Set the speed to 20 gigabits per second.

25g
Set the speed to 25 gigabits per second.

40g
Set the speed to 40 gigabits per second.

50g
Set the speed to 50 gigabits per second.

100g
Set the speed to 100 gigabits per second.

auto 10m
Auto negotiate only with a 10Mb peer

auto 100m
Auto negotiate only with a 100Mb peer

auto 1g
Auto negotiate only with a 1g peer

Default

None

Command Mode

Interface mode

Applicability

Introduced before OcNOS version 1.3 and added parameters **`auto 10m, auto 100m, and auto 1g`** in the OcNOS version 6.4.2.

Example

Enable auto-negotiation:

```
#configure terminal
(config)#interface xe0
(config-if)#speed auto 10m
```

switchport

Use this command to set the mode of an interface to switched.

All interfaces are configured **routed** by default. To change the behavior of an interface from switched to routed, you must explicitly give the **noswitchport** command.

Note: When you change the mode of an interface from switched to routed and vice-versa, all configurations for that interface are erased.

User should be prompted for confirmation, while executing **switchport/no switchport** command. To support this requirement, please refer the command **enable/disable confirmation-dialog.**

Use the **no** form of this command to set the mode to routed.

Command Syntax

```
switchport
no switchport
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport

(config)#interface eth0
(config-if)#no switchport

#configure terminal
(config)#enable confirmation-dialog
(config)#interface xe5
(config-if)#switchport
Are you sure? (y/n): y
(config-if)#
(config-if)#exit

(config)#disable confirmation-dialog
```

```
(config)#interface xe5
(config-if)#switchport
(config-if)#
```

switchport allowed ethertype

Use this command to indicate which types of traffic will be allowed on the switchport.

Note: A maximum of 5 Ethertype values can be assigned on an interface.

Command Syntax

```
switchport allowed ethertype {arp|ipv4|ipv6|ETHTYPE|log}
```

```
switchport allowed ethertype mpls
```

Parameters

arp
ARP traffic

ipv4
IPv4 traffic

ipv6
IPv6 traffic

mpls
MPLS traffic

ETHTYPE
Traffic of any Ethertype value (0x600 - 0xFFFF).

log
Log unwanted ethertype packets.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Note: This command is not available on Qumran platforms.

Example

```
(config)#interface xe32/1
(config-if)#switchport
(config-if)#switchport allowed ethertype ipv4
(config-if)#switchport allowed ethertype 0x800
```

switchport protected

Use this command to enable or disable the protected port feature on an interface.

Command Syntax

```
switchport protected (community | isolated | promiscuous)
no switchport protected
```

Parameters

community
Community mode

isolated
Isolated mode type

promiscuous
Protected mode type

Default

Promiscuous

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0. The **`community`** mode is not supported in Qumran2 (Q2) series platforms (J2C PLUS, Q2A, Q2C, Q2U).

Example

```
#configure terminal
(config)#interface xe1
(config-if)#switchport protected isolated
(config-if)#no switchport protected

(config)#interface po1
(config-if)#switchport protected promiscuous
(config-if)#no switchport protected
```

transceiver

Use this command to set the type of Small Form-factor Pluggable (SFP) transceiver inserted in the physical port.

Use the **no** form of this command to remove the setting.

Command Syntax

```
transceiver (1000base-sx|1000base-lx|1000base-ex|1000base-cx|10gbase-sr|10gbase-lr|10gbase-
er|10gbase-cr|25gbase-sr|25gbase-lr|25gbase-er|25gbase-cr|40gbase-sr4|40gbase-lr4|40gbase-
er4|40gbase-cr4|100gbase-sr4|100gbase-lr4|100gbase-er4|100gbase-cr4)
no transceiver
```

Parameters

1000base-cx
SFP 1000base-cx

1000base-ex
SFP 1000base-ex

1000base-lx
SFP 1000base-lx

1000base-sx
SFP 1000base-sx

100gbase-cr4
QSFP28 100gbase-cr4

100gbase-er4
QSFP28 100gbase-er4

100gbase-lr4
QSFP28 100gbase-lr4

100gbase-sr4
QSFP28 100gbase-sr4

10gbase-cr
SFP+ 10gbase-cr

10gbase-er
SFP+ 10gbase-er

10gbase-lr
SFP+ 10gbase-lr

10gbase-sr
SFP+ 10gbase-sr

25gbase-cr
SFP+ 25gbase-cr

25gbase-er
SFP+ 25gbase-er

25gbase-lr
SFP+ 25gbase-lr

25gbase-sr
SFP+ 25gbase-sr

40gbase-cr4
QSFP 40gbase-cr4

40gbase-er4
QSFP 40gbase-er4

40gbase-lr4
QSFP 40gbase-lr4

40gbase-sr4
QSFP 40gbase-sr4

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
(config)#interface ce1/1
(config-if)#transceiver 40gbase-lr4
```

tx cdr-bypass

Use this command to by-pass the transmitter Clock Data Recovery (CDR) on transceivers which supports CDR control and operating at lower speeds than maximum operating speed.

Use the **no** form of this command to disable CDR by-pass.

Command Syntax

```
tx cdr-bypass
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.5.2.

Examples

```
#configure terminal
(config)#interface ce1
(config-if)#tx cdr-bypass
 Bypass the TX CDR control

(config)#interface ce1
(config-if)#no tx cdr-bypass
```

rx cdr-bypass

Use this command to by-pass the receiver Clock Data Recovery (CDR) on transceivers which supports CDR control and operating at lower speeds than maximum operating speed.

Use the no form of this command to disable CDR by-pass

Command Syntax

```
rx cdr-bypass
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.5.2.

Examples

```
#configure terminal
(config)#interface ce1
(config-if)#rx cdr-bypass
 Bypass the RX CDR control
(config)#interface ce1
(config-if)#no rx cdr-bypass
```

Time Range Commands

This chapter describes the commands used to create and manage time range objects which are used to add a timing boundary for specified activities. The activity starts, ends, and repeats at the specific times that you set.

end-time (absolute)

Use this command to set the end time for the time range to an absolute time.

Command Syntax

```
end-time HH:MM <1-31> (january | february | march | april | may | june | july | august | september |
october | november | december) <1995-2035>
```

Parameters

HH:MM
End time hour and minutes

<1-31>
Day of the month

april
Month of April

august
Month of August

december
Month of December

february
Month of February

january
Month of January

july
Month of July

june
Month of June

march
Month of March

may
Month of May

november
Month of November

october
Month of October

september
Month of September

<1995-2035>
Year

Default

None

Command Mode

Time range mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#time-range TIMER1
(config-tr)#end-time 10:10 20 february 2021
```

end-time after (relative)

Use this command to set the end time for the time range to a relative time in minutes, from the configured start time.

Command Syntax

```
end-time after <1-129600>
```

Parameters

<1-129600>
Number of minutes from the start time

Default

None

Command Mode

Time range mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#time-range TIMER1
(config-tr)#end-time after 100
```

frequency

Use this command to set the frequency for the time range.

Command Syntax

```
frequency (daily|hourly|weekly)
```

Parameters

daily
Daily frequency

hourly
Hourly frequency

weekly
Weekly frequency

Default

None

Command Mode

Time range mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#time-range TIMER1
(config-tr)#frequency hourly
```

frequency days (specific days)

Use this command to set the frequency for the time range to specific days of the week.

Command Syntax

```
frequency days WORD
```

Parameters

WORD
Colon-separated list of 3-letter days of the week for the days on which the range is repeated. For example: **mon:tue:wed:thu:fri:sat:sun**

Default

None

Command Mode

Time range mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#time-range TIMER1
(config-tr)#frequency days mon:wed:fri
(config)#exit
(config)#time-range TIMER2
(config-tr)#frequency days mon:tue:wed:thu:fri:sat:sun
```

start-time (absolute)

Use this command to set the start time for the time range to an absolute time.

Command Syntax

```
start-time HH:MM <1-31> (january | february | march | april | may | june | july | august | september
| october | november | december) <1995-2035>
```

Parameters

HH:MM
End time hour and minutes

<1-31>
Day of the month

april
Month of April

august
Month of August

december
Month of December

february
Month of February

january
Month of January

july
Month of July

june
Month of June

march
Month of March

may
Month of May

november
Month of November

october
Month of October

september
Month of September

<1995-2035>
Year

Default

None

Command Mode

Time range mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#time-range TIMER1
(config-tr)#start-time 09:09 20 february 2021
```

start-time after (relative)

Use this command to set the start time for the time range to a relative time in minutes, from the current time.

Command Syntax

```
start-time after <1-129600>
```

Parameters

<1-129600>
Number of minutes from the current time

Default

None

Command Mode

Time range mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#time-range TIMER1
(config-tr)#start-time after 100
```

start-time now (current)

Use this command to set the start time for the time range to the current system time.

Command Syntax

```
start-time now
```

Parameters

None

Default

None

Command Mode

Time range mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
(config)#time-range TIMER1
(config-tr)#start-time now
```

time-range

Use this command to create a time range and go into the time range mode to configure the time range. If the time range already exists, then it will be edited.

Use the **no** form of this command to remove a time range object.

Command Syntax

```
time-range NAME
no time-range NAME
```

Parameters

NAME
Name of the time range.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)# time-range TIMER1
```

System Configure Mode Commands

This chapter provides a reference for the system configure mode commands.

delay-profile interfaces

Use this command to go into the delay-profile mode to edit the parameters of the "interfaces" profile. In this mode, the user is able to edit the delay measurement profile parameters.

Command Syntax

```
delay-profile interfaces
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.1.

Examples

```
#configure terminal
(config)#delay-profile interfaces
(config-dp-intf)#
```

delay-profile interfaces subcommands

The following commands are to edit the delay-profile parameters.

Note: According to IGP-TE RFC8570 and RFC7471, the advertised delay should be unidirectional. So when the mode is set to two-way, the advertised delay is “Average_RTT_delay / 2” and when the mode is set to one-way, the advertised delay is “Average_FWD_delay”. The default value is “two-way”.

Command Syntax

```
mode <two-way>|<one-way>
burst-interval <1000-15000>
burst-count <1-5>
interval < 30-3600>
sender-port <1025-65535>
advertisement periodic
advertisement periodic threshold <1-100>
advertisement periodic minimum-change <0-10000>
no advertisement periodic
advertisement accelerated
advertisement accelerated threshold <1-100>
advertisement accelerated minimum-change <0-10000>
no advertisement accelerated
```

Parameters

`one-way`	The one-way value sets the mode to one-way measurement.
`two-way`	The two-way value sets the mode to two-way measurement.
`<1000-15000>`	Set the burst interval in milliseconds. The default value is 3000 milliseconds and the range is 1000-15000 milliseconds
`<1-5>`	Set the number of packets to be sent at each burst interval. The default value is 1 and the range is 1-5
`<30-3600>`	Set the computation interval in seconds. The default computation interval is 30 seconds. The range is 30-3600 seconds. This will be used also as the periodic advertisement interval.
`<1-100>`	Set the advertisement threshold percentage in the range of 1-100 (for periodic, default=10% and for accelerated, default=20%
`<1025-65535>`	Set the TWAMP sender port value in the range 1025-65535. If not specified, the default value is 862)
<0-10000>	Set the advertisement minimum change in microseconds in the range 0-10000 (for periodic, default=1000 and for accelerated, default=2000)

Command Mode

Delay profile interface mode

Default

The default mode value is “two-way”.

Applicability

This command was introduced in OcNOS version 5.1.

Examples

```
#configure terminal
(config)#delay-profile interfaces
(config-dp-intf)#mode two-way
(config-dp-intf)#burst-count 5
(config-dp-intf)#burst-interval 3000
(config-dp-intf)#interval 30
(config-dp-int)#sender-port 862
(config-dp-intf)#advertisement periodic threshold 10
(config-dp-intf)#advertisement periodic minimum-change 1000
(config-dp-intf)#advertisement accelerated
(config-dp-intf)#advertisement accelerated threshold 20
(config-dp-intf)#advertisement accelerated minimum-change 2000
(config-dp-intf)#no advertisement periodic
(config-dp-intf)#commit
(config-dp-intf)#exit
(config)#
```

evpn mpls irb

Use this command to enable EVPN MPLS IRB (Integrated Routing & Bridging) feature.

Command Syntax

```
evpn mpls irb
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 6.0.0

Examples

```
(config)#evpn mpls irb
```

The following table list the qualifiers for TCAM group.

Table 117. TCAM Group

Group	Qualifiers
evpn-irb	L4 Ports Destination Port Source IP Destination IP Source/Destination MAC1/MAC2 Ethertype

forwarding profile

Use this command to configure different forwarding profiles in hardware.

Note: To apply profile configuration changes in the hardware, you must save the configuration and reboot, except when modifying the default profile.

Use show forwarding profile limit (page 1819) to verify the configured profile.

Use the no form of this command to set the forwarding profile to default.

Command Syntax

```
forwarding profile (kaps (profile-one | profile-two)) | (elk-tcam (profile-one | profile-two |
profile-three | custom-profile))
no forwarding profile (kaps) | (elk-tcam (custom-profile))
```

Parameter

For details about these profiles, see show forwarding profile limit.

kaps
Internal KBP routing table

profile-one
KAPS profile one

profile-two
KAPS profile two

elk-tcam
External TCAM routing table

profile-one
external TCAM profile one

profile-two
external TCAM profile two

profile-three
external TCAM profile three

custom-profile
external TCAM custom profile

< 10-90>
percent of ipv4 routes

< 10-90>
percent of ipv6 routes

Default

The default forwarding profile are as below

Table 118. Default forwarding profile

Is ELK-TCAM present	KAPS	ELK-TCAM
Yes	profile-two	profile-one
No	profile-one	N/A

1. elk-tcam profiles are supported only on hardware models which have external TCAM for routing.
2. forwarding profile-three is applicable on hardware model Agema AGC7648A.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version SP 1.0. The **no** version of the command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
(config)# forwarding profile elk-tcam profile-one
(config)# no forwarding profile elk-tcam
```

hardware-profile filter (Qumran 1)

Use this command to enable or disable ingress IPv4 or IPv6, egress IPv6 filter groups, EVPN-MPLS,VxLAN filter and TWAMP IPv4 or IPv6 groups. Disabling filter groups increases the configurable filter entries.

Disabling a TCAM filter group is not allowed if the group has any entries configured in hardware. Group dependent entries must be explicitly removed before disabling the TCAM group.

Notes:

- This feature is supported for IPv4 unicast and IPv4 BGP/MPLS VPN service based on RFC 8955.
- The **qos**, **qos-ext**, and **qos-policer** filter groups can only be used for Layer 2 and IPv4 traffic. For IPv6 traffic QoS classification and actions, users must enable the **ingress-ipv6-qos** group and create an IPv6 ACL which can be matched in a class-map for applying QoS actions. For more details, refer to the *Quality of Service Guide*.
- Usually the number of extended ingress filter groups that can be created at the same time is 3. If the PIM bidirectional feature is enabled, only 2 ingress extended filter groups can be created.
- The **ipv4-ext** and **qos-policer grp** parameters are not supported together.
- For better utilization of TCAM resources, it is recommended to enable the large groups first and then smaller groups. For example, Using **admin** credentials, configure **evpn-mpls-mh** as last filter as it is the smallest group.
- In Qumran1 (Q1) series platforms, Egress ACLs are not applicable for packets sent from the CPU.
- Disable and Enable the hardware-profile filter command in a single commit is not recommended.

Example:

```
OcNOS(config)#hardware-profile filter ingress-ipv4 disable
OcNOS(config)#hardware-profile filter ingress-ipv4-ext enable
OcNOS(config)#commit
```

- Configuring and unconfiguring access-list to the interface in a single commit is not recommended.

Example:

```
OcNOS(config)#interface xe8
OcNOS(config-if)#no ip access-group ACL1v4 out
OcNOS(config-if)#exit
OcNOS(config)#interface xe3
OcNOS(config-if)#ip access-group ACL2v4 out
OcNOS(config-if)#commit
```

Example 1

```
(config)#hardware-profile filter ingress-ipv4-ext enable
```

```
(config)#hardware-profile filter ingress-ipv6 enable
(config)#hardware-profile filter qos-ext enable
(config)#hardware-profile filter ingress-l2 enable
      (config)#hardware-profile filter evpn-mpls-mh enable
```

Example 2

```
(config)#hardware-profile filter ingress-ipv4-qos enable
(config)#hardware-profile filter ipv4-bgp-flowspec enable
(config)#hardware-profile filter ingress-l2 enable
      (config)#hardware-profile filter vxlan enable
      (config)#hardware-profile filter vxlan-mh enable
```

Example 3

```
(config)#hardware-profile filter qos-ext enable
(config)#hardware-profile filter egress-ipv4 enable
(config)#hardware-profile filter ipv4-bgp-flowspec enable
(config)#hardware-profile filter ingress-ipv4 enable
(config)#hardware-profile filter ingress-ipv4 enable
```

The **`twamp-ipv4`** hardware profile sets up a PMF group to manage TWAMP IPv4 traffic, enabling precise hardware time stamping of TWAMP packets. These packets are identified by their source IP, destination IP, source **UDP**[1] port, and destination UDP port. When a packet is recognized as a TWAMP packet, the **`bcmFieldActionOam`** action is applied, directing the packet to the OAMP module for time stamping. Additionally, the **`bcmFieldActionForward`** action is used to ensure the packet is encapsulated with the correct **FEC**[2]. If the packet includes MPLS labels, the predefined qualifiers will not match. In this scenario, user-defined qualifiers are added to the same PMF group to identify the TWAMP packet.

The **`twamp-ipv6`** hardware profile establishes two PMF groups to manage TWAMP IPv6 traffic, differentiating between MPLS and non-MPLS traffic due to the inability to fit user-defined qualifiers in a single PMF group. These groups ensure accurate hardware time stamping of TWAMP packets, identified by their source IPv6, destination IPv6, source UDP port, and destination UDP port. When a packet is recognized as a TWAMP packet, the **`bcmFieldActionOam`** action is applied, sending the packet to the OAMP module for time stamping. Additionally, the **`bcmFieldActionForward`** action ensures the packet is encapsulated with the correct FEC. If the packet includes MPLS labels, the predefined qualifiers will not match. In this case, user-defined qualifiers are added to identify the TWAMP packet, and since the IPv6 qualifiers cannot be included in the same group, they are created in a separate group.

Note: Enabling TWAMP hardware profiles requires a system reboot.

Command Syntax

```
hardware-profile filter (ingress-l2|ingress-l2-ext|ingress-ipv4|ingress-ipv4-ext|ingress-ipv4-
qos|ingress-ipv6|ingress-ipv6-ext|ingress-ipv6-ext-vlan|ingress-ipv6-qos|qos-ipv6|ingress-
arp|qos|qos-ext|qos-policer|egress-l2|egress-ipv4|evpn-mpls-cw|evpn-mpls-mh|vxlan|vxlabn-mh|cfm-
domain-name-str|twamp-ipv4|twamp-ipv6|twamp-ipv6-mpls|ipv4-bgp-flowspec|) (enable|disable)
```

[1]User Datagram Protocol

[2]FEC is a technique that detects and corrects errors during data transmission to maintain the reliability of the communication system.

Parameters

ingress-12
Ingress L2 ACL filter group.

ingress-12-ext
Ingress L2 ACL, QoS, mirror filter group.

ingress-ipv4
Ingress IP ACL filter group.

ingress-ipv4-ext
Ingress IP ACL, mirror, PBR filter group.

ingress-ipv4-qos
Ingress IPv4 group for ACL match QoS.

ingress-ipv6
Ingress IPv6 ACL, mirror, PBR filter group

ingress-ipv6-ext
Ingress IPv6 group to support 128-bit address qualification support on physical interface.

ingress-ipv6-ext-vlan
Ingress IPv6 group to support 128-bit address qualification support on vlan interface and subinterface.

ingress-ipv6-qos
Ingress IPv6 group for ACL match QoS.

qos-ipv6
Ingress QOS IPv6 group for IPv6 QoS support with statistics.

ingress-arp
Ingress ARP group.

qos
Ingress QoS filter group

qos-ext
Ingress QoS extended filter group.

qos-policer
Ingress extended QoS group for hierarchical policer support.

egress-12
Egress L2 ACL filter group

egress-ipv4
Egress IP ACL filter group.

evpn-mpls-mh
Ingress EVPN MPLS Multi-Homing Forwarding Group

vxlan
Ingress VxLAN Forwarding group

vxlan-mh
Ingress VxLAN Multi-Homing Forwarding Group.

cfm-domain-name-str
Egress CFM domain group.

twamp-ipv4
TWAMP IPv4 filter group.

twamp-ipv6
TWAMP IPv6 filter group.

twamp-ipv6-mpls
TWAMP IPv6 MPLS filter group.

ipv4-bgp-flowspec
BGP FlowSpec filter group.

enable
Enable filter group.

disable
Disable filter group

Default

By default, all filter groups are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 3.0.

Examples

```
OcNOS#configure terminal
OcNOS(config)#hardware-profile filter ingress-ipv4 enable
OcNOS(config)#hardware-profile filter ingress-ipv4 disable
OcNOS(config)#hardware-profile filter egress-ipv4 enable
OcNOS(config)#hardware-profile filter egress-ipv4 disable
```

hardware-profile filter for Qumran-2

Use this command to enable or disable ingress IPv4 or IPv6, egress IPv6 filter groups, EVPN-MPLS,VxLAN filter and TWAMP IPv4 or IPv6 groups. Disabling filter groups increases the configurable filter entries.

Disabling a TCAM filter group is not allowed if the group has any entries configured in hardware. Group dependent entries must be explicitly removed before disabling the TCAM group.

Notes:

- This feature is supported for IPv4 unicast and IPv4 BGP/MPLS VPN service based on RFC 8955.
- Use the `ingress-IPv4-subif` and `ingress-IPv6-subif-ext` groups when ACL is required on the subinterfaces and IRB interfaces only. Use `ingress-IPv4-ext` and `ingress-IPv6` groups when ACL is required on physical, subinterface and **LAG**[1].
- Updating the access list may take a long time in a scaled configuration because the hardware must reshuffle the filter entries when configuring a high-priority filter.
- In the ingress direction, Qumran-2C (Q2C) series platforms hardware supports stats for 16k filter entries, andQumran-2A (Q2A) series platforms supports 8k filter entries. For the egress direction,Qumran-2C (Q2C) series platforms supports 8k, and Qumran-2A (Q2A) series platforms supports 4k.
- In Qumran2 (Q2) series platforms, either two 160-bit groups or one 320-bit group can be created in the egress direction.
- In Qumran2 series platforms, Egress ACls are not applicable for packets which sent from cpu.
- Disabling and Enabling the hardware-profile filter command in a single commit is not recommended.

  Example:

  ```
  OcNOS(config)#hardware-profile filter ingress-ipv4 disable
  OcNOS(config)#hardware-profile filter ingress-ipv4-ext enable
  OcNOS(config)#commit
  ```

- Configuring and unconfiguring access-list to the interface in a single commit is not recommended.

  Example:

  ```
  OcNOS(config)#interface xe8
  OcNOS(config-if)#no ip access-group ACL1v4 out
  OcNOS(config-if)#exit
  OcNOS(config)#interface xe3
  OcNOS(config-if)#ip access-group ACL2v4 out
  OcNOS(config-if)#commit
  ```

- For better utilization of TCAM resources it is recommended to enable large groups first and then smaller groups.

Note: Enabling TWAMP hardware profiles requires a system reboot.

[1]Link Aggregation Group

Example

```
hardware-profile filter qos-policer enable                # QoS policer/storm control
hardware-profile filter ingress-ipv6 enable              # IPV6 ACL
hardware-profile filter ingress-l2-subif enable       # MAC ACL
hardware-profile filter ingress-ipv4-subif enable   # IPv4 ACL
```

Command Syntax

```
hardware-profile filter (dhcp-snoop|dhcp-snoop-ipv6|egress-dst-
ipv6|egressipv4|egress-ipv4-ext|egress-ipv6|egress-l2|egress-l2-ext|egress-qospolicer|egress-
qos-policer-ext|egress-src-ipv6|ingress-arp|ingress-ipv4|ingressipv4-ext|ingress-ipv4-
qos|ingress-ipv4-qos-copp|ingress-ipv4-subif|ingress-ipv6|ingress-ipv6- ext|ingress-ipv6-ext-

ipv6|qos-policer|evpn-mpls-cw|evpn-mplsmh|vxlan|vxlan-mh|twamp-ipv4|twamp-ipv6|twamp-
ipv6-mpls|vxlan|ipv4-bgpflowspec|) (enable|disable)
```

Parameters

dhcp-snoop	Ingress **DHCP**[1] Snooping group
dhcp-snoop-ipv6	Ingress IPv6 DHCP Snooping group
ingress-arp	Ingress ARP group for ARP ACL support
ingress-l2	Ingress L2 ACL filter group.
ingress-l2-ext	Ingress L2 ACL, QoS, mirror filter group.
ingress-l2-subif	Ingress L2 group for ACL on L2/L3 Subinterfaces.
ipsg	Ingress IP Source Guard group
ipsg-ipv6	Ingress IPv6 Source Guard group
ingress-ipv4	Ingress IP ACL filter group.
ingress-ipv4-ext	Ingress IP ACL, mirror, PBR filter group.
ingress-ipv4-qos	Ingress IPv4 group for ACL match QoS.
ingress-ipv4-subif	Ingress IPv4 group for ACL on L2/L3 Subinterfaces.
ingress-ipv6	Ingress IPv6 ACL, mirror, PBR filter group
Ingress-ipv4-qos-copp	Ingress IPv4 group for ACL match QoS and CoPP.
ingress-ipv6-ext	Ingress IPv6 extended group with 128-bit address support for ACL , ACL match QOS on physical interfaces.
ingress-ipv6-ext-vlan	Ingress IPv6 extended group with 128-bit address support for ACL, ACL match QOS on **SVI**[2] interfaces.
ingress-ipv6-ext-subif	Ingress IPv6 extended group with 128-bit address support for ACL, ACL match QOS on Sub interfaces.
ingress-ipv6-qos	Ingress IPv6 group for ACL match QoS.
qos-ipv6	Ingress QOS IPv6 group for IPv6 QoS support with statistics.

[1]Dynamic Host Configuration Protocol

[2]Switched Virtual Interface

qos	Ingress QoS filter group
qos-ext	Ingress QoS extended filter group.
qos-ipv6	Ingress QOS IPv6 group for IPv6 QoS support with statistics
qos-policer	Ingress extended QoS group for hierarchical policer support with statistics.
egress-l2	Egress L2 ACL filter group
egress-l2-mlag	Egress L2 group for ACL only on MLAG interface.
egress-l2-ext	Egress L2 extended (mac) group for ACL on subinterface.
egress-dst-ipv6	Egress Destination IPv6 group for ACL
egress-ipv4	Egress IP ACL filter group.
egress-ipv4-ext	Egress IPv4 extended group for ACL on subinterface
egress-ipv6	Egress IPv6 group for ACL
egress-qos-policer	Egress QoS policer group only for physical and LAG interface
egress-qos-policer-ext	Egress extended QOS policer group
egress-src-ipv6	Egress Source IPv6 group for ACL
twamp-ipv4	Ingress TWAMP IPv4 Forwarding group.
twamp-ipv6	Ingress TWAMP IPv6 Forwarding group.
twamp-ipv6-mpls	Ingress TWAMP IPv6 MPLS Forwarding group.
ipv4-bgp-flowspec	BGP FlowSpec filter group.
evpn-mpls-mh	Ingress EVPN MPLS Multi-Homing Forwarding Group
vxlan	Ingress VxLAN Forwarding group
vxlan-mh	Ingress VxLAN Multi-Homing Forwarding Group.
vxlan	Ingress Vxlan Forwarding group
enable	Enable filter group.
disable	Disable filter group

Default

By default, all filter groups are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 3.0.

Examples

```
OcNOS#configure terminal
OcNOS(config)#hardware-profile filter ingress-ipv4 enable
OcNOS(config)#hardware-profile filter ingress-ipv4 disable

OcNOS(config)#hardware-profile filter egress-ipv4 enable
OcNOS(config)#hardware-profile filter egress-ipv4 disable
```

hardware-profile filter-match ingress-ip-outer

Use this command to make the following ingress ACL groups match only the outer IPv4 and IPv6 headers:

- ingress-ipv4
- ingress-ipv4-ext,
- ingress-ipv4-subif,
- ingress-ipv6,
- ingress-ipv6-ext,
- ingress-ipv6-ext-vlan
- ingress-ipv6-ext-subif

Command Syntax

```
hardware-profile filter-match ingress-ip-outer
no hardware-profile filter-match ingress-ip-outer
```

Parameters

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.6.0 and supported for the Qumran2 (Q2) series platforms only.

Example

The below configuration shows how to make the ACL groups match only the outer IPv4 and IPv6 headers:

```
OcNOS#configure terminal
OcNOS(config)#hardware-profile filter-match ingress-ip-outer
```

hardware-profile flowcontrol

Use this command to globally enable or disable hardware-based flow control.

Command Syntax

```
hardware-profile flowcontrol (disable|enable)
```

Parameters

disable
Disable flow control globally

enable
Enable flow control globally

Default

By default flow control is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#configure terminal
(config)#hardware-profile flowcontrol enable
```

hardware-profile service-queue

Use this command to set the number of service-queue counts to create in hardware.

Use the no form of this command to set the service queue profile to default

Note: Reboot the switch after giving this command for the changes to take effect.

Command Syntax

```
hardware-profile service-queue (profile1| profile2)
no hardware-profile service-queue
```

Parameters

profile1
Supports new 4 queue-bundle per service (default)

profile2
Supports new 8 queue-bundle per service

Default

By default, **`profile1`** is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is only available on Qumran platforms.

Examples

```
#configure terminal
(config)#hardware-profile service-queue profile2
(config)#no hardware-profile service-queue
```

hardware-profile statistics

Use this command to enable or disable filter statistics in hardware.

- In Q1, you must reboot the switch after giving this command for the changes to take effect. For Q2, Statistic profiles are updated dynamically.
- If both ACL and QOS statistics are required on the same interface, then both ingress-acl and ingress-qos profiles must be enabled and this will limit other profiles from being enabled. More details on restrictions explained below.
- When any two or all of MAC ACL or IP ACL or QoS service-policy are configured on the same interface or in its dependent interface, their entries will use statistics entries from ingress-acl statistics profile, and as a result the statistics is updated on only one entry based on the hardware-profile filter created later.
- Cfm-slm statistics is supported only on Q2 devices.

Command Syntax

```
hardware-profile statistics (ac-lif|cfm-ccm|cfm-lm |cfm-slm|ingress-acl|ingress-qos|egress-acl|mpls-pwe|tunnel-lif|voq-full-color|voq-fwd-drop) (enable|disable)
```

Parameter

ac-lif
VXLAN access ports statistics

cfm-ccm
Cfm ccm counter statistics

cfm-lm
Cfm Loss Measurements statistics

cfm-slm
Cfm Synthetic Loss Measurements statistics

tunnel-lif
VXLAN tunnels statistics

ingress-acl
Ingress ACL, QoS, and PBR statistics

ingress-qos
Ingress QoS statistics (explicit)

egress-acl
Egress ACL statistics

mpls-pwe
Pseudowire logical interfaces statistics

voq-full-color
Statistics for all VOQ counters

voq-fwd-drop
Statistics for forward drop VOQ counters

enable
Enable statistics

disable
Disable statistics

Default

In Q1, By default, only ingress-acl statistics profile is enabled. Other statistics profiles are disabled.

In Q2, By default, **`voq-full-color, cfm-ccm`** statistics profile is enabled. Other statistics profiles are disabled. The **`voq-full-color`** cannot be disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and this command is applicable for Qumran. The voq-full-color and voq-fwd-drop,cfm-slm,cfm-lm and cfm-ccm options are applicable for Qumran2.

Examples

```
#configure terminal
(config)#hardware-profile statistics tunnel-lif enable
```

Table 290 provides details of scalable numbers of each statistics profiles and the applications that use the statistics profiles. For example, the **`ingress-acl`** profile is used by ACL, QoS, and PBR applications and all of them share the statistics entries from this profile. So, consuming 8k statistics entries for ACL application means that QOS and PBR applications do not get any statistics.

There are limitations on the number of statistics profiles that can be enabled at a time. This limitation is based on the stages that each profile uses. Table 290 shows the four stages: ingress, ingress queuing, egress1, and egress2; and only two statistics profiles per stage can be configured.

For example, if both the **`ingress-acl`** and **`mpls-acl`** profiles are configured, then no more profiles that use the “ingress stage” can be enabled because only two profiles are allowed per stage. To use another “ingress-based” profile, you must first disable at least one of the profiles that are currently using the ingress stage.

Table 290. Statistics profile capacity (maximum numbers in best case scenario)

Statistics profile	Stage	QMX	QAX	QUX	Application
ingress-acl	Ingress	~8k	~6k	~1.5K	Ingress ACL, QoS, PBR
egress-acl	Egress1	~8k	~2k	~2k	Egress ACL
ingress-qos	Ingress	~8k	~6k	~1.5K	QoS
voq-full-color	Ingress queuing	~13k	~6k	~6K	QoS (queue statictics)
voq-fwd-drop	Ingress queuing	~32k	~16k	~16K	QoS (queue statictics)
tunnel-lif	Ingress Egress2	~16k	N/A	N/A	VXLAN and MPLS (LSP/tunnels)

Table 290. Statistics profile capacity (maximum numbers in best case scenario) (continued)

Statistics profile	Stage	QMX	QAX	QUX	Application
mpls-pwe	Ingress Egress2	~16k	~8k	~1K	MPLS (pseudowire)
cfm-ccm	Ingress	~3k	~800	~800	CFM (ccm)
cfm-lm	Ingress Egress2	~6k	~1.5k	NA	CFM (loss measurement)
ac-lif	Ingress Egress2	~32k	N/A	N/A	VXLAN and MPLS (access-port)

hardware-profile bgp-flowspec-mode

Use this command to set BGP flowspec mode that specifies the installation rules to the hardware.

Note: No support for Install-partial option in Q2. Setting hardware profile to bgp-flowspec-mode requires, disabling and enabling the ipv4-bgp-flowspec to take effect. Chose a appropriate option based on usage. Use install-all option for normal case.

Syntax

```
hardware-profile bgp-flowspec-mode (install-all|install-partial|no-prioritizing)
```

Parameters

install-all
FLOWSPEC rules are prioritized. The already installed all rules are reinstalled when a new rule is added. (default)

install-partial
FLOWSPEC rules are prioritized. Do not reinstall all previously installed rules when a new rule is added to avoid unnecessary reinstallation.

no-prioritizing
FLOWSPEC rules are not prioritized. Install only rules requested to add but not reinstall any other rules when a new rule is added.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.3.5.

Example

```
(config)#hardware-profile filter ipv4-bgp-flowspec disable
(config)#commit
(config)#hardware-profile bgp-flowspec-mode no-prioritizing
(config)#commit
(config)#hardware-profile filter ipv4-bgp-flowspec enable
(config)#commit
```

ip redirects

Use this global command to trap **ICMP**[1] redirect packets to the CPU and on interface to enable ICMP redirects in kernel.

Use the `no` form of this command to disable the ICMP redirect message on an interface.

Note: This command is applicable for both IPv4 and IPv6 interfaces.

Command Syntax

```
ip redirects
no ip redirects
```

Parameters

None

Default

None

Command Mode

Configure mode and Interface mode

Applicability

Introduced in OcNOS version 3.0.

Example

```
#configure terminal
(config)#ip redirects

(config)#no ip redirects
```

```
#configure terminal
(config)#interface xe1/1
(config-if)#ip redirects

#configure terminal
(config)#interface xe1/1
(config-if)#no ip redirects
```

[1]Internet Control Message Protocol (ICMP) is a fundamental protocol used in networking to relay error messages and operational information.

load-balance enable

Use this command to enable load-balancing configurations in hardware.

Use the no option to reset the load balancing to default settings.

Note: When the command **`load-balance enable`** is issued, the default load-balance settings are unset. User then has to configure the new load-balancing parameters.

Command Syntax

This form unsets load balancing globally:

```
load-balance enable
```

This form resets load balancing globally to default settings:

```
no load-balance enable
```

By default, load balancing is enabled for ECMP and **LAG**[1].

This form sets hashing based on IPv4 fields:

```
load-balance (ipv4 {src-ipv4 | dest-ipv4 | srcl4-port | destl4-port | protocol-id})
no load-balance (ipv4 {src-ipv4 | dest-ipv4 | srcl4-port | destl4-port | protocol-id})
```

This form sets hashing based on IPv6 fields:

```
load-balance (ipv6 {src-ipv6 | dest-ipv6 | srcl4-port | destl4-port | protocol-id | next-hdr})
no load-balance (ipv6 {src-ipv6 | dest-ipv6 | srcl4-port | destl4-port | protocol-id | next-hdr})
```

This form sets hashing based on L2 fields:

```
load-balance (l2 {dest-mac|src-mac|ether-type|vlan})
no load-balance (l2 {dest-mac|src-mac|ether-type|vlan})
```

This form sets hashing on an MPLS fields:

```
load-balance (mpls {labels})
no load-balance (mpls {labels})
```

Following additional parameters are supported on Dune DNX boards:

```
load-balance inner-ipv4 ({non-symmetric| protocol-id| src-dest-ipv4})
no load-balance inner-ipv4 ({non-symmetric| protocol-id| src-dest-ipv4})

load-balance inner-l2 ({ether-type| non-symmetric| src-dest-mac| vlan})
no load-balance inner-l2 ({ether-type| non-symmetric| src-dest-mac| vlan})

load-balance src-dest-l4port (non-symmetric)
no load-balance src-dest-l4port
```

Note: The configured load balancing parameters are global and will be applicable to all LAG & ECMP created in the hardware.

[1]Link Aggregation Group

Parameter

ipv4
Load balance IPv4 packets

src-ipv4
Source IPv4 based load balancing

dest-ipv4
Destination IPv4 based load balancing

srcl4-port
Source L4 port based load balancing

destl4-port
Destination L4 port based load balancing

protocol-id
Protocol ID based load balancing

ipv6
Load balance IPv6 packets

src-ipv6

Source Destination IPV6 based load balancing

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
(config)#load-balance enable
(config)#load-balance ipv4 src-ipv4
```

show forwarding profile limit

Use this command to display the forwarding profile table sizes.

Note: 1k represents 1,024 entries.

Command Syntax

```
show forwarding profile limit
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version SP 1.0.

Examples

```
#show forwarding profile limit

------------------------------------------------------------------------------
          L3 (Ipv4/Ipv6) KAPS Forwarding Profile
------------------------------------------------------------------------------
Active (*)   Configured (*)  Profile-type     IPv4-db-size     IPv6-db-size
                            profile-one      NA               NA
   *           *            profile-two      -                200k

#
```

show hardware-profile filters

Use this command to show details of TCAM filter groups which are enabled. By default, all filter groups are disabled.

Command Syntax

```
show hardware-profile filters
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#show hardware-profile filters

Note: Shared count is the calculated number from available resources.
      Dedicated count provides allocated resource to the group.
      If group shares the dedicated resource with other groups, then dedicated
      count of group will reduce with every resource usage by other groups.

+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      10495     0     1         10486   2048        8448
```

Table 291 explains the output fields.

Table 291. show hardware-profile filters

Field	Description
Ingress	Ingress filtering is a method used to prevent suspicious traffic from entering a network.
TCAMS	Number of ternary content addressable memory (TCAM) entries a particular firewall filter.
Free Entries	Number of TCAM filter entries available for use by the filter group.
Used Entries	Number of TCAM filter entries used by the filter group.
Total Entries	Number of TCAM total filter entries to the filter group.
Dedicated Entries	Number of TCAM filter entries dedicated to the filter group.
Shared Entries	Number of TCAM filter entries shared to the filter groups.

Operational details of TCAM profiles

TCAM group statistics comprises of three parts:

- **Total Entries** – Total configurable entries on the TCAM group. Total has two parts. One is dedicated and other is shared. Dedicated count is the guaranteed entry count for the group. Shared count a logical count calculated for the group from shared pool available at the time of show command execution
- **Used Entries** – Count of entries that have been configured on the TCAM group. Used entries are shown are shown in percentage format as well as an indication of how much TCAM space is used up. However, percentage calculation includes shared pool and subject to change drastically when shared pool is taken up by different group.
- **Free Entries** – Count of possible remaining entries on the TCAM group. Free entries count is not the guaranteed count as the count includes the shared pool count into account.

When a TCAM group is enabled in the device, no hardware resource (bank) is associated with the group. Thus, dedicated count will be initially zero. Total count will be same as shared count which is calculated based on the group width. Group width is determined by width consumed by the qualifiers or width consumed by the actions.

Example of show output when qos-ext group is enabled on QMX device is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      10496     0     0         10496   0           10496
```

When an entry is created on the group for the first time, either a single bank or a bank pair is allocated to the group. A group consuming single bank or a bank pair is decided by group width. Groups like qos, ingress-l2, and ingress-ipv4 consume single bank and groups like qos-ext, qos-policer, ingress-l2-ext, ingress-ipv4-ext, ingress-ipv4-qos, ingress-ipv6, ingress-ipv6-qos, egress-l2, and egress-ipv4 consume a bank pair.

An example of output when a single entry is created in hardware for qos-ext group on QMX device is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      10495     0     1         10496   2048        8448
```

In the above example, dedicated entry count has increased to 2048 as a bank pair is allocated for the group. Unallocated banks capacity is calculated for qos-ext group and counted under shared entries as 8448.

An example of output when 2048 entries are created in hardware for qos-ext group and ingress-l2 and ingress-ipv4-ext groups is enabled with no entries created on those groups for QMX device is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      8448     20     2048      10496   2048        8448
 INGRESS L2           16896     0     0         16896   0           16896
 INGRESS IPV4-EXT     8448      0     0         8448    0           8448
```

In the above example, note that the number of entries between ingress-l2 and ingress-ipv4-ext groups vary as ingress-l2 group is a 160-bit wide group consuming only one bank at a time. On the other hand, ingress-ipv4-ext

group is 320 bit wide group consuming a group pair at a time. With a bank pair already being consumed by qos-ext group, ingress-ipv4-ext group gets possible total entries of 8448 in comparison to 10496 by qos-ext group.

When all the created entry count goes beyond the entries of dedicated bank pair (or a bank), group will be allocated with another bank pair (or a bank) and subsequently shared pool count will reduce across all other groups.

An example of output when 2049 entries are created in hardware for qos-ext group with ingress-l2 and ingress-ipv4-ext groups enabled with no entries created on those groups for QMX device is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      8447      20    2049      10496   4096        6400
 INGRESS L2           12800     0     0         12800   0           12800
 INGRESS IPV4-EXT     6400      0     0         6400    0           6400
```

When a bank is consumed by ingress-l2 group, effect on qos-ext group will still be the count of a bank pair with one bank not usable for qos-ext group even if it is available. The bank can be used by groups which consume single bank.

An example of output when an entry is created in hardware for ingress-l2 group with qos-ext and ingress-ipv4-ext groups in the state as mentioned in above example is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      6399      24    2049      8448    4096        4352
 INGRESS L2           12799     0     1         12800   2048        10752
 INGRESS IPV4-EXT     4352      0     0         4352    0           4352
```

In the above example scenario, it can be noted that the used entry percentage for qos-ext group jumped from 20 to 24 as a result of drastic reduction in total entry count due to bank movement from shared pool to dedicated bank.

Hardware doesn't optimize the utilization of banks when entries are removed from one of the banks resulting in entries used shown up less than capacity of one bank but still multiple banks would be dedicated to a group.

An extended example of above scenario with 10 entries removed from qos-ext group is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      6409      24    2039      8448    4096        4352
 INGRESS L2           12799     0     1         12800   2048        10752
 INGRESS IPV4-EXT     4352      0     0         4352    0           4352
```

It can be noted that the used entry count has come down to 2039 which is less than the capacity of bank pair i.e. 2048. However, since entries are used up across two set of bank pairs, both bank pairs will still be dedicated. If there is a need to recover bank pair from dedicated pool, all the entries should be deleted and re-created in hardware.

TCAM groups are further divided into sub-categories which can share the dedicated banks between the groups. TCAM groups such as ingress-l2, ingress-l2-ext, ingress-ipv4, ingress-ipv4-ext, ingress-ipv4-qos, qos, qos-ext, qos-

policer are considered under default sub-category and don't serve IPv6 traffic. TCAM groups such as ingress-ipv6, ingress-ipv6-qos, and qos-ipv6 are meant for IPv6 traffic and are considered under IPv6 sub-category.

Only four 320-bit wide groups that belong to same sub-category can be created. For default sub-category, number is limited to three as system group will be created by default.

When three default sub-category groups are created along with one group from IPv6 sub-category, one of the default sub-category group will share the bank pair with IPv6 group. This will result in dedicated count to be shown lesser by the number that the other shared group is consuming. With every single resource consumed by one group will reduce the same number from other shared group.

An example of above scenario is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 QOS-EXT              6399      0     1         6400    2048        4352
 INGRESS IPV4-ACL-EXT 6398      0     2         6400    2048        4352
 INGRESS IPV4-QOS     6382      0     1         6383    2031        4352
 INGRESS IPV6-ACL     6382      0     17        6399    2047        4352
```

Note that ingress-ipv4-qos group has shared the resource with ingress-ipv6 group. TCAM group ingress-ipv4-qos has consumed 1 entry and ingress-ipv6 group has consumed 17 entries. Hence, dedicated count for ingress-ipv4-qos group is shown as 2031 (2048 - 17) and dedicated count for ingress-ipv6 group is shown as 2047 (2048 - 1).

Capacity of TCAM profiles

Entries created on other TCAM groups affect the capacity of a particular TCAM group. This dependency is explained in the section .

In this section maximum configurable entries per group when no entries created on other groups are listed below.

Table 292. Maximum configurable entries

TCAM Groups		QAX	QUX
ingress-l2	20992 (2048 x 10 + 256 x 2)	9728 (1024 x 9 + 256 x 2)	3584
ingress-l2-ext	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 +256 x 1)	1792
ingress-ipv4	20992 (2048 x 10 + 256 x 2)	9728 (1024 x 9 + 256 x 2)	3584
ingress-ipv4-ext	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
ingress-ipv4-qos	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
ingress-ipv6	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
ingress-ipv6-ext	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
ingress-ipv6-ext-vlan	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
ingress-ipv6-qos	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
qos-ipv6	12288 (2048 x 6)	5120 (1024 x 5)	1792
qos	20992 (2048 x 10 + 256 x 2)	9728 (1024 x 9 + 256 x 2)	3584

Table 292. Maximum configurable entries (continued)

TCAM Groups		QAX	QUX
qos-ext	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
qos-policer	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
egress-l2	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
egress-ipv4	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)	1792
cfm-domain-name-str	20992 (2048 x 10 + 256 x 2)	9728 (1024 x 9 + 256 x 2)	3584

Combination of TCAM profiles

Device supports configuration of only one egress group in the system. Hence out of the egress groups cfm-domain-name-str, egress-l2 and egress-ipv4, only one egress group can be enabled.

In other words, solution with CFM features enabled, cannot have egress security filters.

Configuration of ingress groups are subject to the sub-category to which a group belongs. Sub-category of each group is shown below:

Table 293. Sub-category of groups

Category	Groups in the category
default (ingress)	ingress-l2 ingress-l2-ext ingress-ipv4 ingress-ipv4-ext ingress-ipv4-qos qos qos-ext qos-policer
Ipv6 (ingress)	ingress-ipv6, ingress-ipv6-qos, qos-ipv6, ingress-ipv6-ext, ingress-ipv6-ext-vlan
default (egress)	egress-l2, egress-ipv4
cfm (egress)	cfm-domain-name-str

Note: Per sub-category, not more than three groups can be created if the group key size is 320 bits wide.

show nsm forwarding-timer

Use this command to display the information of Graceful Restart capable MPLS clients to NSM that are currently shutdown. Use the option LDP or RSVP to see the particular module information.

Command Syntax

```
show nsm (ldp| rsvp) forwarding-timer
```

Parameters

ldp
Use this parameter to display the protocol LDP information.

rsvp
Use this parameter to display the protocol RSVP information.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#sh nsm rsvp forwarding-timer
Protocol-Name  GR-State  Time Remaining (sec)   Disconnected-time
    RSVP        ACTIVE           100           2021/08/18 04:49:23
#sh nsm ldp forwarding-timer
Protocol-Name  GR-State  Time Remaining (sec)   Disconnected-time
     LDP        ACTIVE           111           2021/08/18 04:50:37
#sh nsm forwarding-timer
Protocol-Name  GR-State  Time Remaining (sec)   Disconnected-time
     LDP        ACTIVE           110           2021/08/18 04:50:37
    RSVP        ACTIVE            96           2021/08/18 04:49:23
```

show queue remapping

Use this command to display the traffic class-to-hardware-queue mapping in hardware.

Command Syntax

```
show queue remapping
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is only available on Qumran platforms.

Examples

When service-queue **`profile1`** is set:

```
#show queue remapping

Port queue remapping:
+------------+------------------------+
|  Queue/tc  |     hardware-queue     |
+------------+------------------------+
|      0     |           0            |
|      1     |           1            |
|      2     |           2            |
|      3     |           3            |
|      4     |           4            |
|      5     |           5            |
|      6     |           6            |
|      7     |           7            |
+------------+------------------------+

Service queue remapping:
+------------+------------------------+
|  Queue/tc  |     hardware-queue     |
+------------+------------------------+
|      0     |           0            |
|      1     |           1            |
|      2     |           1            |
|      3     |           1            |
|      4     |           2            |
|      5     |           2            |
|      6     |           3            |
|      7     |           3            |
+------------+------------------------+
```

When service-queue **`profile2`** is set:

```
#show queue remapping

Port queue remapping:
+------------+-----------------------+
|  Queue/tc  |     hardware-queue    |
+------------+-----------------------+
|      0     |           0           |
|      1     |           1           |
|      2     |           2           |

Linux Shell Commands

This chapter is a reference for Linux shell commands that you can run at the OcNOS prompt.

The below table describes the commands:

Notes:

- You must be in privileged exec mode to run these commands.
- You cannot use the pipe (“|”) or redirect (">") operators.

Table 294. Linux shell commands

Command	Description
`cat file`	Display contents of *file*
`cd`	Change to home directory
`cd dir`	Change directory to *dir*
`cp file1 file2`	Copy *file1* to *file2*
`cp -r dir1 dir2`	Copy *dir1* to *dir2*; create *dir2* if it does not exist
`dir`	Display contents of current directory
`less file`	Display the contents of file
`ls options`	Display contents of current directory
`mkdir dir`	Create a directory *dir*
`more file`	Display the contents of *file*
`mv file1 file2`	Rename *file1* to *file2*
`mv file dir`	Move *file* to directory *dir*
`pwd`	Display current directory
`rmdir dir`	Remove a directory *dir* (only if empty)

Commit Rollback

Overview

The Commit Rollback capability in Common Management Layer Commands (CMLSH) is designed to execute a rollback operation for a set of configurations that were previously committed, with each commit operation identified by a unique commit ID. The Commit ID is numeric value and is generated by the CMLSH Commit, Confirmed Commit and Commit Rollback.

This Commit Rollback application is used for rolling back the commits that are performed after the specified commit ID whether they were executed through either Commit or Confirmed Commit operations.

Here, you find the description for Commit and Confirmed Commit:

- Commit operation: Involves committing the candidate configuration to the running configuration.
- Confirmed Commit operation: Provides more options to the commit operation with timeout parameter, user could provide timeout for the commit (default is 300 seconds).

During this timeout interval, users can either confirm the commit or cancel it, and if no confirmation or cancellation is provided before the timer expires, commit will be automatically rolled back after timeout.

Commit Rollback Characteristics

The Confirmed-Commit operation temporarily applies the configuration for the duration specified in seconds. If the user does not confirm the configuration within this timeframe, an automatic rollback will be initiated once the timer expires. For committing the configurations with timings, see commit (page 1567)

Once the configurations are confirmed, users can use the commit rollback operation to revert the configuration, whether it is for a commit operation or a confirmed commit operation.

Benefits

With the integration of CMLSH Commit Rollback with Standard or Confirmed Commit, users can initiate a rollback operation for any specific commit, utilizing the associated commit ID to revert the configurations to their previous state. In this way, reverting to an earlier state, functional configuration is possible in case the new configuration is compromised or if the configuration makes the device unstable.

Prerequisites

Before configuring this operation, enable cml commit-history to ensure the commit records are stored in the commit history list. By default, **`cml commit-history`** is enabled. For enabling or disabling it, see cml commit-history (page 1834).

show commit list

Use this command to display a record of commit operations stored in the commit history list.

Note: For commit records to be stored in the commit history list, enable cml commit-history (page 1834). Otherwise, commit operations will not be stored.

Command Syntax

```
show commit list
```

Parameters

None

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Example for show commit list:

```
#show commit list
S.No.          ID            User    Client         TimeStamp               Commit
Status                        Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~
 ~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684542224876712    ocnos    cmlsh    20-05-2023
00:23:44              Confirmed                          NA
```

show cml commit-id history state

Use this command to check CMLSH commit confirmed and commit rollback feature is enabled or not.

Note: By default cml commit-id rollover feature will be enabled.

Command Syntax

```
show cml commit-history state
```

Parameters

None

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.6.0.

Example

Example for show commit list:

```
OcNOS#
OcNOS#show cml commit-history state
cml commit-history feature is enabled
```

show cml commit-id rollover state

Use this command to check whether commit-id rollover is enabled. When enabled, once the maximum commit-history count is reached, the oldest commit entry is deleted, and a new commit entry is added to the commit-history list.

Note: By default, cml commit-id rollover feature will be enabled.

Command Syntax

```
show cml commit-history state
```

Parameters

None

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.6.0.

Example

Example for show commit list:

```
OcNOS#
OcNOS#show cml commit-id rollover state
cml commit-id rollover feature is enabled
```

commit-rollback

Use this command to revert configurations to a previously committed stable state. This action will remove configurations made after the provided commit ID (Word).

The <commit confirmed> command applies the configuration on a trial basis for the time period specified in seconds. If the configuration is not confirmed by the user within this time, an auto roll-back will be triggered once the timer expires.

After the configurations are confirmed, if the user wishes to revert to either the normal commit operation or the confirmed commit operation, the commit rollback feature can be used.

Note: To use commit-rollback, cml commit-history must be enabled.

Command Syntax

```
commit-rollback to WORD (description LINE|)
```

Parameters

WORD
Commit ID associated with recorded commit operations stored within the commit- history list.

description LINE
[Optional] Short description about commit-rollback, maximum 64 valid characters.

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Example output for commit-rollback WORD:

```
#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                     Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~~
 ~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684542445002144   ocnos    cmlsh    20-05-2023
00:27:25             Confirmed                            NA
```

Example of a Commit Rollback to the Commit List ID 1684542445002144:

```
#commit-rollback to 1684542445002144 description commit-rollback Test
#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                      Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
      ~~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684542445002144   ocnos    cmlsh    20-05-2023
00:27:25            Confirmed                            NA
  2    1684542402123428   ocnos    cmlsh    20-05-2023 00:28:45     Rollback to 20-05-2023
00:27:25         commit-rollback Test
```

Example of an automatic Commit Rollback

```
#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                    Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~   ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~   ~
~~~~~~~~~~~~~~~~~~~~~~~~~
```

```
~~~~~
#show run router ospf
!
#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#router ospf 5
(config-router)#router ospf 6
(config-router)#commit confirmed timeout 20 description This is to test auto rollback of config
(config-router)#end
#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                    Description

(Reverted)         This is to test auto rollback of config

#show run router ospf
!
#
```

clear cml commit-history (WORD|)

Use this command to delete any specific entry mentioned by commit ID or to delete entire list entries.

Notes:

- To use the commit-rollback operation, the **`cml commit-history`** operation must be enabled, and note that commit-rollback cannot be used for deleted entries.
- While the commit confirmation is in progress, the commit entries cannot be deleted using this command.

Command Syntax

```
clear cml commit-history (WORD|)
```

Parameters

Word

commit ID of the recorded commit operations into commit-history list

Default

When no parameter is provided, the commit history is deleted by default. If you specify the 'Word' parameter, it will delete the specific commit record.

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Example for clear commit using Commit History ID:

```
#show commit list

S.No.         ID           User    Client         TimeStamp               Commit
Status                     Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~~
 ~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684486018411866   ocnos    cmlsh    19-05-2023
08:46:58              Confirmed                              NA
  2    1684486037040268   ocnos    cmlsh    19-05-2023 08:47:17              Confirmed

#clear cml commit-history 1684486018411866
#show commit list

S.No.         ID           User    Client         TimeStamp                Commit
Status                    Description
~~~~~  ~~~~~~~~~~~~~~~~~   ~~~~~   ~~~~~~   ~~~~~~~~~~~~~~~~~~~     ~~~~~~~~~~~~~~~~~~~~~~~~~~
 ~~~~~~~~~~~~~~~~~~~~~~~~
  1    1684486037040268   ocnos    cmlsh    19-05-2023
08:47:17             Confirmed                              NA
```

cml commit-history

Use this command to enable or disable confirmed commit operation (commit-history operation). To verify the state of the operation, use the command **`show cml commit-history state`**.

Notes:

- By default, cml commit-history operation is enabled.
- After disabling the cml commit-history operation, confirmed commit CLIs cannot be used, rendering the confirm-commit (WORD|) (page 1569), and cancel-commit (WORD|) (page 1544) operations unavailable.

Command Syntax

```
cml commit-history (enable | disable)
```

Parameters

enable
Enables commit confirmed and commit rollback operations

disable
Disables commit confirmed and commit rollback operations

Default

By default, commit confirmed and commit rollback operations are enabled.

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 6.4.1 and updated the Command Mode to Configuration mode inOcNOS version 6.6.0 .

Examples

Example for disabling Commit History:

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#cml commit-history disable
OcNOS(config)#commit
```

Example for verifying Commit History when commit-history is disabled:

```
OcNOS#show run commit-history
!
cml commit-history disable
!
OcNOS#
OcNOS#show xml run netconf-server
<netconf-server xmlns="http://www.ipinfusion.com/yang/ocnos/ipi-management-serve
r">
        .
        .
  <commit-history>
    <config>
      <disable-commit-history></disable-commit-history>
    </config>
  </commit-history>
OcNOS#
OcNOS#show cml commit-history state
cml commit-history feature is disabled
```

Example for enabling Commit History:

```
OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#cml commit-history enable
OcNOS(config)#commit
```

Example for verifying Commit History when the commit-history is enabled, either by default or explicitly, it will not be displayed in the show run or show xml commands.

```
OcNOS#show run commit-history
!
```

```
OcNOS#
OcNOS#
OcNOS#show xml run netconf-server
=== NO config for commit-history =====
OcNOS#
OcNOS#show cml commit-history state
cml commit-history feature is enabled
OcNOS#
```

cml commit-id rollover

Use this command to enable or disable commit entry rollover when the maximum count of 50 commit entries is reached. When enabled, older commit entries will be automatically deleted from the commit history list to record new entries. When disabled and list contains 50 entries, commit confirmed operation is not allowed.

To verify the state of the operation, use command **`show cml commit-id rollover state`**.

Notes:

- By default, cml commit-id rollover operation is enabled.
- The cml commit-history operation must be enabled to use this operation.
- The commit-rollback operation can not be used for deleted entry.
- When this operation is disabled and the number of commit entries reaches the maximum count, the addition of commit records to the commit history list will be stopped.
- If this operation is disabled and the list contains 50 entries, the commit-confirmed operation cannot be performed. However, a normal commit operation is allowed even with 50 entries in the list.

Command Syntax

```
cml commit-id rollover (enable | disable)
```

Parameters

enable
Enables commit ID rollover

disable
Disables commit ID rollover

Default

By default, commit ID rollover is enabled.

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 6.4.1.

Example

Example for verifying commit ID rollover state:

```
#show cml commit-id rollover state
cml commit-id rollover feature is enabled
```
